Welcome to Dynamics 365 Business Central

6/13/2019 • 2 minutes to read

Business Central is a business management solution for small and mid-sized organizations that automates and streamlines business processes and helps you manage your business. Highly adaptable and rich with features, Business Central enables companies to manage their business, including finance, manufacturing, sales, shipping, project management, services, and more. Companies can easily add functionality that is relevant to the region of operation, and that is customized to support even highly specialized industries.

Business Central is fast to implement, easy to configure, and simplicity guides innovations in product design, development, implementation, and usability. In this section, you can find information about using Business Central in your company. And if you are a partner or customer looking at extending the functionality, you will find relevant links under Development and Administration.

Getting Started with Dynamics 365 Business Central

6/13/2019 • 7 minutes to read

Business Central is a business management solution for small and mid-sized organizations that automates and streamlines business processes and helps you manage your business. Signing up is easy, and you can migrate existing business data from your legacy system. To help you with your subscription, find a Business Central partner [here](#).

When you sign up for the Business Central preview you get access to a demonstration company. The demonstration company contains sample data, but you can create your own sales documents, for example, or set up a bank account.

Get to know Business Central

In Business Central, some things will be familiar to you, and other things might be unfamiliar. In the demonstration company, visual guides explain core functionality, and help you try out daily tasks like creating a sales invoice and viewing a report. If you leave a guide, for example, to explore Business Central on your own, but want to return to it, go back to the Role Center and launch the Getting Started tour. If you want more assistance, contact a Business Central partner.

TIP

You can get back to the Role Center by selecting the company name in the upper left corner.

For some quick, nice-to-know tricks, see:

- [Find things](#)
- [Searching, Filtering, and Sorting Lists](#)
- [Entering Data](#)

For more information, see [Working with Business Central](#).

When you are ready to start working and you want to look at some of the business processes that Business Central supports, see [Business Functionality](#).

Before you can begin to use functionality, certain setup must be made. For more information, see also [Setting Up Business Central](#). Note that some setup steps can be performed semi-automatically by using assisted setup guides.

For an overview of current capabilities and what is coming, take a look at our release plan at [Microsoft Dynamics 365 Business Central Release Plan](#).

The Role Centers

The Role Center page is based on a role-centric design to give you fast access to the business process and intelligence tools that you need to do your job. For example, an accountant can monitor payments and approvals, and view finance performance charts. Check out the various Role Center by choosing the **Settings** icon  in the top right corner, choosing **My Settings**, and then the Role Center to explore. Sign in again to apply the change. For more information, see [Changing Basic Settings](#).

Each Role Center provides a **Setup and Extensions** button. Here you have access to a list of assisted setup guides that can help you get started by setting selected areas up quickly. If an area is not covered by an assisted setup, choose the **Manual Setup** action to access setup pages where you can fill in setup fields for all areas manually. For more information, see also [Setting Up Business Central](#).

NOTE

The list of setup guides, extensions, and services that are available differ depending on the user experience you choose for your company. The **Essential** experience gives access to fewer than the **Premium** experience does. The first time you sign in, you use the Essential experience. For more information, see [Changing Which Features are Displayed](#).

On the **Assisted Setup** page, you will find the following with the **Essential** experience:

ASSISTED SETUP	DESCRIPTION
Migrate Business Data	Lets you import your existing company data such as vendors, customers, and items from Excel or Quickbooks.
Set Up My Company	Creates a new trial company for you to enter data and try out Business Central. If you went through the Getting Started tour this is probably already Completed .
Set Up Cash Flow Forecast	Sets up the Cash Flow Forecast chart, so you can view the predicted movement of cash in and out of your business. The chart is available on the Accountant Role Center .
Set Up Approval Workflows	Sets up the ability to automatically notify an approver when a user tries to create or change certain values on documents, journal lines, or cards, such as an amount above a specified limit.
Set Up a Customer Approval Workflow	Sets up the ability to automatically notify an approver when a user tries to create or change a customer card.
Set Up Email	Gets you ready for sending email messages directly from, for example, sales orders or contacts in Business Central.
Set Up Email Logging	Sets up the capability to log email correspondence in Business Central to follow up on interactions.
Set Up Outlook for Business Central	Sets up the ability to use and launch Business Central from Outlook.
Set Up Reporting	Sets up data sets that you can use to build powerful reports using Excel or Power BI, for example.
Set Up an Item Approval Workflow	Sets up the ability to send a notification to an approver when a user changes or creates an item.
Set Up a Payment Approval Workflow	Sets up the ability to send a notification to an approver when a user sends payment journal lines for approval.

ASSISTED SETUP	DESCRIPTION
Set Up the Business Central Connector	Sets up a connection to Dynamics 365 for Sales, which allows you to synchronize data such as contacts and sales order information.
Set Up Sales Tax	Gets you started with default tax groups and assigning tax area codes that you can assign to customers and vendors in order to automatically calculate sales tax in sales or purchase documents.

Trying things out in your own company

Thinking about subscribing? You can easily change from the demonstration company, and create and work in a company of your own. This is a great way to start toward a subscription. Setups for finances are provided; you just need to create or import your customers, vendors, and the products or services that you sell. After that, you're ready to post invoices and use business intelligence tools to analyze your business. You can use your company for free for a 30-day trial period. If you subscribe to Business Central during that time, you're already up and running. You can continue with the work you did during the trial.

To create a company to try things out, go to the **My Settings** menu in the top right corner, and change the company to **My Company**. Sign out of Business Central and then sign in again to apply the change. An assisted setup guide will help you provide basic information about your company. When that's done, explore the Role Center and find the **Assisted Setup** action.

Alternatively, find a Business Central partner [here](#).

Getting answers to questions

If you are not sure how to do something in Business Central, you can hopefully find the answer either from reading the tooltip for the field that you are unsure of, or by reading the content by opening the *Learn more* link in a tooltip (use the keyboard shortcut Ctrl+F1). You can also get to the documentation by choosing the related link in the [Help and Support page](#).

All fields in Business Central are described in tooltips. You can access tooltips by choosing the name of the field. For example, in a page like the **Customer Card**, simply choose the name of the field to read the tooltip. In a list such as the **Customers** list, or the lines in a document such as a sales order, you have to choose the drop-down menu to the right of the name of the column and then choose the **What's this?** menu item.

If you have additional questions, we recommend that you ask the community or contact your reselling partner. For more information, see [Where do I go if I have questions?](#).

Ready to subscribe?

Each time you sign in during the trial period, a notification in a blue bar at the top displays the time remaining. If you decide to subscribe, find a Business Central partner [here](#). You can also contact the [Business Central Sales team](#).

Other Dynamics 365 apps

Navigate to content about the other Dynamics 365 apps by choosing the [Dynamics 365](#) link in the blue banner at the top of this page. You can also learn more at the [Dynamics 365 Business Central website](#).

If you are an accountant, you can sign up for Dynamics 365 — Accountant Hub and have seamless

integration with Business Central. For more information, see [Welcome to Dynamics 365 — Accountant Hub](#).

What's New in Dynamics 365 Business Central

6/13/2019 • 2 minutes to read

IMPORTANT

Wondering about upcoming and recently released capabilities in Dynamics 365 Business Central?

[Check out the latest version of the release plan](#). We've captured all the details, and you can even get the release plan as a single PDF that you can use for planning.

This page points you to topics that can help you learn about the new features in the latest versions of Dynamics 365 Business Central. If you haven't already, then sign up for a [trial](#), get introduced to the basics of what you can do with Business Central, and then try things out on your own for a while. When you are ready, you can open a blank company and set things up for yourself.

On a regular basis, we will update Business Central with additional capabilities in the core application and with new extensions. For the current list of Microsoft extensions, see [Customizing Business Central Using Extensions](#).

To see all extensions offered by Business Central partners, see [AppSource, Business Central](#).

Check the Business Central Blog

We also talk about new capabilities on [the Business Central blog](#), including when they are made available, and if there are special considerations.

Minimum Requirements for Using Business Central

3/31/2019 • 2 minutes to read

Before you access Business Central, we recommend that you verify that your computer or mobile device meets or exceeds the minimum system requirements for the product. This article lists the requirements.

Browsers

Chrome for Windows and Firefox for Windows: Business Central is designed to work with the current version of these desktop browsers.

Safari: Business Central is designed to work with the current version of Safari on OSX.

Microsoft Edge: Business Central is designed to work with the current version of Microsoft Edge.

Internet Explorer: Business Central is designed to work with Internet Explorer 11 (build 11.0.9600.17239) for Windows 10 (32-bit and 64-bit versions). We recommend that you upgrade to the latest version of Internet Explorer supported for your version of Windows.

Mobile devices

Windows: Business Central for Windows can be installed on devices with at least 1GB of RAM and Windows 10 Home, Pro, Enterprise, or Education (32-bit and 64-bit editions).

iOS: Business Central for iPad and iPhone requires iOS 10.0 or later.

Android: Business Central for Android tablet and Android phone can be installed on devices with at least 1GB of RAM and Android 6.0 or higher.

Device size: Business Central is supported on smartphones with a minimum screen size of 4" and tablets with a minimum screen size of 7".

Outlook

Outlook applications: To use Business Central as your business inbox in Outlook, you will need Outlook 2016 or later, Outlook Web App, OWA for iPhone, OWA for iPad, or OWA for Android.

Browsers: When using Business Central as your business inbox in the Outlook Web App (OWA), the add-in requires that your computer is running one of the listed supported browsers that are listed earlier in this article.

Platforms: When using the Business Central Outlook Add-In in OWA for iPhone, OWA for iPad, and OWA for Android, the add-in requires that your mobile device is running one of the listed supported mobile devices for Business Central.

Excel

Edit in Excel: To use the Excel add-in to make changes in Excel and push the changes back into Business Central, you need Excel 2016 or later. For more information, see [Analyzing Financial Statements in Microsoft Excel](#).

[System Requirements for Dynamics 365 Business Central On-premises](#)

Frequently Asked Questions

6/13/2019 • 6 minutes to read

This section contains answers to frequently asked questions about signing up for a trial, buying a subscription, and using Business Central. You can also learn how to get technical support.

Is Business Central available in my country?

Business Central is available in a limited number of markets, but new countries are added through Microsoft-led localization or through partner-led localization on a quarterly basis. For more information, see [Countries and Translations Supported](#).

How do I get Business Central?

You can sign up for a free trial to explore Business Central. Start a [free trial!](#) If you want more time to explore, [you can extend your trial period](#).

To help you get ready for doing business in Business Central, you can launch assisted setup guides, videos, or help topics for selected setup tasks. For more information, see [Getting Ready for Doing Business](#).

When you are ready to buy Business Central, you can find a Business Central partner on the [I'm looking for a solution provider](#) page.

Where do I go if I have questions?

If you have questions about Business Central that you can't find an answer for in this documentation, you can ask the Business Central community. For more information, see [Dynamics 365 Business Central community](#).

From the community home page, you can also find links to our blogs where you can also find tips and tricks. For more information, see [Dynamics 365 Business Central Blog](#) and [Dynamics 365 Business Central Support Blog](#).

Finally, you can contact your Business Central reselling partner. For more information, see the [How do I get technical support?](#) section.

Why can't I find that capability in my Business Central?

Did you read about a new capability in the release plan or on our blog recently? In that case, your Business Central might not have been upgraded to the latest version yet. If the capability is published as an extension in AppSource, then there is a delay between the extension being announced and its availability in AppSource.

Are there any differences between an on-premises deployment and the cloud version of Business Central?

Yes. Some Cloud-based features may run on premises in certain cases and others are not supported at all. For more information, see [Features not implemented in on-premises deployments of Dynamics 365 Business Central](#).

Can I get training in Business Central?

Yes, you can. But currently, you have to ask your reselling partner. If you don't know who that is, find a Business Central partner on the [I'm looking for a solution provider](#) page.

If you have access to Microsoft CustomerSource, you can get access to the Imagine Academy site with eLearning material. For more information on how to get access, see the [Microsoft Dynamics 365 training](#) page.

How do I get technical support for Business Central?

Business Central is sold through partners, and you should contact your reselling partner to get help with technical problems. If your Business Central partner then cannot resolve the problem, they will raise a support ticket with Microsoft.

For more information, see [Help and Support](#).

Why does Help describe functionality that I cannot access?

If your Experience setting on the **Company Information** page is set to **Essential**, then UI elements for the Manufacturing and Service Management features are not visible to you because they require the **Premium** experience. A text note is inserted in high-level help topics for these feature areas. For more information, see [Changing Which Features are Displayed](#).

Where is the save button?

There is no *save* button on pages like in other programs that you might be familiar with. In Business Central, changes that you make to a field are automatically saved as soon as you move to the next field or close the page, as long as there are no errors. When you make changes to a field and move to another field, you will see the text **Saving** in the top-right corner of the page, which will quickly change to **Saved** if no errors occur. If an error occurs, the text will change to **Not Saved**.

What email address can I use with Business Central?

Business Central requires that you use a work, or school, email address to sign up. Business Central does not support email addresses provided by consumer email services or telecommunication providers. This includes outlook.com, hotmail.com, gmail.com, and others.

If you try to sign up with a personal email address, you will get a message indicating to use a work or school email address. For more information, see [Troubleshooting Self-Service Sign-Up](#).

If you want to deploy Business Central on-premises, then you can use other authentication methods. For more information, see [Deployment of Dynamics 365 Business Central](#).

Do I have to buy Office 365?

No. But if you want to experience Business Central as fully integrated with Office 365, you can sign up for a 1-month free trial of Office 365 [here](#).

If the account you sign up with is a non-Office 365 work account (such as joe@mysolution.com), and you have an Office 365 subscription, then you can associate your domain (mysolution.com) with the Office 365 subscription. For more information, see [Get help with Office 365 domains](#).

If you do not have an Office 365 subscription, and you do not want to buy one, then, when you sign up, we provision a new Azure Active Directory tenant for you so that you have access to the Azure portal where you have access to advanced administration tools.

What is the integration with Office 365 about?

Business Central is fully integrated with Office 365 so that you can navigate freely between Office 365 apps and Business Central using the app launcher. In Business Central, you can open data in Excel, print reports using Word,

and you can work with your Business Central data in Outlook, for example. For more information, see [Using Business Central as your Business Inbox in Outlook](#).

Can I extend my 30-day “New Company” trial period?

Yes. When the expiration date for your trial period is approaching we will display a notification to alert you when you sign in. The notification contains a link to the **Extend Trial Period** guide that you can use to extend your trial period. The extra 30 days start the moment you choose **Extend Trial** in the guide. You can extend the trial period one time yourself. After that, a Microsoft partner can extend it for another 30 days. For more information, see [Extend Your Trial Version](#). To contact a Microsoft partner in your country or region now, see the list of phone numbers in [CustomerSource](#).

NOTE

It may take up to two business days to complete the trial extension process.

Our administrator has moved me to another plan to give me another role, but I still see the same Role Center in Business Central?

This is a bit complicated, but it looks like your administrator didn't change your Role Center and assign user groups that match the new license. Essentially, your access to Business Central is determined by the type of plan (license) that you have - this sets permissions and your default Role Center page. You can change your Role Center manually in My Settings, but if you are moved to another plan, such as moving you from the Business plan to the Team Members plan, you might see the old Home because your permissions were not changed.

Can I cancel my subscription?

Yes, but depending on how you signed up to Business Central, your data can be deleted or preserved. For more information, see [Canceling Business Central](#).

Can I use multi-factor authentication?

Sure. If you do, you might need an app password in order to send email messages. App passwords give an app or a device access to your email account. The steps for getting an app password vary, depending on your email provider. For more information, see the help from your provider. For example, if you're using Outlook, see [Create an app password for Office 365](#).

Resources for Help and Support

6/13/2019 • 4 minutes to read

In Dynamics 365 Business Central, the Help menu item (the question mark in the top right corner) gives you access to the **Help & Support** page, where you can find links to resources that can help you find answers to your questions. You can also see how you can contact technical support for your Business Central.

This page outlines the resources available to you in the different sections of the **Help and Support** page.

Finding Answers

The **Find it** section provides links to the most common places to find answers to your questions. The links fall into four categories and are explained in the following subsections. Some of the links can be configured by your Business Central partner, and as a result the behavior can be slightly different.

Product Help

The **Find it** section includes two links to product Help:

- Help about the page you were just viewing in Business Central

This link is automatically generated. If Business Central cannot find the relevant link, the landing page on [Docs.microsoft.com](https://docs.microsoft.com) for the default version of Business Central is shown. For example, this can happen if the page was part of an app that did not add context-sensitive Help mapping to Business Central.

- Help landing page for Business Central

The functionality in the default version of Business Central is described on the [Docs.microsoft.com](https://docs.microsoft.com) site. In addition to the default version, you can extend and customize Business Central with apps from AppSource. All apps provide links to the relevant product Help so that you can always find guidance for the different workflows in your version of Business Central.

Community

In the [Business Central Forum](#), you can submit a question and learn from other Business Central community members. Partners and Microsoft employees participate in the conversations.

If you are using a trial version of Business Central, and you do not yet have a partner, the Community can help you get unblocked if you have questions.

Blog

The [Business Central blog](#) is where you can learn more about new Business Central capabilities, new app releases, tips and tricks, as well as updates about new country releases.

Capabilities Coming Soon

Business Central is updated with major feature updates every 6 months, and with monthly service updates. Choose the link to view the latest release plan. You can also get an overview of upcoming and recently released capabilities in the release plan across Dynamics 365 at <https://dynamics.microsoft.com/en-us/business-applications/release/>.

For the longer term overview, the Business Central [roadmap page](#) shows the general priorities for Business Central in the coming years.

Do More with Your Trial

This section gives you shortcuts to Microsoft AppSource where you can find solutions and services from Business Central partners. Use the links to explore the full capabilities of Business Central before you decide if you want to buy a subscription. You can also find a link to contact the sales team.

NOTE

This section is only available in trial experiences. If you already bought Business Central, the section is not longer visible.

Give Feedback

On the [Dynamics 365 Ideas site](#), you can provide suggestions for new feature and capabilities. Your input goes directly to Business Central's engineering backlog for investigation and prioritization.

Make sure that you search through the list of submitted suggestions. Chances are that someone already submitted something similar, and that entry might have already received votes. Vote if an idea already has been submitted to get it prioritized on the engineering backlog.

Troubleshooting

The **Troubleshooting** section shows technical information that your administrator or Business Central partner can use to unblock users. This includes information about the latest error message, the current version of Business Central, and a link to go to the **Page Inspection** page. For more information, see [Inspecting Pages in Business Central](#).

Report a Problem

Your Business Central reselling partner is expected to help you with technical support. Business Central is sold through partners, and this section makes it easy for you to contact your reselling partner if they have submitted their support email address. If your Business Central partner then cannot resolve the problem, they will raise a support ticket with Microsoft.

NOTE

This section is only available if you have paid for a Business Central subscription. If you have signed up for a trial and have not yet purchased Business Central, you do not have a reselling partner, and you cannot contact the Microsoft support team. You can find a Business Central partner on the [I'm looking for a solution provider](#) page.

Support email address

The email address that is shown in the **Report a problem** section can be for a person or a team. If you are the Business Central reselling partner for a tenant, you can set up this email address in the **Support Contact Info Card** page. For more information, see [Configuring Technical Support](#) in the developer and ITpro content for Business Central.

To alert your partner to a problem, choose the link. This opens a new email in your default email editor, and you can then add the technical information about your Azure Active Directory tenant and any other information that you find relevant.

Getting Ready for Doing Business

3/31/2019 • 3 minutes to read

Congratulations, you have just initiated your first company in Business Central.

To help you get ready for doing business, you can visit the **Business Assistance** page where you can launch assisted setup guides, videos, or help topics for selected setup tasks. You access the page from the chart on the **Business Manager** Role Center by choosing the **Business Assistance** drop-down, and then choosing the **Show Setup and Help Resources** action. When you refresh the page, the chart is replaced with the setup and help resources.

On the Role Center, in the navigation bar at the top, you will find the **Setup and Extensions** menu. Here you have access to a list of assisted setup guides that can help you get started. Once you have migrated data, such as vendors, customers, and items from your existing financial system, you are ready to begin. But depending on your needs, consider if the other assisted setup can help you. If an area is not covered by an assisted setup, choose the **Manual Setup** action to access setup pages where you can fill in setup fields for all areas manually. For more information, see also [Setting Up Business Central](#).

NOTE

The list of assisted setup guides, extensions, and services that are available differ depending on the user experience you choose for your company. The **Essential** experience gives access to fewer than the **Premium** experience does. The first time you sign in, you use the **Essential** experience. For more information, see [Changing Which Features are Displayed](#).

When you have run an assisted setup guide, it is marked as **Completed**. To run the assisted setup guide, you choose the three dots also called the context menu, and then you select **Start Setup**.

Role Center

On the Role Center, you have an overview of the business. To the left you see a navigation bar that gives you easy access to customers, vendors, items, and so on. In the center you find the **Activities** tiles. **Activities** show current data and can be clicked or tapped for easy access to the selected document. The **Key Performance Indicators** can be set up to display a selected chart for a visual representation of, for example, cash flow or income and expenses. You can also build up a list of **Favorite Customers** on the Role Center for accounts that you do business with often or need to pay special attention to. Use the arrows to collapse part of the page and make more room to show specific data. At the top of the Role Center you will find all of the actions that can be applied to the current content. This too can be collapsed and you only need to click or tap within the collapsed area to view it again.

TIP

You can get back to the Role Center by selecting the company name in the upper left corner.

Company Information

Under **Company Settings** you can view and edit setup information about the current company, much of this was prefilled if you completed the **Set Up Company** assisted setup when signing up for Business Central. If you want to change the company logo, contact information, bank settings, or tax information, you can do it from this page.

Adding Users and Permissions

If you need to add more users, this is done from Office 365 Admin Center. For more information, see [Add Users to Office 365 for business](#). Once users are created in Office 365, they can be imported into the **Users** page by using the **Get Users from Office 365** action. You can then proceed to assign permissions to users and to organize them in user groups. For more information, see [Managing Users and Permissions](#).

Getting Help

In Business Central you will find tooltips that can help guide you through the various business processes. For each field tooltip, you can press Ctrl+F1 or choose the **Learn more** link to open Help for the page in question. The question mark in the upper right corner also points you to product Help.

Next Steps

Based on your migrated data, you can now proceed to create new sales or purchase documents. Use the **My Company** section of your **Home** page to quickly create a new sales quote, sales invoice, sales order, purchase invoice, or payment registration.

Business Functionality

3/31/2019 • 2 minutes to read

Business Central provides functionality for common business processes in small and mid-sized companies, mainly within wholesale and professional services. However, more complex processes, such as assembly, manufacturing, service, and directed warehouse management are also supported.

Business Central includes standard configurations for most business processes, but you can change the configuration to suit your business' needs. From your Role Center, you can access assisted setup guides that help you configure certain scenarios and add features to Business Central. Several areas of business functionality must be set up manually. For more information, see [Setting Up Business Central](#).

TO	SEE
Make and collect payments, manage your cash flow, defer income and revenue, prepare year-end closing, and manage fixed assets.	Finance
Get insight to the performance of your business activities through budgets, account schedules, and analysis views.	Business Intelligence
Manage sales processes and information, such as quotes, orders, returns, and customer accounts, and make drop shipments.	Sales
Manage purchasing processes and information, such as invoices, orders, returns, and vendor accounts, and purchase items from sales documents.	Purchasing
Register new inventory or service-type items, categorize items for easy searching, adjust inventory levels, and perform common inventory costing tasks.	Inventory
Create jobs and schedule resources for project, manage job budgets, monitor progress, and track machine and employee hours.	Project Management
Organize your fixed assets, ensure correct periodic depreciation, and keep track of maintenance costs.	Fixed Assets
Manage and support your sales efforts and focus your interactions on preferred customers and contacts.	Relationship Management
Keep detailed records of your employees, and register absence for analysis purposes.	Human Resources
Plan the production operations that are required to transform inputs into finished goods.	Planning
Put sellable items together in simple steps to make a new item, such as a kit.	Assembly Management

TO	SEE
Define shop floor resources and their capacity, schedule operations, pull production components, and execute production operations.	Manufacturing
Ensure an effective flow of goods that are received and shipped.	Warehouse Management
Schedule service calls and set up service orders, and track repair parts and supplies.	Service Management
Set up and use workflows that connect tasks performed by different users or by the system, such as automatic posting. Requesting and granting approval to create or post documents are typical workflow steps.	Workflow
Enable users to exchange data with external sources during daily tasks, such as sending/receiving electronic documents, importing/exporting bank files, and updating currency exchange rates.	Exchanging Data Electronically
Record external documents in Business Central, including their file attachments, and then manually create the related documents or automatically convert the files to electronic documents.	Incoming Documents

Dynamics 365 Business Central Trials and Previews

3/31/2019 • 2 minutes to read

Business Central is available in an increasing number of countries across the world. If you want to learn about Business Central, you can sign up for a free trial, and if you are a partner, you can create previews using sandboxes that you can then share with prospects and customers.

Getting Started with Previews and Sandboxes

Previews based on sandboxes are great ways to get started with Business Central. A preview instance contains functionality that is in addition to what's available in the current version. As a partner, you can provide customers with trials based on already existing functionality, customizations, and previews of future capabilities. With previews like this, you can try and provide feedback about upcoming capabilities.

You can think of a sandbox as a non-production environment that you can use on top of your production or preview instance of Business Central. A sandbox lets you safely build and test extensions and develop new functionality to customize the service without affecting the data and settings of your production or preview instances. Right now, all customers who have a production or preview version can use a sandbox.

For more information about how to get started with a sandbox, see [Creating a Sandbox Environment](#).

NOTE

The sandbox contains demonstration data for the fictitious CRONUS company. No data is copied or otherwise transferred from the production environment.

Building New Solutions and Intellectual Property

Business Central offers a set of development tools and a modern platform to build on so you can create your own add-on apps and embed solutions to connect or extend Business Central.

For example, you can use an API to build a connected app to exchange data between Business Central and your payroll app. Connect apps can also make use of extensions to create pages to be used for setup, configuration, or to support app-specific features. For more information, see [Build Your Business on Dynamics 365 Business Central](#).

Start a free trial!

Unsubscribe, Remove, or Reset Business Central

3/31/2019 • 2 minutes to read

If you want to stop using Business Central, you can close your account or get the license removed from your account. The steps to take are different if you are currently using the free trial, or if you have a monthly subscription as part of an Office 365 account.

Similarly, you can choose to reset the company that you can been using in Business Central. For a quick overview, see [the Business Central blog](#).

Unsubscribing by removing Business Central from your Office 365 experience

If you have subscribed for Business Central using an existing Office 365 business account, you must ask your Office 365 administrator to remove the Business Central license from your user account. If Business Central is removed from your user account, and other people from your company continue the subscription, they will still have access to your shared data in the Business Central company.

If your company wants to unsubscribe from Business Central, the Office 365 administrator can remove the subscription from the company's account.

User accounts and licenses are managed in the [Office Portal](#). Only administrators can remove Business Central licenses from user accounts or remove the subscription from your company's account.

Closing your free trial of Business Central

If you signed up for the free trial and do not want to continue with Business Central, you can close your account at any time. We recommend that you export any data before you close your account.

To close your account, currently you must contact the Business Central Cancellation team by sending an email message at cancelbusinesscentra@microsoft.com. You must include the name of your Business Central tenant in the message so that we can identify you. The easiest way to do that is to copy the URL from your Business Central home page.

Unsubscribing from Business Central without Office 365

If you signed up for Business Central using a non-Office 365 business account, you do not have an Office 365 administrator. Instead, you must unsubscribe by contacting the Business Central Cancellation team by sending an email message at cancelbusinesscentra@microsoft.com. You must include the name of your Business Central tenant in the message so that we can identify you. The easiest way to do that is to copy the URL from your Business Central home page.

Resetting your Business Central experience

If you have added data to your Business Central free trial, and you want to start over with a fresh experience, you can create a new company and then reset the first company. If you open the **Companies** page, you can create a copy of your current company, sign out and then sign into your new company, and then reset the original company.

NOTE

When you reset a company that you are sharing with other people from your organization, you must make sure other people are not logged in when you reset the company.

Removing Business Central from your app launcher

If you want to hide Business Central from your app launcher, you can quite simply unpin it. This does not remove any data, and it does not cancel your subscription.

Troubleshooting Self-Service Sign-Up

3/31/2019 • 4 minutes to read

Signing up for Business Central is easy and can be done very quickly. You can create a free account even if you are an existing organization. This article addresses issues that you may have during signup.

What email address can I use with Business Central?

Business Central requires that you use a work, or school, email address to sign up. Business Central does not support email addresses provided by consumer email services or telecommunication providers. This includes outlook.com, hotmail.com, gmail.com, and others.

If you try to sign up with a personal email address, you will get a message indicating to use a work or school email address.

Troubleshooting

In many cases, registering for Business Central can be achieved by following the sign-up process. However, there are several reasons why you may not be able to complete self-service signup. The table below summarizes some of the most common reasons you may not be able to complete signup and ways you can workaround these issues.

SYMPTOM/ERROR MESSAGE	CAUSE AND WORKAROUND
<p>For Office 365 email addresses that are not registered in a supported country, you receive a message like the following during signup:</p> <p>That didn't work, we don't support your country or region yet.</p>	<p>Business Central currently only supports Office 365 email accounts that are registered in a limited number of markets. For more information, see Regional Availability.</p>
<p>Personal email addresses such as nancy@gmail.com are not supported. You receive a message like the following during signup:</p> <p>You entered a personal email address: Please enter your work email address so we can securely store your company's data.</p> <p>or</p> <p>That looks like a personal email address. Enter your work address so we can connect you with others in your company. And don't worry. We won't share your address with anyone.</p>	<p>Business Central does not support email addresses provided by consumer email services or telecommunications providers. To complete signup, try again using an email address assigned by your work or school. If you still cannot sign up and are willing to complete a more advanced setup process, you can register for a new Office 365 trial subscription and use that email address to sign up.</p>
<p>.gov or .mil email addresses You receive a message like the following during signup:</p> <p>Business Central unavailable: Business Central is not available for users with .gov or .mil email addresses at this time. Use another work email address or check back later.</p> <p>or</p> <p>We can't finish signing you up. It looks like Business Central isn't currently available for your work or school.</p>	<p>Business Central does not support .gov or .mil addresses at this time.</p>

SYMPTOM/ERROR MESSAGE	CAUSE AND WORKAROUND
<p>Self-service signup is not enabled. You receive a message like the following during signup:</p> <p>We can't finish signing you up. Your IT department has turned off signup for Business Central. Contact them to complete signup.</p> <p>or</p> <p>That looks like a personal email address. Enter your work address so we can connect you with others in your company. And don't worry. We won't share your address with anyone.</p>	<p>Your organization's IT administrator has disabled self-service signup for Business Central. To complete signup, contact your IT administrator and ask them to follow the instructions on the page below to allow existing users to sign up for Business Central and to allow new users to join your existing tenant. You may also experience this problem if you signed up for Office 365 through a partner.</p>
<p>Email address is not an Office 365 ID. You receive a message like the following during signup:</p> <p>We can't find you at contoso.com. Do you use a different ID at work or school? Try signing in with that, and if it doesn't work, contact your IT department.</p>	<p>Your organization uses IDs to sign in to Office 365 and other Microsoft services that are different than your email address. For example, your email address might be Nancy.Smith@contoso.com but your ID is nancys@contoso.com. To complete signup, use the ID that your organization has assigned to for signing in to Office 365 or other Microsoft services. If you do not know what this is, contact your IT administrator. If you still cannot sign up and are able to complete a more advanced setup process, you can register for a new Office 365 trial subscription and use that email address to sign up.</p>
<p>If your Office 365 account is registered to a supported country, and you are signing up for Business Central while in a different country, you receive a message like the following during signup:</p> <p>That didn't work, we don't support your country or region yet.</p>	<p>Your organization's Office 365 subscription is registered to a specific country in the Office 365 administration portal. The signup experience for Business Central uses the language and locale that your current browser uses, and as a result, you can get the error message even though you are in a supported country. Ask your IT administrator to verify the country that is specified in the organization profile in the Office 365 administration portal. You may have to use a different account for Business Central.</p>

Regional Availability

For a list of currently supported markets, see the [International availability of Microsoft Dynamics 365](#) deck and the [Local Functionality](#) landing page.

Intelligent Insights with Business Central

5/22/2019 • 2 minutes to read

As a user of Business Central online, you have full access to scenarios that are based on the intelligent cloud, such as KPIs that are based on machine learning, or when you view your data in Power BI. However, while Business Central is a cloud-first service, also those customers who need to run their workloads fully on-premises or on the intelligent edge connected to the cloud can do so.

If you are interested in Business Central, you can sign up for a free trial online, or you can choose to work with a partner to deploy Business Central locally to your own choice of hardware. You can then decide to get intelligent insights by connecting to a tenant in the cloud. As a result, the data from your locally deployed Business Central will be replicated to the cloud for intelligent cloud scenarios.

Connecting to the intelligent cloud from an on-premises solution requires your administrator to specify information about your database. For more information, see [Connect to the Intelligent Cloud](#) in the ITPro content for Business Central.

Viewing Intelligent Cloud Insights in Business Central Online

In your Business Central online company, the **Intelligent Cloud Insights** page shows four key points of interest for most businesses:

- Cash availability
- Sales profitability
- Net income
- Inventory value

Next to the KPI charts, you get insights into potential areas of concern, including overdue payments. Choose each insight to drill into the data.

The screenshot displays the 'Intelligent Cloud Insights' dashboard in Dynamics 365 Business Central. The dashboard is divided into two main sections: 'KPIs' and 'Insights'.

KPIs Section:

KPI	Value
Cash Available	\$98,188
Sales Profitability	16.3%
Net Income	\$101,953
Inventory Value	\$73,141

Insights Section:

- 10 of your customers are late with their payments to you
- 2 invoices are supposed to be paid by your customers this ...
- 13 invoices weren't paid by you on time
- 0 invoices from vendors should be paid this week

The interface includes a top navigation bar with the 'Dynamics 365 Business Central' logo and a search icon. The main content area has a back arrow, edit, add, and delete icons, and a share icon. Below the KPIs and Insights sections, there are sections for 'Power BI' and 'Azure ML'.

The page also connects to Power BI for even more insights.

Viewing Intelligent Insights On-Premises

When your Dynamics 365 reselling partner has acquired the right license for your on-premises solution to connect to the cloud through Business Central, your administrator can set up the connection. Once that is done, you can view the same insights from the cloud in your on-premises application. Depending on the on-premises solution, the **Intelligent Cloud Insights** page can be embedded in the Home page or be a separate page as in Business Central online and on-premises.

Connecting to Business Central from other Dynamics products

If you use one of the supported on-premises versions, you can also connect to Business Central online and get intelligent insights on-premises. For more information, see [Connect to the Intelligent Cloud](#) in the ITPro content for Business Central.

Visit Our Video Library

3/31/2019 • 2 minutes to read

Please bear with us while we rebuild our library of "how to" videos. A side effect of the recent improvements in Business Central is that we have to reproduce our content so that it accurately reflects the product.

In the meantime, we're offering three videos that can help you quickly get up and running.

TITLE	DESCRIPTION
Introduction	See how product features are organized, and how to get to various types of tasks and information.
Get started	Understand the key first steps when you are trying out Business Central or have recently purchased the product.
Get assistance	Know where to go for answers to various types of questions.

You can access the videos in several ways. When you start Business Central for the first time, you can launch the videos from the welcome page that displays. If you're already working in Business Central, you can get to the library from the **Business Manager** and **Accountant** Role Centers by choosing the **Product Videos** tile.

TIP

Videos in the library display in a frame that might seem a little small. To make the frame larger, choose the double-ended arrow icon in the upper-right corner. Afterward, videos will display in the larger frame until you make it small again.

You can also view our "how to" videos, plus a lot of other content, on the YouTube channel we created for Business Central. To visit the channel now, [click here](#).

Content that is Coming Soon

Just to mention a few examples, the videos we are updating will show how to:

- Migrate business data from another finance app into Business Central
- Set up dimensions so you can track and analyze various documents and entities
- Connect Business Central with Dynamics 365 for Sales
- Set up approval workflows
- Use Power BI with Business Central
- Set up email and send documents directly from Business Central

Extending Business Central

3/31/2019 • 3 minutes to read

Microsoft Dynamics 365 Business Central is a business management solution that helps companies connect their financials, sales, service, and operations to streamline business processes, improve customer interactions, and make better decisions. Business Central is available in the cloud and to users across various multiple types of devices, which is always up-to-date. With this modern business platform you can easily and quickly tailor, extend, and build applications so they fit your specific needs — with little to no code development.

There are plenty of benefits of using Business Central as a platform for App builders, which includes:

- Get started with confidence through a seamless onboarding experience
- Use Microsoft's Go-To-Market services
- Customize your app listing page
- Connect directly with decision-makers and reach more customers
- Enhance business value and increase deal size with existing and new customers
- Achieve more with a platform that delivers a modern experience and offers scale
- Get actionable insights on the performance of your listings via the Cloud Partner Portal or the Office app publishing process
- Bundle with intelligent business apps such as PowerApps, Flow, Power BI, Cortana Intelligence, and many more

Bring your Business Central services to Microsoft AppSource as:

Individual Apps – where you bring your industry expertise to market.

Packaged Consulting Services – where you bring ready-made packaged engagements to market.

The new development tools enable to you to build extensions for Business Central users. If you want to familiarize yourself with the new tools or learn about extensions 2.0, have a look at aka.ms/GetStartedWithApps.

Find information on apps and consulting services that are currently available on [Microsoft AppSource](#).

To help business users get started quickly, Microsoft has added a catalog of consulting services offerings for solutions based on Business Central, Power BI, and PowerApps to AppSource. Learn more about the [Consulting Services](#).

Choosing which Services to Offer with Business Central

Integrate a 3rd Party Solution

Business Central exposes many ready-to-use APIs for [Connect apps](#) to make a seamless integration between your service and Business Central. You can bundle your services with a Business Central and give your customers an integrated experience. Learn more about [Integrating a 3rd Party Solution](#).

Development of a Vertical Solution

Create an app that is specialized within a specific industry. With [Embed app](#), you can extend and customize the existing Business Central application and enrich the end-user experience with an industry specific functionality using the new and modern development tools and Extensions version 2.0. Learn more about the [Development of a Vertical Solution](#).

Development of a Horizontal Solution

Extend the experience and capability of Business Central by creating an [Add-on app](#) which integrates into user experience of Business Central. Build an interface based on how you want your data to flow between Business

Central and your services. Learn more about the [Development of a Horizontal Solution](#).

Development of a Localization Solution

Comply with local regulatory capabilities by developing for Business Central, which adapts functional areas to the requirements of the local market along with [Dynamics 365 Translation Service](#). Align the core capabilities of local legal requirement and extend existing functionality to successfully compete on your local market. Learn more about the [Development of a Localization Solution](#).

Reseller Solution

Since every business is unique, with [Customizing Tenants](#), you can match how you work with your streamlined processes, your terminology, and how your employees or departments connect and collaborate. Additionally, you can choose to resell and adjust Business Central to the individual needs of your customers by providing [Consulting Services](#). Or, use Microsoft Flow, Power Apps, and Power BI to create [Customized Workflows](#), apps and business insight reports without having to write any code. Learn more about [Dynamics 365 Reseller \(VARs\)](#).

Working with Business Central

3/31/2019 • 2 minutes to read

When performing business tasks, you interact with data in different ways, such as creating records and entering data, sorting and filtering data, writing notes, and outputting data to other applications.

For example, you can adjust the size and position of any page, expand the width of columns and increase the height of column headers, and change the sorting of data in columns. And if you want to use the horizontal scroll bar to view all columns on a list page or on document lines, you will see that there is a vertical freeze pane to restrict some columns from scrolling.

NOTE

In addition to the general UI functions described in this section, you can use other general functions that are more business-related. For more information, see [General Business Functionality](#).

The following table lists some of the general functionality with links to topics that describe them.

TO	SEE
Find a specific page, report, action, help topic, or partner extension.	Using Tell Me to Find Features and Information
Filter data in views, reports, or functions by using special symbols and characters.	Sorting, Searching, and Filtering Lists
Learn the many general functions that help you enter data in a quick and easy way.	Entering Data
View or process data in specific date ranges.	Working with Calendar Dates and Times

TO	SEE
Learn how to quickly copy and paste data including by using keyboard shortcuts.	Copying and Pasting
See which fields must be filled in.	Detecting Mandatory Fields
Understand how the computer locale affects the user interface and the Help site and how to change the language.	Changing Language and Locale
Learn how to interact with Excel from practically anywhere in Business Central	Viewing and Editing in Excel
Get notified about certain events or changes in status, such as when you are about to invoice a customer who has an overdue balance.	Managing Notifications
Change basic settings such as company, work date, and Role Center.	Changing Basic Settings
Change which and where UI elements are shown to fit your preferences.	Personalizing Your Workspace
Define, preview, print, or save reports and define and run batch jobs.	Working with Reports and Batch Jobs
Manage the content and format of reports and documents, including which data fields of a report dataset appear on the report and how they are arranged, text style, images, and more.	Managing Report and Document Layouts
Learn about features and capabilities that make Business Central readily available to people with disabilities.	Accessibility and Keyboard Shortcuts

Using Tell Me to Find Features and Information

3/31/2019 • 2 minutes to read

This topic describes how Tell Me can help you quickly go to things like actions, pages, or reports, find information about how to complete a particular task, and discover additional apps and consulting services for Business Central.

When you need help finding something, use the  **Tell me what you want to do** icon to search for it. You can also use ALT+Q to start using Tell Me.

When you start typing characters, Business Central immediately displays matches. Results in the list change as you type more characters. If you notice that when you enter the word "product" and the results include "items," that's because Tell Me uses synonyms and alternate search terms to make it easier to find actions, pages, and reports.

The column to the right indicates the general category of the result. For example, whether it will open a list page or is an administrative task .

NOTE

If you prefer to use your keyboard, use the Tab key and arrow keys to choose an item in the results. If you press **Enter** on your keyboard without choosing a result, Business Central opens the result that is listed first.

Find an Action on the Current Page

The **On Current Page** section lets you find and perform actions on the page you have open. For example, if the Sales Quote page is open and you type "customer," the section includes an action that opens the customer card for the customer chosen on the sales quote.

NOTE

The list includes only actions that are available in the Navigation Bar at the top of the page. Actions on FastTabs are not included.

Find a Page or a Task

The results in the **Go to Pages and Tasks** section provide access to other pages and let you perform tasks. The pages and tasks that are listed depend on the user experience you chose for your company. The **Essential** experience gives access to fewer than the **Premium** experience does. The first time you sign in, you use the Essential experience. For more information, see [Customizing Your Business Central Experience](#).

Find a Report or Archived Information

The **Go to Reports and Analysis** section offers access to reporting tools. For example, you can open the **Balance Sheet** report from the list, or access archived documents and other information.

Find Information in the Help

Under **Documentation** you will see articles from the Business Central documentation that describe concepts and provide step-by-step guidance for completing tasks in the application.

NOTE

Documentation for third-party extensions is not included in the results.

Get More Functionality by Finding an App on Microsoft AppSource

Our partner community is busily developing apps that add capabilities to Business Central. The **Get from Microsoft AppSource** section lists apps for Business Central that are available on Microsoft AppSource and are related to the keyword you searched for.

Searching for Data

The **Tell me what you want to do** function does not search for data, such as customer names, addresses, or transactions. Instead, you can search for data in list pages by choosing the  **Search** icon in the left corner of the list header. The search applies only to the list you are viewing. For more information, see [Sorting, Searching, and Filtering Lists](#).

Questions?

We have shown Tell Me to a range of stakeholders, noted the questions that they had in common, and turned our notes into a list frequently asked questions. If you are interested, see [Tell Me FAQ](#).

Tell Me FAQ

3/31/2019 • 2 minutes to read

This topic answers questions that our advanced users often ask about the new Tell Me feature, which has replaced the previous Page Search feature known as **Find Pages and Reports**.

Are all actions from my current page discoverable in Tell Me?

No. Actions in parts, such as the Sales Lines part or FactBoxes, are not displayed in Tell Me.

Are the results in Tell Me filtered by permissions?

If the user does not have AccessByPermissions then actions are not displayed. However, pages and reports appear in the results but require that the user has permission to access them. A message will display if the user does not have permission to view the object.

Does Tell Me display content from my customizations or installed third-party extensions?

Actions, pages, and reports that originate from extensions are picked up by Tell Me, but custom help documentation is not. For technical information about how to make custom pages and reports discoverable, see [Adding Pages and Reports to Search](#).

What makes this different from what was previously known as Page Search?

Page Search has evolved into Tell Me to help you get work done quickly. Page Search could only help you navigate to pages or reports. At a technical level, Tell Me is no longer based on the legacy MenuSuite concept.

I use on-premises Business Central. Does that include Tell Me?

You can use Tell Me in the on-premises Web Client to find actions, pages, and reports, but not documentation, or apps and consulting services on AppSource. Users connecting to Business Central from the Dynamics NAV client continue to use Page Search.

Is Tell Me available for all form factors?

Tell Me is only available in the Web Client or Windows desktop app.

Are the documentation results available in any language?

The help articles display in the language you have specified in **My Settings**, if help is available in that language.

Sorting, Searching, and Filtering Lists

6/13/2019 • 11 minutes to read

There are a few things that you can do that will help you scan, find, and limit records in a list. These include sorting, searching and filtering. You can apply some or all of these simultaneously to quickly find or analyze your data.

TIP

When viewing your data as tiles, you can search and use basic filtering. To use the full set of powerful features for sorting, searching and filtering, choose the  icon to show as a list.

Sorting

Sorting makes it easy for you to get a quick overview of your data. If you have many customers, for example, you can choose to sort them by **Customer No.**, **Customer Posting Group**, **Currency Code**, **Country Region Code**, or **Sales Tax Registration No.** to get the overview you need.

To sort a list, you can either choose a column heading text to toggle between ascending and descending order, or choose the small down arrow in the column heading, and then choose **Ascending** or **Descending**.

NOTE

Sorting is not supported on images, BLOB fields, FlowFilters, and fields that do not belong to a table.

Searching

At the top of each list page, there is a  **Search** icon that provides a quick and easy way to reduce the records in a list and display only those records that contain the data that you are interested in seeing.

To search, simply select the search icon, and then in the box, type the text that you are looking for. You can enter letters, numbers, and other symbols.

Fine-tuning the Search

In general, search will attempt to match text across all fields; it does not distinguish between uppercase and lowercase characters (in other words, case insensitive), and will match text placed anywhere in the field (at the beginning, end, or in the middle).

However, you can make a more exact search by using the following special characters:

- To find only field values that match the entire text and case exactly, place the search text between single quotes `' '` (for example, `'man'`).
- To find field values that start with a certain text and match the case, place `*` after the search text (for example `man*`).
- To find field values that end with a certain text and match the case, place `*` before the search text (for example `*man`).
- When using `' '` or `*`, the search is case sensitive. If you want to make the search case insensitive, place `@` before the search text (for example `@man*`).

The following table provides some examples to explain how you can use the search.

SEARCH CRITERIA	FINDS...
<input type="text" value="man"/> or <input type="text" value="Man"/>	All records with fields that contain the text man , regardless of the case. For example, Manchester , manual , or Sportsman .
<input type="text" value="'Man '"/>	All records with fields that contain only Man , matching the case.
<input type="text" value="Man*"/>	All records with fields that start with the text Man , matching the case. For example, Manchester but not manual or Sportsman .
<input type="text" value="@Man*"/>	All records with fields that start with man , regardless of the case. For example, Manchester and manual , but not Sportsman .
<input type="text" value="@*man"/>	All records that end with man , regardless of the case. For example Sportsman , but not Manchester or manual .

TIP

You can press F3 to activate and deactivate the search box. For more information see [Keyboard Shortcuts](#).

Filtering

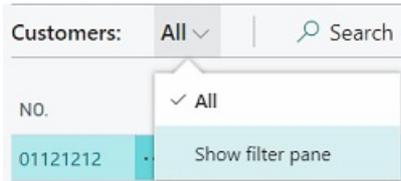

Filtering provides a more advanced and versatile way of controlling which records display in a list. There are two major differences between searching and filtering, as described in the table below.

	SEARCHING	FILTERING
Applicable fields	Searches across all fields that are visible on the page.	Filters one or more fields individually, selecting from any field on the table, including fields that are not visible on the page.
Matching	Displays records with fields that match the search text, irrespective of casing or placement of that text.	Displays records where the field matches the filter exactly and is case sensitive, unless special filter symbols are entered.

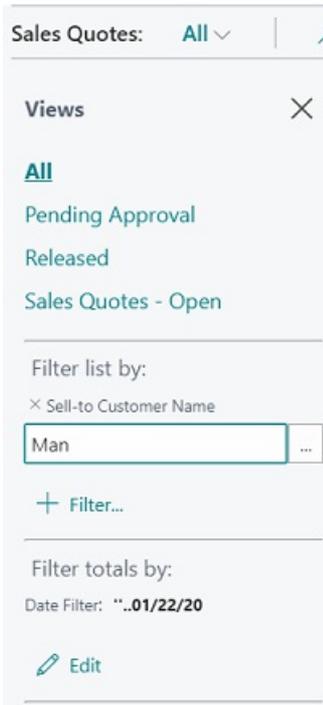

Filtering enables you to display records for specific accounts or customers, dates, amounts, and other information by specifying filter criteria. Only records that match the criteria are displayed. If you specify criteria for multiple fields, then only records that match all criteria will be displayed.

Working in the Filter Pane

To display the filter pane, select  at the top of the list or press **Shift+F3**. For lists within the Role Center, you can also choose the down arrow near the page title in the navigation bar above the list, and then choose **Show filter pane** as shown here:

The filter pane displays the current filters for a list, and enables you to set your own custom filters on one or more fields. The following figure shows an example filter pane for a Sales Quotes list.

A filter pane is divided in three sections: **Views**, **Filter list by**, and **Filter totals by**:

- **Views**

Some lists will include the **Views** section. Views are variations of the list that have been preconfigured with filters. To switch to a different view of your list, simply select another link. You can temporarily change the filters on a view, but the changes will not be permanently saved.

- **Filter list by**

The **Filter list by** section is where you add filters on specific fields to reduce the number of displayed records. To add a filter, select **+ Filter**, select the field that you want to filter from any field in the table, and then enter filter criteria in the box.

- **Filter totals by**

Some lists that display calculated fields, such as amounts and quantities, will include the **Filter totals by** section where you can adjust various dimensions that influence calculations. For example, you can quickly analyze your chart of accounts by filtering amounts to a specific period, or you can view the totals for sales orders only from a specific warehouse.

To add a filter, select **+ Filter**, select one of the predefined dimensions, and then add the filter criteria in the box.

NOTE

Filters in the **Filter totals by** section are controlled by FlowFilters on the page design. For technical information, see [FlowFilters](#).

Entering Filter Criteria in the Filter Pane

To select a field to filter, do one of the following:

- In the filter pane, choose **+ Field**. Type the name of the field you wish to filter, or pick a field from the menu that displays all fields in the table.
- In a column heading, choose the down arrow, and then choose **Filter...** This will open the filter pane and add the column to the filter pane.

You can now type or select your filter criteria in the box. The type of field you filter determines which criteria you can enter. For example, filtering a field that has fixed values will only let you choose from those values. For more information about special filter symbols, see [Filter criteria](#) and [Filter tokens](#).

Columns that already have filters are indicated by the  in the column heading. To remove a filter, select the column heading, then choose **Clear Filter**.

Entering Filter Criteria Without Using the Filter Pane

You can specify simple filters directly within the list without having to use the filter pane. With any field selected on a row, use the **Alt+F3** keyboard shortcut to display only the records having that same value. You can then select another field and use the same shortcut again to continue refining your filters. If the selected field is already filtered, using **Alt+F3** will clear that filter.

TIP

Accelerate finding and analyzing your data by using combinations of keyboard shortcuts. For example, select a field, use **Shift+Alt+F3** to add that field to the filter pane, type the filter criteria, use **Ctrl+Enter** to return to the rows, select another field, and use **Alt+F3** to filter to that value. For more information see [Keyboard Shortcuts](#).

Filter Criteria and Symbols

When you enter criteria, you can use all the numbers and letters that you can normally use in the field. In addition, you can use special symbols to further filter the results. The following tables show the symbols which can be used in filters. For dates and times, you can also refer to [Working with Calendar Dates and Times](#) for more detailed information.

IMPORTANT

There may be instances where field values contain these symbols and you want to filter on them. To do this, you must include the filter expression that contains the symbol in quotation marks (""). For example, if you want to filter on records that start with the text S&R, the filter expression is `'S&R*'`.

(..) Interval

SAMPLE EXPRESSION	RECORDS DISPLAYED
<code>1100..2100</code>	Numbers 1100 through 2100
<code>..2500</code>	Up to and including 2500

SAMPLE EXPRESSION	RECORDS DISPLAYED
<code>..12 31 00</code>	Dates up to and including 12 31 00
<code>P8..</code>	Information for accounting period 8 and thereafter
<code>..23</code>	From the beginning date until 23-current month-current year 23:59:59
<code>23..</code>	From 23-current month-current year 0:00:00 until the end of time
<code>22..23</code>	From 22-current month-current year 0:00:00 until 23-current month-current year 23:59:59

(|) Either/or

SAMPLE EXPRESSION	RECORDS DISPLAYED
<code>1200 1300</code>	Numbers with 1200 or 1300

(<>) Not equal to

SAMPLE EXPRESSION	RECORDS DISPLAYED
<code><>0</code>	All numbers except 0 The SQL Server Option allows you to combine this symbol with a wild card expression. For example, <code><>A*</code> meaning not equal to any text that starts with A.

(>) Greater than

SAMPLE EXPRESSION	RECORDS DISPLAYED
<code>>1200</code>	Numbers greater than 1200

(>=) Greater than or equal to

SAMPLE EXPRESSION	RECORDS DISPLAYED
<code>>=1200</code>	Numbers greater than or equal to 1200

(<) Less than

SAMPLE EXPRESSION	RECORDS DISPLAYED
<code><1200</code>	Numbers less than 1200

(<=) Less than or equal to

SAMPLE EXPRESSION	RECORDS DISPLAYED
<code><=1200</code>	Numbers less than or equal to 1200

(&) And

SAMPLE EXPRESSION	RECORDS DISPLAYED
<input type="text" value=">200&<1200"/>	Numbers greater than 200 and less than 1200

(") An exact character match

SAMPLE EXPRESSION	RECORDS DISPLAYED
<input type="text" value="'man'"/>	Text that matches man exactly and is case sensitive.

(@) Case insensitive

SAMPLE EXPRESSION	RECORDS DISPLAYED
<input type="text" value="@man*"/>	Text that starts with man and is case insensitive.

(*) An indefinite number of unknown characters

SAMPLE EXPRESSION	RECORDS DISPLAYED
<input type="text" value="*Co*"/>	Text that contains "Co" and is case sensitive.
<input type="text" value="*Co"/>	Text that ends with "Co" and is case sensitive.
<input type="text" value="Co*"/>	Text that begins with "Co" and is case sensitive.

NOTE

You cannot use when filtering on option (enumeration) fields, such as the **Status** field on sales orders. To enter a filter for this type of field, you can enter the numeric value as a filtering parameter. For example, in the **Status** field on a sales order that has the values **Open**, **Released**, **Pending Approval**, and **Pending Prepayment**, use the values , , , and to filter for these options.

(?) One unknown character

SAMPLE EXPRESSION	RECORDS DISPLAYED
<input type="text" value="Hans?n"/>	Text such as Hansen or Hanson

Combined Format Expressions

SAMPLE EXPRESSION	RECORDS DISPLAYED
<input type="text" value="5999 8100..8490"/>	Include any records with the number 5999 or a number from the interval 8100 through 8490.
<input type="text" value="..1299 1400.."/>	Include records with a number less than or equal to 1299 or a number equal to 1400 or greater (all numbers except 1300 through 1399).
<input type="text" value=">50&<100"/>	Include records with numbers that are greater than 50 and less than 100 (numbers 51 through 99).

Filter Tokens

When entering filter criteria, you can also type words that have special meaning, called filter tokens. After entering the token word, the word is replaced by the value or values that it represents. This makes filtering easier by reducing the need to navigate to other pages to look up values you want to add to your filter. The tables below describe some of the tokens you can type as filter criteria.

TIP

Your organization may use custom tokens. To learn about the complete set of tokens available to you or to add more custom tokens, talk to your administrator. For technical information see [Adding Filter Tokens](#).

(%me or %userid) Records Assigned to You

Use `%me` or `%userid` when filtering fields that contain the user ID, such as **Assigned to User ID** field, to display all records that are assigned to you.

SAMPLE EXPRESSION	RECORDS DISPLAYED
<code>%me</code> or <code>%userid</code>	Records that are assigned to your user account.

(%mycustomers) Customers in My Customers

Use `%mycustomers` in the customer **No** field to display all records for customers that are included in the **My Customers** list on your Role Center.

SAMPLE EXPRESSION	RECORDS DISPLAYED
<code>%mycustomers</code>	Customers in the My Customers on your Role Center.

(%myitems) Items in My Items

Use `%myitems` in the item **No** field to display all records for items that are included in the **My Items** list on your Role Center.

SAMPLE EXPRESSION	RECORDS DISPLAYED
<code>%myitems</code>	Items in the My Items on your Role Center.

(%myvendors) Vendors in My Vendors

Use `%myvendors` in the vendor **No** field to display all records for vendors that are included in the **My Vendors** list on your Role Center.

SAMPLE EXPRESSION	RECORDS DISPLAYED
<code>%myvendors</code>	Vendors in the My Vendors on your Role Center.

[Common questions about Searching and Filtering](#)

Searching and Filtering FAQ

6/6/2019 • 3 minutes to read

This article answers common questions you might have about searching and filtering.

Is there a difference between searching and filtering?

Yes.

- Search is simple and broad: it matches records that contain the search text across any visible fields on the page, and is case insensitive.
- Filtering is highly flexible and can be applied to specific fields, including those not visible on the page: it displays records with exact, case-sensitive matches, but can be adjusted with powerful search symbols, tokens, and formulas. For more information on how to use these features, see [Sorting, Searching, and Filtering in Lists](#).

Is there a keyboard experience for search and filter?

Search and filter have been highly optimized for users who prefer mouse-free interaction to work efficiently with their data. There are a variety of shortcut keys that can be used in sequence to work at high speed. For more information see [Keyboard Shortcuts](#).

Is the filter pane available on all lists?

The filter pane is available on pages where the list is the primary content on the page, such as worksheets and list pages, including lists reachable from the navigation bar. The filter pane is not yet available for lists that are displayed as parts, such as FactBoxes or Role Center parts. When a list is embedded on a page, such as sales lines on a sales order, the filter pane is available when focusing on that list using the focus mode button. For more information, see [Focusing on Line Items](#).

How can I save my filters?

Your filters and adjustments to predefined filters are remembered throughout the session (while you remain logged in), even if you navigate away from the page. It is currently not possible to permanently save filters. Unlike filters, search text is not remembered when you navigate away from a page.

Is this the same as Advanced Filters and Limit Totals in Microsoft Dynamics NAV?

Business Central builds upon these popular features and delivers a modern and highly usable experience for finding and analyzing your data. With more keyboard shortcuts and the introduction of search, Business Central surpasses the functionality provided in Dynamics NAV.

See also [Is the filter pane available for filtering reports?](#).

Can I search and filter using the companion apps and Outlook AddIn?

On different display targets such as mobile devices or in Outlook, you can search in lists but cannot filter on individual fields in most cases.

Is the filter pane available for filtering reports?

No. The report filter dialog, commonly referred to as the request page, currently use a different experience that provides some, but not all, of the capabilities of the filter pane.

Will Microsoft extend the filter pane experience?

At Microsoft, we're constantly listening to feedback from our diverse community of users and acting upon the top community suggestions. If you are interested in extending the filter pane to more form factors, more types of lists and reports, or have a great idea on how to improve it, add an idea or vote for existing ideas at aka.ms/BusinessCentralIdeas.

Can I do anything about the "Searching for rows is taking too long" message?

There is a time-limit on how a long a search operation can take. First, try changing the search criteria and search again. If you are using Business Central on-premises, contact your system administrator, because an administrator can increase the time-limit for searches.

As an on-premises administrator, you increase the time-limit on searches by changing the **Search Timeout** setting of Business Central server. For more information, see [Configuring Business Central Server](#) in the Business Central Developer and IT Pro Help.

[Sorting, Searching, and Filtering in Lists](#)

Entering Data

6/6/2019 • 13 minutes to read

There are many general features that help you enter data easier, faster, and more accurate. The general features for entering data are described in this article.

Keyboard Shortcuts

There are several keyboard shortcuts that let you to work "mouse-free" and speed up your data entry, especially with large scale entries and repetitive typing tasks.

For more information about shortcuts, see [Keyboard Shortcuts](#). A few of the shortcuts are discussed in this article.

Accelerating Data Entry Using Quick Entry

Quick Entry is a feature designed for data entry when using the keyboard. Quick Entry works on fields (like on card pages) and in lists (rows and columns). It is beneficial when performing repetitive typing tasks that require creating multiple records in sequence, such as a batch of sales orders or registering new items.

You might already be familiar with using the Tab key to navigate from one field on a page to the next editable field. A disadvantage of using Tab is that it always goes sequentially to the next field. Quick Entry lets you change this path. With Quick Entry, you use the Enter key to navigate through only those fields that you are interested in, skipping non-editable fields and fields that you typically do not fill in. You might have already noticed this behavior on some pages. This is because the application already designates which fields to include when pressing Enter and which ones to skip. You can customize Quick Entry by personalizing your workspace and optimizing how you enter data on each page.

How Quick Entry Works

Every field can be marked as either being *included in Quick Entry* or *excluded from Quick Entry*. Fields that are included in Quick Entry, will be included in the path when you press Enter; fields that are excluded from Quick Entry, will not.

When you are finished entering data in a field, you simply press Enter to confirm the changes and go to the next field. If you want to reverse direction, and go the previous field, press Shift+Enter. For more information about shortcuts, see [Quick Entry Keyboard Shortcuts for Fields](#).

Tips and tricks

The following provides some useful information about using Quick Entry.

- It is available for any editable fields.
- It also works across columns and rows.
- It does not prevent accessing other elements of a page, such as actions. These are still accessible by using Tab and Shift+Tab.
- FastTabs do not have to be expanded for Quick Entry to work. If the next Quick Entry field is located in a collapsed FastTab, that FastTab will automatically expand and focus on the designated field.
- Quick Entry works irrespective of whether fields are mandatory. So it is a good idea to ensure that mandatory fields are included in Quick Entry.
- By default, most fields are automatically included in Quick Entry. So initially your task will most likely be excluding fields from Quick Entry.

How to Change Quick Entry Fields

To change which fields are included in or excluded from Quick Entry on a page, you use personalization.

1. Start personalization by selecting the  icon, and then **Personalize**.
2. Select a field that you want change, or in lists, select the corresponding column heading, and then choose either **Include in Quick Entry** or **Exclude from Quick Entry**.

For more information about personalization, see [Personalizing Your Workspace](#).

Mandatory Fields

When you enter data on pages, certain fields are marked with a red asterisk. The red asterisk means that the field must be filled to complete a certain process that uses the field, such as posting a transaction that uses the value in the field.

Even though the field contains a red asterisk, you are not forced to fill the field before you continue to other fields or close the page. The red asterisk only serves as a reminder that you will be blocked from completing a certain process.

Finding Data As You Type

When you start to type characters in a field, a drop-down list is displayed and shows possible field values. The list changes as you type more characters, and you can select the correct value when it is displayed.

Many fields have a down arrow button that you can choose. You choose the arrow to get a list of data that is available to enter in the field. The button has two functions depending on the type of field:

- Lookup - Displays information from another table that you can enter in the field. You can select one piece of data at a time.
- Drop-down - Displays the set of options that exist for the field. You can select only one of the options.

Copying and Pasting Fields and Lines

You can copy one or more rows from a list or a single field on a page, and then paste what you copied into the same page, another page, or an external document (like Microsoft Excel and Outlook email). In short, to copy, you press CTRL+C (cmd+C in macOS) on your keyboard. To paste, you press CTRL+V (cmd+V in macOS).

In a list, to copy the field in the same column of the row above, and paste it into the current row, just press F8.

For more information, see [Copying and Pasting in Business Central](#).

Focusing on Line Items

When working on documents that include a line items part, like a sales order or invoice page, you can switch your view to focus only on the line items, essentially expanding the line items part so that it occupies pretty much the entire workspace - hiding other parts of the page except the actions area at the top. This gives you a better overview of the lines items, and provides more room to work on them. This is particularly beneficial when working with large line item lists and fast data entry is desired.

Another advantage is that it also provides advanced filtering capability, like on other lists, so browsing and searching through line items becomes even easier.

Switching the Focus On and Off

To focus on lines items, select anywhere in the line item part, and then choose  in the upper right corner or press Ctrl+Shift+F12.

To switch back to the normal view, choose  or press Ctrl+Shift+F12 again.

Filtering the Line Items

To start filtering, select  at the top of the list or press **Shift+F3** to open the filter pane. You work with the filter pane as you do on any other list. For more information, see [Filtering](#).

Filtering is especially helpful when viewing and analysing longer documents. For example, imagine you open a posted sales invoice and filter the line items to display all line items that have an individual discount above 5%, or filter to display only bike accessories with 'pro' in the name.

Entering Quantities by Calculation

When entering numbers into quantity fields, such as the **Quantity** field on an item journal line, you can enter the formula instead of the sum quantity.

Examples

- If you enter 19+19, the field is calculated to 38.
- If you enter 41-9, the field is calculated to 32.
- If you enter 12*4, the field is calculated to 48.
- If you enter 12/4, the field is calculated to 3.

Entering Negative Numbers

You can enter negative numbers in two ways. The number -20.5 can be entered as:

- -20.5
- or
- 20.5-

In both cases, the amount will be recorded in as -20.5.

If the last character of the expression is a + or a -, the entire expression will be recorded with that sign. An example, **10-20+** will result in 10 and not -10.

Entering Dates and Times

You can enter dates and times in all the fields that are specifically assigned to dates (date fields). You can enter dates with or without separators.

NOTE

How you enter dates and times depends on your **Region** settings. For more information, see [Changing Basic Settings](#).

Entering Dates

For date fields, you can either use the data picker, which lets you select a date from a calendar, or you can enter dates manually. This section provides a brief overview of how to enter dates. For more details, see [Working with Calendar Dates and Times](#).

For manually date entry, you can enter two, four, six, or eight digits:

- If you enter only two digits, this is interpreted as the day, and it will add the month and the year of the work date.
- If you enter four digits, this is interpreted as the day and the month, and it will add the year of the work date.

- If the date you want to enter is in the range 01/01/1930 through 12/31/2029, you can enter the year with two digits; otherwise, enter the year with four digits.

You can also enter a date as a weekday followed by a week number and, optionally, a year (for example, Mon25 or mon25 means Monday in week 25).

Instead of entering a specific date, you can enter one of these codes.

CODE	RESULT
t	This specifies today's date (the system date for the computer).
p	This specifies an accounting period, where <code>p</code> means the first accounting period, <code>p2</code> means the second accounting period, and so on.
w	This specifies the work date that is setup in the application. To change the work date, see Changing Basic Settings . You may want to use a work date if you have many transactions with a date other than today's date.
c	This specifies that the date after <code>c</code> is a closing date, for example <code>c123101</code> .

Entering Times

When you enter times, you can insert any separator sign that you want between the units, but it is not required. You do not have to write minutes, seconds, or AM/PM.

The following table lists the various ways in which times can be entered and how they are interpreted.

ENTRY	INTERPRETATION
5	05:00:00
5:30	05:30:00
0530	05:30:00
5:30:5	05:30:05
053005	05:30:05
5:30:5,50	05:30:05.5
053005050	05:30:05.05

You must enter two digits for each unit of time if you do not enter a separator.

Entering Datetimes

When you enter datetimes you must enter a space between the date and the time.

The following table lists the various ways in which you can enter datetimes and how they are interpreted.

ENTRY	INTERPRETATION
131202 132455	13-12-02 13:24:55
1-12-02 10	01-12-02 10:00:00
1.12.02 5	01-12-02 05:00:00
1.12.02	01-12-02 00:00:00
11 12	11-current month-current year 12:00:00
1112 12	11-12-current year 12:00:00
t or today	today's date 00:00:00
t time	today's date actual time
t 10:30	today's date 10:30:00
t 3:3:3	today's date 03:03:03
w or workdate	the working date 00:00:00
m or Monday	Monday of the current week 00:00:00
tu or Tuesday	Tuesday of the current week 00:00:00
we or Wednesday	Wednesday of the current week 00:00:00
th or Thursday	Thursday of the current week 00:00:00
f or Friday	Friday of the current week 00:00:00
s or Saturday	Saturday of the current week 00:00:00
su or Sunday	Sunday of the current week 00:00:00
tu 10:30	Tuesday of the current week 10:30:00
tu 3:3:3	Tuesday of the current week 03:03:03

Entering Duration

You enter a duration as a number followed by its unit of measure.

Here are some examples.

DURATION	UNIT OF MEASURE**
2h	2 hrs

DURATION	UNIT OF MEASURE**
6h 30 m	6 hrs 30 mins
6.5h	6 hrs 30 mins
90m	1 hr 30 mins
2d 6h 30m	2 days 6 hrs 30 mins
2d 6h 30m 56s 600ms	2 days 6 hrs 30 mins 56 secs 600 msecs

You can also enter a number and it is automatically converted to a duration. The number you enter is converted according to the default unit of measure that has been specified for the duration field.

To see what unit of measure is being used in a duration field, enter a number and see which unit of measure it is converted to.

The number 5 is converted to 5 hrs, if the unit of measure is hours.

[Working with Business Central](#)

Working with Calendar Dates and Times

3/31/2019 • 16 minutes to read

Dynamics 365 Business Central offers multiple ways to enter dates and times, including powerful features that accelerate data entry, or help you write complex calendar expressions. There are various places throughout the application where you can enter dates and times in fields. For example, on a sales order, you can set the shipment date. When filtering lists or report data, you can enter dates and times to pinpoint only the data that you are interested in.

Check your region and language settings

The **My Settings** page specifies the **Region** and **Language** that you are using in the application. These settings influence how you enter dates and times.

- The **Region** setting determines how dates, times, numbers, and currencies are shown or formatted.
- For date patterns that involve words, the language of the words that you use must correspond to the **Language** setting.

NOTE

Dynamics 365 Business Central uses the Gregorian calendar system.

Entering Dates

In a date field, you can enter a date using the standard format for your region setting. Different regions can use different separators between the days, months and years. For example, some regions use dashes (mm-dd-yyyy) and others use forward slashes (mm/dd/yyyy). However, you can use any separators, even a space, and the date will automatically be changed to use separators that match your region.

Note that the format in which dates are displayed on printed reports or emailed documents is not influenced by your personal choice of region setting.

To work more productively with dates and times, you can use any of the methods or formats that are described in the following sections.

Picking dates from the calendar

Any field displaying a calendar icon can be set using the calendar date picker. To display the calendar date picker, activate the calendar icon or press the Ctrl + Home keyboard shortcut in the field.

Due Date 4/16/2018 

See also [Keyboard Shortcuts in the calendar date picker](#)

Day-week-year pattern

You can enter a date as a weekday followed by a week number and, optionally, a year. For example, `Mon25` or `mon25` means Monday in week 25. If you do not enter a year, the year of the work date is used.

Instead of entering the entire word for the day of the week, you can enter part of the word, starting from the beginning. In case of conflicts (such as with `s` which could be Saturday or Sunday), the days are evaluated

according to the region setting. The input is first evaluated against `workdate` and `today` as well, so keep this in mind when abbreviating. For example, `t` already means today, so it cannot mean Tuesday or Thursday.

The week number scheme is always ISO 8601, where week 1 is the week with 4 January in it, or the week with the first Thursday of the year.

Digit patterns

In a date field you can enter two, four, six, or eight digits:

- If you enter only two digits, this is interpreted as the day, and it will add the month and the year of the work date.
- If you enter four digits, this is interpreted as the day and the month, and it will add the year of the work date. The order of the day and month is determined by your region settings. Even if your region settings have the year before the day and month, four digits are interpreted as the day and month.
- If the date you want to enter is in the range 01/01/1930 through 12/31/2029, you can enter the year with two digits; otherwise, enter the year with four digits.

Today

Enter the word for `today`, in the language set by **Language** setting, that will set the date to the current date. Instead of entering the entire word, you can enter part of the word, starting from the beginning, such as `t` or `tod`, as long as it is not also the start of another word.

Period

To filter on a specific accounting period, in a date field enter the letter `p`, or the word `period`, followed by a number that identifies the accounting period, like `p2` or `period4`. The accounting period is relative to the fiscal year of the current work date that set in your Role Center. For example, if the work date is **03/21/20**, then `p1`, or just `p`, filters on the first accounting period of the fiscal year 2020 (such as `01/01/20..01/31/20`). `p15` filters on the fifteenth accounting period from the start of fiscal year 2020 (such as `03/01/21..03/31/21`).

The accounting periods are defined on the **Accounting Periods** page. To view or change the accounting periods, open the page [here](#).

Current work date

The work date feature allows you to record transactions using a date that is different from the current date.

The word for 'workdate', in the language set by **Language** setting, will set the date to the currently set work date that is specified on the **My Settings** page. Instead of entering the entire word, you can enter part of the word, starting from the beginning, such as 'w' or 'work'.

If you have not defined a work date, the current date will be used as the work date. You may want to use a work date if you have many transactions with a date other than today's date.

See also [Changing Basic Settings, such as the Work Date](#).

Closing Date

When you close a fiscal year, you can use closing dates to indicate that an entry is a closing entry. A closing date technically is between two dates, for example between Dec 31 and Jan 1.

To specify that a date is a closing date, put `c` just before the date, such as `c123101`. This can be used in combination with all the date patterns.

Examples

The following table contains examples of dates using all the formats. It assumes region settings that format dates according to: **year.month.day**, a week starting on Monday, and the English language.

ENTRY	INTERPRETATION
2018.12.31.	2018.12.31.
181231	2018.12.31.
18.12.31.	2018.12.31.
18.12.31.	2018.12.31.
20181231	2018.12.31.
18/12,31	2018.12.31.
11	work date year:work date month.11.
1112	work date year:11.12.
t OR today	today's date
p4	date range that includes the fourth accounting period, such as 04/01/20..04/30/20
w OR workdate	the working date
m OR Monday	Monday of the work date week
tu OR Tuesday	Tuesday of the work date week
sa OR Saturday	Saturday of the work date week
s OR Sunday	Sunday of the work date week
t23	Tuesday of week 23 of the work date year
t 23	Tuesday of week 23 of the work date year
t-1	Tuesday of week 1 of the work date year

Setting Ranges

On lists, totals and reports, you can set filters on dates, times and datetimes containing a start value and optionally an end value to display only the data contained in that range. The standard rules apply to the way you set date ranges.

MEANING	SAMPLE EXPRESSION (DATE)	DATA INCLUDED IN THE FILTER
---------	--------------------------	-----------------------------

MEANING	SAMPLE EXPRESSION (DATE)	DATA INCLUDED IN THE FILTER
Interval	<div style="border: 1px solid gray; padding: 2px; display: inline-block;">12 15 00..01 15 01</div> <div style="border: 1px solid gray; padding: 2px; display: inline-block;">..12 15 00</div> <div style="border: 1px solid gray; padding: 2px; display: inline-block;">p1..p4</div>	<p>Records with dates between and including 12 15 00 and 01 15 01.</p> <p>Records with dates of 12 15 00 or earlier.</p> <p>Date range that includes the second, third, and fourth accounting periods, such as <div style="border: 1px solid gray; padding: 2px; display: inline-block;">01/01/20..04/30/20</div>.</p>
Either/or	<div style="border: 1px solid gray; padding: 2px; display: inline-block;">12 15 00 12 16 00</div>	Records with dates of either 12 15 00 or 12 16 00. If there are records with dates on both days, they will all be displayed.
Combination	<div style="border: 1px solid gray; padding: 2px; display: inline-block;">12 15 00 12 01 00..12 10 00 \n</div> <div style="border: 1px solid gray; padding: 2px; display: inline-block;">..12 14 00 12 30 00..</div>	Records with dates of 12 15 00 or on dates between and including 12 01 00 and 12 10 00. \nRecords with dates of 12 14 00 or earlier, or dates of 12 30 00 or later, that is, all records except those with dates between and including 12 15 00 and 12 29 00.

You can use any of the valid formats in date range filters. For example,

mon14 3..t 4p

 applied on a datetime field results in a filter from 3 AM on Monday in week 14 of the current work date year, inclusive, until today at 4PM, inclusive.

Using Date Formulas

A date formula is a short, abbreviated combination of letters and numbers that specifies how to calculate dates. You can enter date formulas in various date calculation fields or filters.

NOTE

In all data formula fields, one day is automatically included to cover today as the day when the period starts. Accordingly, for example, if you enter

1W

, then the period is actually eight days because today is included. To specify a period of seven days (one true week) including the period starting date, then you must enter

6D

 or

1W-1D

.

Here are some examples of how date formulas can be used:

- The date formula in the recurring frequency field in recurring journals determines how often the entry on the journal line will be posted.
- The date formula in the **Grace Period** field for a specified reminder level determines the period of time that must pass from the due date (or from the date of the previous reminder) before a reminder will be created.
- The date formula in the **Due Date Calculation** field determines how to calculate the due date on the reminder.

The date formula can contain a maximum of 20 characters, both numbers and letters. You can use the following letters, which are abbreviations for calendar units.

LETTER	MEANING
C	Current
D	Day(s)
W	Week(s)
M	Month(s)
Q	Quarter(s)
Y	Year(s)

You can construct a date formula in three ways.

The following example shows how to use `C`, for current, and a time unit.

EXPRESSION	MEANING
CW	Current week
CM	Current month

The following example shows how to use a number and a time unit. A number cannot be larger than 9999.

EXPRESSION	MEANING
10D	10 days from today
2W	2 weeks from today

The following example shows how to use a time unit and a number.

EXPRESSION	MEANING
D10	The next 10th day of a month
WD4	The next 4th day of a week (Thursday)

The following example shows how you can combine these three forms as needed.

EXPRESSION	MEANING
CM+10D	Current month + 10 days

The following example shows how you can use a minus sign to indicate a date in the past.

EXPRESSION	MEANING
-1Y	1 year ago from today

IMPORTANT

If the location uses a base calendar, then the date formula that you enter in, for example, the **Shipping Time** field is interpreted according to the calendar working days. For example, `1W` means seven working days.

Entering Times

When you enter times, you can insert any non-space separators that you want between the units, but if you use double digits for each unit up to milliseconds, then it is not required.

You only have to write the largest units that you require; the rest will be set to zero. You can also leave out any AM/PM indicator.

The following table lists the various ways in which times can be entered and how they are interpreted. It assumes region settings that format times according to: **Hours:Minutes:Seconds.Milliseconds.** and use the AM and PM indicators of 'AM' and 'PM', respectively.

ENTRY	INTERPRETATION
<code>05:23:17</code>	05:23:17
<code>5</code>	05:00:00
<code>5AM</code>	05:00:00
<code>5P</code>	17:00:00
<code>12</code>	12:00:00
<code>12A</code>	00:00:00
<code>12P</code>	12:00:00
<code>17</code>	17:00:00
<code>5:30</code>	05:30:00
<code>0530</code>	05:30:00
<code>5:30:5</code>	05:30:05
<code>053005</code>	05:30:05
<code>5:30:5,50</code>	05:30:05.5
<code>053005050</code>	05:30:05.05

You should be aware that milliseconds are interpreted as decimal notation. So, for example, `3`, `30`, and `300` all mean 300 milliseconds, while `03` means `30` and `003` means 3 milliseconds.

You cannot use `24:00` to mean midnight, or use any value greater than 24:00.

The word for 'time' in the language used by Dynamics 365 Business Central will be evaluated to the current time

on your computer or mobile device. You can enter any part of the word, starting from the beginning, such as `t` or `TIM`.

Entering combined Dates and Times

When you enter datetimes, which are a date and time combined into one field, you must enter a space between the date and the time. The date part can only contain spaces in the form of the official date separator of your region settings. The time can contain spaces around the AM/PM indicator.

It is also possible to enter only a date in a datetime field, but it is not possible to enter only a time.

The following table lists some examples of date/time combinations. The region settings in the examples displays dates in the day-month-year format, using AM/PM designators, English language, and Sunday as the start of the week.

ENTRY	INTERPRETATION
<code>08-01-2016 05:48:12 PM</code>	08-01-2016 05:48:12 PM
<code>131202 132455</code>	13-12-2002 13:24:55
<code>1-12-02 10</code>	01-12-2002 10:00:00
<code>1.12.02 5</code>	01-12-2002 05:00:00
<code>1.12.02</code>	01-12-2002 00:00:00
<code>11 12</code>	11-work date month-work date year 12:00:00
<code>1112 12</code>	11-12-work date year 12:00:00
<code>t</code> or <code>today</code>	today's date 00:00:00
<code>t 10:30</code>	today's date 10:30:00
<code>t 3:3:3</code>	today's date 03:03:03
<code>w</code> or <code>workdate</code>	the working date 00:00:00
<code>m</code> or <code>Monday</code>	Monday of the work date week 00:00:00
<code>tu</code> or <code>Tuesday</code>	Tuesday of the work date week 00:00:00
<code>sa</code> or <code>Saturday</code>	Saturday of the work date week 00:00:00
<code>s</code> or <code>Sunday</code>	Sunday of the work date week 00:00:00
<code>tu 10:30</code>	Tuesday of the work date week 10:30:00
<code>tu 3:3:3</code>	Tuesday of the work date week 03:03:03
<code>t23 t</code>	Tuesday of week 23 of the work date year, current time of day

ENTRY	INTERPRETATION
t23	Tuesday of week 23 of the work date year
t 23	Today 23:00:00
t-1	Tuesday of week 1 of the work date year

Entering Duration

Some fields in the application represent a duration, or amount of elapsed time, instead of a specific date or time. You enter a duration as a number followed by its unit of measure.

Here are some examples.

DURATION	UNIT OF MEASURE
2h	2 hrs
6h 30 m	6 hrs 30 mins
6.5h	6 hrs 30 mins
90m	1 hr 30 mins
2d 6h 30m	2 days 6 hrs 30 mins
2d 6h 30m 56s 600ms	2 days 6 hrs 30 mins 56 secs 600 msecs

You can also enter a number, which will be automatically converted to a duration. The number you enter is converted according to the default unit of measure that has been specified for the duration field.

To see what unit of measure is being used in a duration field, enter a number and see which unit of measure it is converted to.

For example, if the unit of measure is hours, the number is converted to 5 hrs.

[Entering Criteria in Filters](#)

Copying and Pasting

3/31/2019 • 3 minutes to read

You can copy one or more rows from a list or a single field on a page, and then paste what you copied into the same page, another page, or an external document (like Microsoft Excel and Outlook email). In short, to copy, you press CTRL+C (cmd+C in macOS) on your keyboard. To paste, you press CTRL+V (cmd+V in macOS).

There are several other keyboard shortcuts for copying and pasting that help you save time when entering data. For more information about these, see [Keyboard Shortcuts](#).

This article answers common questions you might have about copying and pasting.

What can I copy and paste?

- Copy one or more rows in Business Central to the same list, or to any list with identical columns.
- Copy one or more rows in Business Central and paste into Excel or other applications.
- Copy one or more rows in Excel and paste into a Business Central list.
- Copy the value of an individual field in Business Central and paste it anywhere.

How do I copy rows?

To copy a single row, select it, and press Ctrl+C.

If you want to copy more rows, you can:

- Press Ctrl+Click on another row or press Shift+Click to select the row and all rows in between. See [Keyboard Shortcuts](#) for more mouse and keyboard combinations for selecting rows.
- Select  in the first column of a row, choose **Select More**, select the check box next to each row that you want to copy, and then press Ctrl+C.

How do I paste rows?

Select an empty row, and press Ctrl+V. If you want to replace existing rows, select the rows and press Ctrl+V. In this case, you can only paste the same number of rows that you selected.

Can I paste rows into an Outlook email or OneNote?

Yes. This is pasted as a nicely-formatted table that preserves indentation, numeric alignment and coloring, just as you would see in Business Central.

Does copy and paste work with tiles?

No. The list must be viewed as rows (List View) for you to copy and paste.

In which lists can I copy and paste rows?

You can copy rows in any kind of list, including worksheets, FactBoxes, or list that are embedded on a page (like lines of a sales order). However, to paste rows, the list must be editable.

In some pages, the application design may prevent you from pasting of rows. Contact your administrator or application developer to change the [Editable property](#) on the page or [PastelsValid property](#) on the source table.

On which clients is copy and paste available?

Copy and paste are available in the browser or the Business Central app for Windows 10.

What is the maximum number of rows that can be copied?

You can copy as many rows as you have scrolled into view. For example, to copy all 1000 rows in a page, you must first scroll to the bottom of the page and wait for the rows to appear before copying. The maximum number of rows you can copy is only limited by the memory of your device.

Must I have the exact same number of columns when pasting rows?

Yes. Whether you are copying from Business Central, from Excel, or from some other table source, the rows that you paste must have the exact matching columns - no more no less.

Why do I get errors when pasting rows?

When pasting into Business Central, each row is checked to make sure that values in each column are valid. If a column contains a value that is not valid, the pasting is stopped, and an error message is displayed. To avoid this, make sure that the columns have valid values before you paste them.

[Frequently Asked Questions](#)

Detecting Mandatory Fields

3/31/2019 • 2 minutes to read

When you enter data on pages in Business Central, certain fields are marked with a red asterisk. The red asterisk means that the field must be filled to complete a certain process that uses the field, such as posting a transaction that uses the value in the field.

Even though the field contains a red asterisk, you are not forced to fill in the field before you continue to other fields or close the page. The red asterisk only serves as a reminder that you will be blocked from completing a certain process.

Examples

On the **Customer Card** page, the red asterisk appears in the **Name** field, in the **Tax Area Code** field, and in the posting group fields to indicate that you cannot post a sales transaction for the customer unless the fields are filled.

On the **Item Card** page, the red asterisk appears in the **Description** field to indicate that you cannot enter the item on a document line, such as a sales order, unless this field is filled.

Changing Language and Locale

3/31/2019 • 2 minutes to read

Business Central is supported in a number of markets and available in the languages that those markets require. This is a result of support for multiple languages at runtime in combination with support for legal requirements in the supported markets. This means that Business Central can present itself in different languages. You can change the language that is used to display texts, and the change is immediate, once you have been automatically signed out and in again. The setting applies to you and not to everyone else in your company.

For example, if you are using the Canadian version of Business Central, you can see the user interface in English and in French, but it is still the Canadian version of Business Central in all other aspects. It is not the same as, say, Business Central in the United Kingdom.

To change the language of the user interface, go to the **My Settings** page. For more information, see [Changing Basic Settings](#).

Changing the texts that are stored as application data is not part of the multilanguage capability. This is an application design issue. Examples of such texts are the names of items in the inventory or the comments for a customer. In other words, these types of text are not translated.

NOTE

Business Central only supports a single character set for data. Therefore some characters may not be supported in your tenant, and you may experience problems when retrieving data that was entered using a different character set. For instance, your tenant may support only English and Russian characters and if you enter data in a different language, it may not be stored correctly. You should contact your system administrator to make sure you understand which languages are supported for your Business Central.

Changing the Locale

Locale is different from both language and legal requirements in local markets. Locale determines how your data presents itself in terms of comma separator, aligned to the left or to the right, and certain other settings. The locale also determines some of the system elements in the browser, such as the action to create a new item in a list, for example.

You can change the locale in the browser tab that you are using to work in Business Central. the change applies only to you and not to the other users in your company.

IMPORTANT

When you change the locale, you will see a long list of languages and locales. However, only the locale setting is used in the current version of Business Central.

To change the locale, go to the **My Settings** page. For more information, see [Changing Basic Settings](#).

Languages of the Business Central Help

The Help content for the core functionality in Business Central publishes to the Microsoft Docs site and available in a number of different languages. If you access the docs from inside Business Central, the content will display in your language. If a particular page is not available in your language yet, it will be shown in English.

How Do I Change the Language?

It's simple - scroll to the bottom of the browser page and choose the globe symbol in the bottom left corner.

NOTE

The list shows all languages that are supported by the Microsoft Docs site. Business Central is available in a limited number of countries/regions, but the Help content is made available in more languages. However, the Help content is not available in all languages that the Microsoft Docs site supports.

[Getting Started](#)

Viewing and Editing in Excel From Business Central

3/31/2019 • 2 minutes to read

With pages that display a list of records in rows and columns, like a list of customers, sale orders, or invoices, you can also view the records using Microsoft Excel. To do this, you have two options. You can either select the **Open in Excel** action or the **Edit in Excel** action on the page. The differences between the two actions is as follows:

Open in Excel

- With this action, Excel respects any filters on the page the limit the records shown. This means that the Excel workbook will contain the same rows and columns that appear on the the page in Business Central.
- You can make changes to the records in Excel, but you cannot publish the changes back to Business Central. You can only save the changes to Excel file on your computer.
- This action works on both on Windows and macOS.

NOTE

For Business Central on-premises, the **Open in Excel** action is not available if the **Edit in Excel** action is.

Edit in Excel

- With this action, the Excel workbook does not respect filters on the page the limit the records shown. This means that the Excel workbook will contain all the available records and columns, regardless of what is shown on the page.
- The advantage of the **Edit in Excel** action is that it lets you make changes to records in Excel and then publish the changes back to Business Central.
- It only works on Windows; not macOS.

NOTE

For Business Central on-premises, the **Edit in Excel** action is only available if the Excel add-in has been installed by your administrator. For administrators, if you want to learn how to install the excel add-in, see [Setting up the Excel Add-In](#).

See the differences between the options

Managing Notifications

3/31/2019 • 2 minutes to read

Business Central can help you work smarter by notifying you about certain events or changes in status, such as when you are about to invoice a customer who has an overdue balance, or the available inventory is lower than the quantity you are about to sell, for example. These notifications are shown as discreet tips in the context of the task you are doing, and you can choose to ignore the notification or to see details about the issue.

If you choose to see details for a notification, you can take action to resolve the issue, such as contacting the customer, buying more inventory, and so on. It's your choice what to do, and Business Central gives you advice and recommendations.

Notifications can help untrained users complete unfamiliar tasks, and do not reduce productivity for the more trained user.

To turn notifications on or off, and control when they are sent

When you first start with Business Central all notifications are turned on, but you can turn them on or off, for example, if you aren't interested in a certain event or status.

Additionally, some notifications let you specify the conditions under which they are sent. For example, if you want to be notified when inventory is running low, but only for items you buy from a certain vendor.

Turning notifications on or off, and specifying conditions, applies only to you.

1. Choose the  icon, enter **My Notifications**, and then choose the related link.
2. To turn on or turn off a notification, select or clear the **Enabled** check box.
3. To specify conditions that trigger a notification, choose the **View filter details** link, and then fill in the fields.

Changing Basic Settings

3/31/2019 • 3 minutes to read

In the **My Settings** page, you can see and change basic settings for Business Central. The changes that you make will only affect your workspace; not the workspaces of other users.

Role Center

The Role Center represents the home page, a starting screen that is designed for the needs of a specific role in an organization. Depending on your role, the Role Center gives you an overview of the business, your department, or your personal tasks. It also helps you navigate to your daily tasks and find work that is assigned to you.

- At the top, the navigation allows you to switch between customers, vendors, items, and other important lists of information. Similarly, actions allow you to initiate tasks, such as create a new sales invoice, directly from the Role Center.
- In the center, you find **Activities**. Activities show current data and can be clicked or tapped to view more detailed information. Key Performance Indicators can be set up to display a selected chart for a visual representation of, for example, cash flow or income and expenses. You can also build up a list of favorite customers on the home page for accounts that you do business with often or need to pay special attention to.

To change Role Center

The default Role Center is **Business Manager**, but you can select another Role Center that fits your needs better.

1. In the top right corner, choose the **Settings** icon , and then choose **My Settings**.
2. On the **My Settings** page, in the **Role Center** field, select the Role Center that you want to set as the standard. For example, select **Accountant**.
3. Choose the **OK** button.

Company

A company functions as a container for data in Business Central. There can be multiple companies in a database, but only one can be selected at a time.

The default company is called CRONUS and contains demonstration data only.

TIP

If you want to display a different name for your company in the application (such as on the Role Center), set the **Name** field on the **Company Information** page or the **Display Name** field on the **Companies** page.

Work Date

The default work date is usually today's date. You may have to temporarily change the work date to be able to perform tasks, such as completing transactions for a date that is not the current date.

TIP

Type **w** to quickly enter the work date in a date field. Write **t** to quickly enter the current date in the date field.

IMPORTANT

After you change the work date, if you sign out or switch to another company, the work data reverts to the default work date. So the next time you sign in or switch back to the original company, you may have to set the work date again.

Work Date Indication

If the work date is not set to the current day (today), then on all pages where you can edit data, the current work date is shown in the upper-left corner of the page.

Region

The **Region** setting determines how dates, times, numbers, and currencies are shown or formatted.

Language

Changes the display language. This field appears only when there is more than one language to choose from.

The initial language is either determined by the administrator or by your browser settings when you sign up for Business Central. The language that you set will be used on all devices that you sign in from, such as a phone or tablet.

Changing When I Receive Notifications

Choose this link to view or change the notifications that you get about certain events or changes in status, such as when you are about to invoice a customer who has an overdue balance, or the available inventory is lower than the quantity you are about to sell. For more information, see [Smart Notifications](#).

Personalizing Your Workspace

6/17/2019 • 8 minutes to read

You can customize, or *personalize*, your workspace to suit your work and preferences by changing pages so that they display only the information you need, where you need it. The personalization changes that you make will only affect what you see, not what other users see.

Depending on the type of page and what it includes, you can do various things, like moving or hiding fields, columns and actions, moving and hiding entire parts, and more.

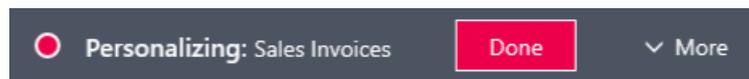

NOTE

In addition to what users can personalize, administrators and super users can override users' personalization and define which features are accessible in all or specific companies. For more information, see [Customizing Business Central](#).

To personalize a page

1. In the upper-right corner, select the  icon, and then choose **Personalize**.

The **Personalizing** banner appears at the top to indicate that you can start making changes.

2. Go to a page that you want to personalize.

If you see a  or  in the banner, you cannot personalize the page. For more details, see [Why Can't I Personalize the Page](#).

3. Point to an area that you want to personalize, such as a field or column header in a list. Anything that you can personalize is immediately highlighted with an arrowhead or border. See the [next section](#) for details about what you can do.
4. You can continue to make changes on the same page or open another page. Your changes are automatically saved as you make them. When you are done, in the **Personalizing** banner, choose **Done**.

What You Can Personalize

WHAT DO YOU WANT TO DO	HOW TO DO IT	REMARKS
Move something, like a field, column in list, tile, action, or part	Point anywhere on what you want to move, and drag it to its new location. The location is indicated by either a thick horizontal or vertical line.  indicates that you cannot move the element to the selected location.	Parts are subdivisions or areas on a page that contain things like multiple fields, another page, a chart, or tiles. For more details about action personalization, see the next section .

WHAT DO YOU WANT TO DO	HOW TO DO IT	REMARKS
Hide something, like a field, column in list, tile, or part.	Select the arrowhead, and choose Hide .	If the field you hide is also shown in the FastTab heading when the FastTab is collapsed, the field will no longer appear there.
Add a field or column.	<p>In the Personalizing banner, choose More, and then choose Field. The Add Field to Page pane opens on the right. It lists the fields that you can add to the page.</p> <p>To add a field, drag it from the pane to the location that you want it. The location is indicated by either a thick horizontal or vertical line.</p>	Each page includes a predefined set of fields that you can display. Use this procedure to add fields or columns that have not been previously displayed or to show fields that you have hidden.
Display a field in the heading of a Fastab when the FastTab is collapsed.	<p>Select the arrowhead, and choose Show when collapsed.</p> <p>If you do not see this option, then it is already set. In this case, to stop displaying the field in the FastTab heading, choose Show always.</p>	<p><i>FastTab</i> is the term used for a group of fields that appear under a common heading. Use the Show when collapsed option to display the most important fields. If you select a field in the heading, the FastTab will open and focus on the selected field.</p> <p>This option is only applicable if a page has a more than one FastTab. If the is only one FastTab, it cannot be collapsed, so the Show when collapsed option is not available.</p>
Make a field display only when you select Show more .	<p>Select the arrowhead, and choose Show under "Show More".</p> <p>If you do not see the Show under "Show More" option, then it is already set. In this case, to make a field display always, not just when you select Show more, choose Show always.</p>	
Change the freeze pane in a list to another column.	<p>Select the arrowhead of the column that you want as the last column of the freeze pane, and then choose Set Freeze Pane.</p> <p>If you want to set the freeze pane back to its original designed location, select the arrowhead for the current freeze pane column, and choose Clear Freeze Pane. Note: You cannot remove this freeze pane.</p>	The freeze pane specifies the columns that always appear on the left, even as you scroll horizontally.
Change the width of a column.	<p>In the header of the list, drag the boundary between columns.</p> <p>You can double-click the boundary between column headers to auto-fit, which sets the width to a comfortable size for readability.</p>	

WHAT DO YOU WANT TO DO	HOW TO DO IT	REMARKS
Skip over a field when pressing Enter.	Select the arrowhead next to the field, or column heading in a list, and choose Exclude from Quick Entry . If you do not see this option, then the field is already set to be skipped. In this case, to stop skipping the field, choose Include in Quick Entry .	See Accelerating Data Entry Using Quick Entry

Personalizing Actions

You can personalize the action bar that is located at the top of the page, as indicated by the highlighted area in the following illustration.

Personalization lets you decide which actions to show on the action bar and where to show them. You can show, hide, or move individual actions or action groups. Personalizing the action bar is done basically the same way as with other elements of the workspace. However, exactly what you can do with an action or group depends on where the action or group is located in the action bar. The best way to find out is to just try things out and let the screen guide you. The following sections will explain some of the nuances of personalizing the action bar.

Action Bar Overview

There are a couple terms that you should be familiar with to better understand action personalization: *action group* and *promoted category*.

An *action group* is an item that expands to display other actions or groups. For example, in the following illustration, **Posting** is an action group.

A *promoted category* is an action group that appears between the two vertical lines  in the action bar. The categories typically include the most commonly used actions, so that you can quickly find them. For example, in the following illustration, **Release**, **Posting**, **Invoice**, and **Navigate** are promoted categories.

To remove, hide, and show actions and groups

To show or hide an action or action group, select it, and then choose from one of the following options:

OPTION	WHAT IT DOES
Remove	This option appears if the selected action is also shown somewhere else in the action bar. Choosing this option deletes the action from the selected location so that it no longer appears. The action or action group will remain in the other locations.
Hide	This option appears if the action or action group is not located anywhere else in the action bar. Like Remove , choosing this option will make the action or action group disappear from the action bar. However, in the personalization mode, the action or action group will still be shown in the current location, except that it appears dimmed.
Show	This option appears if the action or action group has been previously hidden (dimmed). Choosing this option will make the action or action group appear in the action bar.

To move actions and action groups

To move an action or action group, drag and drop it to the desired location, just like with fields and columns.

Where you can drop actions or actions groups is indicated by a horizontal line between to actions or border around an action group.

- You can move individual actions into the promoted categories, but you cannot rearrange the order of the actions in the category.
- You cannot move an action group into a promoted category.
- To move an action or action group into another action group that is empty, drag the action or action group to the new group and drop it in the **Drop an action here** box.

Additional Points of Interest

To help you better understand personalization, here are some pointers.

- When you make changes to a card page that you open from a list, the changes will take effect on all records that you open from that list. For example, let's say you open a specific customer from the Customers list page, and then personalize the page by adding a field. When you open other customers from the list, the field that you added will also be shown.
- Changes that you make will take effect on all your Role Centers. For example, if you make a change to the Customer list when the Role Center is set to Business Manager, you will also see the change in the Customer list when Role Center is set to Sales Order Processor.
- Changes to a page in a pane will take effect on the page where ever it is shown.
- You can only add fields and columns from a predefined list, which is based on the page. You cannot create new ones.

To clear personalization

At some point, you might want to undo some or all of the personalization changes that you have made to a page over time. To do this, in the **Personalizing** banner, choose **More, Clear Personalization**, and then choose one of the following options. Be aware that clearing personalization cannot be undone.

OPTION	WHAT IT DOES
Only Actions	Clears any personalization changes that you have ever made to action bar on the page.
All Except Actions	Clears any personalization changes that you have ever made to the page except those in the action bar. This includes changes to fields, columns, parts, and tiles.
All	Clears all personalization changes that you have made to the page to the page so it looks like it did originally. This includes changes to action bar, fields, columns, parts, and tiles.

Why a Page is Locked from Personalization

3/31/2019 • 2 minutes to read

There are two conditions that prevent you from personalizing a page. Either the page is locked (as indicated by ) or it is blocked (as indicated by )

Locked from Personalizing

If there is a  icon in the **Personalizing** banner when you open a page (as shown), this means that you are currently prevented from making any more personalization changes to the page.

There can be two reasons for this:

1. You have personalized the page before, but it was done using an earlier version of the product. We changed the way personalization works behind the scenes since the last time that you personalized the page. Unfortunately, the old way and new way of doing things do not work together.
2. Until now, you have only used the Dynamics NAV Client connected to Business Central to personalize the page.

Unlocking the Page

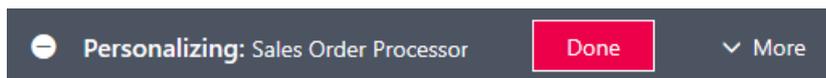

If you want to unlock a page and continue personalizing it, choose , and then **Unlock**.

Before you unlock the page, be aware of the following:

- The current personalization of the page will be cleared. The page will go back to its original layout, and you will have to start from scratch.
- In the Dynamics NAV Client connected to Business Central, the page will remain as-is and will not be affected by the new personalization changes made in the Business Central client. Going forward, the personalization in the Dynamics NAV Client connected to Business Central and Business Central client will be completely separate from each other.

Blocked from Personalizing

If there is a  icon in the Personalizing banner, this means that you are blocked from doing any personalization to the page.

The reason for this is that the Role Center or profile that is currently associated with your user account modifies this page specifically for your role. Please contact your administrator for assistance or, if it makes sense, try switching to a Role Center (from **My Settings**) that does include role-tailoring for this page.

Changing Which Features are Displayed

Displaying Lists in Different Ways

3/31/2019 • 2 minutes to read

In the right corner of any list in Business Central you will find icons that let you switch view on the list. A list can be viewed as a detailed list, which is the standard view. But you can also switch to view as tiles, which will show less detail on the specific record and stack the entries as tiles. This view is very useful to gain an overview of several entries and is in particular useful on smaller devices, because it makes each entry easier to tap.

Items list

On the Items list, having pictures helps you get a quick overview of what you sell and switching to the tiles gives you an item catalogue to browse through. If a picture is defined for the specific item, you have a third option besides the detailed list and the tiles; the large tiles view. This view displays large pictures for each entry.

You can import a picture for a specific item by going to the **Item** card and to the right select **Picture** and then choose **Import**. Likewise you can export a picture to a file or delete the picture for the item.

Working with Reports and Batch Jobs

5/16/2019 • 6 minutes to read

A report gathers information based on a specified set of criteria, and organizes and presents the information in an easy-to-read, printable format. There are many reports that you can access throughout the application. The reports typically provide information relative to the context of the page you are on. For example, the **Customer** page includes reports for the top 10 customers and the sales statistics, and more.

Batch jobs do more or less the same as reports but for the purpose of performing a process. For example, the **Create Reminders** batch job creates reminder documents for customers with overdue payments.

NOTE

This topic refers mainly to "report", but similar information applies to batch jobs.

You can find reports in the **Reports** tab on selected pages, or you can use search  to find reports by name.

Specifying the Data to Include in the Report

When you open a report, you are typically presented with a page where you set various options and filters that determine what to include in the report. This page is called the report request page. For example, the report request page lets you create a report for a specific customer, a certain date range, or sort the order of information in the report. Here is an example of a report request page:

Edit - Customer - Order Summary 

Saved Settings

Name ...

Options

Show Amounts in LCY
Starting Date ...

Customer

Show results:

Where: ... is: ...
And: ... is:
And: ... is: ...

Limit totals to:

And: ... is: ...

- Move through pages
- Zoom in and out
- Resize to fit the page
- Select text

You can copy text from a report, and then paste it somewhere else, like a page in Business Central or Microsoft Word. Using a mouse, for example, you press and hold where you want to start, and then move the mouse to select one or more words, sentences, or paragraphs. You can then press the right mouse button and select **Copy**. You can then paste the selected text where ever you want it.

- Pan the document

You can move the visible area of the report in any direction so you can view other areas of the report. This is helpful when you have zoomed in to see details. Using your mouse, for example, press and hold the mouse button anywhere in the report preview, and then move your mouse.

- Download to a PDF file on your computer or network.
- Print

Saving a Report

You can save a report to a PDF document, Microsoft Word document, or Microsoft Excel document by choosing **Send to**, and then making your selection.

Scheduling a Report to Run

You can schedule a report to run at a specific date and time. Scheduled reports are entered in the job queue and processed at the scheduled time, similar to other jobs. You can choose to save the processed report to a file, such as an Excel, Word, or PDF, print it to a selected printer, or process the report only. If you choose to save the report to a file, then the processed report is sent to the **Report Inbox** area on your Role Center, where you can view it.

You can schedule a report when you open a report. You choose the **Schedule** action and then you enter information such as printer, and time and date. The report is then added to the job queue and will be run at the specified time. When the report is processed, the item will be removed from the job queue. If you saved the processed report to a file, it will be available in the **Report Inbox** area.

Printing a Report

You can print a report from the **Print** button on the options page that appears when you open the report or from the menu bar in Preview.

Printing reports in Thai

Specifically for the Thai version of Business Central, the **Print** button cannot print reports correctly due to limitations in the service that generates the printable PDF file. Instead, you can open the report in Word and then save the report as a printable PDF.

Alternatively, you can ask your administrator to create a Word report layout for your most used reports. For more information, see [Managing Report and Document Layouts](#).

Changing the layout and look of a report

A report layout controls what is shown on a report, how it is arranged, and how it is styled. If you want to switch to a different layout, see [Change Which Layout is Currently Used on a Report](#). Or, if you want to customize your own

report layout, see [Create and Modify a Custom Report Layout](#).

Specify Printer Selection for Reports

3/31/2019 • 2 minutes to read

This page is empty because you cannot yet set up specific printers for specific reports. We are working on solving this.

In the meantime, when you want to print a report, you have to download the report as a PDF document first by choosing the **Send to** button. Then you select the type of file to download the report as, and here you should pick **PDF Document**. Now, you can either open the PDF document right-away and print it, or save it and print it later.

Working with Reports and Batch Jobs

5/16/2019 • 6 minutes to read

A report gathers information based on a specified set of criteria, and organizes and presents the information in an easy-to-read, printable format. There are many reports that you can access throughout the application. The reports typically provide information relative to the context of the page you are on. For example, the **Customer** page includes reports for the top 10 customers and the sales statistics, and more.

Batch jobs do more or less the same as reports but for the purpose of performing a process. For example, the **Create Reminders** batch job creates reminder documents for customers with overdue payments.

NOTE

This topic refers mainly to "report", but similar information applies to batch jobs.

You can find reports in the **Reports** tab on selected pages, or you can use search  to find reports by name.

Specifying the Data to Include in the Report

When you open a report, you are typically presented with a page where you set various options and filters that determine what to include in the report. This page is called the report request page. For example, the report request page lets you create a report for a specific customer, a certain date range, or sort the order of information in the report. Here is an example of a report request page:

Edit - Customer - Order Summary 

Saved Settings

Name ...

Options

Show Amounts in LCY
Starting Date ...

Customer

Show results:

Where: ... is: ...
And: ... is:
And: ... is: ...

Limit totals to:

And: ... is: ...

The **Show results** section on a request page provides a generic filtering capability for reports. These filters are optional.

Some reports will ignore any such filters, meaning that no matter what filter is set in the **Show results** section, the output of the report is the same. It is not possible to provide a list of which fields are ignored in which reports, so you will have to experiment with the filters when using them.

Example: When you use the **Create Reminders** batch job, a filter for the **Customer Ledger Entries** field of **Last Issued Reminder Level** will be ignored because filters are fixed for that batch job.

Using Saved Settings

With some reports, depending on how they are designed, the report page might include the **Saved Settings** section that contains one or more entries in the **Use default value from** box. The entries in this box are called *saved settings*. A saved setting is basically a predefined group of options and filters that you can apply to the report before previewing or sending the report to a file. The saved settings entry called **Last used options and filters** is always available. This entry sets the report to use options and filters that were used the last time you looked at the report.

Using saved settings is a fast and reliable way to consistently generate reports that contain the correct data. After you set the **Use default value from** box to a saved settings entry, you can change any of the options and filters before previewing or saving the report. The changes that you make will not be saved to the saved settings entry you selected, but they will be saved to the **Last used options and filters**.

NOTE

If you are an administrator, you can create and manage the saved settings for reports for all users. For more information, see [Managing Saved Settings on Reports](#).

Setting Options and Filters

If you want to further limit or pin-point the data that is included in a report, you can set additional options and filters.

Filters enable you to display data based on a specific criteria. Filters are grouped by the entity to which they belong, such as **Customer** in the illustration above. You define a filter by setting the **Where** box to the field that you want to filter on, and then adding the criteria in the **is:** box.

You can add more filters by filling the **And** and **is** boxes. When you have more than one filter, only results that meet the criteria for all filters will be included in the report.

Depending on what type field you are filtering, you can specify the filter criteria to look for an exact match, partial match, range of values, and more. For help about how to set up filters, see:

- [Filtering](#)
- [Working with Calendar Dates and Times](#)

Previewing a Report

Choose **Preview** to see the report in the Internet browser. Point to an area of the report to show the menu bar.

Select text or pan

Use the menu bar to:

- Move through pages
- Zoom in and out
- Resize to fit the page
- Select text

You can copy text from a report, and then paste it somewhere else, like a page in Business Central or Microsoft Word. Using a mouse, for example, you press and hold where you want to start, and then move the mouse to select one or more words, sentences, or paragraphs. You can then press the right mouse button and select **Copy**. You can then paste the selected text where ever you want it.

- Pan the document

You can move the visible area of the report in any direction so you can view other areas or the report. This is helpful when you have zoomed in to see details. Using your mouse, for example, press and hold the mouse button anywhere in the report preview, and then move your mouse.

- Download to a PDF file on your computer or network.
- Print

Saving a Report

You can save a report to a PDF document, Microsoft Word document, or Microsoft Excel document by choosing **Send to**, and then making your selection.

Scheduling a Report to Run

You can schedule a report to run at a specific date and time. Scheduled reports are entered in the job queue and processed at the scheduled time, similar to other jobs. You can choose to save the processed report to a file, such as an Excel, Word, or PDF, print it to a selected printer, or process the report only. If you choose to save the report to a file, then the processed report is sent to the **Report Inbox** area on your Role Center, where you can view it.

You can schedule a report when you open a report. You choose the **Schedule** action and then you enter information such as printer, and time and date. The report is then added to the job queue and will be run at the specified time. When the report is processed, the item will be removed from the job queue. If you saved the processed report to a file, it will be available in the **Report Inbox** area.

Printing a Report

You can print a report from the **Print** button on the options page that appears when you open the report or from the menu bar in Preview.

Printing reports in Thai

Specifically for the Thai version of Business Central, the **Print** button cannot print reports correctly due to limitations in the service that generates the printable PDF file. Instead, you can open the report in Word and then save the report as a printable PDF.

Alternatively, you can ask your administrator to create a Word report layout for your most used reports. For more information, see [Managing Report and Document Layouts](#).

Changing the layout and look of a report

A report layout controls what is shown on a report, how it is arranged, and how it is styled. If you want to switch to a different layout, see [Change Which Layout is Currently Used on a Report](#). Or, if you want to customize your

own report layout, see [Create and Modify a Custom Report Layout](#).

Managing Saved Settings on Reports

3/31/2019 • 2 minutes to read

When running a reports, users are typically presented with a page that lets them set certain options and filters for changing the data that is included in the generated report. This page is called the report request page. A report can include one or more *saved settings* that users can apply to the report from the request page. *Saved settings* are basically predefined options and filters. Using saved settings is a fast and reliable way to consistently generate reports that contain the correct data. For more information about how saved settings are used, see [Using Saved Settings](#).

If you have the proper permissions, you can view, create, and modify the saved settings for all reports for all users in company. You can assign saved settings for a report to individual users or all users in the company.

Create and modify saved settings for all users

You manage saved settings from page **1560 Reports Settings**. There are two ways to open this page:

- Choose the  icon, enter **Report Settings**, and then choose the related link.
- Open a report, choose the lookup next to the **Used default values from:** box, choose **Select from full list**.

The page displays all the existing save settings entries for all users. If there is a user name in the **Assigned to** column, only that user can use the saved settings for the associated report. If there is a check mark in the **Share with all users** column, all users can use the saved settings for the report.

From the **Report Settings** page, you can:

- Choose **New** to create a new saved settings entry from scratch.
- Select a saved settings entry from the list, and choose **Copy** to create a copy.
- Select a saved settings entry from the list, and choose **Edit** to modify a saved settings entry.

IMPORTANT

Consider the name that you give a saved settings entry. If you create a saved settings entry for all users, and you give it the same name as an existing saved settings entry that is assigned to a specific user only, then that user will not be able to use the saved settings entry that is assigned to everyone. Under **Saved Settings** on the report request page, the user will see two saved settings entries with the same name. However, no matter which option he chooses, the user-specific saved settings entry will be used.

NOTE

The saved settings feature is available only on reports where the [SaveValues](#) property of the report's request page is set to Yes . The **SaveValues** property is set in the development environment.

View Test Reports Before Posting

3/31/2019 • 2 minutes to read

When you are ready to post a document, such as an order, invoice, or a credit memo, you can test the document to ensure that no issues exist that will block the posting.

NOTE

The following procedure is about testing before posting a purchase document. The functionality works in the same way for sales documents.

To print a test report before posting a purchase invoice

1. Choose the  icon, enter **Purchase Invoices**, and then select the related link.
2. Open the purchase invoice that you want to test.
3. Choose the **Test Report** action.

All parts of the purchase invoice are tested, and the result is presented in a report. If the report indicates any errors or missing information, then you must correct the problem before posting the purchase invoice.

Run Batch Jobs

3/31/2019 • 2 minutes to read

A batch job is a routine that processes data in batches, for example the **Adjust Exchange Rates** batch job. There are batch jobs that perform periodic accounting activities, such as closing the income statement at the end of a fiscal year. Many batch jobs do calculation work, such as calculation of finance charges, exchange rate adjustment, and calculation of unit prices.

A batch job is like a report, except the batch job uses the result of its work to update information directly, instead of printing the results.

To run a batch job

1. To open the request page for the relevant batch job, choose the  icon, enter the name of the batch job, and then choose the related link.
2. If there is an **Options** FastTab for the batch job, fill in the fields to determine what the batch job will do.
3. The page may contain one or more FastTab with filters, which you can use to limit the data included in the batch job. You can enter criteria in the suggested filters or add more filters.
4. Choose the **OK** button to start the batch job.

Managing Report and Document Layouts

5/22/2019 • 3 minutes to read

A report layout controls content and format of the report, including which data fields of a report dataset appear on the report and how they are arranged, text style, images, and more. From Business Central, you can change which layout is used on a report, create new layout, or modify the existing layouts.

NOTE

In Business Central, the term "report" also covers externally-facing documents, such as sales invoices and order confirmations that you send to customers as PDF files.

In particular, a report layout sets up the following:

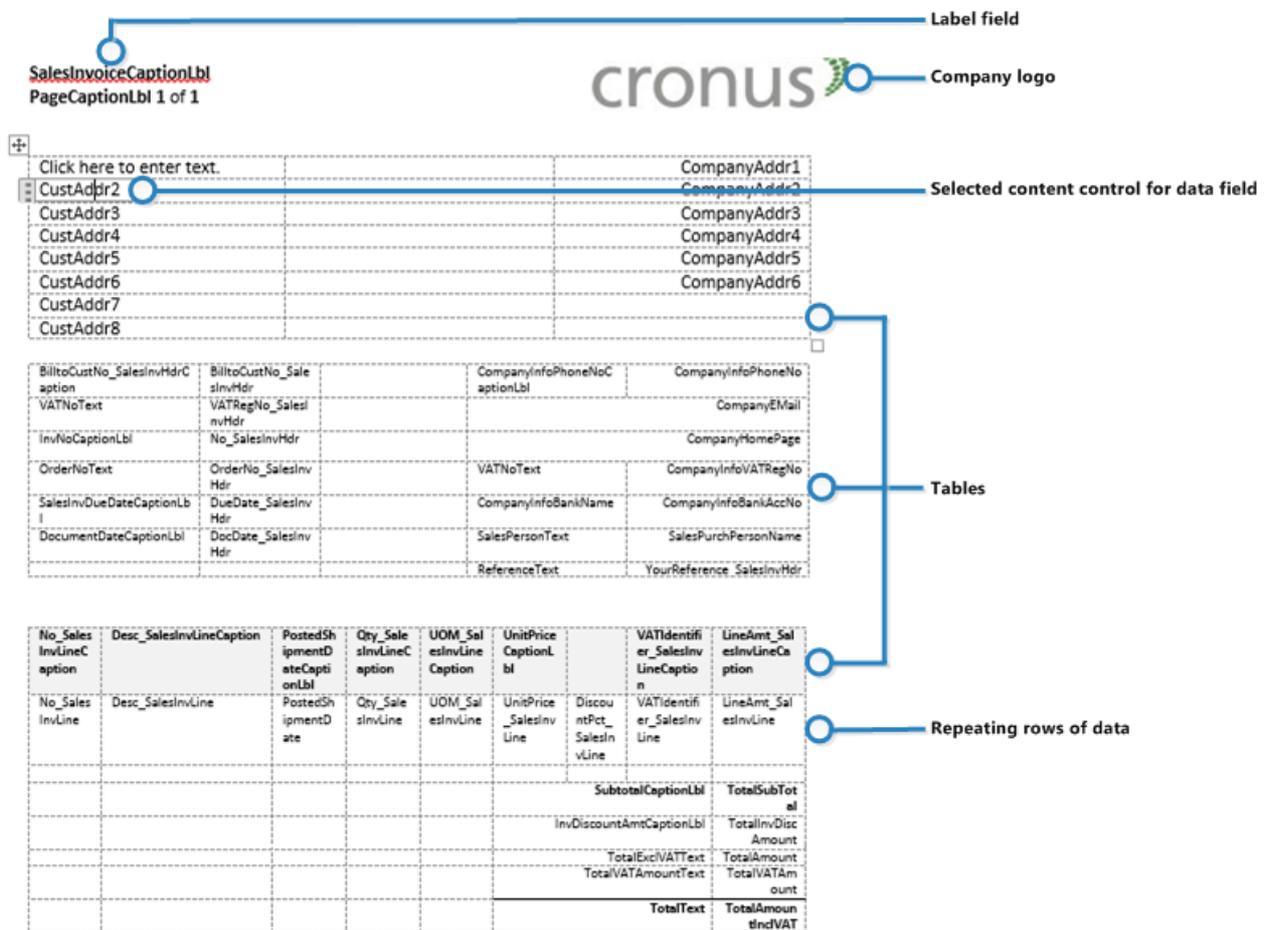

- The label and data fields to include from the dataset of the Business Central report.
- The text format, such as font type, size, and color.
- The company logo and its position.
- General page settings, such as margins and background images.

A report can be set up with multiple report layouts, which you can switch among as required. You can use one of the built-in report layouts or you can create custom report layouts and assign them to your reports as needed. For more information, see [Create a Custom Report or Document Layout](#).

There are two types of report layouts that you can use on reports; Word and RDLC.

Word report layout overview

A Word report layout is based on Word document (.docx file type). Word report layouts enable you to design report layouts by using Microsoft Word 2013 or later. A Word report layout determines the report's content - controlling how that content elements are arranged and how they look. A Word report layout document will typically use tables to arrange content, where the cells can contain data fields, text, or pictures.

RDLC layout overview

RDLC layouts are based on client report definition layouts (.rdlc or .rdl file types). These layouts are created and modified by using SQL Server Report Builder. The design concept for RDLC layouts is similar to Word layouts, where the layout defines the general format of the report and determines the fields from the dataset to include. Designing RDLC layouts is more advanced than Word layouts. For more information, see [Designing RDLC Report Layouts](#).

Built-in and custom report layouts

Business Central includes several built-in layouts. Built-in layouts are predefined layouts that are designed for specific reports. Business Central reports will have a built-in layout as either an RDLC report layout, Word report layout, or in some cases both. You cannot modify a built-in report layout from Business Central but you use them as a starting point for building your own custom report layouts.

Custom layouts are report layouts that you design to change the appearance of a report. You typically create a custom layout based on a built-in layout, but you can create them from scratch or from a copy of an existing custom layout. Custom layouts enable you to have multiple layouts for the same report, which you switch among as needed. For example, you can have different layouts for each Business Central company, or you can have different layouts for the same company for specific occasions or events, like a special campaign or holiday season.

Deciding whether to use a Word or RDLC report layout

A report layout can be based on either a Word document or RDLC file. Deciding on whether to use a Word report layout or RDLC report layout type will depend on how you want the generated report to look and your knowledge of Word and SQL Server Report Builder.

The general design concepts for Word and RDLC layouts are very similar. However each type has certain design

features that affect how the generated report appears in Business Central. This means that the same report might look different when using the Word report layout compared to the RDLC report layout.

The process for setting up Word report layouts and RDLC report layouts on reports is the same. The main difference is in the way you modify the layouts. Word report layouts are typically easier to create and modify than RDLC report layouts because you can use Word. RDLC report layouts are modified by using SQL Server Report builder which targets more advanced users.

For information on how to change which layout to use, see [Change Which Layout is Currently Used on a Report](#).

Updating Report or Document Layouts

3/31/2019 • 3 minutes to read

Occasionally, you may need to update a custom report layout that is used on a report. This is required when there has been a design change to the report's data set, for example, a field that is used in the layout has been removed from the report data set. If a report layout requires updating, you will get an error message when you try to preview, print or save the report.

You can automatically update a report layout from the error message that appears when you run the report by choosing the **Yes** button on the error message. Or, in advance of running reports, you can update specific report layouts or all custom report layouts that might be affected by dataset changes.

You also have the option to test updates without applying the required changes to the custom report layouts. This enables you to see what changes will be applied to the report layout and identify possible issues in the process. From the test results, you can open the custom report layouts directly for editing to fix any issues. We recommend that you test the report layout update before you apply the updates.

Not all report dataset changes can be automatically updated in the report layouts. Some changes will require that you manually edit the report layout. For more information, see [Limitations of the Custom Report Layout Update](#).

To update one or more custom report layouts

1. Choose the  icon, enter **Report Layouts**, and then choose the related link.
2. On the **Report Layouts** page, if you want to update a specific report, select the layout from the list, and then choose the **Update Layout** action. Or, if you want to update all custom report layouts for the company, choose the **Update All Layouts** action.

If no errors occur, then the updates is applied to the report layouts. If errors occur, then a message that contains the errors appears. You will then have to manually edit the custom report layout to fix the error. For more information, see [Fixing Errors](#).

To test custom report layout updates

1. Choose the  icon, enter **Report Layout Selection**, and then choose the related link.
2. On the **Report Layout Selection** page, choose the **Test Layout Updates** action.

Changes to the report layouts are tested but not applied to the actual report layouts. A **Report Layout Update Log** page appears that provides the status a potential updates for each report layout. If there are errors for a report layout, you can access the report layout directly for editing from the message to fix any issues. For more information, see [Fixing Errors](#).

Limitations of the Custom Report Layout Update

There are several types of changes that the automatic update can apply to custom report layouts, for example, a field that is used in the layout has been removed from the report data set. However, the automatic update cannot handle the following changes to a report dataset.

1. Deleted fields, labels, or data items.
2. Duplicate field names in the report layout after a field has been renamed in the dataset. This should be treated as a design error.

3. Upgrade scenarios where there are multiple iterations of a report layout that causes multiple rename actions on the same fields, labels or data items.

If the update process detects any one of these issues, the update cannot be applied. You will have to fix the issues manually, for example by editing the report layout in Word, or programmatically by using upgrade codeunits.

Fixing Errors

If you get an error message when you update or test report layout updates, you most likely will have to modify the report layout to fix the problem. Read the error message to help determine the cause of the problem.

The most typical problem occurs when a field that is used on the layout has been removed from the report dataset. In this case, you will see a line in the error message that states that an item has been removed. To fix this issue, you will have to modify the layout and remove the field in question.

For more information, see [Create and Modify a Custom Report Layout](#).

After you modify the layout, try to update the layout again.

Create and Modify a Custom Report or Document Layout

3/31/2019 • 5 minutes to read

By default, a report will have a built-in report layout, which can be either an RDLC report layout or Word report layout, or both. You cannot modify built-in layouts. However, you can create your own custom layouts that enable you to change the appearance of report when it is viewed, printed or saved. You can create multiple custom report layouts for the same report, and then switch the layout that is used by a report as needed.

NOTE

In Business Central, the term "report" also covers externally-facing documents, such as sales invoices and order confirmations that you send to customers as PDF files.

To create a custom layout, you can either make a copy of an existing custom layout or add a new custom layout, which in most cases is based on a built-in layout. When you add a new custom layout, you can choose to add an RDLC report layout type, Word report layout type, or both. The new custom layout will automatically be based on the built-in layout for the report if one is available. If there is no built-in layout for the type, then a new blank layout is created, which you will have to modify and design from scratch. For more information about RDLC and Word report layouts, built-in and custom layouts, and more, see [Manage Report Layouts](#).

To create a custom layout

1. Choose the  icon, enter **Report Layout Selection**, and then choose the related link.

The **Report Layout Selection** page lists all the reports that are available in the company that is specified in the **Company** field at the top of the page.

2. Set the **Company** field to the company in which you want to create the report layout.
3. Select the row for the report that you want to create the layout for, and then choose the **Custom Layouts** action.

The **Custom Report Layouts** page appears and lists all the custom layouts that are available for the selected report.

4. If you want to create a copy of an existing custom layout, select the existing custom layout in the list, and then choose the **Copy** action.

The copy of the custom layout appears on the **Custom Report Layouts** page and has the words *Copy of* in the **Description** field.

5. If you want to add a new custom layout that is based on a built-in layout, do the following:

- a. Choose the **New** action. The **Insert Built-in Layout for a Report** page appears. The **ID** and **Name** fields are automatically filled in.
- b. To add a custom Word report layout type, then select the **Insert Word Layout** check box.
- c. To add a custom RDLC report layout type, then select the **Insert RDLC Layout** check box.
- d. Choose the **OK** button.

The new custom layouts appear on the **Custom Report Layouts** page. If a new layout is based on a built-in layout, then it has the words **Copy of a Built-in Layout** in the **Description** field. If there was no built-in layout for the report, then the new layout has the words **New Layout** in the **Description** field,

which indicates that custom layout is blank.

6. By default, the **Company Name** field is blank, which means that the custom layout will be available for the report in all companies. To make the custom layout available in a specific company only, choose **Edit**, and then set the **Company Name** field to the company that you want.

The custom layout has been created. You can now modify the custom layout as needed.

Modifying a custom layout

To modify a report layout, you must first export the report layout as a file to a location on your computer or network, and then open the exported document and make the changes. When you are finished making the changes, you import the report layout.

To modify a custom layout

1. You export a custom layout from the **Custom Report Layouts** page. If this page is not already open, search for and open the **Report Layout Selection** page, select the report that has the layout that you want to modify, and then choose the **Custom Layouts** action.
2. On the **Custom Report Layouts** page, select the layout that you want to modify, choose the **Export Layout** action, and then choose **Save** or **Save As** to save the report layout document to a location on your computer or network.
3. Open the report layout document that you just saved, and then make changes.

If you are changing a Word layout, open the layout document in Word. For editing details, see the next section [Making Changes to the Report Layout](#).

RDLC report layouts are more advanced than Word report layouts. For more information about modifying an RDLC report layout, see [Designing RDLC Report Layouts](#).

Remember to save your changes when done.

4. Return to the **Custom Report Layouts** page, select the report layout that you exported and modified, and then choose the **Import Layout** action.
5. In the **Import** dialog box, select **Choose** to find and select the report layout document, and then choose **Open**.

Making changes to a Word report layout

To can make general formatting and layout changes, such as changing text font, adding and modifying a table, or removing a data field, just use the basic editing features of Word, like you do with any Word document.

If you are designing a Word report layout from scratch or adding new data fields, then start by adding a table that includes rows and columns that will eventually hold the data fields.

TIP

Show the table gridlines so that you see the boundaries of table cells. Remember to hide the gridlines when you are done editing. To show or hide table gridlines, select the table, and then under **Layout** on the **Table** tab, choose **View Gridlines**.

Embedding Fonts in Word Layouts for Consistency

To ensure that reports always display and print with the intended fonts, regardless of where users open or print the reports, you can embed the fonts in the Word document. However, be aware that embedding fonts can significantly increase the size of the Word files. For more information about embedding fonts in Word, see [Embed fonts in Word, PowerPoint, or Excel](#).

Removing Label and Data Fields in Word Layouts

Label and data fields of a report are contained in content controls in Word. The following figure illustrates a content control when it is selected in the Word document.

The name of the label or data field name displays in the content control. In the example, the field name is CompanyAddr1.

To remove a label or data field

1. Right-click the field that you want to delete, and then choose **Remove Content Control**.

The content control is removed, but the field name remains as text.

2. Delete the remaining text as needed.

Adding data fields

Adding data fields from a report dataset is a more advanced and requires some knowledge of the report dataset. For information about adding fields for data, labels, data, and images, see [Add Fields to a Word Report Layout](#).

[Working with Business Central](#)

Import and Export a Report or Document Layout

3/31/2019 • 2 minutes to read

You can import and export an existing custom report layout as a file to and from a location on your computer and network. For example, you can export a report layout, and then send the file to another person to modify. That person can then make the modifications to layout and return the file to you so that you can import it back.

IMPORTANT

You cannot import or export built-in report layouts.

To export a report layout to a file

1. Choose the  icon, enter **Report Layout Selection**, and then choose the related link.
2. Select the row for the report that contains the custom report layout that you want to export, and then on the **Home** tab, in the **Process** group, choose **Custom Layouts**.
3. On the **Report Layouts** page, select the report layout that you want to export to a file, and then on the **Home** tab, in the **Process** group, choose **Export Layout**.
4. In the **Export File** dialog box, choose **Save**, and then save the file to a location on your computer or network.

To import a report layout file

1. Make sure that the relevant file that defines the report layout is available on your computer or network.

A Word report layout file must have the .docx file type extension. An RDLC report layout file must have the .rdlc or .rdl file type extension.
2. Choose the  icon, enter **Report Layout Selection**, and then choose the related link.
3. Select the row for the report to which you want to import the report layout, and then on the **Home** tab, in the **Process** group, choose **Custom Layouts**.
4. On the **Report Layouts** page, select the report layout to which you want to import the file, and then on the **Home** tab, in the **Process** group, choose **Import Layout**.
5. In the **Import** dialog box, select the document that defines the report layout, and then choose **Open**.

The original custom report layout is replaced with the imported report layout.

[Working with Reports and Batch Jobs](#)

Change Which Layout is Currently Used on a Report

4/8/2019 • 2 minutes to read

A report can be set up with more than one report layout, which you can then switch among as needed.

Depending on the layouts that are available for a report, you can choose to use a built-in RDLC report layout, a built-in Word report layout, or a custom layout. For more information about RDLC and Word report layouts, built-in and custom layouts, and more, see [Manage Report Layouts](#).

TIP

Document reports (not lists) that use a Word report layout are typically faster than those that use an RDLC report layout. So if you have the option to choose between a Word or RDLC report layout for a document report, use the Word report layout for the best performance.

To change the layout that is used on a report

1. Choose the  icon, enter **Report Layout Selection**, and then choose the related link.
The **Report Layout Selection** page lists all the reports that are available for the company that is specified in the Company field at the top of the page. The Selected Layout field specifies the layout that is currently used on the report.
2. Set the **Company** field at the top of the page to the company that includes the report.
3. To change the layout that is used by a report, in the row for the report in the list, set the **Selected Layout** field to one of the following options:
 - RDLC (built-in), uses the built-in RDLC report layout on the report.
 - Word (built-in), uses the built-in Word report layout on the report.
 - Custom, uses a custom layout on the report.
You can see which custom layouts are available for the report in the Report Layouts Part FactBox. If there are no custom layouts for the report, then you will have to create one first. If you choose this option, go to the next procedure to specify the custom layout that you want to use.

NOTE

If you choose **RDLC (built-in)** or **Word (built-in)** and you get an error message that the report does not have a layout of the specified type, then you must choose another layout option or create a custom report layout of the type that you want to use.

If you selected a built-in RDLC or Word report layout, then no further action is required and the layout will be used the next time the report is run.

To specify a custom layout on a report

1. You specify which custom layout to use on the report from the **Custom Report Layouts** page. If the **Custom Report Layouts** page is not open, then in the **Report Layout Description** field, choose the lookup button.
2. On the **Custom Report Layouts** page, select the row for custom layout that you want to use, and then close the page.

You return to the **Report Layout Selection** page. The name of the selected custom layout displays in the **Custom Layout Description** field. The custom layout will be used the next time that you run the report.

Add Fields to a Word Report Layout

3/31/2019 • 5 minutes to read

A report dataset can consist of fields that display labels, data, and images. This topic describes the procedure for adding fields of a report dataset to an existing Word report layout for a report. You add fields by using the Word custom XML part for the report and adding content controls that map to the fields of the report dataset. Adding fields requires that you have some knowledge of the report's dataset so that you can identify the fields that you want to add to the layout.

NOTE

You cannot modify built-in report layouts.

To open the Custom XML part for the Report in Word

1. If not already open, then open the Word report layout document in Word.

For more information, see [Create and Modify a Custom Report Layout](#).

2. Show the **Developer** tab in the ribbon of Microsoft Word.

By default, the **Developer** tab is not shown in the ribbon. For more information, see [Show the Developer Tab on the Ribbon](#).

3. On the **Developer** tab, choose **XML Mapping Pane**.

4. In the **XML Mapping** pane, in the **Custom XML Part** dropdown list, choose the custom XML part for ADD INCLUDE report, which is typically last in the list. The name of the custom XML part has the following format:

```
urn:microsoft-dynamics-nav/reports/report_name/ID
```

report_name is the name that is assigned to the report.

ID is the identification number of the report.

After you select the custom XML part, the XML Mapping pane displays the labels and field controls that are available for the report.

To add a label or data field

1. Place your cursor in the document where you want to add the control.
2. In the **XML Mapping** pane, right-click the control that you want to add, choose **Insert Content Control**, and then choose **Plain Text**.

NOTE

You cannot add a field by manually typing the dataset field name in the content control. You must use the **XML Mapping** pane to map the fields.

To add repeating rows of data fields to create a list

1. In a table, add a table row that includes a column for each field that you want repeated.

This row will act as a placeholder for the repeating fields.

2. Select the entire row.
3. In the **XML Mapping** pane, right-click the control that corresponds to the report data item that contains the fields that you want repeated, choose **Insert Content Control**, and then choose **Repeating**.
4. Add the repeating fields to the row as follows:
 - a. Place your pointer in a column.
 - b. In the **XML Mapping** pane, right-click the control that you want to add, choose **Insert Content Control**, and then choose **Plain Text**.
 - c. For each field, repeat steps a and b.

Adding Image Fields

A report dataset can include a field that contains an image, such as a company logo or a picture of an item. To add an image from the report dataset, you insert a **Picture** content control.

Images align in the top-left corner of the content control and resize automatically in proportion to fit the boundary of the content control.

IMPORTANT

You can only add images that have a format that is supported by Word, such as .bmp, .jpeg, and .png file types. If you add an image that has a format that is not supported by Word, you will get an error when you run the report from the ADD INCLUDE client.

To add an image

1. Place your pointer in the document where you want to add the control.
2. In the **XML Mapping** pane, right-click the control that you want to add, choose **Insert Content Control**, and then choose **Picture**.
3. To increase or decrease the image size, drag a sizing handle away from or towards the center of the content control.

Custom XML Part Overview

Word report layouts are built on *custom XML parts*. A custom XML part for a report consists of elements that correspond to the data items, columns, and labels that comprise the report's dataset. The custom XML part is used to map the data into a report when the report is run.

XML Structure of Custom XML Part

The following table provides a simplified overview of the XML of a custom XML part.

XML ELEMENTS	DESCRIPTION
<pre><?xml version="1.0" encoding="utf-16"?></pre>	Header
<pre><WordReportXmlPart xmlns="urn:microsoft-dynamics-365/report/<reportname>/<id>/"</pre>	XML namespace specification. <code><reportname></code> is the name that is assigned to the report. <code><id></code> is the ID that is assigned to the report.

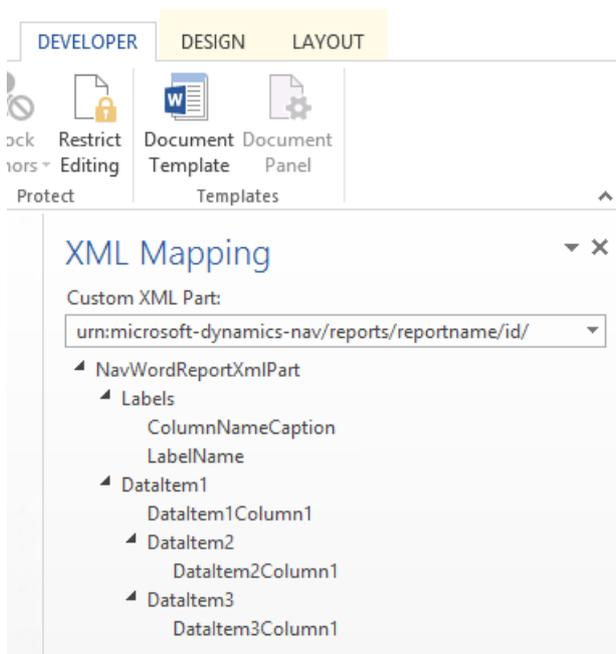

XML ELEMENTS	DESCRIPTION
<pre> ..<Labels> <ColumnNameCaption>ColumnNameCaption</ColumnNameCaption><LabelName>LabelCaption</LabelName> ..</Labels> </pre>	<p>Contains all the labels for the report.</p> <ul style="list-style-type: none"> - Label elements that are related to columns have the format <code><ColumnNameCaption>ColumnNameCaption</ColumnNameCaption></code>. - Label elements have the format <code><LabelName>LabelName</LabelName></code>. - Labels are listed in alphabetical order.
<pre> ..<DataItem1> <DataItem1Column1>DataItem1Column1</DataItem1Column1> </pre>	<p>Top-level data item and columns. Columns are listed in alphabetical order.</p>
<pre><DataItem2> <DataItem2Column1>DataItem2Column1</DataItem2Column1></DataItem2><DataItem3> <DataItem3Column1>DataItem3Column1</DataItem3Column1></DataItem3> </pre>	<p>Data items and columns that are nested in the top-level data item. Columns are listed in alphabetical order under the respective data item.</p>
<pre> ..</DataItem1> </WordReportXmlPart> </pre>	<p>Closing element.</p>

Custom XML Part in Word

In Word, you open the custom XML part in the **XML Mapping** pane, and then use the pane to map elements to content controls in the Word document. The **XML Mapping** pane is accessible from the **Developer** tab (for more information, see [Show the Developer Tab on the Ribbon](#)).

The elements in the **XML Mapping** pane appear in a structure that is similar to the XML source. Label fields are grouped under a common **Labels** element and data item and columns are arranged in a hierchal structure that corresponds to the XML source, with columns listed in alphabetical order. Elements are identified by their name as defined by the Name property in Report Dataset Designer in ADD INCLUDE.

The following figure illustrates the simple custom XML part from the previous section in the **XML Mapping** pane of a Word document.

- To add a label or field to the layout, you insert a content control that maps to the element in the **XML Mapping** pane.
- To create repeating rows of columns, insert a **Repeating** content control for the parent data item element, and then add content control for the columns.
- For labels, the actual text that appears in the generated report is the value of the **Caption** property for the field in the data item table (if the label is related to the column in the report dataset) or a label in the Report Label Designer (if the label is not related to a column in the dataset).
- The language of the label that is displayed when you run the report depends on the language setting of the report object.

Accessibility and Keyboard Shortcuts

5/22/2019 • 2 minutes to read

This topic provides information about the features that make Business Central readily available to people with disabilities. Business Central supports the following accessibility features:

- Keyboard shortcuts

For more information, see [Keyboard Shortcuts](#)

- Navigation
- Headings
- Alternative text for images and links
- Support for common assistive technologies

Navigation

You can navigate between the tabs and actions in the ribbon, elements in the navigation bar, and other controls on Business Central pages and reports using the keyboard. To move the focus from one tab, action, or control to another, press the Tab key to move forward. Press Shift+Tab to move backward.

By using the tab order, you can also switch between the main browser page and dialog boxes that request confirmation, for example, or the login page.

Headings

The HTML source for Business Central content uses tags to help users of assistive technology to understand the structure and content of the page. For example, on list pages, the columns are defined in TH tags and the column headings are set with TITLE attribute inside the tag. Captions for elements, such as FastTabs, FactBoxes, and fields are included in heading tags (H1, H2, H3, and H4).

Image and Links

A descriptive text for images is set with the ALT attribute inside the IMG tag. A descriptive text for hyperlinks is set with the title attribute inside the A tag.

Assistive Technologies

Business Central supports various assistive technologies, such as high contrast, screen readers, and voice recognition software. Some assistive technologies may not work well with certain elements in Business Central pages.

For more accessibility information

You can find additional information about accessibility with Microsoft products and assistive technologies on the [Microsoft Accessibility](#) site.

Frequently Asked Questions

Keyboard Shortcuts

6/6/2019 • 11 minutes to read

This article provides an overview of some of the shortcut key combinations that you can use when you are working with Business Central.

TIP

For a quick, print-friendly overview of the most popular shortcuts, [see the reference article here](#) or click the following image:

Overview

The keyboard shortcuts aid accessibility and can make it easier and more efficient to navigate to different areas and elements on a page.

The keyboard shortcuts are supported by most web browsers; however, the behavior may vary slightly.

The keyboard shortcuts described here refer to the U.S. keyboard layout. The layout of the keys on other keyboards may not correspond exactly to the keys on a U.S. keyboard.

Most of the shortcuts are the same no matter whether the operating system is Windows or macOS; however, there are some shortcuts that differ for macOS. These are indicated in parentheses in the tables in the sections that follow.

General Keyboard Shortcuts

The following table describes keyboard shortcuts for navigating and accessing different elements of a page, such as actions, drop-down lists, lookups, and more. For details about keyboard shortcuts for navigating records once you get inside a list, see the next section.

PRESS THESE KEYS (IN MACOS)	TO DO THIS
Alt+Down Arrow	Open a drop-down list or look up a value for a field.
Alt+Right Arrow	See the transactions that resulted in a calculated value in a field.
Alt+F2	Show and hide the FactBox pane.
Alt+Q (Ctrl+Alt+Q)	Open Tell me what you want to do box that can help you find a page, a report, an action on the current page, or an article in the documentation.
Alt+T	Open the My Settings page.

PRESS THESE KEYS (IN MACOS)	TO DO THIS
Alt+Up Arrow	Show tooltip for a field or a column header of a table. If the field has validation errors, press "Alt+Up Arrow" to show the validation error. Press "Esc" or "Alt+Up Arrow" to close the tooltip.
Ctrl+Alt+F1	Open and close the page inspection pane. The page inspection pane shows information about the page, like its source table, fields, filters, extensions, and more. For more information, see Inspecting Pages .
Ctrl+C	Copy the value of field. If the field is in focus, and you have not selected any text in the field, this will copy the entire value. If you have selected any text in the field, then it will copy the selected text only.
Ctrl+F1	Open the Business Central help for the page.
Ctrl+F5	Reload the Business Central application. This is similar to selecting refresh/reload in the browser.
F5	Refresh the data on the current page. Use this to ensure that the data on the page is up-to-date with any changes that others have made while you are working.
Ctrl+F12	Switch between wide and narrow layout view.
Enter	Enable or access the element or control that is in focus.
Esc	Close the current page or drop-down.
Tab	Move focus to the next control or element on a page, such as actions, buttons, fields, or list headings.
Shift+Tab	Move focus to the previous control or element on a page, such as actions, buttons, fields, or list headings.

Keyboard Shortcuts in Lists

The following table describes the keyboard shortcuts that you can use in a list page. The shortcut action is slightly different depending on whether the page is shown in the list view or tile view.

General

PRESS THESE KEYS (IN MACOS)	TO DO THIS IN A LIST VIEW	TO DO THIS IN A TILE VIEW
Alt+F7	Sort the selected column in ascending or descending order.	Not applicable.

PRESS THESE KEYS (IN MACOS)	TO DO THIS IN A LIST VIEW	TO DO THIS IN A TILE VIEW
Shift+F10	Open a menu of options that are available for selected row.	Not applicable.
Alt+N	Open a page for creating a new record; the same way as selecting the New action.	Same.

Navigating Between Rows and Columns

PRESS THESE KEYS (IN MACOS)	TO DO THIS IN A LIST VIEW	TO DO THIS IN A TILE VIEW	
Ctrl+Home (Fn+Ctrl+Left Arrow)	Select the first row in the list; focus remains in the same column.	Move to the first tile in first row.	
Ctrl+End (Fn+Ctrl+Right Arrow)	Select the last row in the list; focus remains in the same column.	Move to the last tile in last row.	
Home (Fn+Left Arrow)	Move to the first field in the row.	Move to the first tile in the row.	
End (Fn+right Arrow)	Move to the last field in the row.	Move to the last tile in the row.	
Enter	Open the record that is associated with the field. Only relevant if a card page is associated with the record.	Opens the record. Only relevant if a card page is associated with the record.	
Ctrl+Enter	Move focus to the next element outside the list.	Move focus to the next element outside the list.	
Down Arrow	Move in the same column to the field in the row below.	Move in the same column to the tile in the row below.	
Up Arrow	Move in the same column to the field in the row above.	Move in the same column to the tile in the row above.	
Right Arrow	In a view-only list, move in the same row to the next field to the right. In an editable list, move to the right within the current field.	Move in the same row to the next tile to the right.	

PRESS THESE KEYS (IN MACOS)	TO DO THIS IN A LIST VIEW	TO DO THIS IN A TILE VIEW	
Left Arrow	In a view-only list, move in the same row to the previous field to the left. In an editable list, move to the left within the current field.	Move in the same row to the previous tile to the left.	
Page Up (Fn+up Arrow)	Scroll to display the set rows above the current rows in view.	Scrolls to display the set of tiles above the current tiles in view.	
Page Down (Fn+down Arrow)	Scroll to display the set rows below the current rows in view.	Scroll to display the set of tiles below the current tiles in view.	
Tab	In editable list, move in the same row to the next field to the right.	Not applicable.	
Shift+Tab	In editable list, move in the same row to the previous field to the left.	Not applicable.	

Selecting, Copying, and Pasting

PRESS THESE KEYS (IN MACOS)	TO DO THIS IN A LIST VIEW	TO DO THIS IN A TILE VIEW
Ctrl+Click (Cmd+Click)	Extend the selection of rows to include the row that you click.	Not applicable.
Shift+Click	Extend the selection of rows to include the row that you click and all the rows in between. You can use this after using Ctrl+Up Arrow or Ctrl+Up Down to expand your selection.	Not applicable.
Ctrl+Up Arrow (Ctrl+Cmd+Up Arrow)	Move focus to the row above and keep the current row selected.	Not applicable.
Ctrl+Down Arrow (Ctrl+Cmd+Down Arrow)	Move focus to the row below and keep the current row selected.	Not applicable.
Ctrl+ Space Bar (Ctrl+Cmd+Space)	Extend the selection of rows to include the focused row. You can use this after using Ctrl+Up Arrow or Ctrl+Down Arrow to expand your selection.	Not applicable.
Ctrl+A	Select all rows.	Not applicable.

PRESS THESE KEYS (IN MACOS)	TO DO THIS IN A LIST VIEW	TO DO THIS IN A TILE VIEW
Shift+Up Arrow	Extend the selection of rows to include the row above.	Not applicable.
Shift+Down Arrow	Extend the selection of rows to include the row below.	Not applicable.
Shift+Page Up (Shift+Fn+Up Arrow)	Extend the selection of rows to include all visible rows above the current selection of rows.	Not applicable.
Shift+Page Down (Shift+Fn+Down Arrow)	Extend the selection of rows to include all visible rows below the current selection of rows.	Not applicable.
Ctrl+C (Cmd+C)	Copy the selected rows to the Clipboard.	Not applicable.
Ctrl+V (Cmd+V)	Paste the selected rows from the Clipboard into the current page or external document, like Microsoft Excel or Outlook email. You can only do this in editable lists.	Not applicable.
F8	Copy the field in the same column of the row above, and paste it into the current row. You can only do this in editable lists. Using this shortcut followed by a Tab lets you quickly fill out fields in line items that you want to have the same value as the row above.	Not applicable.

Searching and Filtering Lists

PRESS THESE KEYS (IN MACOS)	TO DO THIS
F3	<p>Toggles the search box.</p> <ul style="list-style-type: none"> • Activate the search box, so you can start typing your search text. • If the search box is already activated, F3 returns to the list without clearing the search text.
Shift+F3	<p>Open and close the filter pane.</p> <ul style="list-style-type: none"> • If the filter pane is not open, Shift+F3 opens it and focuses on the + Filter action under Filter list by, which lets you just hit Enter to start adding a field filter. • If the filter pane is already open, Shift+F3 closes it but does not clear any filters that you have added.

PRESS THESE KEYS (IN MACOS)	TO DO THIS
Ctrl+Shift+F3	<p>Open and close the filter pane.</p> <ul style="list-style-type: none"> • If the filter pane is not open, Ctrl+Shift+F3 opens it and focuses on the + Filter action under Filter total by, which lets you just hit Enter to start adding a totals filter. • If the filter pane is already open, Ctrl+Shift+F3 closes it but does not clear any filters that you have added.
Alt+F3	<p>Toggle filtering to the selected value.</p> <ul style="list-style-type: none"> • Applies a column filter on the selected field value in the list. This does the same as choosing Filter to this value from a column heading. It opens the filter pane, sets filter to the selected value, while focus remains on cell in the list. • If the column is already filtered, Alt+F3 clears the filter on that column.
Shift+Alt+F3	<p>Open the filter pane and add a filter on the selected column in the list. Focus is on the new filter field which lets start typing the filter criteria right away.</p> <p>This does the same as selecting Filter from the column heading.</p> <p>If there is already a filter on the field, a new filter is added.</p>
Ctrl+Shift+Alt+F3	<p>Reset filters. This does the same as choosing Reset filters in the filter pane, and it applies to field and totals filters.</p> <p>Filters return to the default filters for the current view. If the current view is All, then this is the same as returning to an unfiltered view with all records.</p>
Ctrl+Enter	<p>Change focus from the the filter pane back to the list.</p>

Keyboard Shortcuts in Cards and Documents

The following shortcuts are available on card pages (like **Customer**) and document pages (like **Sales Order**) for displaying and modifying records.

PRESS THESE KEYS (IN MACOS)	TO DO THIS
Alt+F6	<p>Collapse and expand the current FastTab.</p>
Alt+N	<p>Open a page for creating a new record; the same way as choosing the New action.</p>
Alt+Shift+N	<p>Close the current card page and creates a new entity; the same as selecting the back arrow and then the New action.</p>
Ctrl+Down Arrow	<p>Open the next record for an entity.</p>

PRESS THESE KEYS (IN MACOS)	TO DO THIS
Ctrl+Up Arrow	Open the previous record for an entity.
Ctrl+Shift+F12	Maximize the line items part in a document page, like a sales order or invoice. Other parts of the page are hidden, and the line items part expands to entire workspace. Press the keys again to return to the normal display. For more information, see Focusing on Line Items .
F6	Move to next FastTab or part (sub-page).
Shift+F6	Move to previous FastTab or part (sub-page).

Quick Entry Shortcuts for Fields

The following shortcuts pertain to the Quick Entry feature on cards, documents, and list pages. On lists, the shortcuts cannot be used when the list is in the tile view. For more information about Quick Entry, see [Accelerating Data Entry Using Quick Entry](#).

PRESS THESE KEYS (IN MACOS)	TO DO THIS	REMARKS
Enter	Confirm the value in the current field and go to the next Quick Entry field.	
Shift+Enter	Confirm the value in the current field and go to the previous Quick Entry field.	
Ctrl+ Shift+Enter	Confirm the value in the current column and go to next Quick Entry field outside the list. This shortcut applies to embedded lists on a page, such as line items on a sales order. It enables you to quickly get out of the list and continue entering data in other fields on the page.	

Keyboard Shortcuts in Worksheets

The following shortcuts are only available on Worksheet pages, like **Item Journals**.

PRESS THESE KEYS (IN MACOS)	TO DO THIS
Ctrl+Delete	Delete a line item.

Keyboard Shortcuts in the Calendar (Date Picker)

When setting a date field, you can either enter the date manually or open a calendar (date picker) that lets you select the date you want. The following table describes the keyboard shortcuts for the calendar.

PRESS THESE KEYS (IN MACOS)	TO DO THIS
Ctrl+Home	Open the calendar if closed.
Ctrl+Home (Cmd+Home)	Move to the current month, current day.
Ctrl+Left Arrow (Cmd+Left Arrow)	Move to the previous day.
Ctrl+Right Arrow (Cmd+Right Arrow)	Move to the next day.
Ctrl+Up Arrow (Cmd+Up Arrow)	Move to the previous week, same day of the week.
Ctrl+Down Arrow (Cmd+Down Arrow)	Move to the next week, same day of the week.
Enter	Select the focused date.
Ctrl+End (Cmd+End)	Close the calendar and delete current the date.
Esc	Close the calendar without a selection, keep current date.
Page Down	Move to the next month.
Page Up	Move to the previous month.

Keyboard Shortcuts in the Report Preview

PRESS THESE KEYS (IN MACOS)	TO DO THIS
Down Arrow	Scroll down the page.
Up Arrow	Scroll up the page.
Ctrl+0 (zero) (Cmd+0)	Fits the entire page on the page.
Ctrl+Home (Cmd+Home)	Go to the first page of the report.
Ctrl+End (Cmd+Home)	Go to the last page of the report.
Left Arrow	Scroll to the left when the page is zoomed in so that it is not entirely in view.
Right Arrow	Scroll to the right when the page is zoomed in so that it is not entirely in view.

PRESS THESE KEYS (IN MACOS)	TO DO THIS
Page Down (Fn+Down Arrow)	Go to the next page of the report.
Page Up (Fn+Up Arrow)	Go to the previous page of the report.

Setting Up Business Central

4/8/2019 • 3 minutes to read

Business Central includes standard configurations for most business processes, but you can change the configuration to suit the needs of company.

For example, your chart of accounts is prefilled with a number of posting accounts ready for use. You can, of course, change the chart of accounts to suit your needs. For more information, see [Finance](#).

From your Role Center, you can access assisted setup guides that help you configure certain scenarios and add features to Business Central. For information about how to access all assisted and manual setup pages, see [Getting Ready for Doing Business](#).

NOTE

You can set up a new company in Business Central with RapidStart Services, which is a tool designed to shorten deployment times, improve quality of implementation, introduce a repeatable approach to implementations, and enhance productivity by automating and simplifying recurring tasks. For more information, see [Setting Up a Company With RapidStart Services](#).

Some functionality, either general or for specific business processes, can be set up manually in addition to the assisted setup guide. The following lists some of functionality that can you can set up manually.

TO	SEE
Set up payment methods, currencies, and the chart of accounts, and define rules and defaults for managing financial transactions.	Setting Up Finance
Set up your own and your vendors' bank accounts and enable services for importing and exporting bank files.	Setting Up Banking
Configure the rules and values that define your company's sales policies, register new customers, and set up how you communicate with customers.	Setting Up Sales
Configure the rules and values that define your company's purchasing policies, register new vendors, and prioritize your vendors for payment processing.	Setting Up Purchasing
Configure the rules and values that define the company's inventory policies, set up locations if you keep inventory in multiple warehouses, and categorize your items to improve searching and sorting .	Setting Up Inventory
Set up resources, time sheets, and jobs to manage projects.	Setting Up Project Management
Configure how to insure, maintain, and depreciate fixed assets, and how you record the costs of fixed assets in your company books.	Setting Up Fixed Assets

TO	SEE
Define the general rules and values for warehouse processes and the specific handling at each location.	Setting Up Warehouse Management
Prepare production BOMs and routings to define how end items are produced, and prepare machine or work centers to perform the required operations.	Setting Up Manufacturing
Establish standard services, symptoms, and fault codes and set up the service items, resources, and documentation needed to provide service to your customers.	Setting Up Service Management
Read best practices for setting items up for up inventory costing and supply planning.	Setting Up Complex Application Areas Using Best Practices
Improve the quality of implementation and shorten deployment time by using a toolset for setting up a new company using wizards, templates, worksheets, and customer questionnaires.	Setting Up a Company With RapidStart Services
Transfer customers, vendors, inventory, and bank accounts information from another system into Business Central	Importing Business Data from Other Finance Systems.
Use Business Central Outlook add-ins to see financial data related to customers and vendors or create and send financial documents, such as quotes and invoices.	Using Business Central as Your Business Inbox in Outlook
Get insights into your Business Central data with Power BI and the Business Central content packs.	Enabling Your Business Data for Power BI
Use your Business Central data as part of a workflow in Microsoft Flow.	Using Business Central in an Automated Workflow
Make your Business Central data available as a data source in PowerApps.	Connecting to Your Business Central Data to Build a Business App Using PowerApps
Use dedicated Quickbooks migration guides.	Changing from a QuickBooks App to Business Central
Access your Business Central data from your mobile device.	Getting Business Central on Your Mobile Device
Do bulk invoicing of appointments created in Bookings.	Bulk Invoicing for Microsoft Bookings
Set up an SMTP server to enable e-mail communication in and out of Business Central	Set Up Email Manually or Using the Assisted Setup
Set up unique identification codes for records, such as cards, documents, and journal lines, to track them in the system.	Create Number Series
Set up and assign a base calendar to your company and its business partners, such as customers, vendors, or locations. Delivery and receipt dates on future sales order, purchase order, transfer order, and production order lines are then calculated according to the calendar's specified working days.	Set Up Base Calendars

Some areas require you to be an administrator in your Business Central subscription. For more information,

Setting Up Finance

5/2/2019 • 2 minutes to read

To help you get going quickly, Business Central includes standard configurations for most financial processes. If you need to change the configurations to suit your business, go right ahead. For example, from the Role Center, you can use an assisted setup guide to set up sales tax rate for your location.

However, there are some things you need to set up yourself. For example, if you want to use dimensions as a basis for business intelligence.

The following table describes a sequence of tasks, with links to the topics that describe them.

TO	SEE
Choose how you pay your vendors.	Defining Payment Methods
Specify the posting groups that map entities like customers, vendors, items, resources, and sales and purchase documents to general ledger accounts.	Setting Up Posting Groups
Create account schedules and define account categories to define the contents of financial charts and reports, such as the Balance Sheet and Income Statement reports.	Prepare Financial Reporting with Account Schedules and Account Categories
Set up a tolerance by which the system closes an invoice even though the payment, including any discount, does not fully cover the amount on the invoice.	Work with Payment Tolerances and Payment Discount Tolerances
Set up fiscal periods.	Open a New Fiscal Year
Define how you report value-added tax amounts that you have collected for sales to the tax authorities.	Setting Up Calculations and Posting Methods for Value-Added Tax
Prepare to handle unrealized VAT in connection with cash-based accounting methods.	Set Up Unrealized VAT for Cash-Based Accounting
Set your Sales and Purchases features up to handle payments in foreign currencies.	Enable Application of Ledger Entries in Different Currencies
Define one or more additional currencies so that amounts are automatically reported in both LCY and an additional reporting currency on each G/L entry and on other entries.	Set Up an Additional Reporting Currency
Periodically adjust additional currency equivalents to make up for fluctuating exchange rates.	Update Currency Exchange Rates
Define multiple interest rates to be used for different periods for delayed payments in trade transactions.	Set Up Multiple Interest Rates
Prepare to round invoice amounts automatically when you create invoices.	Set Up Invoice Rounding

TO	SEE
Add new accounts to the existing chart of accounts.	Setting Up the Chart of Accounts
Set up business intelligence (BI) charts to analyze cash flow.	Setting Up Cash Flow Analysis
Enable invoicing of a customer who is not set up in the system.	Set Up Cash Customers
Set up Intrastat reporting, and submit the report to an authority	Set Up and Report Intrastat
Make sure an entry in a general journal is allocated to several different accounts when you post the journal, either quantity, percentage, or amount.	Use Allocation Keys in General Journals

Defining Payment Methods

3/31/2019 • 2 minutes to read

Payment methods define the way you prefer for customers to pay you, and how you like to pay your vendors. The method can vary for each customer or vendor. Examples of typical payment methods are **bank, cash, check**, or **account**.

You can assign a payment method to customers and vendors so that the same method is always used on the sales and purchase documents you create for them. If needed, you can change the method on the sales or purchase document. For example, if you want to pay a particular purchase invoice in cash rather than by check. This does not change the default payment method assigned to the vendor.

The same payment methods are used for sales and purchase documents. For example, a *cash* payment method is used both when you make payments and when you receive them. Business Central knows that when you are creating a sales invoice you expect to receive payment, and the opposite for purchase invoices.

Credit memos for returns, however, are exceptions because money is flowing in the opposite directions, from you to your customer and from your vendor to you. Therefore, a default payment method is not assigned to credit memos. There is, however, a workaround if you have specified terms of payment for the customer or vendor. Though the **Calc. Pmt. Disc. on Cr. Memos** field is not intended for this, if you choose the check box on the **Payment Terms** page a default payment method will be added when you create a credit memo.

To set up a payment method

Business Central provides a few payment methods that businesses often use. You can, however, add as many as you need.

1. Choose the  icon, enter **Payment Methods**, and then choose the related link.
2. Fill in the fields as necessary. Hover over a field to read a short description.

To assign a payment method to a customer or vendor

1. Choose the  icon, enter **Customer** or **Vendor**, and then choose the related link.
2. In the **Payment Method** field, choose the method to use by default for the customer or vendor.

Setting Up Posting Groups

3/31/2019 • 5 minutes to read

Posting groups map entities like customers, vendors, items, resources, and sales and purchase documents to general ledger accounts. They save time and help avoid mistakes when you post transactions. The transaction values go to the accounts specified in the posting group for that particular entity. The only requirement is that you have a chart of accounts. For more information, see [Set Up the Chart of Accounts](#).

Posting groups are covered under three umbrellas:

- General - Define who you sell to and buy from, and what you sell and what you buy. You can also combine groups to specify things like the income statement accounts to post to, or use groups to filter reports.
- Specific - Use sales documents, for example, instead of posting directly to the general ledger. When you create entries in the customer ledger, corresponding entries are made in the general ledger.
- Tax - Define the tax percentages and calculation types that apply to who you sell to and buy from, and what you sell and what you buy.

The following tables describe the posting groups under each umbrella.

GENERAL POSTING GROUPS	DESCRIPTION
General Business Posting Groups	Assign this group to customers and vendors to specify who you sell to, and who you buy from. Set these up on the Gen. Business Posting Groups page. When you do, think about how many groups you'll need to break down sales and purchases. For example, group customers and vendors by geographical area, or by the type of business.
General Product Posting Groups	Assign this group to items and resources to specify what you sell, and what you buy. Set these up on the Gen. Product Posting Groups page. When you do, consider the number of groups you'll need to break down sales by product (items and resources) and purchases by items. For example, divide these groups by raw materials, retail, resources, capacity, and so on.
General Posting Setups	Combine business and product posting groups and choose the accounts to post to. For each combination of business and product posting groups, you can assign a set of general ledger accounts. For example, this means you can post the sale of the same item to different sales accounts in the general ledger because customers are assigned to different business posting groups. Set these up on the General Posting Setup page.
SPECIFIC POSTING GROUPS	DESCRIPTION

SPECIFIC POSTING GROUPS	DESCRIPTION
Customer Posting Groups	Define the accounts to use when you post accounts receivable transactions. If you use inventory with receivables, the general business posting group assigned to your customer, and the general product posting group assigned to the inventory item determine the accounts that the sales order lines post to. See "General Business Posting Groups" and "General Product Posting Groups" under General Posting Groups above. Set these up on the Customer Posting Groups page.
Vendor Posting Groups	Define where to post transactions for payables accounts, service charge accounts, and payment discount accounts. This is similar to customer posting groups. Set these up on the Vendor Posting Groups page.
Inventory Posting Groups	Define inventory posting groups that you then assign to the relevant item accounts on the Inventory Posting Setup page. This way, when you post entries concerning an item, the system will post to the G/L account that is set up for the combination of inventory posting group and location that is linked to the item. Inventory posting groups also provide a good way to organize your inventory, so you can separate items by their posting group when you generate reports. Set these up on the Inventory Posting Groups page.
Bank Account Posting Groups	Define accounts for bank accounts. For example, this can simplify the processes of tracing transactions and reconciling bank accounts. Set these up on the Bank Account Posting Groups page.
Fixed Assets Posting Groups	Define accounts for different types of expenses and costs, such as acquisition costs, accumulated depreciation amounts, acquisition costs on disposal, accumulated depreciation on disposal, gains on disposal, losses on disposal, maintenance expenses, and depreciation expenses. Set these up on the FA Posting Groups page.
TAX POSTING GROUP	DESCRIPTION
Tax Business Posting Groups	Determine how to calculate and post sales tax for customers and vendors. Set these up on the Tax Business Posting Groups page. When you do, think about how many groups you need. For example, this can depend on factors like local legislation, and whether you trade both domestically and internationally.
Tax Product Posting Groups	Indicate the tax calculations needed for the types of items or resources you buy or sell.
Tax Posting Setup	Combine tax business posting groups and tax product posting groups. When you fill in a general journal line, purchase line, or sales line, we'll look at the combination to identify the accounts to use.

Example of linking posting groups

Here's a scenario.

These posting groups are chosen on the customer card:

- General business posting group
- Customer posting group

These posting groups are chosen on the item card:

- General product posting group
- Inventory posting group

When you create a sales document, the sales header uses the customer card information, and the sales lines use the item card information.

- The revenue posting (income statement) is determined by the combination of the general business posting group and the general product posting group.
- The accounts receivable posting (balance sheet) is determined by the customer posting group.
- The inventory posting (balance sheet) is determined by the inventory posting group.
- The cost of goods sold posting (income statement) is determined by the combination of general business posting group and general product posting group.

Your setup determines when posting happens. For example, the timing is affected by when you do periodic activities, such as posting inventory cost or adjusting cost item entries.

Copying posting setup lines

The more product and business posting groups you have, the more lines you see in the General Posting Setup page. This can mean a lot of data entry to set up the general posting setup for the company. While there may be many different combinations of business and product posting groups, different combinations may still post to the same general ledger accounts. To limit the amount of manual entry, copy the general ledger accounts from an existing line on the **General Posting Setup** page.

Prepare Financial Reporting with Account Schedules and Account Categories

3/31/2019 • 9 minutes to read

Use account schedules to get insight into the financial data stored in your chart of accounts. Account schedules analyze figures in G/L accounts, and compare general ledger entries with general ledger budget entries. The results display in charts on your Role Center, such as the Cash Flow chart, and in reports, such as the Income Statement and the Balance Sheet reports.

You access these two reports, for example, with the **Financials Statements** action on the Business Manager and Accountant Role Centers.

Business Central provides a few sample account schedules that you can use right away, or you can set up your own rows and columns to specify the figures to compare. For example, you can create account schedules to calculate profit margins on dimensions like departments or customer groups. You can create as many customized financial statements as you want.

Setting up account schedules requires an understanding of the financial data in the chart of accounts. For example, you can view general ledger entries as percentages of budget entries. This requires that budgets are created. For more information, see [Create G/L Budgets](#).

Account Schedules

Account schedules are used to arrange accounts listed in the chart of accounts in ways suited for presentation of information about those accounts. You can set up various layouts to define the information that you want to extract from the chart of accounts. One of the main functions of account schedules is to provide a place for calculations that cannot be made directly in the chart of accounts, such as creating subtotals for groups of accounts, which can be included in new totals and can then be used in other totals. For example, users can create account schedules to calculate profit margins on such dimensions as departments or customer groups. In addition, general ledger entries and general ledger budget entries can be filtered, for example, by net change or debit amount.

You can also compare two or more account schedules and column layouts by using formulas. This kind of comparison provides the ability to:

- Create customized financial reports.
- Create as many account schedules as needed, each with a unique name.
- Set up various report layouts and print the reports with the current figures.

Account Categories

You can use account categories to change the layout of your financial statements. After you set up your account categories on the **G/L Account Categories** page, and you choose the **Generate Account Schedules** action, the underlying account schedules for the core financial reports are updated. The next time you run one of these reports, such as the Balance Statement report, new totals and subentries are added, based on your changes. For more information, see [Account Categories](#).

To create a new account schedule

You use account schedules to analyze figures in general ledger accounts or to compare general ledger entries with general ledger budget entries. For example, you can view the general ledger entries as percentages of the budget

entries.

The account schedules in the standard version of Business Central are the basis of the standard financial reports, which may not suit the needs of your business. To quickly create your own financial reports, you can start by copying an existing account schedule. See step 3 below.

The **Acc. Schedule Overview** page is where you preview the financial report that the account schedule defines. In the following, it is important to understand that what you set up as account schedule rows and columns can only be seen and validated on the **Acc. Schedule Overview** page, which you open from an account schedule by choosing the **Overview** action. The **Account Schedule** page itself is only a setup area.

1. Choose the  icon, enter **Account Schedules**, and then choose the related link.
2. On the **Account Schedules** page, choose the **New** action to create a new account schedule name.
3. Alternatively, choose the **Copy Account Schedule** action, fill in the two fields, and then choose the **OK** button.
4. Fill in the fields as necessary. In the **Default Column Layout** field select an existing layout. You can edit it later if you want.

You use column layouts to define columns for different parameters by which the financial data on the rows are shown. For example, you can design a column layout to compare net change and balance for the same period this year and last year, with four columns. For more information, see [To edit a column layout](#).

5. Choose the **Edit Account Schedule** action.
6. Create a row for each financial element that you want to appear in the report, such as one row for current assets and another row for fixed assets. For inspiration, see existing account schedules in the CRONUS demonstration company.
7. Choose the **Overview** action to see the resulting financial report.
8. On the **Acc. Schedule Overview** page, in the **Column Layout Name** field, select another column layout to see the financial data by other parameters.
9. Choose the **OK** button.

You have now defined the basis of the account schedule, the rows of financial data to be displayed, and an existing layout of columns to show the data on the rows per different parameters. If the default column layout that you selected in step 4 does not suit your purpose, follow the next procedure.

To edit a column layout

You use column layouts to define what columns should be included in the resulting report. For example, you can design a layout to compare net change and balance for the same period this year and last year.

NOTE

A printed/previewed/saved version of an account schedule can display a maximum of five columns. If the account schedule is only meant for analysis on the **Acc. Schedule Overview** page, you can create as many columns as you want.

1. On the **Account Schedules** page, select the relevant account schedule, and then choose the **Edit Column Layout Setup** action.
2. On the **Column Layouts** page, create a row for each column by which financial data is shown in the financial report. Hover over a field to read a short description.
3. Choose the **OK** button.
4. Open the **Acc. Schedule Overview** page from time to time to verify that the new column layout works as

intended.

NOTE

The columns that you define on each row represent columns 3 and up on the **Acc. Schedule Overview** page. The first two columns, **Row No.** and **Description**, are fixed.

To create a column that calculates percentages

Sometimes you may want to include a column in an account schedule to calculate percentages of a total. For example, if you have a number of rows that break down sales by dimension, you may want a column to indicate the percentage of total sales that each row represents.

1. Choose the  icon, enter **Account Schedules**, and then choose the related link.
2. On the **Account Schedule Names** page, select an account schedule.
3. Choose the **Edit Account Schedule** action to set up an account schedule row to calculate the total on which the percentages will be based.
4. Insert a line immediately above the first row for which you want to display a percentage.
5. Fill in the fields on the line as follows: In the **Totaling Type** field, enter **Set Base for Percent**. In the **Totaling** field, enter a formula for the total that the percentage will be based on. For example, if row 11 contains the total sales, enter **11**.
6. Choose the **Edit Column Layout Setup** action to set up a column.
7. Fill in the fields on the line as follows: In the **Column Type** field, select **Formula**. In the **Formula** field, enter a formula for the amount that you want to calculate a percentage for, followed by %. For example, if column number N contains the net change, enter **N%**.
8. Repeat steps 4 through 7 for each group of rows that you want to break down by percentage.

To set up account schedules with overviews

You can use an account schedule to create a statement comparing general ledger figures and general ledger budget figures.

1. Choose the  icon, enter **Account Schedules**, and then choose the related link.
2. On the **Account Schedule Names** page, select an account schedule.
3. Choose the **Edit Account Schedule** action
4. On the **Account Schedule** page, in the **Name** field, select the default account schedule name.
5. Choose the **Insert Accounts** action.
6. Select the accounts that you want to include in your statement, and then choose the **OK** button.

The accounts are now inserted into your account schedule. If you want you can also change the column layout.

7. Choose the **Overview** action.
8. On the **Acc. Schedule Overview** page, on the **Dimension Filters** FastTab, set the budget filter to the desired filter name.
9. Choose the **OK** button.

Now you can copy and paste your budget statement into a spreadsheet.

Comparing Accounting Periods using Period Formulas

Your account schedule can compare the results of different accounting periods, such as this month versus same month last year. To do that, you add a column with the **Comparison Period Formula** field, and then set that field to a period formula.

An accounting period does not have to match the calendar, but each fiscal year must have the same number of accounting periods, even though each period can be different in length.

Business Central uses the period formula to calculate the amount from the comparison period in relation to the period represented by the date filter on the report request. The comparison period is based on the period of the start date of the date filter. The abbreviations for period specifications are:

ABBREVIATION	DESCRIPTION
P	Period
LP	Last period of a fiscal year, half-year or quarter.
CP	Current period of a fiscal year, half-year or quarter.
FY	Fiscal year. For example, FY[1..3] denotes first quarter of the current fiscal year

Examples of formulas:

FORMULA	DESCRIPTION
<Blank>	Current period
-1P	Previous period
-1FY[1..LP]	Entire previous fiscal year
-1FY	Current period in previous fiscal year
-1FY[1..3]	First quarter of previous fiscal year
-1FY[1..CP]	From the beginning of previous fiscal year to current period in previous fiscal year, inclusive
-1FY[CP..LP]	From current period in previous fiscal year to last period of previous fiscal year, inclusive

If you want to calculate by regular time periods, you must enter a formula in the **Comparison Date Formula** field instead.

NOTE

It is not always transparent which periods you are comparing because you can set a date filter on a report that spans different dates than the accounting periods that are reflected in the data in the chart of accounts. For example, you create an account schedule where you want to compare this period with the same period last year, so you set the **Comparison Date Period Filter** field to *-1FY*. Then, you run the report on February 28th and set the date filter to January and February. As a result, the account schedule compares January and February this year to January last year, which is the only completed accounting period of the two for last year.

Work with Payment Tolerances and Payment Discount Tolerances

6/13/2019 • 13 minutes to read

You can set up a payment tolerance to close an invoice when the payment does not fully cover the amount on the invoice. You can set up a payment discount tolerance to grant a payment discount after the payment discount date has passed.

You can use payment tolerances so that every outstanding amount has a set maximum allowed payment tolerance. If the payment tolerance is met, then the payment amount is analyzed. If the payment amount is an underpayment, then the outstanding amount is fully closed by the underpayment. A detailed ledger entry is posted to the payment entry so that no remaining amount is left on the applied invoice entry. If the payment amount is an overpayment, then a new detailed ledger entry is posted to the payment entry so that no remaining amount is left on the payment entry.

You can use payment discount tolerances so that if you accept a payment discount after the payment discount date, then it is always posted to either the payment discount account or a payment tolerance account.

Applying Payment Tolerance to Multiple Documents

A single document has the same payment tolerance whether it is applied on its own or with other documents. Acceptance of a late payment discount when you are applying payment tolerance to multiple documents automatically occurs for each document where the following rule is true:

payment discount date < payment date on the selected entry <= payment tolerance date

This rule also applies to determine whether to display warnings when you apply payment tolerance to multiple documents. The payment discount tolerance warning is displayed for each entry that meets the date criteria. For more information, see [Example 2 - Tolerance Calculations for Multiple Documents](#).

You can choose to display a warning that is based on different tolerance situations.

- The first warning is for the payment discount tolerance. You are informed that you can accept a late payment discount. You can then choose whether to accept tolerance on the discount date.
- The second warning is for the payment tolerance. You are informed that all entries can be closed because the difference is in the sum of the maximum payment tolerance for the applied entries. You can then choose whether to accept tolerance on the payment amount.

For more information, see [To enable or disable payment tolerance warning](#).

To set up tolerances

Tolerance on days and amounts allows you to close an invoice even though the payment does not fully cover the amount on the invoice, whether this is because the due date for the payment discount has been exceeded, goods have been deducted or because of a minor error. This also applies to refunds and credit memos.

To set up tolerance you have to set up various tolerance accounts, specify both payment discount tolerance and payment tolerance posting methods and then run the **Change Payment Tolerance** batch job.

1. Choose the  icon, enter **General Posting Setup**, and then choose the related link.
2. On the **General Posting Setup** page, set up a debit and a credit sales payment tolerance account and a debit and a credit purchase payment tolerance account.

3. Choose the  icon, enter **Customer Posting Groups**, and then choose the related link.
4. On the **Customer Posting Groups** page, set up a debit and a credit payment tolerance account. For more information, see [Setting Up Posting Groups](#).
5. Choose the  icon, enter **Vendor Posting Setup**, and then choose the related link.
6. On the **Vendor Posting Groups** page, set up a debit and a credit payment tolerance account.
7. Choose the  icon, enter **General Ledger Setup**, and then choose the related link.
8. Open the **General Ledger Setup** page.
9. On the **Application** FastTab, fill in the **Pmt. Disc. Tolerance Posting**, **Payment Discount Grace Period** and **Payment Tolerance Posting** fields.
10. Choose the **Change Payment Tolerance** action.
11. On the **Change Payment Tolerance** page, fill in the **Payment Tolerance %** and **Max Payment Tolerance Amount** fields, and then choose the **OK** button.

IMPORTANT

You have now set up tolerance for local currency only. If you want Business Central to handle tolerance on payments, credit memos, and refunds in a foreign currency, you must run the **Change Payment Tolerance** batch job with a value in the **Currency Code** field.

NOTE

If you want to get a payment tolerance warning every time that you post an application in the tolerance, you must activate the payment tolerance warning. For more information, see [To enable or disable payment tolerance warning](#) section.

To deactivate tolerance for a customer or vendor, you must block tolerances on the relevant customer or vendor card. For more information, see [To block payment tolerance for customers](#).

When you set up tolerance, Business Central also checks if there are any open entries and calculates the tolerance for these entries.

To enable or disable payment tolerance warnings

The payment tolerance warning appears when you post an application that has a balance in the allowed tolerance. You can then choose how you want to post and document the balance.

1. Choose the  icon, enter **General Ledger Setup**, and then choose the related link.
2. On the **General Ledger Setup** page, on the **Application** FastTab, select the **Payment Tolerance Warning** check box to activate the warning. To deactivate the warning, clear the check box.

NOTE

The default option for the **Payment Tolerance Warning** page is **Leave the Balance as Remaining Amount**. The default option for the **Pmt. Disc. Tolerance Warning** page the is **Do Not Accept the Late Payment Discount**.

To block payment tolerance for customers

The default setting for payment tolerance is allowed. To disallow a certain customer or vendor payment tolerance you need to block tolerance on the respective customer or vendor card. The following describes how to do it for a customer. The steps are similar for a vendor.

1. Choose the  icon, enter **Customer** or **Vendor**, and then choose the related link.
2. On the **Payments** FastTab, select the **Block Payment Tolerance** check box.

NOTE

If the customer or vendor has open entries, you must first remove payment tolerance from entries that are currently open.

Example 1 - Tolerance Calculations for a Single Document

The following are some example scenarios showing the expected tolerance calculations and postings occurring in different situations.

The **G/L Setup** page contains the following setup:

- Payment Discount Grace Period: 5D
- Max Payment Tolerance: 5

Scenarios with alternative A or B represent the following:

- **A** In this case, the payment discount tolerance warning has been turned off OR the user has the warning on and has selected to allow the late payment discount (Post the Balance as Payment Tolerance).
- **B** In this case, the user has the warning on and has selected not to allow the late payment discount (Leave the Balance as Remaining Amount).

Payment Range Diagrams

In relation to the scenario above, the diagrams of payment ranges are as follows:

(1) Payment Date <=01/15/03 (Scenarios 1-3)

Remaining Amount per

Normal Application Rules

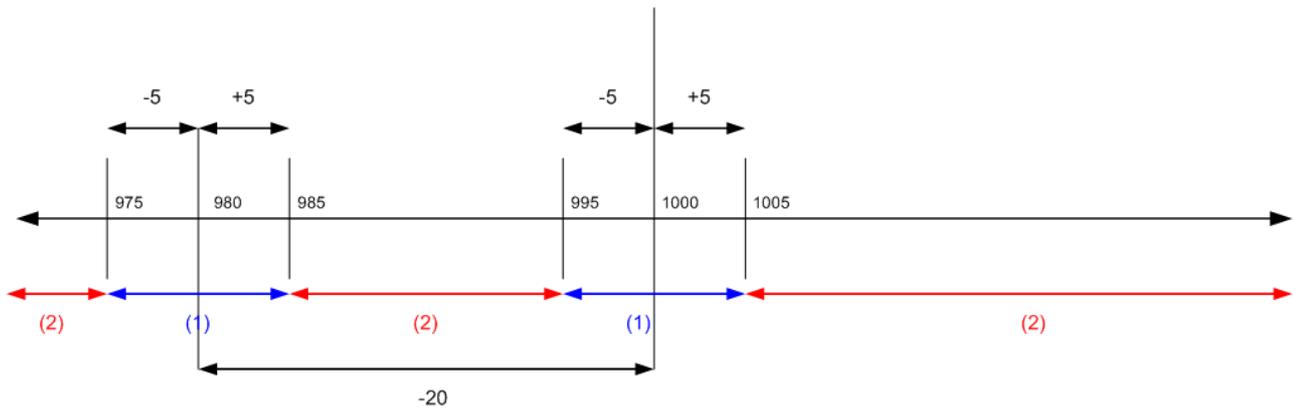

(1) If payment falls in these ranges, all application entries can be closed with or without tolerance.

(2) If payment falls in these ranges, all application entries cannot be closed even with tolerance.

(2) Payment Date is between 01/16/03 and 01/20/03 (Scenarios 4-9)

Remaining Amount per

Normal Application Rules

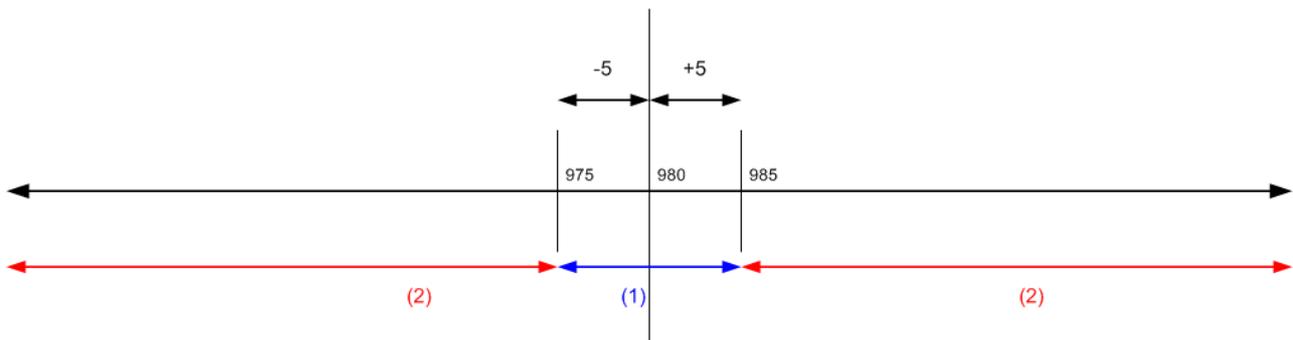

(1) If payment falls in these ranges, all application entries can be closed with or without tolerance.

(2) If payment falls in these ranges, all application entries cannot be closed even with tolerance.

(3) Payment Date is after 01/20/03 (Scenarios 10-15)

Remaining Amount per

Normal Application Rules

(1) If payment falls in these ranges, all application entries can be closed with or without tolerance.

(2) If payment falls in these ranges, all application entries cannot be closed even with tolerance.

Example 2 - Tolerance Calculations for Multiple Documents

The following are some example scenarios showing the expected tolerance calculations and postings occurring in different situations. The examples are limited to being only those scenarios that result in all entries in the application being closed.

The **G/L Setup** page contains the following setup:

- Payment Discount Grace Period 5D
- Max Payment Tolerance 5

Scenarios with alternative A, B, C, or D represent the following:

- **A** In this case the payment discount tolerance warning has been turned off, OR the user has the warning on and has selected to allow the late payment discount (Post as Tolerance) in any invoice.
- **B** In this case, the user has the warning on and has selected not to allow the late payment discount on any invoice.
- **C** - In this case, the user has the warning on and has selected to allow the late payment discount on the first invoice but not the second.
- **D** - In this case, the user has the warning on and has selected not to allow the late payment discount on the first invoice but allowed it on the second.

Payment Range Diagrams

In relation to the scenario above, the diagrams of payment ranges are as follows:

(1) Payment Date <=01/15/03 (Scenarios 1-3)

Remaining Amount per

Normal Application Rules

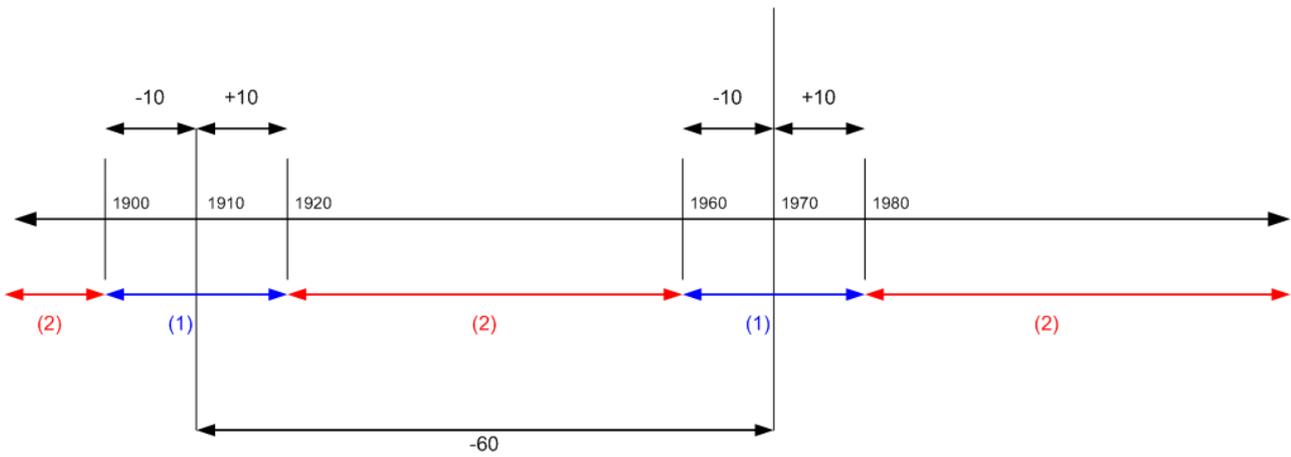

(1) If payment falls in these ranges, all application entries can be closed with or without tolerance.

(2) If payment falls in these ranges, all application entries cannot be closed even with tolerance.

(2) Payment Date is between 01/16/03 and 01/17/03 (Scenarios 4-9)

Remaining Amount per

Normal Application Rules

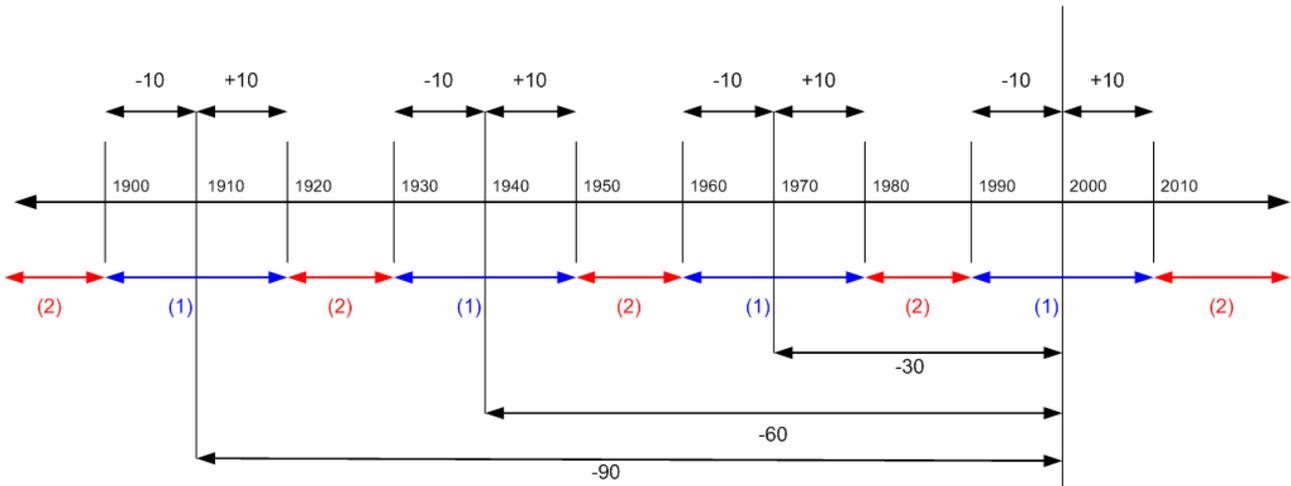

(1) If payment falls in these ranges, all application entries can be closed with or without tolerance.

(2) If payment falls in these ranges, all application entries cannot be closed even with tolerance.

(3) Payment Date is between 01/18/03 and 01/20/03 (Scenarios 10-21)

Remaining Amount per

Normal Application Rules

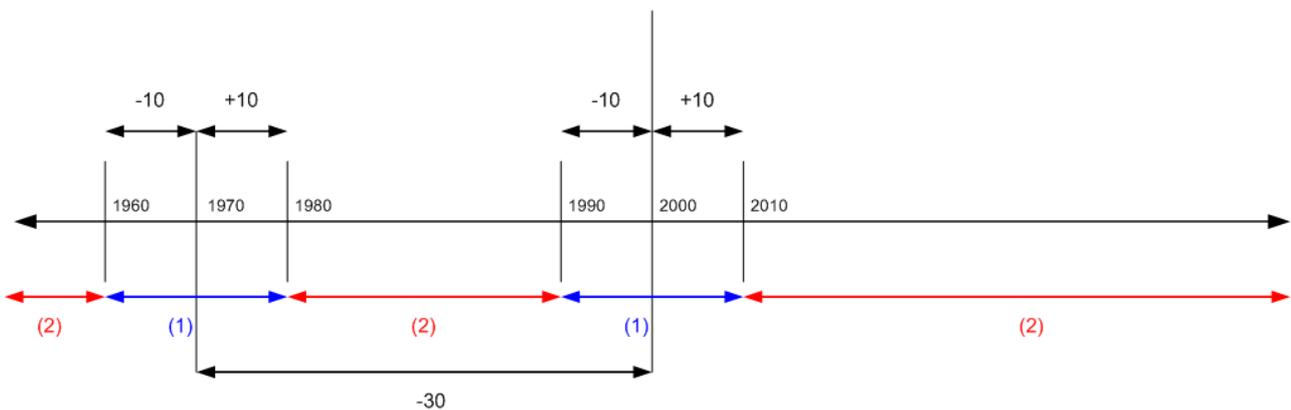

(1) If payment falls in these ranges, all application entries can be closed with or without tolerance.

(2) If payment falls in these ranges, all application entries cannot be closed even with tolerance.

(4) Payment Date is between 01/21/03 and 01/22/03 (Scenarios 22-27)

Remaining Amount per

Normal Application Rules

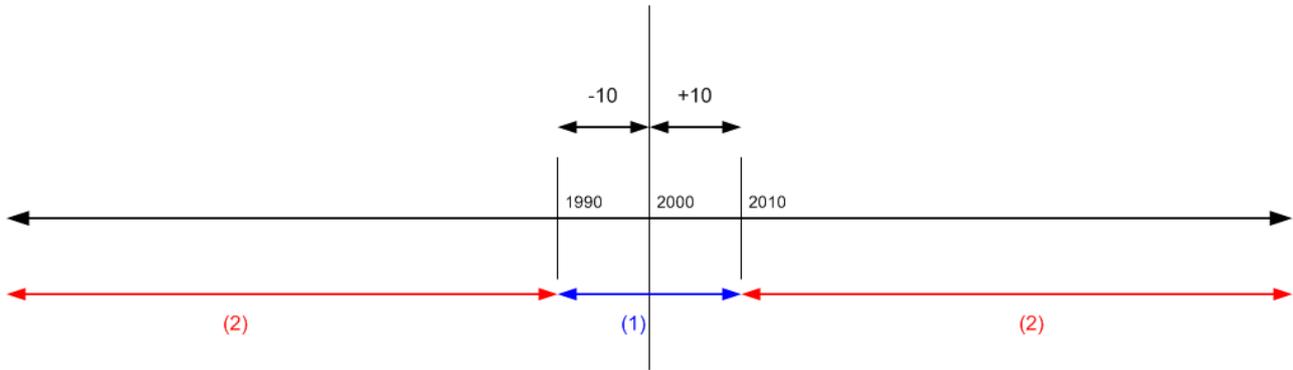

(1) If payment falls in these ranges, all application entries can be closed with or without tolerance.

(2) If payment falls in these ranges, all application entries cannot be closed even with tolerance.

(5) Payment Date is after 01/22/03 (Scenarios 28-30)

Remaining Amount per

Normal Application Rules

(1) If payment falls in these ranges, all application entries can be closed with or without tolerance.

(2) If payment falls in these ranges, all application entries cannot be closed even with tolerance.

Open a New Fiscal Year and Create Accounting Periods

2 minutes to read

Before you can post in a fiscal year, you must open the fiscal year and define its accounting periods.

For many companies, the fiscal year does not coincide with the calendar year. Fiscal periods can be measured in other units of time, such as months or quarters. You can use the **Create Fiscal Year** page to set up the accounting periods that suit your business needs. However,

To open a new fiscal year

1. Choose the  icon, enter **Accounting Periods**, and then choose the related link.
2. On the **Accounting Periods** page, choose the **Create Year** action.
3. Fill in the fields to define the structure of the fiscal year.

The fiscal year is typically 12 periods of one month each, but you can also divide it in other ways.

4. Choose the **OK** button.

The accounting periods are added to the page with the **Starting Date** and **Name** fields filled in. The default names are based on the name of the month from the starting date, but you can change the name. After the last period in the fiscal year, an additional accounting period is inserted with the **New Fiscal Year** check box selected.

Setting Up Calculations and Posting Methods for Value-Added Tax

3/31/2019 • 18 minutes to read

Consumers and businesses pay value-added tax (VAT) when they purchase goods or services. The amount of VAT to pay can vary, depending on several factors. In Business Central, you set up VAT to specify the rates to use to calculate tax amounts based on the following:

- Who you sell to
- Who you buy from
- What you sell
- What you buy

You can set up VAT calculations manually, but that can be tricky and time consuming. To make it easy, we provide an assisted setup guide named **VAT Setup** that will help you with the steps. We recommend that you use the assisted setup guide to set up VAT.

NOTE

You can use the guide only if you have created a My Company, and have not posted transactions that include VAT. Otherwise, it would be very easy to use different VAT rates by mistake, and make VAT-related reports inaccurate.

If you want to set up VAT calculations yourself, or just want to learn about each step, this topic contains descriptions of each step.

To use the VAT Setup assisted setup guide to set up VAT (recommended)

We recommend that you use the VAT Setup assisted setup guide to set up VAT in Business Central.

To start the assisted setup guide, follow these steps:

1. Choose the  icon, enter **Assisted Setup**.
2. Choose **Set up VAT**.

To set up VAT registration numbers for your country or region

To help ensure that people enter valid VAT registration numbers, you can define formats for the VAT registration numbers that are used in the countries or regions in which you do business. Business Central will display an error message when someone makes a mistake or uses a format that is incorrect for the country or region.

To setup VAT registration numbers, follow these steps:

1. Choose the  icon, enter **Countries/Regions**.
2. Choose the country or region, and then choose the **VAT Reg. No. Formats** action.
3. In the **Formats** field, define the format by entering one or more of the following characters:
 - # Requires a single-digit number.
 - @ Requires a letter. This is not case-sensitive.

- ? Allows any character.

TIP

You can use other characters as long as they are always present in the country or region format. For example, if you need to include a period or a hyphen between sets of numbers, you can define the format as ##.####.### or @@-###-###.

To set up VAT business posting groups

VAT business posting groups should represent the markets in which you do business with customers and vendors, and define how to calculate and post VAT in each market. Examples of VAT business posting groups are **Domestic** and **European Union (EU)**.

Use codes that are easy to remember and describe the business posting group, such as **EU**, **Non-EU**, or **Domestic**. The code must be unique. You can set up as many codes as you need, but you cannot have the same code more than once in a table.

To set up a VAT business posting group, follow these steps:

1. Choose the  icon, enter **VAT Business Posting Group**, and then choose the related link.
2. Fill in the fields as necessary.

You set up default VAT business posting groups by linking them to general business posting groups. Business Central automatically assigns the VAT business posting group when you assign the business posting group to a customer, vendor, or general ledger account.

To set up VAT product posting groups

VAT product posting groups represent the items and resources you buy or sell, and determine how to calculate and post VAT according to the type of item or resource that is being bought or sold.

It is a good idea to use codes that are easy to remember and describe the rate, such as **NO-VAT** or **Zero**, **VAT10** or **Reduced** for 10% VAT, and **VAT25** or **Standard** for 25%.

To set up a VAT business posting group, follow these steps:

1. Choose the  icon, enter **VAT Product Posting Groups**, and then choose the related link.
2. Fill in the fields as necessary.

To combine VAT posting groups in VAT posting setups

Business Central calculates VAT amounts on sales and purchases based on VAT posting setups, which are combinations of VAT business and product posting groups. For each combination, you can specify the VAT percent, VAT calculation type, and general ledger accounts for posting VAT for sales, purchases, and reverse charges. You can also specify whether to recalculate VAT when a payment discount is applied or received.

Set up as many combinations as you need. If you want to group VAT posting setup combinations with similar attributes, you can define a **VAT Identifier** for each group, and assign the identifier to the group members.

To combine VAT posting setups, follow these steps:

1. Choose the  icon, enter **VAT Posting Setup**, and then choose the related link.
2. Fill in the fields as necessary.

To assign VAT posting groups by default to multiple entities

If you want to apply the same VAT posting groups to multiple entities, you can set up Business Central to do so by default. There are a couple of ways to do this:

- You can assign VAT business posting groups to general business posting groups, or customer or vendor templates
- You can assign VAT product posting groups on general product posting groups

The VAT business or product posting group is assigned when you choose a business or product posting group for a customer, vendor, item, or resource.

To assign VAT posting groups to individual accounts, customers, vendors, items, and resources

The following sections describe how to assign VAT posting groups to individual entities.

To assign VAT posting groups to individual general ledger accounts

1. Choose the  icon, enter **Chart of Accounts**, and then choose the related link.
2. Open the **G/L Account** card for the account.
3. On the **Posting** FastTab, in the **Gen. Posting Type** field, choose either **Sale** or **Purchase**.
4. Choose the VAT posting groups to use for the sales or purchase account.

To assign VAT business posting groups to customers and vendors

1. Choose the  icon, enter **Customer** or **Vendor**, and then choose the related link.
2. On the **Customer** or **Vendor** card, expand the **Invoicing** FastTab.
3. Choose the VAT business posting group.

To assign VAT product posting groups to individual items and resources

1. Choose the  icon, enter **Item** or **Resource**, and then choose the related link.
2. Do one of the following:
 - On the **Item** card, expand the **Price & Posting** FastTab, and then choose **Show more** to display the **VAT Product Posting Group** field.
 - On the **Resource** card, expand the **Invoicing** FastTab.
3. Choose the VAT product posting group.

Setting up VAT statement templates and VAT statement names

Tax authorities can, and do, change their requirements for posting VAT. **VAT statement templates** and **VAT statement names** can help you prepare for upcoming changes and make a smooth transition to the new requirements. You can use VAT statement templates to define the fields to include in your VAT statement, which in turn define the calculations, and you can create a new VAT statement template when requirements change. For example, one template might calculate VAT for this year based on the current requirements, and another might calculate VAT based on requirements for next year. Templates are also a way to keep a history of VAT statement formats, for example, so that you can look back to see how you calculated VAT in previous years.

How to define and preview VAT statements

VAT statements let you calculate your VAT settlement amount for a certain period, for example, a quarter. After you define a VAT statement, you can preview it to make sure it meets your needs.

To define a VAT statement, follow these steps:

1. Choose the  icon, enter **VAT Statements**, and then choose the related link.

2. Choose the **Name** field, and then choose **New** on the **VAT Statement Names** page.
3. Fill in the required fields. Hover over a field to read a short description.

TIP

You can filter the information that the statement will include, depending on what you choose in the **Type** field. **Account Totaling** is useful when you want the VAT from a specific account. **VAT Entry Totaling** gets VAT from the accounts assigned to the selections in the **Gen. Posting Type**, **VAT Bus. Posting Group**, and/or the **VAT Prod. Posting Group** fields. **Row Totaling** lets you enter a value or quick filter criteria in the **Row Totaling** field. For more information, see [Searching, filtering, and Sorting Data](#). **Description** is often used to add a note to the statement. For example, you could use it as a heading when you've used row totaling.

To preview the VAT statement, follow these steps:

1. Choose **Preview**.
2. Enter a date filter to limit the statement to a specific period. For more information about how to customize the page to show the date filter, see [Searching, filtering, and Sorting Data](#).
3. You can select various options to specify the type of VAT entries to include in the statement.
4. On the lines where the **Type** field contains **VAT Entry Totaling** you can see a list of VAT entries by choosing the amount in the **Column Amount** field.

To set up clauses to explain the use of non-standard VAT rates

You set up a VAT clause to describe information about the type of VAT that is being applied. The information may be required by government regulation. After you set up a VAT clause, and associate it with a VAT posting setup, the VAT clause is displayed on printed sales documents that use the VAT posting setup group.

If needed, you can also specify how to translate VAT clauses to other languages. Then, when you create and print a sales document that contains a VAT identifier, the document will include the translated VAT clause. The language code specified on the Customer card determines the language.

You can modify or delete a VAT clause, and your modifications will be reflected in a generated report. However, Business Central does not keep a history of the change. On the report, the VAT clause descriptions are printed and displayed for all lines in the report alongside the VAT amount and the VAT base amount. If a VAT clause has not been defined for any lines on the sales document, then the whole section is omitted when the report is printed.

To set up VAT clauses

1. Choose the  icon, enter **VAT Clauses**, and then choose the related link.
2. On the **VAT Clauses** page, create a new line.
3. In the **Code** field, enter an identifier for the clause. You use this code to assign the clause to VAT posting groups.
4. In the **Description** field, enter the text that you want to display on documents that can include VAT. In the **Description 2** field, enter additional text, if needed. The text displays on new lines.
5. Optional: To assign the VAT clause to a VAT posting setup right away, choose **Setup**, and then choosing the clause. If you want to wait, you can assign the clause later on the VAT Posting Setup page.
6. Optional: To specify how to translate the VAT clause, choose the **Translations** action.

To assign a VAT clause to a VAT posting setup

1. Choose the  icon, enter **VAT Posting Setup**, and then choose the related link.
2. In the **VAT Clause** column, choose the clause to use for each VAT posting setup it applies to.

To specify translations for VAT clauses

1. Choose the  icon, enter **VAT Clauses**, and then choose the related link.

2. Choose the **Translations** action.
3. In the **Language Code** field, choose the language you are translating to.
4. In the **Description** and **Description 2** fields, enter the translations of the descriptions. This text displays in the translated VAT report documents.

To create a VAT posting setup to handle Import VAT

You use the Import VAT feature when you need to post a document where the entire amount is VAT. You will use this if you receive an invoice from the tax authorities for VAT for imported goods.

To set up codes for import VAT, follow these steps:

1. Choose the  icon, enter **VAT Product Posting Groups**, and then choose the related link.
2. On the VAT Product Posting Groups page, set up a new VAT product posting group for import VAT.
3. Choose the  icon, enter **VAT Posting Setup**, and then choose the related link.
4. On the VAT Posting Setup page, create a new line, or use an existing VAT business posting groups in combination with the new VAT product posting group for import VAT.
5. In the **VAT Calculation Type** field, choose **Full VAT**.
6. In the **Purchase VAT Account** field, enter the general ledger account to use for posting import VAT. All other accounts are optional.

To verify VAT registration numbers

It is important that the VAT registration numbers you have for customers, vendors, and contacts are valid. For example, companies sometimes change their tax liability status, and in some countries tax authorities might ask you to provide reports, such as the EC Sales List report, that list the VAT registration numbers you use when you do business.

The European Commission provides the VIES VAT Number Validation service on its website, which is public and free. Business Central can save you a step and let you use the VIES service to validate and track VAT numbers for customers, vendors, and contacts straight from the customer, vendor, and contact cards. The service in Business Central is named **EU VAT Reg. No. Validation Service**. The service is available on the **Service Connections** page, and you can start using it right away. The service connection is free, and signup is not required.

NOTE

To enable the EU VAT Reg. No. Validation Service, you must have administrator permissions.

When you use our service connection, we record a history of VAT numbers and verifications for each customer, vendor, or contact, in the **VAT Registration Log**, so you can easily track them. The log is specific to each customer. For example, the log is useful for proving that you have verified that the current VAT number is correct. When you verify a VAT number, the **Request Identifier** column in the log will reflect that you have taken action.

You can view the VAT Registration log on the Customer, Vendor, or Contact cards, on the **Invoicing** FastTab, by choosing the lookup button in the **VAT Registration No.** field.

Our service can also save you time when you create a customer or vendor. If you know the customer's VAT number, you can enter it in the **VAT Registration No.** field on the Customer or Vendor cards, and we will fill out the customer name for you. Some countries also provide company addresses in a structured format. In those countries, we fill in the address too.

There are a couple of things to note about the VIES VAT Number Validation service:

- The service uses the http protocol, which means that data transferred through the service is not encrypted.

- You may experience downtime for this service for which Microsoft is not responsible. The service is part of a broad EU network of national VAT registers.

Using Reverse Charge VAT for Trade between EU Countries or Regions

Some companies must use reverse charge VAT when trading with other companies. For example this rule applies to purchases from EU countries/regions and sales to EU countries/regions.

NOTE

This rule applies when trading with companies that are registered as VAT liable in another EU country/region. If you do business directly with consumers in other EU countries/regions, then you should contact your tax authority for applicable VAT rules.

TIP

You can verify that a company is registered as VAT liable in another EU country by using the EU VAT Registration Number Validation service. The service is available for free in Business Central. For more information, see the section titled *Verify VAT registration numbers* in this topic.

Sales to EU countries or regions

VAT is not calculated on sales to VAT-liable companies in other EU countries/regions. You must report the value of these sales to EU countries/regions separately on your VAT statement.

To correctly calculate VAT on sales to EU countries/regions, you should:

- Set up a line for sales with the same information for purchases. If you have already set up lines on the VAT Posting Setup page for purchases from EU countries/regions, then you can also use these lines for sales.
- Assign the VAT business posting groups in the **VAT Bus. Posting Group** field on the **Invoicing** FastTab of the customer card of each EU customer. You should also enter the customer's VAT registration number in the **VAT Registration No.** field on the **Foreign Trade** FastTab.

When you post a sale to a customer in another EU country/region, the VAT amount is calculated, and a VAT entry is created by using the information about the reverse charge VAT and the VAT base, which is the amount that is used to calculate the VAT amount. No entries are posted to the VAT accounts in the general ledger.

Understanding VAT rounding for documents

Amounts in documents that are not yet posted are rounded and displayed to correspond with the final rounding of amounts that are actually posted. VAT is calculated for a complete document, which means that VAT is calculated based on the sum of all lines with the same VAT identifier in the document.

Understanding the VAT Rate Conversion Process

The VAT rate change tool performs VAT rate conversions for master data, journals, and orders in different ways. The selected master data and journals will be updated by the new general product posting group or VAT product post group. If an order has been fully or partially shipped, the shipped items will keep the current general product posting group or VAT product posting group. A new order line will be created for the unshipped items and updated to align current and new VAT or general product posting groups. In addition, item charge assignments, reservations, and item tracking information will be updated accordingly.

There are, however, a few things that the tool does not convert:

- Sales or purchase orders and invoices where shipments have been posted. These documents are posted using the current VAT rate.
- Documents that have posted prepayment invoices. For example, you have made or received prepayments on invoices that have not been completed before you use the VAT rate change tool. In this case, there will be a difference between the VAT that is due and the VAT that has been paid in the prepayments when the invoice is completed. The VAT rate change tool will skip these documents and you will have to manually update them.
- Drop shipments or special orders.
- Sales or purchase orders with warehouse integration if they are partially shipped or received.
- Service contracts.

To prepare VAT rate change conversions

Before you set up the VAT rate change tool, you must make the following preparations.

- If you have transactions that use different rates, then they must be separated into different groups either by creating new general ledger accounts for each rate or by using data filters to group transactions according to rate.
- If you create new general ledger accounts, then you must create new general posting groups.
- To reduce the number of documents that get converted, post as many documents as possible and reduce unposted documents to a minimum.
- Back up data.

To set up the VAT rate change tool

1. Choose the , enter **VAT Rate Change Setup**, and then choose the related link.
2. On the **Master Data, Journals, and Documents** FastTabs, choose a posting group value from the option list for needed fields.

To set up product posting group conversion

1. Choose the , enter **VAT Rate Change Setup**, and then choose the related link.
2. On the **VAT Rate Change Setup** page, on the **Home** tab, in the **Process** group, choose either **VAT Prod. Posting Group Conv.** or **Gen Prod. Posting Group Conv.**
3. In the **From Code** field, enter the current posting group.
4. In the **To Code** field, enter the new posting group.

To perform VAT rate change conversion

You use the VAT rate change tool to manage changes in the standard rate of VAT. You perform VAT and general posting group conversions to change VAT rates and maintain accurate VAT reporting. Depending on your setup, the following changes are made:

- VAT and general posting groups are converted.
- Changes are implemented in general ledger accounts, customers, vendors, open documents, journal lines, and so on.

IMPORTANT

Before you perform VAT rate change conversion, you can test the conversion. To do so, follow the steps below, but make sure to clear the **Perform Conversion** and **VAT Rate Change Tool Completed** check boxes. During test conversion, the **Converted** field in the **VAT Rate Change Log Entry** table is cleared and the **Converted Date** field in the **VAT Rate Change Log Entry** table is blank. After the conversion is complete, choose **VAT Rate Change Log Entries** to view the results of the test conversion. Verify each entry before you perform the conversion. In particular, verify transactions that use an old VAT rate.

1. Choose the , enter **VAT Rate Change**, and then choose the **VAT Rate Change Setup** link.

2. Verify that you have already set up the VAT product posting group conversion or general product posting group conversion.
3. Choose the **Perform Conversion** check box.

IMPORTANT

Clear the **VAT Rate Change Tool Completed** check box. The check box is automatically selected when the VAT rate change conversion is completed.

4. Choose the **Convert** action.
5. After the conversion is complete, on the **Home** tab, in the **Process** group, choose **VAT Rate Change Log Entries** to view the results of the conversion.

IMPORTANT

After the conversion, the **Converted** field in the **VAT Rate Change Log Entry** table is chosen and the **Converted Date** field in the **VAT Rate Change Log Entry** table displays the conversion date.

Set Up Unrealized VAT for Cash-Based Accounting

3/31/2019 • 2 minutes to read

If you are using cash-based accounting methods, you can set up Business Central to handle unrealized VAT.

To use general ledger accounts for unrealized VAT

You can choose to have VAT amounts calculated and posted to a temporary general ledger account when an invoice is posted, and then posted to the correct general ledger account and included in VAT statements when the actual payment of the invoice is posted. Before you can do this, you must complete the VAT posting setup.

To use accounts for unrealized VAT, follow these steps:

1. Choose the  icon, and enter **General Ledger Setup**.
2. On the **General Ledger Setup** page, select the **Unrealized VAT** check box.
3. Choose the **Search for Page or Report** icon , and enter **VAT Posting Setup**.
4. On the **VAT Posting Setup** page, choose the VAT posting group, and then choose the **Edit** action.
5. In the **Unrealized VAT Type** field, choose an option to specify how to allocate payments to the invoice amount (excluding VAT) and the VAT amount itself, and how to transfer VAT amounts from the unrealized VAT account to the realized account. The following table describes the options.

OPTION	DESCRIPTION
Blank	Choose this option if you don't want to use the unrealized VAT feature.
Percentage	Payments covers both VAT and the invoice amount in proportion to the payment's percentage of the remaining invoice amount. The paid VAT amount is transferred from the unrealized VAT account to the realized VAT account.
First	Payments cover VAT first and then invoice amounts. In this case, the amount transferred from the unrealized VAT account to the VAT account will equal the amount of the payment until the total VAT has been paid.
Last	Payments cover the invoice amount first and then VAT. In this case, no amount will be transferred from the unrealized VAT account to the VAT account until the total amount of the invoice, excluding VAT, has been paid.
First (Fully Paid)	Payments will cover VAT first (like the <i>First</i> option), but no amount will be transferred to the VAT account until the full amount of VAT has been paid.
Last (Fully Paid)	Payments will cover invoice amount first (like the <i>Last</i> option), but no amount will be transferred to the VAT account until the full amount of VAT has been paid.

6. In the **Sales VAT Unreal. Account** field, choose the account for unrealized sales VAT.

NOTE

The VAT amount will be posted to this account, and stay there until the customer payment is posted. The amount is then transferred to the account for sales VAT.

7. In the **Purch. VAT Unreal. Account** field, enter the general ledger account for unrealized purchase VAT.

NOTE

The VAT amount will be posted to this account, and stay there until the customer payment is posted. The amount is then transferred to the account for purchase VAT.

Enable Application of Ledger Entries in Different Currencies

3/31/2019 • 2 minutes to read

If you purchase from a vendor in one currency and submit payment in another currency, you can apply the payment to the purchase.

Likewise, if you sell to a customer in one currency and receive payment in another currency, you can apply the payment to the sales invoice.

The following procedure describes how to set this up for vendor ledger entries on the **Purchases & Payables Setup** page. The setup is similar for customer ledger entries on the **Sales & Receivables Setup** page.

To enable application of vendor ledger entries in different currencies

1. Choose the  icon, enter **Purchases & Payables Setup**, and then choose the related link.
2. In the **Appln. between Currencies** field, select one of the following options.

OPTION	DESCRIPTION
None	Application between currencies is not allowed.
EMU	Application between EMU currencies is allowed.
All	Application between all currencies is allowed.

To set up G/L accounts for currency application rounding differences

If you apply entries in different currencies, you must set up the general ledger accounts to which you want to post rounding differences.

NOTE

You must set up the general ledger accounts before you complete the task. For more information, see [Understanding the General Ledger and the Chart of Accounts](#).

1. Choose the  icon, enter **Customer Posting Groups**, and then choose the related link.
2. In the **Debit Curr. Appln. Rndg. Acc.** and **Credit Curr. Appln. Rndg. Acc.** fields, enter the relevant general ledger accounts to post rounding differences.
3. Choose the  icon, enter **Vendor Posting Groups**, and then choose the related link.
4. In the **Debit Curr. Appln. Rndg. Acc.** and **Credit Curr. Appln. Rndg. Acc.** fields, enter the relevant general ledger accounts to post rounding differences.

Set Up an Additional Reporting Currency

3/31/2019 • 8 minutes to read

As companies operate in increasingly more countries/regions, it becomes more important that they are able to review and report financial data in more than one currency.

Your general ledger is set up to use your local currency (LCY), but you can set it up to also use another currency with a current exchange rate assigned. By designating a second currency as a so-called additional reporting currency, Business Central will automatically record amounts in both LCY and this additional reporting currency on each G/L entry and other entries, such as VAT entries.

WARNING

The Additional Reporting Currency functionality should not be used as a basis for financial statement translation. It is not a tool that can perform translation of foreign subsidiary financial statements as part of a company consolidation. The additional reporting currency can only be used to prepare reports in another currency, as if that currency was the company's local currency.

Displaying Reports and Amounts in the Additional Reporting Currency

Using an additional reporting currency can assist the reporting process for a company in the following cases:

- Companies in non-EU countries/regions that have a high proportion of transactions with EU country/region companies. In this case, the non-EU company may also wish to report in euro to make its financial reports more usable for EU trade partners.
- Companies that also wish to display reports in a more internationally traded currency than their own local currency.

Several financial reports are based on G/L entries. To display report data in the additional reporting currency, you simply place a check mark in the **Show Amounts in Add. Reporting Currency** field on the **Options** FastTab for the relevant G/L report.

Adjusting Exchange Rates

Because exchange rates fluctuate constantly, additional currency equivalents in your system must be adjusted periodically. If these adjustments are not done, amounts that have been converted from foreign (or additional) currencies and posted to the general ledger in LCY may be misleading. In addition, daily entries posted before a daily exchange rate is entered into the program must be updated after the daily exchange rate information is entered. The **Adjust Exchange Rates** batch job is used to adjust the exchange rates of posted customer, vendor and bank account entries. It can also update additional reporting currency amounts on G/L entries. For more information, see [Update Currency Exchange Rates](#).

Setting Up an Additional Reporting Currency

To set up an additional reporting currency, you must follow these steps:

- Specify general ledger accounts for posting exchange rate adjustments.
- Specify the exchange rate adjustment method for all general ledger accounts.
- Specify the exchange rate adjustment method for VAT entries.
- Activate the additional reporting currency.

To specify general ledger accounts for posting exchange rate adjustments

1. Choose the , enter **Currencies**, and then choose the related link.
2. On the **Currencies** page, fill in the following fields for the additional reporting currency.

FIELD	DESCRIPTION
Realized GL Gains Account	The general ledger account to which exchange rate gains for currency adjustments between LCY and the additional reporting currency will be posted.
Realized GL Losses Account	The general ledger account to which exchange rate losses for currency adjustments between LCY and the additional reporting currency will be posted.
Residual Gains Account	The general ledger account to which residual amounts that are gains are posted if you post in the general ledger application area in both LCY and an additional reporting currency.
Residual Losses Account	The general ledger account to which residual amounts that are losses are posted if you post in the general ledger application area in both LCY and an additional reporting currency.

NOTE

Residual amounts can occur when Business Central rounds debit and credit amounts that have been converted from LCY to an additional reporting currency.

For each general ledger account, you must specify how general ledger amounts for that account will be adjusted for exchange rate fluctuations between LCY and the additional reporting currency.

To specify the exchange rate adjustment method for all general ledger accounts

1. Choose the , enter **Chart of Accounts**, and then choose the related link.
2. On the **Chart of Accounts** page, select the relevant account, and then choose the **Edit** action.
3. On the **GL Account Card** page, select the relevant method in the **Exchange Rate Adjustment** field.

If you post in an additional reporting currency, specify in the **Exchange Rate Adjustment** field how this general ledger account will be adjusted for exchange-rate fluctuations between LCY and the additional reporting currency. The following table shows the options to choose from.

FIELD	DESCRIPTION
No Adjustment	No exchange rate adjustment is made to the general ledger account. This is the default option. NOTE: This option should be selected if the exchange rate between the LCY and additional reporting currency is always fixed.

FIELD	DESCRIPTION
Adjust Amount	The LCY amount is adjusted for any exchange rate gains or losses. Exchange rate gains or losses are posted to the general ledger account in the Amount field and to the accounts you specified for gains or losses in the Realized G/L Gains Account and Realized G/L Losses Account fields on the Currencies page.
Adjust Additional-Currency Amount	The additional reporting currency is adjusted for any exchange rate gains or losses. Exchange rate gains or losses are posted to the general ledger account in the Additional-Currency Amount field and to the accounts you specified for gains or losses in the Realized G/L Gains Account and Realized G/L Losses Account fields on the Currencies page.

Exchange rate gains and losses are posted when you run the **Adjust Exchange Rates** batch job. In that batch job, the adjustment exchange rate is identified on the **Currency Exchange Rates** page, and then the amounts in the **Amount** and **Additional-Currency Amount** fields on the general ledger entry are compared to determine whether there is an exchange rate gain or loss. The batch job uses the option that you select in the **Exchange Rate Adjustment** field to determine how to calculate and post exchange rate gains or losses for general ledger accounts.

4. Close the **G/L Account Card** page.

To specify exchange rate adjustment method for VAT entries

1. Choose the  icon, enter **General Ledger Setup**, and then choose the related link.
2. On the **General Ledger Setup** page, select the relevant method in the **VAT Exchange Rate Adjustment** field.
3. If you post in an additional reporting currency, you can specify in the **VAT Exchange Rate Adjustment** field how the accounts set up for VAT posting on the **VAT Posting Setup** page will be adjusted for exchange-rate fluctuations between LCY and the additional reporting currency.

When you run the **Adjust Exchange Rates** batch job, the adjustment exchange rate is identified on the **Currency Exchange Rate** page and then the amounts in the **Amount** and **Additional-Currency Amount** fields on the VAT entry are compared to determine if there is an exchange rate gain or loss. The batch job uses the option that you select in this field to determine how to post exchange rate gains or losses for VAT accounts.

You have the same options as with general ledger entries but in this case the entries adjusted will be the VAT entries. The following table shows the options to choose from.

FIELD	DESCRIPTION
No Adjustment	No exchange rate adjustment is made to the general ledger account. This is the default option.
Adjust Amount	The LCY amount is adjusted for any exchange rate gains or losses. Exchange rate gains or losses are posted to the general ledger account in the Amount field and to the accounts you specified for gains or losses in the Realized G/L Gains Account and Realized G/L Losses Account fields on the Currencies page.

FIELD	DESCRIPTION
Adjust Additional-Currency Amount	The additional reporting currency is adjusted for any exchange rate gains or losses. Exchange rate gains or losses are posted to the general ledger account in the Additional-Currency Amount field and to the accounts you specified for gains or losses in the Realized G/L Gains Account and Realized G/L Losses Account fields on the Currencies page.

To activate the additional reporting currency

1. Choose the  icon, enter **General Ledger Setup**, and then choose the related link.
2. On the **General Ledger Setup** page, choose the **Additional Reporting Currency** field to select the additional currency that you want to report in.
3. When you leave the field, Business Central displays a confirmation message describing the effects of activating the additional reporting currency.
4. Choose the **Yes** button to confirm that you want to activate the currency.
5. The **Adjust Add. Reporting Currency** batch job opens.

This batch job converts LCY amounts on existing entries to the additional reporting currency. The batch job uses a default exchange rate copied from the exchange rate that is valid on the work date on the **Currency Exchange Rates** page. Residual amounts that occur on conversion of LCY to additional reporting currency are posted to the residual gains and losses accounts specified on the **Currencies** page. The posting date and document number for these entries are the same as for the original general ledger entry. After all these residual entries are posted, the batch job posts a rounding entry on the closing date of each closed year to the retained earnings account. This is to make sure that the ending balance of the income accounts for each closed years is 0 in both LCY and the additional reporting currency.

6. Fill in the fields as necessary. Hover over a field to read a short description.
7. Choose the **OK** button to run the batch job.

After running the batch job, amounts on the following existing entries will be in both LCY and in the additional reporting currency:

- General ledger entries
- Item application entries
- VAT entries
- Job ledger entries
- Value entries
- Production order lines
- Production order ledger entries

In addition, all future entries of the same type will have amounts recorded in both LCY and the additional reporting currency.

NOTE

The **Add. Reporting Currency** field will only be activated after you choose the **OK** button in the **Adjust Add. Reporting Currency** batch job.

Update Currency Exchange Rates

6/6/2019 • 4 minutes to read

As companies operate in increasingly more countries/regions, it becomes more important that they be able to trade and report financials in more than one currency. You must set up a code for each currency you use if you buy or sell in currencies other than your local currency, have receivables or payables in other currencies, or record G/L transactions in different currencies.

Your general ledger is set up to use your local currency (LCY), but you can set it up to also use another currency with a current exchange rate assigned. By designating a second currency as a so-called additional reporting currency, Business Central will automatically record amounts in both LCY and this additional reporting currency on each G/L entry and other entries, such as VAT entries. For more information, see [Set Up an Additional Reporting Currency](#).

Adjusting Exchange Rates

Because exchange rates fluctuate constantly, additional currency equivalents in your system must be adjusted periodically. If these adjustments are not done, amounts that have been converted from foreign (or additional) currencies and posted to the general ledger in LCY may be misleading. In addition, daily entries posted before a daily exchange rate is entered into the program must be updated after the daily exchange rate information is entered.

The **Adjust Exchange Rates** batch job is used to manually adjust the exchange rates of posted customer, vendor and bank account entries. It can also update additional reporting currency amounts on G/L entries. You can also have the exchange rates adjusted automatically by using a service. For more information, see [To set up a currency exchange rate service](#).

Effect on Customers and Vendors

For customer and vendor accounts, the batch job adjusts the currency by using the exchange rate that is valid on the posting date that is specified in the batch job. The batch job calculates the differences for the individual currency balances and posts the amounts to the general ledger account that is specified in the **Unrealized Gains Acc.** field or the **Unrealized Losses Acc.** field on the **Currencies** page. Balancing entries are automatically posted to the receivables/payables account in the general ledger.

The batch job processes all open customer ledger entries and vendor ledger entries. If there is an exchange rate difference for an entry, the batch job creates a new detailed customer or vendor ledger entry which reflects the adjusted amount on the customer or vendor ledger entry.

Dimensions on Customer and Vendor Ledger Entries

The adjustment entries are assigned the dimensions from the customer/vendor ledger entries, and the adjustments are posted per combination of dimension values.

Effect on Bank Accounts

For bank accounts, the batch job adjusts the currency by using the exchange rate that is valid on the posting date specified in the batch job. The batch job calculates the differences for each bank account that has a currency code and posts the amounts to the general ledger account that is specified in the **Realized Gains Acc.** field or the **Realized Losses Acc.** field on the **Currencies** page. Balancing entries are automatically posted to the general ledger bank accounts that are specified in the bank account posting groups. The batch job calculates one entry per currency per posting group.

Dimensions on Bank Account Entries

The adjustment entries for the bank account's general ledger account and for the gain/loss account are assigned the

bank account's default dimensions.

Effect on G/L Accounts

If you post in an additional reporting currency, you can have the batch job create new general ledger entries for currency adjustments between LCY and the additional reporting currency. The batch job calculates the differences for each general ledger entry and adjusts the general ledger entry depending on the contents of the **Exchange Rate Adjustment** field for each general ledger account.

Dimensions on G/L Account Entries

The adjustment entries are assigned the default dimensions from the accounts they are posted to.

IMPORTANT

Before you can use the batch job, you must enter the adjustment exchange rates that are used to adjust the foreign currency balances. You do so on the **Currency Exchange Rates** page.

To set up a currency exchange rate service

You can use an external service to keep your currency exchange rates up to date, such as FloatRates.

1. Choose the  icon, enter **Currency Exchange Rate Services**, and then choose the related link.
2. Choose the **New** action.
3. On the **Currency Exchange Rate Service** page, fill in the fields as necessary. Hover over a field to read a short description.
4. Choose the **Enabled** check box to enable the service.

To update currency exchange rates through a service

1. Choose the  icon, enter **Currencies**, and then choose the related link.
2. Choose the **Update Exchange Rates** action.

The value in the **Exchange Rate** field on the **Currencies** page is updated with the latest currency exchange rate.

Set Up Multiple Interest Rates

3/31/2019 • 2 minutes to read

Multiple interest rates are used for different periods for delayed payments in trade transactions. For example, a government specifies the maximum interest to be levied for a consumer. This interest rate can be changed twice a year on 01 January and 01 July. The interest rate between businesses (B2B) is agreed by the parties and there is no limit to that customer group. The announced rate is usually four percent more than the normal bank interest.

When you create finance charge terms and reminder terms, for delayed payment penalty, you can specify multiple interest rates so that the penalty fee is calculated from different interest rates in different periods. For more information, see [Collect Outstanding Balances](#).

To set up multiple interest rates

1. Choose the  icon, enter **Finance Charge Terms**, and then choose the related link.
2. On the **Finance Charge Terms** page, select the required finance term, and then choose the **Interest Rates** action.
3. Fill in the fields as necessary. Hover over a field to read a short description.
4. Choose the **OK** button.
5. Choose the  icon, enter **Reminder Terms**, and then choose the related link.
6. On the **Reminder Terms** page, select the required reminder term, and then choose the **Levels** action.
7. On the **Reminder Levels** page, select the **Calculate Interest** field.

When you issue a finance charge memo, the memo shows the finance charges with multiple interest rates for a specific time period. The memo also contains the contact details of the customer, the company issuing the memo, the additional amount, and the total amount. The opening entry on the memo is displayed in bold. The finance charges are calculated with multiple interest rates for a specific time period and are printed after the opening entry of the memo.

Set Up Invoice Rounding

3/31/2019 • 2 minutes to read

If you need to round invoice amounts when you create invoices, you can use the automatic rounding function. When an invoice is rounded, an extra line is added with the rounding amount and posted with the other invoice lines.

NOTE

Local regulations or local custom may require the invoice to be rounded in a specific way, for example, to an amount divisible by 0.05.

To use automatic invoice rounding, you must:

- Specify the general ledger accounts to which rounding differences will be posted.
- Set up rules for rounding invoices in local currency and in foreign currency.
- Activate the function.

NOTE

In addition to the invoice rounding features, you can round amounts on invoices by the unit-amount rounding feature and the amount rounding feature.

Set up general ledger accounts for invoice rounding differences

To use the automatic invoice rounding function, you must set up the general ledger account or accounts where rounding differences will be posted. Before you can do this, you must set up VAT product posting groups. For more information, see [Set up VAT](#).

To set up general ledger accounts for invoice rounding differences

1. Choose the  icon, enter **Chart of Accounts**, and then choose the related link.
2. On the **Chart of Accounts** page, set up the account and name it **Invoice Rounding** or something similar. Business Central will use the account name as text for invoices that are rounded.
3. Depending on whether you use VAT or sales tax, in the **Tax Prod. Posting Group** or **VAT Prod. Posting Group** fields, choose a posting group for rounded amounts. You may want to set up a new group code to use for invoice rounding.
4. Leave the **Gen. Posting Type**, and either the **Tax Bus. Posting Group** or **VAT Bus. Posting Group** fields blank.

Now you can assign the invoice rounding account to posting groups on the **Vendor Posting Groups** page.

Set up rounding for foreign and local currencies

Before you can use the automatic invoice rounding function, you must set up rounding rules for foreign and local currencies.

To set up rounding for foreign currencies

1. Choose the  icon, enter **Currencies**, and then choose the related link.
2. On the **Currencies** page, choose the foreign currency to open the **Currency Card**, and then fill in the **Amount**

Rounding Precision, Unit-Amount Rounding Precision, Invoice Rounding Precision and **Invoice Rounding Type** fields.

To set up rounding for your local currency

1. Choose the  icon, enter **General Ledger Setup**, and then choose the related link.
2. On the **General Ledger Setup** page, on the **General** FastTab, fill in the **Inv. Rounding Precision** and **Inv. Rounding Type** fields.

Activate the invoice rounding function

To ensure that sales and purchase invoices are rounded automatically, you must activate the invoice rounding function. You activate invoice rounding separately for sales and purchase invoices.

1. Choose the  icon, enter **Sales & Receivables Setup** or **Purchases & Payables Setup**, and then choose the related link.
2. On the **General** FastTab, choose the **Invoice Rounding** check box.

Setting Up or Changing the Chart of Accounts

3/31/2019 • 2 minutes to read

The chart of accounts shows the ledger accounts that store your financial data. Business Central includes a standard chart of accounts that is ready to support your business. However, you can change the default accounts, and you can add new accounts.

Adding or Changing Accounts

From the chart of accounts, you can open each G/L account and add or change settings.

NOTE

You can delete a general ledger account. However, before you delete it, the following must be true:

- The balance on the account must be zero.
- The **Allow G/L Acc. Deletion Before** field must be set on the **General Ledger Setup** page, and the account must not have ledger entries on or after that date.
- If the **Check G/L Account Usage** field on the **General Ledger Setup** page is selected, then the account must not be used in any posting groups or posting setup.

Business Central will prevent you from deleting a general ledger account that stores data that is needed in the chart of accounts.

Setting Up Cash Flow Analysis

5/13/2019 • 4 minutes to read

If you want some help to decide what to do with your cash, have a look at the charts on the Accountant Role Center:

- **Cash Cycle**
- **Income & Expense**
- **Cash Flow**
- **Cash Flow Forecasts**

This topic describes where the data in the charts comes from and, if necessary, what to do to start using the charts.

The Cash Cycle and Income & Expense charts

The **Cash Cycle** and **Income & Expense** charts are ready to go, based on the Chart of Accounts and account schedules. The accounts are where the data comes from, and account schedules calculate the relationship between sales and receivables. Some accounts and account schedules are provided. You can use them as-is, change them, and add new ones. If you add G/L accounts to your chart of accounts, for example, by importing them from QuickBooks, you'll need to map to the accounts on the **Account Schedules** page for the following account schedule names:

ACCOUNT SCHEDULE NAME	WHERE IT'S USED
I_CACYCLE	Cash Cycle
I_CASHFLOW	Cash Flow
I_INCEXP	Income & Expense
I_MINTRIAL	As an income statement if you don't use the chart of accounts

Note It's a good idea to keep the calculations that are provided for the account schedule.

Enter accounts in the **Totaling** field for **Total Revenue**, **Total Receivables**, **Total Payables**, and **Total Inventory**. To map to a range of accounts, or more than one specific account, enter the account numbers separated by "." or by a vertical bar, respectively. For example, **1111.4444** or **2222|3333|5555**.

Tip Verify your mapping by choosing the **Overview** action.

Set up the Cash Flow chart

The Cash Flow chart is based on the following:

- A chart of cash flow accounts.
- One or more cash flow setups. These specify the accounts to use for general ledger, purchases, sales, services, and fixed assets.

To help you get going, some accounts and cash flow setups are provided. You can add, change, or remove them.

To set these up, search for **cash flow accounts**, choose the link, and then fill in the fields. Hover over a field to read a short description. Repeat these steps for **cash flow setup**.

Set up cash flow forecasts

The **Cash Flow Forecast** chart uses cash flow accounts, cash flow setups, and cash flow forecasts. Some are provided, however, you can set up your own by using an assisted setup guide. The guide helps you specify things like how often to update the forecast, the accounts to base it on, information about when you pay taxes, and whether to turn on [Cortana Intelligence](#).

Cash flow forecasts can use Cortana Intelligence to include documents with a due date in the future. The result is a more comprehensive prediction. The connection to Cortana Intelligence is already set up for you. You just need to turn it on. When you sign in to Business Central, a notification displays in a blue bar, and provides a link to the default cash flow setup. The notification displays only once. If you close it, but decide to turn on Cortana Intelligence, you can use the assisted setup guide, or a manual process.

NOTE

Alternatively, you can use your own predictive web service. For more information, see [Create and use your own predictive web service for cash flow forecasts](#).

To use the assisted setup guide:

1. In the Accountant Role Center, under the **Cash Flow Forecast** chart, choose the **Open Assisted Setup** action.
2. Fill in the fields in each step of the guide.
3. Choose the  icon, enter **Cash Flow Forecast**, and then choose the related link.
4. On the **Cash Flow Forecast** page, choose the **Recalculate Forecast** action.

To use a manual process:

1. In the Accountant Role Center, search for **Cash Flow Setup**, and then choose the related link.
2. Expand the **Cortana Intelligence** FastTab, and then choose the **Cortana Intelligence Enabled** check box.
3. Choose the  icon, enter **Cash Flow Forecast**, and then choose the related link.
4. On the **Cash Flow Forecast** page, choose the **Recalculate Forecast** action.

TIP

Consider the length of the periods that the service will use in its calculations. The more data you provide, the more accurate the predictions will be. Also, watch out for large variances in periods. They will also impact predictions. If Cortana Intelligence does not find enough data, or the data varies a lot, the service will not make a prediction.

Create and use your own predictive web service for cash flow forecasts

You can also create your own predictive web service based on a public model named **Forecasting model for Microsoft Business Central**. This predictive model is available online in the Cortana Intelligence Gallery. To use the model, follow these steps:

1. Open a browser and go to the [Cortana Intelligence Gallery](#).
2. Search for **Forecasting Model for Microsoft Business Central**, and then open the model in Azure Machine Learning Studio.
3. Use your Microsoft account to sign up for a workspace, and then copy the model.
4. Run the model, and publish it as a web service.
5. Make a note of the API URL and API key. You will use these credentials for a cash flow setup.
6. Choose the  icon, enter **Cash Flow Setup**, and then choose the related link.
7. Expand the **Cortana Intelligence** FastTab, and then fill in the fields.

Set Up Cash Customers

3/31/2019 • 2 minutes to read

You cannot create an invoice without a customer number. This is true, even if you make a cash sale and do not have anything to record in a customer account.

To set up a cash customer

1. Choose the  icon, enter **Customer**, and then choose the related link.
2. Create a new **Customer** card. For more information, see [Register New Customers](#).
3. In the **No.** field, enter **Cash**, for example.
4. In the **Name** field, enter **Cash Sale**, for example.
5. On the **Invoicing** FastTab, fill in the **Customer Posting Group** and the **Gen. Bus. Posting Group** fields.

Now you have set up a customer that contains sufficient information for invoicing.

NOTE

You may have chosen a posting group that is also used for domestic credit sales. If you want to maintain separate data on cash sales, for example, with a special sales or receivables account, you can set up an extra posting group for this purpose.

You must enter a number for a receivables account for the posting group, even though the balance in this account will always be 0 after you post an invoice.

How To: Set Up and Report Intrastat

6/6/2019 • 7 minutes to read

All companies in the European Union must report their trade with other EU countries/regions. You must report the movement of goods to the statistics authorities in your country/region every month, and the report must be delivered to the tax authorities. This is referred to as Intrastat Reporting. You use the **Intrastat Journal** page to complete periodic Intrastat reports.

Required and Optional Setups

Before you can use the Intrastat journal to report Intrastat information, there are several things you must set up:

- **Intrastat Setup:** Intrastat Setup page is used to enable intrastat reporting and set defaults for it. You can specify whether you need to report Intrastat from shipments (dispatches), receipts (arrivals) or both depending on thresholds set by your local regulations. You can also set default transaction types for regular and return documents, used for nature of transaction reporting.
- **Intrastat journal templates:** You must set up the Intrastat journal templates and batches you will use. Because Intrastat is reported monthly, you must create 12 Intrastat journal batches based on the same template.
- **Commodity codes:** Customs and tax authorities have established numerical codes that classify items and services. You specify these codes on items.
- **Transaction nature codes:** Countries and regions have different codes for types of Intrastat transactions, such as ordinary purchase and sale, exchange of returned goods, and exchange of non-returned goods. Set up all of the codes that apply to your country/region. You use these codes on sales and purchase documents, and when you process returns.
- **Transport methods:** There are seven, one-digit codes for Intrastat transport methods. **1** for sea, **2** for rail, **3** for road, **4** for air, **5** for post, **7** for fixed installations, and **9** for own propulsion (for example, transporting a car by driving it). Business Central does not require these codes, however, we recommend that the descriptions provide a similar meaning.

Optionally, you can also set up:

- **Transaction specifications:** Use these to supplement the descriptions from the transaction types.
- **Areas:** Use these to supplement information about countries and regions.
- **Entry/exit points:** Use these to specify the locations where you ship or receive items to or from other countries. Heathrow Airport is an example of an entry or exit point. You enter entry or exit points on sales and purchase documents on the **Foreign Trade** FastTab. This information will also be copied from the item entries when you create the Intrastat journal.

To set up Intrastat templates and batches

The Intrastat batch jobs include only item entries, and not general ledger entries. If you have general ledger entries that qualify for Intrastat reporting, you must enter them manually. For example, if you purchase a computer from another EU country or region, the computer is not placed in inventory, but is posted to a general ledger account. You must manually enter this type of entry in the Intrastat journal.

You can export the entries to a file that you can send to your Intrastat authorities. You can also print a report, manually enter the information on the forms from your authorities, and then submit the information.

[!Note] We recommended that you set up an Intrastat journal batch for each month.

1. Choose the  icon, enter **Intrastat Journal Templates**, and then choose the related link.
2. Fill in the fields as necessary. Hover over a field to read a short description.. Create a template for each Intrastat form you use.
3. To create batches, choose the **Navigate** tab, and then choose **Batches**.
4. Fill in the fields as necessary. Hover over a field to read a short description.. Create a template for each Intrastat form you use..

NOTE

In the **Statistics Period** field, enter the statistics period as a four-digit number, where the first two digits represent the year and the next two digits represent the month. For example, enter 1706 for June, 2017.

To set up commodity codes

All items that you buy or sell must have a commodity code.

1. Choose the  icon, enter **Commodity Codes**, and then choose the related link.
2. Fill in the fields as necessary. Hover over a field to read a short description.
3. To assign a commodity code to an item, go to the **Item Card** page, expand the **Costs & Posting** FastTab, and then enter the code in the **Commodity Code** field.

To set up transaction nature codes

1. Choose the  icon, enter **Transaction Nature Codes**, and then choose the related link.
2. Fill in the fields as necessary. Hover over a field to read a short description.

TIP

If you frequently use a particular transaction nature code, you can make it the default. To do this, go to the **Intrastat Setup** page, and choose the code.

To set up transport methods

1. Choose the  icon, enter **Transport Methods**, and then choose the related link.
2. Fill in the fields as necessary. Hover over a field to read a short description.

To set up which Intrastat report fields are mandatory

In some countries, such as Spain and UK, the authorities require that Intrastat reports include, for example, the shipment method for purchases or some other values when sales is over a certain threshold. On the **Intrastat Setup** page, you can select to make **Intrastat Checklist Setup** to set mandatory fields on the **Intrastat Journal** page.

1. Choose the  icon, enter **Intrastat Setup**, and then choose the related link.
2. Chooses the **Intrastat Checklist Setup** action.
3. On the **Intrastat Checklist Setup** page, click in the **Field Name** to pick Intrastat report field you want to make mandatory.

To Report Intrastat

After you fill in the Intrastat journal, you can run the **Checklist report** action to make sure that that all information in the journal is correct. Mandatory fields you have set in **Intrastat Checklist Setup** page that are missing values, will be shown in Errors and warning factbox on **Intrastat Journal** page. Afterward, you can print an Intrastat report as a form, or create a file to submit to the tax authority in your country/region.

To fill in Intrastat journals

1. Choose the  icon, enter **Intrastat Journal** and then choose the related link.
2. On the **Intrastat Journal** page, in the **Batch Name** field, choose the relevant journal batch, and then choose **OK**.
3. Choose the **Suggest Lines** action. The **Starting Date** and **Ending Date** fields will already contain the dates specified for the statistics period on the journal batch.
4. In the **Cost Regulation %** field, you can enter a percentage to cover transport and insurance. If you enter a percentage, the content of the **Statistical Value** field in the journal is proportionally higher.
5. Choose **OK** to start the batch job.

The batch job retrieves all the item entries in the statistics period and inserts them as lines in the Intrastat journal. You can edit the lines if needed.

IMPORTANT

The batch job retrieves only the entries that contain a country/region code for which an Intrastat code has been entered on the **Countries/Regions** page. Therefore, you must enter Intrastat codes for the country/region codes for which you will run the batch job.

Report Intrastat on a form or a file

To get the information that is required on the Intrastat form from the statistical authorities, you must print the **Intrastat – Form** report. Before you can do this, you must prepare the Intrastat journal and fill it in. If you have both sales and purchase transactions, you must complete a separate form for each type, so that you must print the report two times.

1. Choose the  icon, enter **Intrastat Journals**, and then choose the related link.
2. On the **Intrastat Journal** page, choose the relevant journal batch in the **Batch Name** field.
3. If you have not already done this, fill in the journal manually or choose **Suggest Lines**.
4. Choose the **Prints Intrastat Journal** action.
5. On the **Intrastat Jnl. Line** FastTab, add a **Type** filter and then specify whether this is a **Receipt** or a **Shipment**.
6. Choose **Send to** to print the report.

Report Intrastat in a file

You can submit the Intrastat report as a file. Before creating the file, you can print a checklist that contains the same information that will be in the file.

1. Choose the  icon, enter **Intrastat Journal**, and then choose the related link.
2. On the **Intrastat Journal** page, select the relevant journal batch in the **Batch Name** field.
3. If you have not already done this, fill in the journal manually or by choosing **Suggest Lines**.
4. Choose the **Create File** action.
5. In the batch job page, choose **OK**.
6. Choose **Save**.
7. Browse to the location where you want to save the file, enter the file name, and then choose **Save**.

Reorganize Intrastat Journals

Because you must submit an Intrastat report every month, and you create a new journal batch for each report, you will eventually have many journal batches. The journal lines are not deleted automatically. You may want to reorganize the journal batch names periodically. You do this by deleting the journal batches that you no longer need. The journal lines in these batches are also deleted.

1. Choose the  icon, enter **Intrastat Journals**, and then choose the related link.
2. To view the options, choose the **Batch Name** field.

3. Choose the journal batches to deleted, and then choose **Delete**.

Use Allocation Keys in General Journals

3/31/2019 • 2 minutes to read

You can allocate an entry in a general journal to several different accounts when you post the journal. The allocation can be made by quantity, percentage, or amount.

To set up allocation keys

1. Choose the  icon, enter **Recurring General Journal**, and then choose the related link.
2. Choose the **Batch Name** field to open the **General Journal Batches** page.
3. You can either modify allocations on an existing batch in the list or create a new batch with allocations.
 - To create a new batch, choose the **New** action, and go to the next step.
 - To change the allocations of an existing journal, select the journal and go to step 7.
4. In the **Name** field, enter a name for the batch, such as CLEANING. In the **Description** field, enter a description, such as Cleaning Expenses Journal.
5. When you are done, close the page. A new, empty recurring journal opens.
6. Fill in the fields on the line.
7. Choose the **Allocations** action.
8. Add a line for each allocation. You must fill in either the **Allocation %**, **Allocation Quantity**, or **Amount** field. You must also fill in the **Account No.** field and, if you are allocating the transaction among global dimensions, the global dimension fields.
9. If you enter a percentage on a line, the amount in the **Amount** field is calculated automatically. These amounts have the opposite sign from the total amount in the **Amount** field in the recurring journal.
10. After entering the allocations lines, choose **OK** to return to the **Recurring General Journal** page. The **Allocated Amt. (USD)** field is filled in and matches the **Amount** field.
11. Post the journal.

To change an allocation key that has already been set up

1. Choose the  icon, enter **Recurring General Journal**, and then choose the related link.
2. On the **Recurring General Journal** page, select the journal with the allocation.
3. Choose the line with the allocation, and then choose **Allocations** action.
4. Change the relevant fields, and then choose the **OK** button.

Set Up Bank Accounts

3/31/2019 • 2 minutes to read

You use bank accounts in the Business Central to keep track of your banking transactions. Accounts can be denominated in your local currency or in a foreign currency. After you have set up bank accounts, you can also use the check printing option.

To set up bank accounts

1. Choose the  icon, enter **Bank Accounts**, and then choose the related link.
2. On the **Bank Accounts** page, choose the **New** action.
3. Fill in the fields as necessary. Hover over a field to read a short description.

NOTE

To fill in the **Balance** field with an opening balance, you must post a bank account ledger entry with the amount in question. You can do this by performing a bank account reconciliation. For more information, see [Reconcile Bank Accounts Separately](#). Alternatively, you can implement the opening balance as a part of general data creation in new companies by using the **Migrate Business Data** assisted setup guide. For more information, see [Getting Started](#).

To set up your bank account for import or export of bank files

Fields on the **Transfer** FastTab on the **Bank Account Card** page are related to import and export of bank feeds and files. For more information, see [Set Up the Bank Data Conversion Service](#) and [Set Up the Envestnet Yodlee Bank Feeds Service](#).

1. Choose the  icon, enter **Bank Accounts**, and then choose the related link.
2. Open the card for a bank account that you will export or import bank files for.
3. On the **Transfer** FastTab, fill in the fields as necessary. Hover over a field to read a short description.

NOTE

Different file export services and their formats require different setup values on the **Bank Account Card** page. You will be informed about wrong or missing setup values as you try to export the file. So read the short descriptions of the fields carefully or refer to the related procedure topics. For example, exporting a payment file for North American electronic funds transfer (EFT) requires that both the **Last Remittance Advice No.** field and the **Transit No.** field are filled in. For more information, see [Export Payments to a Bank File](#).

To set up vendor bank accounts for export of bank files

Fields on the **Transfer** FastTab on the **Vendor Bank Account Card** page are related to export of bank feeds and files. For more information, see [Set Up the Bank Data Conversion Service](#) and [Export Payments to a Bank File](#).

1. Choose the  icon, enter **Vendors**, and then choose the related link.
2. Open the card for a vendor whose bank account you will export payment bank files to.
3. Choose the **Bank Accounts** action.
4. On the **Vendor Bank Account Card** page, on the **Transfer** FastTab, fill in the fields as necessary. Hover over a field to read a short description.

Set Up the Envestnet Yodlee Bank Feeds Service

3/31/2019 • 6 minutes to read

You can import electronic bank statements from your bank to quickly fill on the **Payment Reconciliation Journal** page so you can apply payments and reconcile the bank account. For more information, see [Applying Payments Automatically and Reconciling Bank Accounts](#).

NOTE

The Envestnet Yodlee Bank Feeds service is only supported in the online version of Business Central. To use this functionality on-premises, you must obtain a cobrand account from Envestnet Yodlee.

The Envestnet Yodlee Bank Feeds service is only supported in the US, Canada, and UK.

The Envestnet Yodlee Bank Feeds service is installed as an extension to Business Central online and is ready to be enabled in the supported countries. For more information, see [Customizing Business Central Using Extensions](#).

After you enable the bank feed service, you must link a bank account to the online bank account that the feed will come from. You link bank accounts to online bank accounts in the following different scenarios:

- A bank account does not exist in Business Central for your online bank account. Therefore, you create the bank account by linking from the online bank account.
- A bank account exists in Business Central, which you want to link to an online bank account.
- A linked bank account must be unlinked because you want to stop using the bank feed service for the account.
- Online bank accounts have changed and you want to update the information on bank accounts in Business Central.

When the bank feed service is enabled, you can set a bank account up to automatically import new bank statements into the **Payment Reconciliation Journal** page every two hour. Transactions for payments that have already been posted as applied and/or reconciled on the **Payment Reconciliation Journal** page will not be imported. For more information, see the "To enable automatic import of bank statements" section.

NOTE

If you use the Set Up Company assisted setup guide, some of the steps in the following procedures happen automatically when you get to the company bank account setup. For more information, see [Getting Started](#).

To enable the bank feed service

1. Choose the  icon, enter **Bank Accounts**, and then choose the related link.
2. Open the bank account that you will use for the bank feed service.
3. On the **Bank Account** page, in the **Bank Statement Import Format** field, select YODLEEBANKFEED.

The bank feed service will be enabled when you link a bank account to its related online bank account. See the next procedure.

NOTE

If you use the **Company Setup** assisted setup guide, then you enable the service by selecting the **Use a bank feed service** check box. For more information, see [Creating New Companies in Business Central](#).

To create a new linked bank account

1. Choose the  icon, enter **Bank Accounts**, and then choose the related link.
2. Select the relevant bank account, and then choose the **Create New Linked Bank Account**. The **Bank Account Linking** page opens after a few moments.

NOTE

This page shows the actual web page of the Envestnet Yodlee Bank Feeds service. Terminology and functionality on the page may not match instructions provided in this topic.

3. On the **Online Bank Account Linking** page, in the **Link Account** pane, use the Search function to find the bank where you have one or more online bank accounts.
4. Choose the bank name. The **Log In** pane opens.
5. Enter the username and password that you use to log on to the online bank, and then choose the **Next** button.
6. The bank feed service prepares to link the first online bank account at the specified bank to a new bank account in Business Central.

NOTE

If you have more than one online bank account at the bank, you must create additional bank accounts in Business Central for them. See steps 8 through 10.

After the process completes, the bank name will appear in the **My Accounts** pane on the **Linked** tab. The number in brackets indicates how many online bank accounts were linked.

7. Choose the **OK** button.

If you are only linking one online bank account, the **Bank Account Card** page opens and displays the name of the online bank account. In this case, the bank account linking task is completed. All that's left to do is to set up the bank account. For more information, see [Set Up Bank Accounts](#).

If you are linking more than one online bank accounts, the **Bank Account Linking** page opens and lists the online bank accounts that are not yet linked to bank accounts in Business Central. In that case, follow the next step.

8. On the **Bank Account Linking** page, select the line for an online bank account, and then choose the **Link to New Bank Account** action.

The **Bank Account Card** page for a new bank account opens and displays the name of the online bank account.

If a bank account already exists in Business Central that you want to link the additional online bank account to, follow the next step.

9. On the **Bank Account Linking** page, select the line for an online bank account, and then choose the **Link to**

Existing Bank Account action.

10. On the **Bank Account List** page, select the bank account that you want to link to, and then choose the **OK** button.

To link a bank account to an online bank account

1. Choose the  icon, enter **Bank Accounts**, and then choose the related link.
2. Select the line for a bank account that is not linked to an online bank account, and then choose the **Link to Online Bank Account** action. The **Online Bank Account Linking** page opens with the name of the bank prefilled in the **Link Account** pane.
3. Choose the bank name. The **Log In** pane opens.
4. Enter the username and password that you use to log on to the online bank, and then choose the **Next** button.

The bank feed service prepares to link your bank account in Business Central to the related online bank account.

When the process has completed successfully, the bank name will appear in the **My Accounts** pane on the **Linked** tab. If the bank has more than one bank account, only the bank account that you selected in step 2 is linked.

5. Choose the **OK** button.

On the **Bank Account List** page, the **Linked** check box is selected.

To unlink a bank account

1. Choose the  icon, enter **Bank Accounts**, and then choose the related link.
2. Select the line for a linked bank account that you want to unlink from its related online bank account, and then choose the **Unlink Online Bank Account** action.

NOTE

If you choose **Yes** on the confirmation dialog, the link to the online bank account is removed, and the log-in details are cleared. To link the bank account to the online bank account again, you must log on to the bank again. For more information, see the "To link a bank account to an online bank account" section.

To update bank account linking

1. Choose the  icon, enter **Bank Accounts**, and then choose the related link.
2. Select the relevant bank account, and then choose the **Update Bank Account Linking** action.

If issues exist for any of the linked bank accounts on the **Bank Account List** page, the **Bank Account Linking** page opens specifying which bank accounts have issues. Issues can best be resolved by unlinking the online bank account and then re-creating the link. For more information, see the "To link a bank account to an online bank account" section.

To enable automatic import of bank statements

1. Choose the  icon, enter **Bank Accounts**, and then choose the related link.
2. Select the line for a linked bank account, and then choose the **Automatic Bank Statement Import Setup**

action.

3. On the **Automatic Bank Statement Import Setup** page, in the **Number of Days Included** field, specify how far back in time to get new bank transactions for.

NOTE

It is recommended that you set this value to 7 days or more.

4. Select the **Enabled** check box.

Every hour, the **Payment Reconciliation Journal** page will display new payments that are made on the online bank account.

NOTE

Transactions for payments that have already been posted as applied and/or reconciled on the **Payment Reconciliation Journal** page will not be imported.

Set Up the Bank Data Conversion Service

3/31/2019 • 3 minutes to read

A global provider of services to convert payment information to any data format that your bank requires is connected and ready to be enabled in Business Central. This is referred to in Business Central as the bank data conversion service.

You can export payment lines from the **Payment Journal** page to a file or a data stream that you then upload to your bank for automatic processing so that you do not have to make electronic payments individually. For more information, see [Export Payments to a Bank File](#).

You can import bank statement files into the **Payment Reconciliation Journal** page by using the bank data conversion service to convert a file that you receive from your bank to a data stream that Business Central can import. For more information, see [Applying Payments Automatically and Reconciling Bank Accounts](#).

As an alternative to importing bank statements with the bank data conversion service, you can use the Envestnet Yodlee Bank Feeds service. For more information, see [Set Up the Envestnet Yodlee Bank Feeds Service](#).

To import or export bank files, you must set up your own bank account and your vendors' bank accounts. For more information, see [Set Up Bank Accounts](#).

NOTE

The bank data conversion service may impose a limit on the number of lines that can be exported in one file. You will receive an error message if the limit is exceeded. It is recommended that bank statement files do not exceed 1000 lines as the processing time in the bank data conversion service may otherwise increase significantly.

To sign your company up for the bank data conversion service

1. Choose the  icon, enter **Bank Data Conv. Service Setup**, and then choose the related link.
2. The **Bank Data Conv. Service Setup** page opens with three fields prefilled with relevant URLs of the provider of bank data conversion service.

NOTE

In the CRONUS International Ltd. demonstration database, the User Name and Password fields are prefilled with demonstration logon information, which you will replace with your company's actual information as you sign up for the bank data conversion service.

3. In the **Sign-up URL** field, choose the browser button to open the service provider's sign-up page.
4. On the sign-up page of the bank data service provider, enter the user name and password for your company's subscription to the service, and then complete the sign-up process as instructed by the service provider.

Your company is now signed up for the bank data conversion service. Proceed to enter the user name and password that you specified for the service in the related setup fields in Business Central.

5. On the **Bank Data Conv. Service Setup** page, in the User **Name** field, enter the same value that you entered as logon name on the service provider's page in step 4.

6. In the **Password** field, enter the same value that you entered in the **Password** field on the service provider's page in step 4.

NOTE

You login data is automatically encrypted.

To view or update the list of currently supported bank data formats

1. Choose the  icon, enter **Bank Data Conv. Service Setup** , and then choose the related link.
2. On the **Bank Data Conv. Service Setup** page, choose the **Bank Name - Data Conversion List** action to open the list of bank names representing bank data formats that are supported by the conversion service.
3. On the **Bank Name - Data Conversion List** page, choose the **Update Bank Name List** action.

The list of bank data formats that are supported by the bank data conversion service is now updated. This is the list of bank names, filtered by the country/region, that you can select from in the **Bank Name - Data Conversion** field on the **Bank Account Card** page.

NOTE

The update of supported bank data formats also occurs when you select or enter a value in the **Bank Name - Data Conversion** field on the bank account.

You have now signed up for the bank data conversion service. Proceed to reflect the sign-up information on every bank account that will use the service.

Define Check Layouts

4/29/2019 • 2 minutes to read

You can design your checks to conform with the standards set by the local authorities. Check images can be printed in English, French, or Spanish.

Checks are designed to print in both the United States and Canadian check image formats in either a check-stub-check format or a stub-stub-check format.

To define check layouts

1. Choose the  icon, enter **Report Selections Bank Account**, and then choose the related link.
2. On the **Report Selection - Bank Acc.** page, in the **Usage** field, select **Check**.
3. Select one of the following report IDs.

REPORT ID	REPORT NAME	DESCRIPTION
1401	Check	This is the default report.
10411	Check (Stub/Stub/Check)	This report is designed to print checks in a stub/stub/check format.
10412	Check (Stub/Check/Stub)	This report is designed to print checks in a stub/check/stub format.
10413	Three Checks per Page	This report is designed to print three checks on each page.

When you have set up check layouts, you can print checks from the **Payment Journal** page. For more information, see [Work with Checks](#).

Setting Up Sales

6/17/2019 • 2 minutes to read

Before you can manage sales processes, you must configure the rules and values that define the company's sales policies.

You must define the general setup, such as which sales documents are required and how their values are posted. This general setup is typically performed once during the initial implementation.

A separate series of tasks related to registering new customers is to record any special price or discount agreements that you have with each customer.

Finance-related sales setup, such as payment methods and currencies, are covered in the Finance Setup section. For more information, see [Setting Up Finance](#).

TO	SEE
Create a customer card for each customer that you sell to.	Register New Customers
Enable customers to pay through PayPal by choosing the PayPal logo on sales documents.	Enable Customer Payment Through PayPal
Enter the different discounts and special prices that you grant to customers depending on item, quantities, and/or date.	Record Sales Price, Discount, and Payment Agreements
Set up salespeople so that you can assign them to customer contacts or measure salespeople's performance as a basis for calculating the sales commission or bonus.	Set Up Salespeople
Specify for individual customers or for all customers how sales documents are sent by default when you choose the Post and Send action.	Set Up Document Sending Profiles
Set your email up to contain a summary of information in the sales document that is being sent.	Send Documents by Email.
Use an EU web service to verify a customer's VAT registration number.	Verify VAT Registration Numbers
Define the different incoterms that you offer to customers or that your vendors offer you.	Set Up Shipment Methods
Enter information about the different transportation vendors you use, including a link to their package tracking service.	Set Up Shipping Agents

Register New Customers

3/31/2019 • 2 minutes to read

Customers are the source of your income. You must register each customer you sell to as a customer card. Customer cards hold the information that is required to sell products to the customer. For more information, see [Invoice Sales](#) and [Register New Items](#).

Before you can register new customers, you must set up various sales codes that you can select from when you fill in customer cards. For more information, see [Setting Up Sales](#).

NOTE

If customer templates exist for different customer types, then a page appears when you create a new customer card from where you can select an appropriate template. If only one customer template exists, then new customer cards always use that template.

To create a new customer card

1. Choose the  icon, enter **Customers**, and then choose the related link.
2. On the **Customers** page, choose the **New** action.

If only one customer template exists, then a new customer card opens with some fields filled with information from the template.

If more than one customer template exists, then a page opens from which you can select a customer template. In that case, follow the next two steps.

3. On the **Select a template for a new customer** page, choose the template that you want to use for the new customer card.
4. Choose the **OK** button. A new customer card opens with some fields filled with information from the template.
5. Proceed to fill or change fields on the customer card as necessary. Hover over a field to read a short description.

On the **Sales Prices** FastTab, you can view special prices or discounts that you grant for the customer if certain criteria are met, such as item, minimum order quantity, or ending date. Each row represents a special price or line discount. Each column represents a criterion that must apply to warrant the special price that you enter in the **Unit Price** field, or the line discount that you enter in the **Line Discount %** field. For more information, see [Record Sales Price, Discount, and Payment Agreements](#).

The customer is now registered, and the customer card is ready to be used on sales documents.

If you want to use this customer card as a template when you create new customer cards, you can save it as a template. For more information, see the following section.

To save the customer card as a template

1. On the **Customer Card** page, choose the **Save as Template** action. The **Customer Template** page opens showing the customer card as a template.
2. Fill in the fields as necessary. Hover over a field to read a short description.

3. To reuse dimensions in templates, choose the **Dimensions** action. The **Dimension Templates** page opens showing any dimension codes that are set up for the customer.
4. Edit or enter dimension codes that will apply to new customer cards created by using the template.
5. When you have completed the new customer template, choose the **OK** button.

The customer template is added to the list of customer templates, so that you can use it to create new customer cards.

Enable Customer Payments Through Payment Services

3/31/2019 • 2 minutes to read

As an alternative to collecting payments through bank transfer or credit cards, your customers can pay you through their account with payment services, such as Microsoft Pay, PayPal, or WorldPay.

After you enable a payment service in Business Central, a link to the service is available on sales documents that you send by email to your customers. Customers can use the link to go to the payment service and pay the bill, directly from the sales document. If you don't want to include the link, for example, if a customer will pay with cash, you can remove the payment service from the invoice before posting.

The Microsoft Pay, PayPal Payments Standard, and WorldPay Payments Standard extensions are installed in Business Central, and are ready for you to enable.

To enable a payment service in Business Central

1. Choose the  icon, enter **Payment Services**, and then choose the related link.
2. On the **Payment Services** page, choose the **New** action.
3. Select the payment service, and then close the page.
4. On the **Payment Services** page, choose the **Setup** action.
5. Fill in the fields as necessary. Hover over a field to read a short description.
6. Close the page.

To select a payment service on a sales invoice

1. Choose the  icon, enter **Sales Invoices**, and then choose the related link.
2. Open the sales invoice that you want to pay by using the payment service.
3. In the **Payment Service** field, choose the payment service.

NOTE

The **Payment Service** field is available only if you've enabled the payment service.

[Working with Business Central](#)

Record Special Sales Prices and Discounts

3/31/2019 • 9 minutes to read

The different price and discount agreements that apply when selling to different customers must be defined so that the agreed rules and values are applied to sales documents that you create for the customers.

When you have recorded special prices and line discounts for sales and purchases, Business Central ensures that your profit on item trade is always optimal by automatically calculating the best price on sales and purchase documents and on job and item journal lines. For more information, see [Best Price Calculation](#).

Concerning prices, you can have a special sales price inserted on sales lines if a certain combination of customer, item, minimum quantity, unit of measure, or starting/ending date exists.

Concerning discounts, you can set up and use two types of sales discounts:

DISCOUNT TYPE	DESCRIPTION
Sales Line Discount	An amount discount that is inserted on sales lines if a certain combination of customer, item, minimum quantity, unit of measure, or starting/ending date exists. This works in the same way as for sales prices.
Invoice Discount	A percentage discount that is subtracted from the document total if the value amount of all lines on a sales document exceeds a certain minimum.

Because sales prices and sales line discounts are based on a combination of item and customer, you can also perform this configuration from the item card of the item where the rules and values apply.

NOTE

If you do not want an item to ever be sold at a discounted price, simply leave discount fields on the item card empty, and do not include the item in any line discount setup.

To set up a sales price for a customer

1. Choose the  icon, enter **Customers**, and then choose the related link.
2. Open the relevant customer card, and then choose the **Prices** action.

The **Sales Type** field is prefilled with **Customer**, and the **Sales Code** field is prefilled with the customer number.

3. Fill in the fields on the line as necessary. Hover over a field to read a short description. Fill a line for each combination that will grant a special sales price to the customer.

To set up a sales line discount for a customer

1. Choose the  icon, enter **Customers**, and then choose the related link.
2. Open the relevant customer card, and then choose the **Line Discounts** action.

The **Sales Type** field is prefilled with **Customer**, and the **Sales Code** field is prefilled with the customer

number.

3. Fill in the fields on the line as necessary. Hover over a field to read a short description. Fill a line for each combination that will grant a sales line discount to the customer.

To set up an invoice discount for a customer

When you have decided which customers are eligible for invoice discounts, enter the invoice discount code on the customer cards and set up the terms for each code.

1. Choose the  icon, enter **Customers**, and then choose the related link.
2. Open the customer card for a customer that will be eligible for invoice discounts.
3. In the **Invoice Disc. Code** field, select a code for the relevant invoice discount terms to use to calculate invoice discounts for the customer.

NOTE

Invoice discount codes are represented by existing customer cards. This enables you to quickly assign invoice discount terms to customers by picking the name of another customer who will have the same terms.

Proceed to set up new the sales invoice discount terms.

1. On the **Customer Card** page, choose the **Invoice Discounts** action. The **Cust. Invoice Discounts** page opens.
2. In the **Currency Code** field, enter the code for a currency that the invoice discount terms on the line applies to. Leave the field blank to set up invoice discount terms in USD.
3. In the **Minimum Amount** field, enter the minimum amount that an invoice must have to be eligible for the discount.
4. In the **Discount %** field, enter the invoice discount as a percentage of the invoice amount.
5. Repeat steps 5 through 7 for each currency that the customer will receive a different invoice discount for.

The invoice discount is now set up and assigned to the customer in question. When you select the customer code in the **Invoice Disc. Code** field on other customer cards, the same invoice discount is assigned to those customers.

To work with sales invoice discounts and service charges

When you use invoice discounts, the size of the invoice amount determines the size of the discount that is granted.

On the **Cust. Invoice Discounts** page, you can also add a service charge to invoices over a certain amount.

Before you can use invoice discounts with sales, you must enter certain information in the program. You must decide:

- which customers will be granted this type of discount.
- which discount percentages you will use.

If you invoice discounts to be calculated automatically, you can specify this on the **Sales & Receivables Setup** page.

For each customer, you can specify whether you will grant invoice discounts if the requirement is satisfied (that is, if the invoice amount is large enough). You can define the terms of the invoice discount in local currency for domestic customers and in foreign currency for foreign customers.

You link discount percentages to specific invoice amounts in **Cust. Invoice Discounts** pages. You can enter any

number of percentages in each page. Each customer can have its own page, or you can link several customers to the same page.

In addition to (or instead of) a discount percentage, you can link a service charge amount to a specific invoice amount.

TIP

Before you start entering this information in the program, it is a good idea to prepare an outline of the discount structure you want to use. This makes it easier to see which customers can be linked to the same invoice discount page. The fewer pages you have to set up, the faster you can enter the basic information.

Best Price Calculation

When you have recorded special prices and line discounts for sales and purchases, Business Central ensures that your profit on item trade is always optimal by automatically calculating the best price on sales and purchase documents and on job and item journal lines.

The best price is the lowest permissible price with the highest permissible line discount on a given date. Business Central automatically calculates this when it inserts the unit price and the line discount percentage for items on new document and journal lines.

NOTE

The following describes how the best price is calculated for sales. The calculation is the same for purchases.

1. Business Central checks the combination of the bill-to customer and the item and then calculates the applicable unit price and line discount percentage, using the following criteria:
 - Does the customer have a price/discount agreement, or does the customer belong to a group that does?
 - Is the item or the item discount group on the line included in any of these price/discount agreements?
 - Is the order date (or the posting date for the invoice and credit memo) within the starting and ending date of the price/discount agreement?
 - Is a unit of measure code specified? If so, Business Central checks for prices/discounts with the same unit of measure code, and prices/discounts with no unit of measure code.
2. Business Central checks if any price/discount agreements apply to information on the document or journal line, and then inserts the applicable unit price and line discount percentage, using the following criteria:
 - Is there a minimum quantity requirement in the price/discount agreement that is fulfilled?
 - Is there a currency requirement in the price/discount agreement that is fulfilled? If so, the lowest price and the highest line discount for that currency are inserted, even if local currency would provide a better price. If there is no price/discount agreement for the specified currency code, Business Central inserts the lowest price and the highest line discount in your local currency.

If no special price can be calculated for the item on the line, then either the last direct cost or the unit price from the item card is inserted.

To copy sales prices

If you want to copy sales prices, such as an individual customer's sales prices to use for a customer price group, you must run the **Suggest Sales Price on Wksh.** batch job. You can an action for the batch job on the **Sales Price Worksheet** page.

1. Choose the  icon, enter **Sales Price Worksheet**, and then choose the related link.
2. Choose the **Suggest Sales Price on Wksh.** action.
3. On the **Sales Prices** FastTab, fill in the **Sales Type** and **Sales Code** fields with the original sales prices you want to copy.
4. In the top section of the request page, fill in the **Sales Type** and **Sales Code** fields with the type and name you want the sales prices copied to.
5. If you want the batch job to create new prices, select the **Create New Prices** check box.
6. Choose the **OK** button to fill in the lines on the **Sales Price Worksheet** page with the suggested new prices, indicating that they are valid for the selected sales type.

NOTE

This batch job only creates suggestions and it does not implement the suggested changes. If you are satisfied with the suggestions and want to implement them, that is insert them on the **Sales Prices** page, choose the **Implement Price Changes** action on the **Sales Price Worksheet** page.

To bulk update item prices

If you want to bulk update item prices, such as increase all item prices by some percentage, you must run the **Suggest Item Price on Wksh.** batch job. You can find a link to the batch job on the **Sales Price Worksheet** page.

1. Choose the  icon, enter **Sales Price Worksheet**, and then choose the related link.
2. Choose the **Suggest Item Price on Wksh.** action.
3. On the **Item** FastTab, fill in the **No.** or **Invenotry Posting Group** or other fields with the original item prices you want to update.
4. In the top section of the request page, fill in the **Sales Type** and **Sales Code** with the type and name you want the sales prices copied to.
5. If you want the batch job to automatically adjust suggested item prices, enter adjustment in **Adjustment Factor** field. For example, you would enter 1.15 in **Adjustment Factor** for 15% increase in item price.
6. If you want the batch job to create new prices, select the **Create New Prices** field.
7. Choose the **OK** button to fill in the lines on the **Sales Price Worksheet** page with the suggested new prices, indicating that they are valid for the selected **Item**.

NOTE

This batch job only creates suggestions and it does not implement the suggested changes. If you are satisfied with the suggestions and want to implement them, that is insert them in the **Sales Prices** table, you can use the **Implement Price Changes** batch job, which is found on the **Actions** tab, in the **Functions** group, on the **Sales Price Worksheet** page.

Set Up Salespeople

3/31/2019 • 2 minutes to read

Many companies want to follow an individual employee's performance as a basis for calculating the sales commission or bonus. See, for example, the **Salesperson Commissions** report. A company may also want to assign a salesperson to each of their contacts.

When you have set up a salesperson on the **Salespeople** page, you can select it in the **Salesperson Code** field on all relevant records, such as G/L account, customer, vendor, contacts, and campaign cards. Then, when you post or set up invoices, credit memos, journal lines, finance charge activities, and so on, the salesperson code is carried to the resulting ledger entries.

To set up a salesperson code

1. Choose the  icon, enter **Salespeople**, and then choose the related link.
2. On the **Salespeople** page, choose the **New** action.

You can use salespeople in various relationship management and marketing work. For example, you can assign tasks to salespeople, so that the tasks are incorporated in sales opportunities that the salesperson are assigned to. For more information, see [Set Up Opportunity Sales Cycles and Cycle Stages](#).

Set Up Document Sending Profiles

3/31/2019 • 2 minutes to read

You can set each customer up with a preferred method of sending sales documents, so that you do not have to select a sending option every time you choose the **Post and Send** action.

On the **Document Sending Profiles** page, you set up different sending profiles that you can select from in the **Document Sending Profile** field on a customer card. You can select the **Default** check box to specify that the document sending profile is the default profile for all customers, except for customers where the **Document Sending Profile** field is filled with another sending profile.

When you choose the **Post and Send** action on a sales document, the **Post and Send Confirmation** dialog box shows the sending profile used, either the one set up for the customer or the default for all customers. In the dialog box, you can change the sending profile for the sales document. For more information, see [Invoice Sales](#).

To set up a document sending profile

1. Choose the  icon, enter **Document Sending Profiles**, and then choose the related link.
2. On the **Document Sending Profiles** page, choose the **New** action.
3. Fill in the fields as necessary. Hover over a field to read a short description.

To specify a sending profile on a customer card

1. Choose the  icon, enter **Customers**, and then choose the related link.
2. Open the card of the customer who you want to set up a sending profile for.
3. In the **Document Sending Profile** field, select a profile that you have set up as described in the previous procedure.

Send Documents by Email

5/22/2019 • 3 minutes to read

To communicate the contents of business documents quickly to your business partners, such as the payment information on sales documents to customers, you can use the Report Layout feature to define document-specific content that gets inserted in email bodies automatically. For more information, see [Managing Report and Document Layouts](#).

To enable emails from within Business Central, start the **Set Up Email** assisted setup guide on the Role Center.

You can email practically all document types as attachments to email messages directly from the page that shows the document. In addition to the attachment, you can set up document-specific email bodies with core information from the document preceded by standard text that greets the mail recipient and introduces the document in question. To offer your customers to pay for sales electronically using a payment service, such as PayPal, you can also have the PayPal information and hyperlink inserted in the email body.

From all supported documents, you initiate emailing by choosing the **Send** action, on posted documents, or the **Post and Send** action, on non-posted documents.

If the **Email** field on the **Send Document to** page is set to **Yes (Prompt for Settings)**, then the **Send Email** page opens prefilled with the contact person in the **To:** field and the document attached as a PDF file. In the **Body** field, you can either enter text manually or you can have the field filled with a document-specific email body that you have set up.

The following procedure describes how to set the **Sales - Invoice** report up to be used for document-specific email bodies when you email posted sales invoices.

To set up a document-specific email body for sales invoices

1. Choose the  icon, enter **Report Selections Sales**, and then choose the related link.
2. On the **Report Selection - Sales** page, in the **Usage** field, select **Invoice**.
3. On a new line, in the **Report ID** field, select, for example, standard report 1306.
4. Select the **Use for Email Body** check box.
5. Choose the **Email Body Layout Code** field, and then select a layout from the drop-down list.

Report layouts define both the style and the content of the email body, including the standard text that precedes the core document information in the email body. You can see all available report layouts if you choose the **Select from full list** button in the drop-down list.

6. To view or edit the layout that the email body is based on, select the layout on the **Custom Report Layouts** page, and then choose the **Edit Layout** action.
7. If you want to offer customers to pay for sales electronically, you can set up the related payment service, such as PayPal, and then have the PayPal information and hyperlink inserted in the email body as well. For more information, see [Enable Customer Payments Through PayPal](#).
8. Choose the **OK** button.

Now, when you choose, for example, the **Send** action on the **Posted Sales Invoice** page, the email body will contain the document information of report 1306 preceded by styled standard text according to the report layout that you selected in step 5.

The following procedure describes how to send a posted sales invoice as an email message with the document attached as a PDF file and with a document-specific email body.

To send documents by email

1. Choose the  icon, enter **Posted Sales Invoices**, and then choose the related link.
2. Select the relevant posted sales invoice, and then choose the **Send** action. The **Send Document to** page opens.
3. In the **Email** field, select **Yes (Prompt for Settings)**. For more information, see [Set Up Document Sending Profiles](#).
4. Choose the **OK** button. The **Send Email** page opens.
5. In the **To:** field, enter a valid email address. The default value is the customer email address.
6. In the **Subject** field, enter a descriptive subject text. The default value is the customer name and invoice number.
7. In the **Attachment** field, the generated invoice is attached by default as a PDF file.
8. In the **Body** field, enter a short message to the recipient.

If a document-specific email body is set up on the **Report Selection - Sales** page, then the **Body** field is filled in automatically. For more information, see [To set up a document-specific email body for sales invoices](#).

9. Choose the **OK** button to send the email message.

NOTE

If you do not want to specify email settings each time you email a document, you can select the **Yes (Use Default Settings)** option in the **Email** field on the **Send Document to** page. In that case, the **Send Email** page will not open. See Step 4. For more information, see [Set Up Document Sending Profiles](#).

Set Up Shipment Methods

6/17/2019 • 2 minutes to read

Shipment methods, also called incoterms, often depend on the items, the customers, and the vendors. For example, if the customer lives on an island, they can choose to have items always shipped by air or always by sea. Some customers may require next day delivery. Some may want to pick up the order. On the customer and vendor cards, you can specify what sort of delivery is desired.

You set up the description and code for each shipment method on the **Shipment Methods** page. For example, you can set up the code FOB, and enter Free on Board in the **Description** field. You can then enter the code in **Shipment Method Code** fields elsewhere in the system, such as on a customer card. Then when you create new orders, invoices, credit memos, and so on, the system will enter the description represented by the code. You can change it on the document as needed.

To set up a shipment code

1. Choose the  icon, enter **Shipment Methods**, and then choose the related link.
2. On the **Shipment Methods** page, choose the **New** action.
3. On the new line, specify a code and description for the shipment method.

Set Up Shipping Agents

6/17/2019 • 2 minutes to read

You can set up a code for each of your shipping agents and enter information about them.

If you enter an Internet address for the shipping agent, and the agent provides package tracking services on the Internet, you can use the automatic package tracking feature. For more information, see [Track Packages](#).

When you set up shipping agents on your sales orders, you can also specify the services that each shipping agent offers.

For each shipping agent, you can set up an unlimited number of services, and you can specify a shipping time for each service.

When you have assigned a shipping agent service to a sales order line, the shipping time of the service will be included in the order promising calculation, for that line. For more information, see [Calculate Order Promising Dates](#).

To set up a shipping agent

1. Choose the  icon, enter **Shipping Agents**, and then choose the related link.
2. Fill in the fields as necessary. Hover over a field to read a short description..
3. Choose the **Shipping Agent Services** action.
4. In the **Shipping Agent Services**, fill in the fields as necessary.

NOTE

If you delete the shipping agent on the order line, the shipping agent service code is also deleted. The contents of fields that were based in part on the shipping agent service are recalculated.

Setting Up Purchasing

3/31/2019 • 2 minutes to read

Before you can manage purchase processes, you must configure the rules and values that define the company's purchase policies.

You must define the general setup, such as which purchase documents are required and how their values are posted. This general setup is typically performed once during the initial implementation.

A separate series of tasks related to registering new vendors is to record any special price or discount agreements that you have with each vendor.

Finance-related purchase setup, such as payment methods and currencies, are covered in the Finance Setup section. For more information, see [Setting Up Finance](#).

TO	SEE
Create a vendor card for each vendor that you purchase from	Register New Vendors

Register New Vendors

3/31/2019 • 2 minutes to read

Vendors provide the products that you sell. Each vendor that you purchase from must be registered as a vendor card.

Before you can register new vendors, you must set up various purchase codes that you can select from when you fill vendor cards. When all of the required master data is created, you can perform additional configuration of the vendor, such as prioritize the vendor for payment purposes and list items that the vendor and other vendors can supply. Another group of setup tasks for vendors is to record your agreements concerning discounts, prices, and payment methods. For more information, see [Setting Up Purchasing](#).

Vendor cards hold the information that is required to buy products from the vendor. For more information, see [Record Purchases](#) and [Register New Items](#).

NOTE

If vendor templates exist for different vendor types, then a page appears when you create a new vendor card from where you can select an appropriate template. If only one vendor template exists, then new vendor cards always use that template.

To create a new vendor card

1. Choose the  icon, enter **Vendors**, and then choose the related link.
2. On the **Vendors** page, Choose **New**.

If more than one vendor template exists, then a page opens from which you can select a vendor template. In that case, follow the next two steps.
3. On the **Select a template for a new vendor** page, choose the template that you want to use for the new vendor card.
4. Choose the **OK** button. A new vendor card opens with some fields filled with information from the template.
5. Proceed to fill or change fields on the vendor card as necessary. Hover over a field to read a short description.

NOTE

If you do not know the invoicing address that will be used for every invoice from a vendor, do not fill in the **Pay-to** field. Instead, choose the pay-to vendor number after you have set up a purchase quote, order, or invoice header.

The vendor is now registered, and the vendor card is ready to be used on purchase documents.

If you want to use this vendor card as a template when you create new vendor cards, you can save it as a vendor template. For more information, see the following section.

To save the vendor card as a template

1. On the **Vendor Card** page, choose the **Save as Template** action. The **Vendor Template** page opens

showing the vendor card as a template.

2. Fill in the fields as necessary. Hover over a field to read a short description.
3. To reuse dimensions in templates, choose the **Dimensions** action. The **Dimension Templates** page opens showing any dimension codes that are set up for the vendor.
4. Edit or enter dimension codes that will apply to new vendor cards created by using the template.
5. When you have completed the new vendor template, choose the **OK** button.
The vendor template is added to the list of vendor templates, so that you can use it to create new vendor cards.

Record Special Purchase Prices and Discounts

3/31/2019 • 7 minutes to read

The different price and discount agreements that apply when you buy from different vendors must be defined so that the agreed rules and values are applied to purchase documents that you create for the vendors.

When you have recorded special prices and line discounts for sales and purchases, Business Central ensures that your profit on item trade is always optimal by automatically calculating the best price on sales and purchase documents and on job and item journal lines. For more information, see [Best Price Calculation](#).

Concerning prices, you can have a special purchase price inserted on purchase lines if a certain combination of vendor, item, minimum quantity, unit of measure, or starting/ending date exists.

Concerning discounts, you can set up and use two types of purchase discounts:

DISCOUNT TYPE	DESCRIPTION
Purchase Line Discount	An amount discount that is inserted on purchase lines if a certain combination of vendor, item, minimum quantity, unit of measure, or starting/ending date exists. This works in the same way as for purchase prices.
Invoice Discount	A percentage discount that is subtracted from the document total if the value amount of all lines on a purchase document exceeds a certain minimum.

Because purchase line discounts and purchase prices are based on a combination of item and vendor, you can also enter this configuration from the item card, where the rules and values are defined. For more information, see [Register New Items](#).

To set up a special purchase price for a vendor

1. Choose the  icon, enter **Vendors**, and then choose the related link.
2. Open the relevant vendor card, and then choose the **Prices** action.

The **Purchase Type** field is prefilled with **Vendor**, and the **Purchase Code** field is prefilled with the vendor number.

3. Fill in the fields on the line as necessary. Hover over a field to read a short description.
4. Fill a line for each combination for which the vendor grants you a purchase line discount.

To set up a line discount for a vendor

1. Choose the  icon, enter **Vendors**, and then choose the related link.
2. Open the relevant vendor card, and then choose the **Line Discounts** action.

The **Purchase Type** field is prefilled with **Vendor**, and the **Purchase Code** field is prefilled with the vendor number.

3. Fill in the fields on the line as necessary. Hover over a field to read a short description.
4. Fill a line for each combination for which the vendor grants you a purchase line discount.

To set up an invoice discount for a vendor

When your vendors have informed you which invoice discounts they grant, enter the invoice discount code on the vendor cards and set up the terms for each code.

1. Choose the  icon, enter **Vendors**, and then choose the related link.
2. Open the vendor card for a vendor that will be eligible for invoice discounts.
3. In the **Invoice Disc. Code** field, select a code for the relevant invoice discount terms to use to calculate invoice discounts for the vendor.

NOTE

Invoice discount codes are represented by existing vendor cards. This enables you to quickly assign invoice discount terms to vendors by picking the name of another vendors who will have the same terms.

Proceed to set up new the purchase invoice discount terms.

4. On the **Vendor Card** page, choose the **Invoice Discounts** action. The **Vend. Invoice Discounts** page opens.
5. In the **Currency Code** field, enter the code for a currency that the invoice discount terms on the line applies to. Leave the field blank to set up invoice discount terms in USD.
6. In the **Minimum Amount** field, enter the minimum amount that an invoice must have to be eligible for the discount.
7. In the **Discount %** field, enter the invoice discount as a percentage of the invoice amount.
8. Repeat steps 5 through 7 for each currency that the vendor will receive a different invoice discount for.

The invoice discount is now set up and assigned to the vendor in question. When you select the vendor code in the **Invoice Disc. Code** field on other vendor cards, the same invoice discount is assigned to those vendor.

To choose a principle for posting purchase discounts

When you post a purchase invoice that includes one or more discounts, you can choose between two principles for posting discount amounts. You can post discounts separately or you can subtract discounts from invoice discounts.

Before you can do this, you must have already set up the necessary accounts for posting discount amounts in the chart of accounts. You must also check that you have entered the correct account numbers in the general posting setup in the **Purch. Line Disc. Account** and **Purch. Inv. Disc. Account** fields.

1. Choose the  icon, enter **Purchases & Payables Setup**, and then choose the related link.
2. In the **Discount Posting** field, choose one of the following principles for posting discounts.

DISCOUNT POSTING PRINCIPLE	INVOICE DISCOUNT	LINE DISCOUNT
All Discounts	Posted separately	Posted separately
Invoice Discounts	Posted separately	Subtracted
Line Discounts	Subtracted	Posted separately
No Discounts	Subtracted	Subtracted

Purchase Invoice Discounts and Service Charges

If you have fixed terms for invoice discounts with any vendors, you can enter them for those vendors. Then the discount will be calculated when you fill in a purchase invoice.

Before you can use invoice discounts with purchases, you must specify the vendors that offer you the discounts.

You link discount percentages to specific invoice amounts in **Vend. Invoice Discounts** pages. You can enter any number of percentages in each page. Each vendor can have its own page, or you can link several vendors to the same page.

In addition to a discount percentage, you can link a service charge amount to a specific invoice amount.

You can define the terms of the invoice discount in LCY for domestic vendors and in foreign currency for foreign vendors.

You can choose to have Business Central automatically calculate the invoice discounts for quotes, blanket orders, orders, invoices, or credit memos.

TIP

Before you enter this information, it is a good idea to prepare an outline of the discount structure that you want to use. This makes it easier to see which vendors can be linked to the same invoice discount page. The fewer pages that you have to set up, the faster that you can enter the basic information.

Best Price Calculation

When you have recorded special prices and line discounts for sales and purchases, Business Central ensures that your profit on item trade is always optimal by automatically calculating the best price on sales and purchase documents and on job and item journal lines.

The best price is the lowest permissible price with the highest permissible line discount on a given date. Business Central automatically calculates this when it inserts the unit price and the line discount percentage for items on new document and journal lines.

NOTE

The following describes how the best price is calculated for sales. The calculation is the same for purchases.

1. Business Central checks the combination of the bill-to customer and the item and then calculates the applicable unit price and line discount percentage, using the following criteria:
 - Does the customer have a price/discount agreement, or does the customer belong to a group that does?
 - Is the item or the item discount group on the line included in any of these price/discount agreements?
 - Is the order date (or the posting date for the invoice and credit memo) within the starting and ending date of the price/discount agreement?
 - Is a unit of measure code specified? If so, Business Central checks for prices/discounts with the same unit of measure code, and prices/discounts with no unit of measure code.
2. Business Central checks if any price/discount agreements apply to information on the document or journal line, and then inserts the applicable unit price and line discount percentage, using the following criteria:
 - Is there a minimum quantity requirement in the price/discount agreement that is fulfilled?
 - Is there a currency requirement in the price/discount agreement that is fulfilled? If so, the lowest price and the highest line discount for that currency are inserted, even if LCY would provide a better price. If there is no price/discount agreement for the specified currency code, Business Central inserts the lowest

price and the highest line discount in LCY.

If no special price can be calculated for the item on the line, then either the last direct cost or the unit price from the item card is inserted.

Prioritize Vendors

3/31/2019 • 2 minutes to read

Business Central can suggest various payments to vendors, for example, payments that will be due soon or payments where a discount is available. For more information, see [Suggest Vendor Payments](#).

First, you must prioritize your vendors by assigning numbers to them.

To prioritize vendors

1. Choose the  icon, enter **Vendors**, and then choose the related link.
2. Select the relevant vendor, and then choose **Edit**.
3. In the **Priority** field, enter a number.

Business Central considers the lowest number, except 0, to have the highest priority. So, for example, if you use 1, 2, and 3, then 1 will have the highest priority.

If you do not want to prioritize a vendor, leave the **Priority** field blank. Then, if you use the payment suggestion feature, the vendor will be listed after all the vendors that have a priority number. You can enter as many priority levels as necessary.

Set Up Purchasers

3/31/2019 • 2 minutes to read

If several purchasers work at your company, you can set them up in a page and assign them each a code. You can then use the codes to prepare statistics and to filter information in printed reports.

To set up purchasers

1. Choose the  icon, enter **Salespeople/Purchasers**, and then choose the related link.
2. On the **Salespeople/Purchasers** page, choose **New**.
3. On the **Salesperson/Purchaser Card** page, fill in the fields as necessary. Hover over a field to read a short description.

To assign purchasers to vendors

1. Choose the  icon, enter **Vendors**, and then choose the related link.
2. Open the relevant vendor card for the vendor that will be assigned a purchaser.
3. In the **Purchaser Code** field, select the applicable purchaser code and then close the page.

Work with Responsibility Centers

3/31/2019 • 3 minutes to read

Responsibility centers provide the ability to handle administrative centers. A responsibility center can be a cost center, a profit center, an investment center, or other company-defined administrative center. Examples of responsibility centers are a sales office, a purchasing department for several locations, and a plant planning office. Using this functionality, for example, companies can set up user-specific views of sales and purchase documents related exclusively to a particular responsibility center.

Using multiple locations together with responsibility centers provides the ability to manage business operations in the most flexible, yet optimal way.

Multiple locations allows companies to manage their inventory in multiple locations using one database. Two concepts, locations and stockkeeping units, are the cornerstones of this granule. A location is defined as a place that handles physical placement and quantities of items. The concept is broad enough to include locations such as plants or production facilities as well as distribution centers, warehouses, showrooms and service vehicles. A stockkeeping unit is defined as an item at a specific location and/or as a variant. Using stockkeeping units, companies with multiple locations are able to add replenishment information, addresses, and some financial posting information at the location level. As a result, they have the ability to replenish variants of the same item for each location as well as to order items for each location on the basis of location-specific replenishment information.

Responsibility centers extends the multiple locations functionality by providing users the ability to handle administrative centers. A responsibility center can be a cost center, a profit center, an investment center, or other company-defined administrative center. Examples of responsibility centers are a sales office, a purchasing department for several locations, and a plant planning office. Using this functionality, for example, companies can set up user-specific views of sales and purchase documents related exclusively to a particular responsibility center.

To set up a responsibility center

1. Choose the  icon, enter **Responsibility Centers**, and then choose the related link.
2. Choose the **New** action.
3. Fill in the fields as necessary. Hover over a field to read a short description.

If you are using responsibility centers to administer your company, it can be useful to have a default responsibility center for your company.

4. Choose the  icon, enter **Company Information**, and then choose the related link.
5. In the **Responsibility Center** field, enter a responsibility center code.

This code will be used on all purchase, sales, or service documents, if the user, customer, or vendor has no default responsibility center. On any sales, purchase, or service document, you can enter another responsibility center than the default.

NOTE

When you enter a responsibility center code on a document, it affects the address, dimensions, and prices on the document.

To assign responsibility centers to users

You can set up users so that in their daily routines the program retrieves only the documents relevant for their particular work areas. Users are usually associated with one responsibility center and work only with documents related to specific application areas at that particular center.

To set this up, you assign responsibility centers to users in three functional areas: Purchases, Sales, and Service Management.

1. Choose the  icon, enter **User Setup**, and then choose the related link.
2. On the **User Setup** page, select the user you want to assign a responsibility center to. If the user not is on the list, you must enter a user ID in the **User ID** field.
3. In the **Sales Resp. Ctr. Filter** field, enter the responsibility center where the user will have tasks related to sales.
4. In the **Purchase Resp. Ctr. Filter** field, enter the responsibility center where the user will have tasks related to purchasing.
5. In the **Service Resp. Ctr. Filter** field, enter the responsibility center where the user will have tasks related to service management.

NOTE

Users will still be able to view all posted documents and ledger entries, not just those related to their own responsibility center.

Set Up Locations

3/31/2019 • 2 minutes to read

If you buy, store, or sell items at more than one place or warehouse, you must set each location up with a location card and define transfer routes.

You can then create document lines for a specific location, view availability by location, and transfer inventory between locations. For more information, see [Manage Inventory](#).

To create a location card

1. Choose the  icon, enter **Locations**, and then choose the related link.
2. Choose the **New** action.
3. On the **Location Card** page, fill in the fields as necessary. Hover over a field to read a short description.
4. Repeat steps 2 and 3 for every location where you want to keep inventory.

NOTE

Many fields on the location card refer to the handling of items in inbound and outbound warehouse processes. For more information, see [Setting Up Warehouse Management](#).

To create a transfer route

1. Choose the  icon, enter **Transfer Routes**, and then choose the related link.
2. Alternatively, from any **Location Card** page, choose the **Transfer Routes** action.
3. Choose the **New** action.
4. On the **Location Card** page, fill in the fields as necessary. Hover over a field to read a short description.

You can now transfer inventory items between two locations. For more information, see [Transfer Inventory Between Locations](#).

Register New Items

3/31/2019 • 4 minutes to read

Items, among other products, are the basis of your business, the goods or services that you trade in. Each item must be registered as an item card.

Item cards hold the information that is required to buy, store, sell, deliver, and account for items.

The item card can be of type **Inventory**, **Service**, or **Non-Inventory** to specify if the item is a physical inventory unit, a labor time unit, or a physical unit that is not tracked in inventory. For more information, see [About Item Types](#).

An item can be structured as a parent item with underlying child items in a bill of materials (BOM). In Business Central, a bill of material can be either an assembly BOM or a production BOM, depending on its use. For more information, see [Work with Bills of Material](#).

If you purchase the same item from more than one vendor, you can connect those vendors to the item card. The vendors will then appear on the **Item Vendor Catalog** page, so that you can easily select an alternate vendor.

Items that you offer to your customers but you do not want manage in your system until you start selling them can be set up as catalog items. Catalog items are not to be mistaken with regular items of type **Non-Inventory**. For more information, see [Work with Catalog Items](#).

NOTE

If item templates exist for different item types, then a page appears when you create a new item card from where you can select an appropriate template. If only one item template exists, then new item cards always use that template.

To create a new item card

1. Choose the  icon, enter **Items**, and then choose the related link.
2. On the **Items** page, choose the **New** action.

If only one item template exists, then a new item card opens with some fields filled with information from the template.

3. On the **Select a template for a new item** page, choose the template that you want to use for the new item card.
4. Choose the **OK** button. A new item card opens with some fields filled with information from the template.
5. Proceed to fill or change fields on the item card as necessary. Hover over a field to read a short description.

NOTE

In the **Costing Method** field, you set up how the item's unit cost is calculated by making assumptions about the flow of physical items through your company. Five costing methods are available, depending on the type of item. For more information, see [Design Details: Costing Methods](#).

If you select **Average**, then the item's unit cost is calculated as the average unit cost at each point in time after a purchase. Inventory is valued with the assumption that all inventories are sold simultaneously. With this setting, you can choose the **Unit Cost** field to view, on the **Average Cost Calc. Overview** page, the history of transactions that the average cost is calculated from.

On the **Price and Posting** FastTab, you can view special prices or discounts that you grant for the item if certain criteria are met, such as customer, minimum order quantity, or ending date. Each row represents a special price or line discount. Each column represents a criterion that must apply to warrant the special price that you enter in the **Unit Price** field, or the line discount that you enter in the **Line Discount %** field. For more information, see [Record Sales Price, Discount, and Payment Agreements](#).

The item is now registered, and the item card is ready to be used on purchase and sales documents.

If you want to use this item card as a template when you create new item cards, you can save it as a template. For more information, see the following section.

To save the item card as a template

1. On the **Item Card** page, choose the **Save as Template** action. The **Item Template** page opens showing the item card as a template.
2. Fill in the fields as necessary. Hover over a field to read a short description.
3. To reuse dimensions in templates, choose the **Dimensions** action. The **Dimension Templates** page opens showing any dimension codes that are set up for the item.
4. Edit or enter dimension codes that will apply to new item cards created by using the template.
5. When you have completed the new item template, choose the **OK** button.

The item template is added to the list of item templates, so that you can use it to create new item cards.

To set up multiple vendors for an item

If you purchase the same item from more than one vendor, you must enter information about each vendor of the item, such as prices, lead time, discounts, and so on.

1. Choose the  icon, enter **Items**, and then choose the related link.
2. Select the relevant item, and then choose the **Edit** action.
3. Choose the **Vendors** action.
4. Choose the **Vendor No.** field, and then select the vendor that you want to set up for the item.
5. Optionally, fill in the remaining fields.
6. Repeat steps 2 through 5 for each vendor that you want to buy the item from.

The vendors will now appear on the **Item Vendor Catalog** page, which you open from the item card, so that you can easily select an alternate vendor.

About Item Types

3/31/2019 • 2 minutes to read

In the **Type** field on the **Item Card** page, you can select what the item is used for in your business and therefore how it is managed in the system. Three options exist:

OPTION	TYPICAL PURPOSE
Inventory	A physical unit, such as a bicycle, for full business support.
Non-Inventory	A physical unit, such as a bolt, for limited business support, for example, because the item is only used internally and has a low cost.
Service	A labor time unit, such as a consultancy hour, for limited business support.

The **Inventory** type involves full tracking of inventory quantity and value. Therefore, all item transaction types are supported, and items of type Inventory can be used with all item-handling features.

The **Service** and **Non-Inventory** types do not involve tracking of inventory quantity and value. Therefore, only selected item transaction types and features are supported.

The three item types support the following features respectively.

ITEM TYPE	SALES	PURCHASING	JOB COST	SEVICE COST	ASSEMBLY	PRODUCTION	ASSEMBLY	PRODUCTION	LOAN	PHYSICAL	INVENTORY	INTERNAL	ITEM	REVERSE	WAREHOUSE	PLANNING
Inventory	Yes	Yes	Yes	Yes	Yes	Yes	Yes	Yes	Yes	Yes	Yes	Yes	Yes	Yes	Yes	Yes
Non-Inventory	Yes	Yes	Yes	Yes	Yes	Yes	No	No	No	No	No	No	No	No	No	No
Service	Yes	Yes	Yes	No	No	No	No	No	No	No	No	No	No	No	No	No

NOTE

Items that you offer to your customers but you do not want manage in your system until you start selling them can be set up as catalog items. Catalog items are not to be mistaken with regular items of type Non-Inventory. For more information, see [Work with Catalog Items](#).

NOTE

Customers' items that you perform service on, such as a printer, are called service items. Service items have nothing to do with regular or catalog items. However, service components can be regular items. For more information, see [Set Up Service Items and Service Item Components](#).

Set Up Item Units of Measure

3/31/2019 • 3 minutes to read

You can set up multiple units of measure for an item so that you can assign units of measure to the item for the following purposes:

- Assign a base unit of measure on the item's item card to define how it is stored in inventory and to serve as the conversion basis for alternate units of measure.
- Assign alternate units of measure to purchase, production, or sales documents to specify how many units of the base unit of measure you handle at a time in those processes. For example, you may buy the item on pallets and only use single pieces in your production.

If an item is stocked in one unit of measure but produced in another, a production order is created that uses a manufacturing batch unit of measure to calculate the correct quantity of the components during the **Refresh Production Order** batch job. An example of a manufacturing batch unit of measure calculation is when a manufactured item is stocked in pieces but produced in tons. For more information, see [Work with Manufacturing Batch Units of Measure](#).

To set up a unit of measure

1. Choose the  icon, enter **Items**, and then choose the related link.
2. Open the card of the item for which you want to set up alternate units of measure.
3. Choose the **Units of Measure** action. The **Item Units of Measure** page opens.
4. If the **Base Unit of Measure** field on the item card is filled, then that unit of measure is already set up.
5. Choose the **New** action. A new empty line is inserted.
6. In the **Code** field, enter the name of the unit of measure. Alternatively, choose the field to select from the unit of measure codes that are in the database.
7. In the **Qty. per Unit of Measure** field, enter how many units of the base unit of measure the new unit of measure contains.
8. Repeat steps 5 through 7 to set up all the alternate units of measure that you want to use in different processes for this item.

You can now use the alternate units of measure on purchase, production, and sales documents. For more information, see [Enter Default Units of Measure Codes for Purchase Transactions and Sales Transactions](#) or [Use the Manufacturing Batch Unit of Measure](#).

To set up unit of measure translations

When you sell items to foreign customers, you may want to specify the unit of measure in the customer's language. You can do this after you have set up the necessary unit of measure translations.

1. Choose the  icon, enter **Units of Measure**, and then choose the related link.
2. Select the code for which you want to set up translations, and then choose the **Translations** action.
3. In the **Language Code** field, select the drop-down arrow to see a list of available language codes. Select the language code for which you want to enter a translation, and then choose the OK button to copy the code to the field.
4. In the **Description** field, enter the appropriate text.
5. Repeat steps 2 through 4 for the unit of measure codes and the languages for which you want to enter translations.

To enter a default unit of measure code for sales and purchasing transactions

If you usually buy or sell in units different from the base unit of measure, you can specify separate units of measure for purchases and sales. To do this, the units of measure must be set up on the **Item Units of Measure** page.

1. Choose the  icon, enter **Items**, and then choose the related link.
2. Open the relevant item card for which you want to specify a default sales or purchase unit of measure code.
3. For sales, on the **Invoicing** FastTab, in the **Sales Unit of Measure** field, open the **Item Units of Measure** page.
4. For purchasing, on the **Replenishment** FastTab, in the **Purch. Unit of Measure** field, open the **Item Units of Measure** page.
5. Select the code you want to set up as the default unit of measure for sales or purchasing respectively, and then choose the **OK** button.

Set Up Stockkeeping Units

3/31/2019 • 2 minutes to read

You can use stockkeeping units to record information about your items for a specific location or a specific variant code.

Stockkeeping units are a supplement to item cards. They do not replace them, although they are related to them. Stockkeeping units allow you to differentiate information about an item for a specific location, such as a warehouse or distribution center, or a specific variant, such as different shelf numbers and different replenishment information, for the same item.

To set up a stockkeeping unit

1. Choose the  icon, enter **Stockkeeping Units**, and then choose the related link.
2. Choose the **New** action.
3. Fill in the fields on the card. The following fields are required: **Item No.**, **Location Code**, and/or **Variant Code**.
Hover over a field to read a short description.

When you have set up the first stockkeeping unit for an item, the **Stockkeeping Unit Exists** check box on the **Item** card is selected.

To create several stockkeeping units for an item, use the **Create Stockkeeping Unit** batch job.

NOTE

The information on the **Stockkeeping Unit** card has priority over the **Item** card.

WARNING

If the SKU is supplied through production, then the **Standard Cost** field is not used when invoicing and adjusting the actual cost of the produced item. Instead, the **Standard Cost** field on the underlying item card is used, and any variances are calculated against the cost shares of that item.

Because production BOMs and routing cannot be assigned to SKUs, then the unit cost roll-up and the related calculation of cost shares are also not available on SKUs. For more information, see [About Calculating Standard Cost](#)

Categorize Items

3/31/2019 • 2 minutes to read

To maintain an overview of your items and to help you sort and find items, it is useful to organize your items in item categories.

To find items by characteristics, you can assign item attributes to items and also to item categories. For more information, see [Work with Item Attributes](#).

To create an item category

1. Choose the  icon, enter **Item Categories**, and then choose the related link.
2. On the **Item Categories** page, choose the **New** action.
3. On the **Item Category Card** page, on the **General** FastTab, fill in the fields as necessary. Hover over a field to read a short description.
4. On the **Attributes** FastTab, specify any item attributes for the item category. For more information, see [To assign item attributes to item categories](#).

NOTE

If the item category has a parent item category, as indicated by the **Parent Category** field, then any item attributes that are assigned to that parent item category are prefilled on the **Attributes** FastTab.

NOTE

Item attributes that you assign to an item category will automatically apply to the item that the item category is assigned to.

To assign an item category to an item

1. Choose the  icon, enter **Items**, and then choose the related link.
2. Open the card for the item that you want to assign to an item category.
3. Choose the lookup button in the **Item Category Code** field and select an existing item category. Alternatively, choose the **New** action to first create a new item category as explained in [To create an item category](#).

Import Multiple Item Pictures

3/31/2019 • 2 minutes to read

You can import multiple item pictures in one go. Simply name your picture files with names corresponding to your item numbers, compress them to a ZIP file, and then use the **Import Item Pictures** page to manage which item pictures to import.

All common file formats are supported.

To name picture files by the item names and prepare the ZIP file

1. At the location where your item pictures are stored, name each files according to the number of the related item. For example:

ITEM NO.	FILE NAME
1000	1000.bmp
1001	1001.bmp
1002	1002.bmp

2. Collect all the files in a ZIP file. For example, in Windows Explorer, select the files, and then choose **Send to, Compressed (zipped) folder**.

To import item pictures

1. Choose the  icon, enter **Inventory Setup**, and then choose the related link.
2. Choose the **Import Item Pictures** action.
3. In the **Select a ZIP file** field, select the relevant ZIP folder, and then choose the **Open** button.

A line for each item and picture is created on the **Import Item Pictures** page.

NOTE

For item cards that already have a picture, the **Picture Already Exists** check box is selected. If you do not want any existing pictures to be replaced, deselect the **Replace Pictures** check box. If you do not want individual existing pictures to be replaced, delete the lines in question.

4. Choose the **Import Pictures** action.

The **Import Status** field is updated to show if the picture import was skipped or completed.

Setting Up Project Management

3/31/2019 • 2 minutes to read

Before you can use Business Central to manage projects, you must set up resources, time sheets, and jobs.

Then you can create jobs and schedule resources for projects as well as manage budgets and track machine and employee hours with time sheets. For more information, see [Managing Projects](#).

The following table describes a sequence of tasks, with links to the topics that describe them.

TO	SEE
Set up project management.	Set general information for jobs
Set up your resources and the related costs and prices, either for individual resources, resource groups, or for all available resources of the company.	Set Up Resources
Enable resources to report time usage for an individual or a machine and enable a manager to review the usage and its allocation.	Set Up Time Sheets
Create job cards and prepare job tasks. Set up prices for job items and job resources and define job posting groups.	Set Up Jobs

Set Up Resources

3/31/2019 • 3 minutes to read

To correctly manage resource activities, you must set up your resources and the related costs and prices. The job-related prices, discounts, and cost factor rules are set up on the job card. You can specify the costs and prices for individual resources, resource groups, or all available resources of the company.

When resources are used or sold in a job, the prices and costs associated with them are retrieved from the information that you set up.

You specify the default amount per hour when the resource is created. For example, if you use a specific machine on a job for five hours, the job would be calculated based on the amount per hour.

To set up a resource

Create a card for each resource that you want to use in projects.

1. Choose the  icon, enter **Resources**, and then choose the related link.
2. Choose the **New** action.
3. Fill in the fields as necessary. Hover over a field to read a short description.

To set up a resource group

You can combine several resources in one resource group. All capacities and budgets of resource groups are accumulated from the individual resources. It is also possible to enter capacities for resource groups either independently of the accumulated values or in addition to them.

1. Choose the  icon, enter **Resource groups**, and then choose the related link.
2. Choose the **New** action.
3. Fill in the fields as necessary.

To set capacity for a resource

To calculate how much time a resource can spend on jobs, their capacity must first be set up as available time per period on the work calendar. This setup is used when you fill in job planning lines that contain the resource. For more information, see [Create Jobs](#).

1. Choose the  icon, enter **Resources**, and then choose the related link.
2. Open the relevant resource card, and then choose the **Resource Capacity** action.
3. On the **Resource Capacity** page, in the **View By** field, specify the length of the period, such as **Day**, that is shown on columns on the **Resource Capacity Matrix** FastTab.
4. For each resource on a line, specify for each period on the columns the number of hours that the resource is available.
5. Alternatively, to detail the resource's weekly capacity within a starting and ending date, choose the **Set Capacity** action.
6. On the **Resource Capacity Settings** page, fill in the fields as necessary.
7. Choose the **Update Capacity** action. The **Resource Capacity** page is updated with the entered capacity.
8. Close the page.

To set up alternate resource costs

In addition to the cost specified on the resource card, you can set up alternate costs for each resource. For example, if you pay an employee a higher hourly rate for overtime, you can set up a resource cost for the overtime rate. The alternate cost that you set up for the resource will override the cost on the resource card when you use the resource in the resource journal.

1. Choose the  icon, enter **Resources**, and then choose the related link.
2. Select the resource for that you want to set up one or more alternate costs for, and then choose the **Costs** action.
3. On the **Resource Costs** page, fill in the fields on a line as necessary.
4. Repeat step 3 for each alternate resource cost that you want to set up.

Note. To set up resource costs that will apply to all resources and resource groups, open the **Resource Costs** page and fill in the fields.

To set up alternate resource prices

In addition to price specified on the resource card, you can set up alternate prices for each resource. These alternate prices can be conditional. They can depend on whether the resource is used with a specific job or work type.

1. Choose the  icon, enter **Resources**, and then choose the related link.
2. Select the resource for that you want to set up one or more alternate prices for, and then choose the **Prices** action.
3. On the **Resource Prices** page, fill in the fields on a line as necessary.
4. Repeat step 3 for each alternate resource price that you want to set up.

Set Up Time Sheets

3/31/2019 • 2 minutes to read

Time sheets in Business Central handle time registration in weekly increments of seven days. You use them to track the time used on jobs, and you can use them to record simple resource time registration. Before you can use time sheets, you must specify how you want them to be set up and configured.

After you have set up how your organization will use time sheets, you can specify if and how time sheets are approved. Depending on the needs of your organization, you can designate:

- One or more users as the time sheet administrator and approver for all time sheets.
- A time sheet approver for each resource.

When you have set up time sheets, you can create time sheets for resources, assign them to job planning lines, and post time sheet lines. For more information, see [Use Time Sheets](#).

To set up general information for time sheets

1. Choose the  icon, enter **Resources Setup**, and then choose the related link.
2. Fill in the fields as necessary. Hover over a field to read a short description.
3. For the **Time Sheet by Job Approval** field, select one of the following options.

OPTION	DESCRIPTION
Never	The user in the Time Sheet Approver User ID field on the resource card approves the time sheet.
Always	The user in the Person Responsible field on the job card approves the time sheet.
Machine Only	If the machine time sheet is linked with a job, then the user in the Person Responsible field on the job card approves the time sheet. If the machine time sheet is linked with a resource, then the user in the Time Sheet Approver User ID field on the resource card approves the time sheet.

To assign a time sheet administrator

1. Choose the  icon, enter **User Setup**, and then choose the related link.
2. Add a new user if the user list does not include the person who you want to be the time sheet administrator.
For more information, see [Managing Users and Permissions](#).
3. Select a user to be a time sheet administrator, and then select the **Time Sheet Admin.** check box.

TIP

It is recommended that you designate only one user to be the time sheet administrator for a company. In the following procedure, you set up a time sheet owner and approver where the time sheet approver is assigned for each resource.

To assign a time sheets owner and approver

1. Choose the  icon, enter **Resources**, and then choose the related link.
2. Select the resource for which you want to set up the ability to use time sheets, and then select the **Use Time Sheet** check box.
3. In the **Time Sheet Owner User ID** field, enter the ID of the owner of the time sheet. The owner can enter time usage on a time sheet and submit it for approval. In general, when the resource is a person, that person is also the owner.
4. In the **Time Sheet Approver User ID** field, enter the ID of the approver of the time sheet. The approver can approve, reject, or reopen a time sheet.

NOTE

You cannot change the ID of the time sheet approver if there are time sheets that have not yet been processed and have the status of **Submitted** or **Open**.

Set Up Jobs

3/31/2019 • 7 minutes to read

As a project manager, you can set up jobs that define each of the projects that you manage in Business Central. On the **Jobs Setup** page, you must specify how you want to use certain job features.

For each job, you then specify individual job cards with information about prices for job items, job resources, and job G/L accounts, and you must set up job posting groups.

To set general information for jobs

1. Choose the , enter **Jobs Setup**, and then choose the related link.
2. Fill in the fields as necessary. Hover over a field to read a short description.

NOTE

The impact of the **Apply Usage Link by Default** field is rather complex and is therefore explained in the following section.

To set up job usage tracking

When you are executing a job, you might want to know how your usage is tracking against your plan. To easily do this, you can create a link between your job planning lines and the actual usage. This lets you track your costs and to easily see at how much work remains to be done. By default, the job planning line type is **Budget**, but using the line type **Both Budget and Billable** has similar effects.

If you select the **Apply Usage Link by Default** field, then you can review information on the job planning line. You can set the quantity of the resource, item, or general ledger account and then indicate what quantity you want to transfer to the job journal. The **Remaining Quantity** field on the job planning line will tell you what remains to be transferred and posted to the job journal.

TIP

You can enable or disable job usage tracking for a specific job. The value of the **Apply Usage Link** field on the individual job card overrides the setting in the **Jobs Setup** page.

When the **Apply Usage Link by Default** check box is selected, and the job planning line type is **Billable**, a job planning line of type **Budget** is created after you post a job journal line.

IMPORTANT

If job usage tracking is enabled, either in the **Jobs Setup** page or on the individual job, and the **Line Type** field on the job journal line is blank, then new job planning lines of line type **Budget** are created when you post job journal lines.

If job usage tracking is *not* enabled, either in the **Jobs Setup** page or on the individual job, and the **Line Type** field on the job journal line is blank, then no job planning lines are created when you post job journal lines. For more information, see [Record Usage for Jobs](#).

1. Choose the , enter **Jobs Setup**, and then choose the related link.
2. Select the **Apply Usage Link by Default** check box.

To set up prices for job resources

You can set up specific prices for resources for a job. You use the **Job Resource Prices** page to do this.

1. Choose the  icon, enter **Jobs**, and then choose the related link.
2. Select the relevant job, and then choose the **Resource** action.
3. On the **Job Resource Prices** page, fill in the fields as necessary.

The optional information in the **Job Task No.**, **Work Type**, **Currency Code**, **Line Discount %**, and **Unit Cost Factor** fields will be used on the job planning lines and usage journals when this resource is entered and added to the job.

The value in the **Unit Price** field for the resource will be used on the job planning lines and job journals when this resource, a resource assigned to the resource group, or any resource is entered.

NOTE

This price will always override any prices set up in the existing **Resource Price/Resource Group Prices** page.

To set up prices for job items

You can set up specific prices for items for a job. You use the **Job Item Prices** page to do this.

1. Choose the  icon, enter **Jobs**, and then choose the related link.
2. Select the relevant job, and then choose the **Item** action.
3. On the **Job Item Prices** page, fill in the fields as necessary.

The optional information in the **Job Task No.**, **Currency Code**, and **Line Discount %** fields will be used in the job planning lines and job journals when this item is entered or added to the job.

The value in the **Unit Price** field for the item will be used on the job planning lines and job journals when this item is entered.

NOTE

This price will always override the regular customer price (the "best price" mechanism) for items. If you want to use the regular customer price mechanisms, then you should not create any job item prices for the job.

To set up prices for job general ledger accounts

You can set up specific prices for general ledger expenses for a job. You use the **Job G/L Account Prices** page to do this.

1. Choose the  icon, enter **Jobs**, and then choose the related link.
2. Select the relevant job, and then choose the **G/L Account** action.
3. On the **Job G/L Account Prices** page, fill in the fields as necessary.

The optional information in the **Job Task No.**, **Currency Code**, **Line Discount %**, **Unit Cost Factor**, and **Unit Cost** fields will be used on the job planning lines and job journals when this general ledger account is entered and added to a job.

The value in the **Unit Price** field for the general ledger job expense will be used on the job planning lines and job journals when this general ledger account is entered.

To set up job posting groups

One aspect of planning jobs is deciding which posting accounts to use for job costing. To be able to post jobs, you set up accounts for posting for each job posting group. A posting group represents a link between the job and how it should be treated in the general ledger. When you create a job, you specify a posting group, and by default, each task you create for the job is associated with that posting group. However, as you create tasks, you can override the default and select a posting group that is more appropriate.

NOTE

The necessary accounts in the chart of accounts must be set up before you set up posting groups. For more information, see [Set Up or Change the Chart of Accounts](#).

1. Choose the  icon, enter **Job Posting Groups**, and then choose the related link.
2. Choose the **New** action, and then fill in the account fields as described in the following table.

ACCOUNT FIELD	DESCRIPTION
Code	A code for the posting group. You can enter up to 10 characters, including spaces.
WIP Costs Account	The WIP account for the calculated cost of the job WIP, which is a balance sheet capital asset account.
WIP Accrued Costs Account	An account for the Cost Value or Cost of Sales method of WIP calculation, which is a balance sheet accrued expense liability account. This will be posted to when the WIP adjustment requires that usage costs posted to the income statement be increased.
Job Costs Applied Account	A balancing account to the WIP Costs Account, which is a contra for a negative expense account.
Item Costs Applied Account	A balancing account to the WIP Costs Account, which is a contra for a negative expense account.
Resource Costs Applied Account	A balancing account to the WIP Costs Account, which is a contra for a negative expense account.
Costs Applied Account	A balancing account to the WIP Costs Account, which is a contra for a negative expense account.
Job Costs Adjustment Account	The balancing account to the WIP Accrued Costs account, which is an expense account.
G/L Expense Acc. (Budget)	The sales account that will be used for general ledger expenses in job tasks with this posting group. If left empty, the general ledger account entered on the job planning line is used.
WIP Accrued Sales Account	The WIP account for the calculated sales value of the WIP, which is a balance sheet Accrued Revenue account. This is posted to when the WIP adjustment requires the recognized revenue to be increased.

ACCOUNT FIELD	DESCRIPTION
WIP Invoiced Sales Account	The account for the invoiced sales value of the WIP that is not able to be recognized. It is a balance sheet Unearned Revenue account.
Job Sales Applied Account	The balancing account to the WIP Invoiced Sales account, which is a contra income account.
Job Sales Adjustment Account	The balancing account to the WIP Job Sales Account, which is an income account.
Recognized Costs Account	The expense account that contains the recognized costs for the job. It is a debit expense account ordinarily.
Recognized Sales Account	The income account that contains the recognized income for the job. It is a credit income account ordinarily.

Setting Up Fixed Assets

3/31/2019 • 2 minutes to read

Before you can work with Fixed Assets, you need to define a few things:

- How you insure, maintain, and depreciate fixed assets.
- How you record costs and other values in the general ledger.

The table below has links to more information. After you set those things up, you can start various activities. For more information, see [Fixed Assets](#).

NOTE

You can record fixed asset transactions in the **Fixed Asset G/L Journal** or **Fixed Asset Journal** pages, depending on whether the transactions are for financial reporting or for internal management. Help for Fixed Assets only describes how to use the **Fixed Asset G/L Journal** page.

When you enable a fixed asset activity in the **G/L Integration** section on the **Depreciation Book Card** page, the **Fixed Asset G/L Journal** page is used to post transactions for the activity.

The following table describes a sequence of tasks, with links to the topics that describe them.

TO	SEE
Set up default G/L accounts, allocation keys, journal templates and batches for fixed asset posting, and set up fixed asset classes and subclasses, such as Tangible and Intangible.	Set Up General Fixed Assets Information
Create depreciation books, define various depreciation methods, integrate with the general ledger, and enable duplication of entries in several depreciation books.	Set Up Fixed Asset Depreciation
Enable insurance of fixed assets, set up general insurance information, an insurance card per policy, and prepare journals to post insurance costs.	Set Up Fixed Asset Insurance
Enable maintenance of fixed assets, set up general maintenance information, set up maintenance posting accounts, and define types of maintenance work.	Set Up Fixed Asset Maintenance
Learn about different fixed asset depreciation methods.	Depreciation Methods

Set Up General Fixed Assets Information

3/31/2019 • 6 minutes to read

Before you can manage fixed assets, you must set up default G/L accounts, allocation keys, journal templates and batches for fixed asset posting and reclassification, and you can classify fixed assets in classes, such as Tangible and Intangible.

To set up general default values for fixed assets

You define the general behavior or the fixed asset functionality and set up document number series in the on the **Fixed Assets Setup** page.

1. Choose the  icon, enter **Fixed Assets Setup**, and then choose the related link.
2. Fill in the fields as necessary. Hover over a field to read a short description.

To set up fixed asset posting groups

You use posting groups to define groups of fixed assets. Entries for these posting groups are posted to the same general ledger accounts.

1. Choose the  icon, enter **FA Posting Groups**, and then choose the related link.
2. Choose the **New** action.
3. On the **FA Posting Group Card** page, fill in the fields as necessary.

NOTE

To make sure that balancing accounts for different fixed assets postings are automatically inserted when you choose the **Insert FA Bal. Account** action on journal lines, follow the next step, based on appreciation posting.

4. On the **Balancing Account** FastTab, in the **Appreciation Bal. Account** field, select the general ledger account to which you want to post balancing entries for appreciation.

For more information about using the **Insert FA Bal. Account** action on fixed asset G/L journal lines, see, for example, [Revalue Fixed Assets](#).

To set up fixed asset allocation keys

Transactions can be allocated to various departments or projects, according to user-defined allocation keys. For example, you could set up an allocation key to allocate depreciation costs on cars with 35 percent to the administration department and 65 percent to the sales department. For more information, see [Allocate Costs and Income](#).

Allocation keys apply to fixed asset classes, not to individual assets.

1. Choose the  icon, enter **FA Posting Groups**, and then choose the related link.
2. On the **FA Posting Groups** page, choose the **Allocations** action, and then choose a posting type.
3. On the **FA Allocations** page, fill in the fields as necessary.
4. Repeat steps 2 and 3 for each posting type that you want to define allocation keys for.

To set up fixed asset journal templates

A template is a predefined layout for a journal. The template contains information about trace codes, reports, and number series. For more information, see [Working with General Journals](#).

Business Central automatically creates a fixed asset journal template the first time that you open the **Fixed Asset Journal** page, but you can set up additional journal templates.

1. Choose the  icon, enter **FA Journal Templates**, and then choose the related link.
2. Fill in the fields as necessary.

To set up fixed asset journal batches

You can set up multiple journal batches, which are individual journals for each journal template. For example, employees can have their own journal batch that uses the employee's initials as the journal batch name. For more information, see [Work with General Journals](#).

1. Choose the  icon, enter **FA Journal Templates**, and then choose the related link.
2. Select the relevant journal template, and then choose the **Batches** action.
3. On the **FA Journal Batches** page, fill in the fields as necessary.

To set up fixed asset reclassification journal templates

You use dedicated reclassification journals when you need to transfer, split, or combine fixed assets. Business Central automatically creates a fixed asset reclassification journal template the first time that you open the **FA Reclass. Journal** page, but you can set up additional reclassification journal templates. For more information, see [Work with General Journals](#).

1. Choose the  icon, enter **FA Reclass. Journal Templates**, and then choose the related link.
2. Fill in the fields as necessary.

To set up fixed asset reclassification journal batches

You can set up multiple journal batches, which are individual journals for each reclassification journal template. For example, employees can have their own reclassification journal batch that uses the employee's initials as the reclassification journal batch name. For more information, see [Work with General Journals](#).

1. Choose the  icon, enter **FA Reclass. Journal Templates**, and then choose the related link.
2. Select the relevant journal template, and then choose the **Batches** action.
3. On the **FA Reclass. Journal Batches** page, fill in the fields as necessary.

To set up fixed asset class codes

Fixed asset class codes can be used to group fixed assets, for example, in tangible and intangible assets.

1. Choose the  icon, enter **FA Classes**, and then choose the related link.
2. Enter codes and names for the classes that you want to create.

To set up fixed asset subclass codes

You use fixed asset subclass codes to group your fixed assets into categories, such as buildings, vehicles, furniture, or machinery.

1. Choose the  icon, enter **FA Subclasses**, and then choose the related link.
2. Enter codes and names for the classes that you want to create.

To set up fixed asset location codes

You use fixed asset location codes to register the location of the fixed asset, such as sales department, reception, administration, production, or warehouse. This information is useful for insurance and inventory purposes.

1. Choose the  icon, enter **FA locations**, and then choose the related link.
2. Enter codes and names for the fixed asset locations that you want to create.

To register opening entries

If you are using the fixed assets in Business Central for the first time, you must set up the general ledger application area before you set up fixed assets. How you do this depends on whether fixed assets is integrated with general ledger.

The following procedure is used if fixed asset transactions are to be posted to the general ledger.

1. Make sure that you have completed the basic setup procedures for fixed assets.
2. Create a fixed asset card for each existing asset.
3. Create a fixed asset depreciation book for each depreciation purpose (such as tax and financial statements). For each depreciation book, you must define the terms and conditions, such as integration with general ledger.

Enable general ledger integration by following the next steps. First, make sure that general ledger integration is disabled for all depreciation books, then post the opening entries, and finally, turn on general ledger integration.

4. Choose the  icon, enter **Depreciation Books**, and then choose the related link.
5. Select the relevant depreciation book. On the **Home** tab, in the **Manage** group, choose **Edit** to open the **Depreciation Book Card** page.
6. On the **Integration** FastTab, make sure all fields are blank by clearing all check marks. If you have more than one depreciation book, turn off general ledger integration for each one.
7. In the fixed asset journal, enter the following lines for each asset:
 - A line with the acquisition cost.
 - A line with the accumulated depreciation to the end of the previous fiscal year.
 - A line with the accumulated depreciation from the start of the current fiscal year to the date that Business Central is set to start calculating the depreciation.If you have other opening balances you can also enter them now, such as write-down and appreciation.
8. After you have entered and posted the journal lines for each asset, turn on general ledger integration in the depreciation books.

If the fixed assets are not integrated with the general ledger, skip step 6 and 8.

Set Up Fixed Asset Depreciation

3/31/2019 • 4 minutes to read

You can use various methods of depreciation for preparing financial statements and income tax returns. Many large corporations use straight-line depreciation in their financial statements because this generally permits reporting higher earnings. For income tax purposes, however, many businesses use an accelerated depreciation method. For more information, see [Depreciation Methods](#).

When you have created the relevant depreciation books, you must assign one or more depreciation books to each fixed asset. A depreciation book that is assigned to a fixed asset is referred to as a fixed asset depreciation book. Accordingly, the page for assigned depreciation books is called **FA Depreciation Books**.

To create a depreciation book

In a fixed asset depreciation book, you specify how fixed assets are depreciated. To accommodate various methods of depreciation, you can set up multiple depreciation books.

1. Choose the  icon, enter **Depreciation Books**, and then choose the related link.
2. On the **Depreciation Books List** page, choose the **New** action.
3. On the **Depreciation Book Card** page, fill in the fields as necessary. Hover over a field to read a short description.

NOTE

You can record fixed asset transactions on the **Fixed Asset G/L Journal** page or on the **Fixed Asset Journal** page, depending on whether the transactions are for financial reporting or for internal management. Follow the next step to define which type of journal is used for the different fixed asset activities by default.

4. On the **Integration** FastTab, select the check box for each fixed asset activity whose transactions you want to post using the **Fixed Asset G/L Journal** page.
5. Repeat steps 2 through 4 for each depreciation method or posting method that you want to assign to fixed assets as a depreciation book.

To assign a depreciation book to a fixed asset

1. Choose the  icon, enter **Fixed Assets**, and then choose the related link.
2. Select the fixed asset that you want to set up a fixed asset depreciation book for.
3. On the **Depreciation Book** FastTab, fill in the fields as necessary.
4. If you need to assign more than one depreciation book to the fixed asset, choose the **Add More Depreciation Books** action.
5. Alternatively, choose the **Depreciation Books** action to specify one or more fixed asset depreciation books.

NOTE

When you use the manual depreciation method, you must enter depreciation manually in the fixed asset G/L journal. The **Calculate Depreciation** function omits fixed assets that use the manual depreciation method. You can use this method for assets that are not subject to depreciation, such as land.

To assign a depreciation book to multiple fixed assets with a batch job

If you want to assign a depreciation book to several fixed assets, you can use the **Create FA Depreciation Books** batch job to create fixed asset depreciation books.

1. Choose the  icon, enter **Fixed Assets**, and then choose the related link.
2. Select the fixed asset that you want to set up a assign a depreciation book to, and then choose the **Edit** action.
3. On the **Depreciation Book Card** page, choose the **Create FA Depreciation Books** action.
4. On the **Create FA Depreciation Books** page, fill in the **Depreciation Book** field.
5. Choose the **Copy from FA No.** field, and then select the fixed asset number that you want to use as the basis for creating new fixed asset depreciation books.

If you fill in this field, the depreciation fields in the new fixed asset depreciation books will contain the same information as the corresponding fields in the fixed asset depreciation book that you copy from. Leave the field blank if you want to create new fixed asset depreciation books with empty depreciation fields.

6. On the **Fixed Asset** FastTab, you can set a filter to select the assets that you want to create the fixed asset depreciation books for.
7. Choose the **OK** button.

To set up depreciation posting types

For each depreciation book, you must set up how you want Business Central to handle various posting types. For example, whether posting should be debit or credit and whether the posting type should be included in the depreciable basis.

1. Choose the  icon, enter **Depreciation Books**, and then choose the related link.
2. Select the depreciation book that you want to set up, and them choose the **FA Posting Type Setup** action.
3. On the **FA Posting Type Setup** page, fill in the fields as necessary.

NOTE

You cannot insert or delete lines on the **FA Posting Type Setup** page. You can only modify the existing lines.

We recommend that you do not change the setup for depreciation books for entries that have already been posted. Changes will not affect the entries that are already posted, which would make depreciation book statistics misleading.

To set up default templates and batches for fixed asset depreciation

For each depreciation book, you define a default setup of templates and batches. You use these defaults to duplicate lines from one journal to another, create journal lines using the **Calculate Depreciation** or **Index Fixed Assets** batch jobs, duplicate acquisition costs in the insurance journal.

1. Choose the  icon, enter **Depreciation Books**, and then choose the related link.
2. Select the depreciation book that you want to define default journals for, and then choose the **FA Journal Setup** action.
3. If you want to have a default setup for each user, choose the **User ID** field to select from the **Users** page.
4. In the other fields, select the journal template or journal batch that must be used by default.

Depreciation Methods

3/31/2019 • 12 minutes to read

There are eight methods of depreciation available:

- Straight-Line
- Declining-Balance 1
- Declining-Balance 2
- DB1/SL
- DB2/SL
- User-defined
- Manual

NOTE

Use this method for assets that are not subject to depreciation, for example, land. You must enter depreciation in the fixed asset G/L journal. The **Calculate Depreciation** batch job omits fixed assets that use this depreciation method.

- Half-Year Convention

NOTE

When you use this method, a fixed asset is depreciated by the same amount each year.

Straight-Line Depreciation

When you use the straight-line method, you must specify one of the following options in the fixed asset depreciation book:

- The depreciation period (years or months) or a depreciation ending date
- A fixed yearly percentage
- A fixed yearly amount
- Depreciation period

Depreciation Period

If you enter the depreciation period (the number of depreciation years, the number of depreciation months, or the depreciation ending date), the following formula calculates the depreciation amount:

$$\text{Depreciation Amount} = ((\text{Book value} - \text{Salvage Value}) \times \text{Number of Depreciation Days}) / \text{Remaining Depreciation Days}$$

Remaining depreciation days are calculated as the number of depreciation days minus the number of days between the depreciation starting date and the last fixed asset entry date.

Book value may be reduced by posted appreciation, write-down, custom 1 or custom 2 amounts, depending on whether the **Include in Depr. Calculation** field is deactivated and whether the **Part of Book Value** field is activated on the **FA Posting Type Setup** page. This calculation ensures that the fixed asset is fully depreciated at

the depreciation ending date.

Fixed Yearly Percentage

If you enter a fixed yearly percentage, the program uses the following formula to calculate the depreciation amount:

$$\text{Depreciation Amount} = (\text{Straight-Line \%} \times \text{Depreciable Basis} \times \text{Number of Depr. Days}) / (100 \times 360)$$

Fixed Yearly Amount

If you enter a fixed yearly amount, the program uses this formula to calculate the depreciation amount:

$$\text{Depreciation Amount} = (\text{Fixed Depreciation Amount} \times \text{Number of Depreciation Days}) / 360$$

Example - Straight-Line Depreciation

A fixed asset has an acquisition cost of LCY 100,000. The estimated life is eight years. The **Calculate Depreciation** batch job is run biannually.

For this example, the fixed asset ledger entry looks like this:

DATE	FA POSTING TYPE	DAYS	AMOUNT	BOOK VALUE
01/01/10	Acquisition Cost	*	100,000.00	100,000.00
06/30/10	Depreciation	180	-6,250.00	93,750.00
12/31/10	Depreciation	180	-6,250.00	87,500.00
06/30/11	Depreciation	180	-6,250.00	81,250.00
12/31/11	Depreciation	180	-6,250.00	75,000.00
06/30/17	Depreciation	180	-6,250.00	6,250.00
12/31/17	Depreciation	180	-6,250.00	0

- Depreciation starting date

Declining-Balance 1 Depreciation

This accelerated depreciation method allocates the largest portion of the cost of an asset to the early years of its useful lifetime. If you use this method, you must enter a fixed yearly percentage.

The following formula calculates depreciation amounts:

$$\text{Depreciation Amount} = (\text{Declining-Bal. \%} \times \text{Number of Depreciation Days} \times \text{Depr. Basis}) / (100 \times 360)$$

The depreciable basis is calculated as the book value less posted depreciation since the starting date of the current fiscal year.

The posted depreciation amount can contain entries with various posting types (write-down, custom1, and custom2) posted since the starting date of the current fiscal year. These posting types are included in the posted depreciation amount if there are check marks in the **Depreciation Type** and the **Part of Book Value** fields on the **FA Posting Type Setup** page.

Example - Declining-Balance 1 Depreciation

A fixed asset has an acquisition cost of LCY 100,000. The **Declining-Balance %** field is 25. The **Calculate Depreciation** batch job is run biannually.

The following table shows how the fixed asset ledger entries look.

DATE	FA POSTING TYPE	DAYS	AMOUNT	BOOK VALUE
01/01/10	Acquisition Costs	*	100,000.00	100,000.00
06/30/10	Depreciation	180	-12,500.00	87,500.00
12/31/10	Depreciation	180	-12,500.00	75,000.00
06/30/11	Depreciation	180	-9,375.00	65,625.00
12/31/11	Depreciation	180	-9,375.00	56,250.00
06/30/12	Depreciation	180	-7,031.25	49,218.75
12/31/12	Depreciation	180	-7,031.25	42,187.50
06/30/13	Depreciation	180	-5,273.44	36,914.06
12/31/13	Depreciation	180	-5,273.44	31,640.62
06/30/14	Depreciation	180	-3,955.08	27,685.54
12/31/14	Depreciation	180	-3,955.08	23,730.46

- Depreciation starting date

Calculation Method:

1st Year: 25% of 100,000 = 25,000 = 12,500 + 12,500

2nd Year: 25% of 75,000 = 18,750 = 9,375 + 9,375

3rd Year: 25% of 56,250 = 14,062.50 = 7,031.25 + 7,031.25

The calculation continues until the book value equals the final rounding amount or the salvage value that you entered.

Declining-Balance 2 Depreciation

The Declining-Balance 1 and Declining-Balance 2 methods calculate the same total depreciation amount for each year. However, if you run the **Calculate Depreciation** batch job more than once a year, the Declining-Balance 1 method will result in equal depreciation amounts for each depreciation period. The Declining-Balance 2 method, on the other hand, will result in depreciation amounts that decline for each period.

Example - Declining-Balance 2 Depreciation

A fixed asset has an acquisition cost of LCY 100,000. The **Declining-Balance %** field is 25. The **Calculate Depreciation** batch job is run biannually. The fixed asset ledger entries look like this:

DATE	FA POSTING TYPE	DAYS	AMOUNT	BOOK VALUE
01/01/10	Acquisition Costs	*	100,000.00	100,000.00
06/30/10	Depreciation	180	-13,397.46	86,602.54

DATE	FA POSTING TYPE	DAYS	AMOUNT	BOOK VALUE
12/31/10	Depreciation	180	-11,602.54	75,000.00
06/30/11	Depreciation	180	-10,048.09	64,951.91
12/31/11	Depreciation	180	-8,701.91	56,250.00

- Depreciation starting date

Calculation Method:

- BV = Book value
- ND = Number of depreciation days
- DBP = Declining-balance percent
- P = DBP/100
- D = ND/360

The formula for calculating the depreciation amounts is:

$$DA = BV \times (1 - (1 - P)^D)$$

The depreciation values are:

DATE	CALCULATION
06/30/10	$DA = 100,000.00 \times (1 - (1 - 0.25)^{0.5}) = 13,397.46$
12/31/10	$DA = 86,602.54 \times (1 - (1 - 0.25)^{0.5}) = 11,602.54$
06/30/11	$DA = 75,000.00 \times (1 - (1 - 0.25)^{0.5}) = 10,048.09$
12/31/11	$DA = 64,951.91 \times (1 - (1 - 0.25)^{0.5}) = 8,701.91$

DB1/SL Depreciation

DB1/SL is an abbreviated combination of Declining-Balance 1 and Straight-Line. The calculation continues until the book value equals the final rounding amount, or the salvage value that you entered.

The **Calculate Depreciation** batch job calculates a straight-line amount and a declining balance amount, but only the greater of the two amounts is transferred to the journal.

You can use various percentages to calculate declining-balance.

If you use this method, you must enter the estimated useful lifetime and a declining balance percentage on the **FA Depreciation Books** page.

Example - DB1-SL Depreciation

A fixed asset has an acquisition cost of LCY 100,000. On the **FA Depreciation Books** page, the **Declining-Balance %** field contains 25 and the **No. of Depreciation Years** field contains 8. The **Calculate Depreciation** batch job is run biannually.

The fixed asset ledger entries look like this:

DATE	FA POSTING TYPE	DAYS	AMOUNT	BOOK VALUE
01/01/10	Acquisition Costs	*	100,000.00	100,000.00
06/30/10	Depreciation	180	-12,500.00	87,500.00
12/31/10	Depreciation	180	-12,500.00	75,000.00
06/30/11	Depreciation	180	-9,375.00	65,625.00
12/31/11	Depreciation	180	-9,375.00	56,250.00
06/30/12	Depreciation	180	-7,031.25	49,218.75
12/31/12	Depreciation	180	-7,031.25	42,187.50
06/30/13	Depreciation	180	-5,273.44	36,914.06
12/31/13	Depreciation	180	-5,273.44	31,640.62
06/30/14	Depreciation	180	-3,955.08	27,685.54
12/31/14	Depreciation	180	-3,955.08	23,730.46
06/30/15	Depreciation	180	-3,955.08	19,775.38 SL
12/31/15	Depreciation	180	-3,955.08	15,820.30 SL
06/30/16	Depreciation	180	-3,955.08	11,865.22 SL
12/31/16	Depreciation	180	-3,955.07	7,910.15 SL
06/30/17	Depreciation	180	-3,955.08	3,955.07 SL
12/31/17	Depreciation	180	-3,955.07	0.00 SL

- Depreciation starting date

"SL" after the book value means that the straight-line method has been used.

Calculation method:

1st year:

Declining-balance amount: 25% of 100,000 = 25,000 = 12,500 + 12,500

Straight-line amount = 100,000 / 8 = 12,500 = 6,250 + 6,250

The declining-balance amount is used because it is the greater amount.

6th year (2015):

Declining-balance amount: 25% of 23,730.46 = 4,943.85 = 2,471.92 + 2,471.92

Straight-line amount = 23,730.46/3 = 7,910.15 = 3,995.07 + 3,995.08

The straight-line amount is used because it is the greater amount.

User-defined Depreciation

The program has a facility that allows you to set up user-defined depreciation methods.

With a user-defined method, you use the **Depreciation Tables** page, where you must enter a depreciation percentage for each period (month, quarter, year, or accounting period).

The formula for calculating the depreciation amounts is:

$$\text{Depreciation Amount} = (\text{Depreciation \%} \times \text{Number of Depreciation Days} \times \text{Depr. Basis}) / (100 \times 360)$$

Depreciation Based on Number of Units

This user-defined method can also be used to depreciate based on number of units, for example, in the case of production machines with an established lifetime capacity. On the **Depreciation Tables** page, you can enter the number of units that can be produced in each period (month, quarter, year, or accounting period).

To set up user-defined depreciation methods

On the **Depreciation Table** page, you can set up user-defined depreciation methods. For example, you can set up depreciation based on number of units.

1. Choose the  icon, enter **Depreciation Tables**, and then choose the related link.
2. On the **Depreciation Table List** page, choose the **New** action.
3. **Depreciation Table Card** page, fill in the fields as necessary. Hover over a field to read a short description.

Example - User-defined Depreciation

You use a depreciation method that allows you to depreciate assets in an accelerated manner for income tax purposes.

You would use the following depreciation rates for a fixed asset with a three-year lifetime for tax purposes:

- year 1: 25%
- year 2: 38%
- year 3: 37%

The acquisition cost is LCY 100,000, and the depreciable lifetime is five years. Depreciation is calculated annually.

DATE	FA POSTING TYPE	DAYS	AMOUNT	BOOK VALUE
01/01/10	Acquisition Cost	*	100,000.00	100,000.00
12/31/10	Depreciation	360	-25,000.00	75,000.00
12/31/11	Depreciation	360	-38,000.00	37,000.00
12/31/12	Depreciation	360	-37,000.00	0
12/31/13	Depreciation	None	None	0
12/31/14	Depreciation	None	None	0

- Depreciation starting date

If you use a user-defined method, the **First User-Defined Depr. Date** and **Depreciation Starting Date** fields must be filled in on the **FA Depreciation Books** page. The **First User-Defined Depr. Date** field and the contents in the **Period Length** field on the **Depreciation Tables** page are used to determine the time intervals to be used for depreciation calculations. This ensures that the program will start using the specified percentage on the same

day for all assets. The **Depreciation Starting Date** field is used to calculate the number of depreciation days.

In the previous example, both the **First User-Defined Depr. Date** and **Depreciation Starting Date** fields contain 01/01/01. If, however, the **First User-Defined Depr. Date** field contained 01/01/10 and the **Depreciation Starting Date** field contained 04/01/11, the result would be:

DATE	FA POSTING TYPE	DAYS	AMOUNT	BOOK VALUE
01/01/10	Acquisition Cost	*	100,000.00	100,000.00
12/31/10	Depreciation	270	-18,750.00	81,250.00
12/31/11	Depreciation	360	-38,000.00	42,250.00
12/31/12	Depreciation	360	-37,000.00	6,250.00
12/31/13	Depreciation	90	-6,250.00	0
12/31/14	Depreciation	None	None	0

- Depreciation starting date

Half-Year Convention Depreciation

The Half-Year Convention method will only be applied if you have placed a check mark in the **Use Half-Year Convention** field in the fixed **FA Depreciation Book** page.

This depreciation method can be used in conjunction with the following depreciation methods in the program:

- Straight-Line
- Declining-Balance 1
- DB1/SL

When you apply the Half-Year Convention, a fixed asset has six months of depreciation in the first fiscal year, regardless of the contents of the **Depreciation Starting Date** field.

NOTE

The estimated life of the fixed asset that is remaining after the first fiscal year will always contain a half-year using the Half-Year Convention Method. Thus, for the Half-Year Convention method to be applied correctly, the **Depreciation Ending Date** field on the **FA Depreciation Book** page must always contain a date which is exactly six months before the final date of the fiscal year in which the fixed asset will fully depreciate.

Example - Half-Year Convention Depreciation

A fixed asset has an acquisition cost of LCY 100,000. The **Depreciation Starting Date** is 03/01/10. The estimated life is five years, so the **Depreciation Ending Date** must be 06/30/15. The **Calculate Depreciation** batch job is run annually. This example is based on a calendar fiscal year.

The fixed asset ledger entries look like this:

DATE	FA POSTING TYPE	DAYS	AMOUNT	BOOK VALUE
03/01/10	Acquisition Cost	*	100,000.00	100,000.00

DATE	FA POSTING TYPE	DAYS	AMOUNT	BOOK VALUE
12/31/10	Depreciation	270	-10,000.00	90,000.00
12/31/11	Depreciation	360	-20,000.00	70,000.00
12/31/12	Depreciation	360	-20,000.00	50,000.00
12/31/13	Depreciation	360	-20,000.00	30,000.00
12/31/14	Depreciation	360	-20,000.00	10,000.00
12/31/15	Depreciation	180	-10,000.00	0.00

- Depreciation starting date

Example - DB1/SL Depreciation Using Half-Year Convention

A fixed asset has an acquisition cost of LCY 100,000. The **Depreciation Starting Date** is 11/01/10. The estimated life is five years, so the **Depreciation Ending Date** must be 06/30/15. On the **FA Depreciation Books** page, the **Declining-Balance %** field contains 40. The **Calculate Depreciation** batch job is run annually. This example is based on a calendar fiscal year.

The fixed asset ledger entries look like this:

DATE	FA POSTING TYPE	DAYS	AMOUNT	BOOK VALUE
11/01/10	Acquisition Cost	*	100,000.00	100,000.00
12/31/10	Depreciation	60	-20,000.00	80,000.00
12/31/11	Depreciation	360	-32,000.00	48,000.00
12/31/12	Depreciation	360	-19,200.00	28,800.00
12/31/13	Depreciation	360	-11,520.00	17,280.00
12/31/14	Depreciation	360	-11,520.00	5,760.00 SL
12/31/15	Depreciation	180	-5,760.00	0.00 SL

- Depreciation starting date

"SL" after the book value means that the straight-line method has been used.

Calculation method:

1st year:

Declining-balance amount = Full year amount = 40% of 100,000 = 40,000. Thus, for half a year $40,000 / 2 = 20,000$

Straight-line amount = Full year amount = $100,000 / 5 = 20,000$. Thus, for half a year $= 20,000 / 2 = 10,000$

The declining-balance amount is used because it is the greater amount.

5th year (2004):

Declining-balance amount = 40% of 17,280.00 = 6,912.00

Straight-line amount = 28,800 / 1.5 = 11,520.00

The straight-line amount is used because it is the greater amount.

Duplicating Entries to More Depreciation Books

If you have three depreciation books, B1, B2 and B3, and you want to duplicate entries from B1 to B2 and B3, you can place a check mark in the **Part of Duplication List** field on the depreciation book cards for B2 and B3. This can be useful if depreciation book B1 is integrated with the general ledger and uses the fixed asset G/L journal, and depreciation books B2 and B3 are not integrated with the general ledger and use the fixed asset journal.

When you enter an entry in B1 in the fixed asset G/L journal and place a check mark in the **Use Duplication List** field, the program will duplicate the entry in book B2 and B3 in the fixed asset journal when the entry is posted.

NOTE

You cannot duplicate in the same journal and journal batch as you are duplicating from. If you post entries in the fixed asset G/L journal, you can duplicate them in the fixed asset journal or in the fixed asset G/L journal using another batch.

NOTE

You cannot use the same number series in the fixed asset G/L journal and the fixed asset journal. When you post entries in the fixed asset G/L journal, you must leave the **Document No.** field empty. If you enter a number in the field, the number is duplicated in the fixed asset journal. You'll have to manually change the document number before you can post the journal.

Set Up Fixed Asset Insurance

3/31/2019 • 2 minutes to read

To manage fixed asset insurance coverage, you must first set up some general insurance information and an insurance card per policy.

To set up general insurance information

To use the insurance features in Business Central, you must set up some general insurance information.

1. Choose the  icon, enter **FA Setups**, and then choose the related link.
2. Fill in the fields as necessary. Hover over a field to read a short description.

To set up insurance types

You can group your insurance policies into categories, such as insurance against theft or fire insurance. The insurance types are used on the insurance card.

1. Choose the  icon, enter **Insurance Types**, and then choose the related link.
2. Fill in the fields as necessary.

To set up insurance cards

You may accumulate information about each insurance policy on the insurance card.

1. Choose the  icon, enter **Insurance**, and then choose the related link.
2. On the **Insurance** page, choose the **New** action to create a new insurance card.
3. Fill in the fields as necessary.

To set up insurance journal templates

Business Central automatically creates an insurance journal template the first time that you open the **Insurance Journal** page, but you can set up additional journal templates. For more information, see [Working with General Journals](#).

1. Choose the  icon, enter **Insurance Journal Templates**, and then choose the related link.
2. Fill in the fields as necessary.

To set up insurance journal batches

You can set up batches in an insurance journal template. The values in the journal batch are used as default values if the fields are not filled in on the journal lines. For more information, see [Work with General Journals](#)

1. Choose the  icon, enter **Insurance Journal Templates**, and then choose the related link.
2. Select an insurance journal template, and then choose the **Batches** action.
3. On the **Insurance Journal Batches** page, fill in the fields as necessary.

NOTE

Numbers have a special function in journal names. If a journal template name or journal batch name contains a number, the number automatically advances by one every time that the journal is posted. For example, if HH1 is entered in the **Name** field, the journal name will change to HH2 after the journal named HH1 has been posted.

Set Up Fixed Asset Maintenance

3/31/2019 • 2 minutes to read

To manage fixed asset maintenance, you must first set up some general maintenance information, a posting account for maintenance costs, and maintenance codes for types of work, such as Routine Service or Repair.

To set up general maintenance information

If you set up the fields for maintenance, you can post maintenance expenses from the fixed asset journal.

1. Choose the  icon, enter **Fixed Assets**, and then choose the related link.
2. Select the fixed asset that you to define insurance coverage for, and then choose the **Edit** action.
3. On the **Maintenance** FastTab, fill in the fields as necessary. Hover over a field to read a short description.

To set up maintenance codes

When you post maintenance costs from a general journal, you fill in the **Maintenance Code** field to record what kind of maintenance has been performed, such as routine service or repair.

1. Choose the  icon, enter **Maintenance**, and then choose the related link.
2. On the **Maintenance** page, set up codes for different types of maintenance work.

To set up maintenance expense accounts

To post maintenance costs, you must first enter an account number on the **FA Posting Groups** page.

1. Choose the  icon, enter **FA Posting Groups**, and then choose the related link.
2. Fill in the **Maintenance Expense Account** field for each posting group.

NOTE

To define that maintenance costs are allocated to departments or projects, set up an allocation keys. For more information, see [Set Up General Fixed Assets Features](#).

Setting Up Warehouse Management

3/31/2019 • 2 minutes to read

A company's distribution strategy is reflected in the configuration of its warehouse processes. This includes defining how different items are handled in different warehouse locations, such as the degree of bin control and the extend of workflow required between warehouse activities.

The following table describes a sequence of tasks, with links to the topics that describe them.

TO	SEE
Get an overview of the capabilities of basic versus advanced warehouse functionality.	Design Details: Warehouse Overview
Set up eight different bin types, such as Picking Bin, to define the flow activities that relate to each bin type.	Set Up Bin Types
Create bins, either manually or automatically, with information, such as name, number series, and category, according to a bin template.	Create Bins
Define which items you want to store in any given bin and set the rules that decide when to fill the bin with a particular item.	Create Bin Contents
Set an item up to always be placed in a specific bin.	Assign Default Bins to Items
Create templates to govern where and how items are put away during directed put-away.	Set Up Put-away Templates
Set users up as warehouse employees at specific locations.	Set Up Warehouse Employees
Define different types of bins across the warehouse to control where items are placed according to their type, rank, or handling level.	Set Up Locations to Use Bins
Make additional settings to an existing location to enable it for warehouse activities.	Convert Existing Locations to Warehouse Locations
Enable picking, moving, and putting away for assembly or production orders in basic warehouse configurations.	Set Up Basic Warehouses with Operations Areas
Set items and locations up for the most advanced scope of warehouse management where all activities must follow a strict workflow.	Set Up Items and Locations for Directed Put-away and Pick
Define when and how items in warehouse locations are counted for maintenance or financial reporting purposes.	Count, Adjust, or Reclassify Inventory
Enable warehouse workers to break a larger unit of measure into smaller units of measure to fulfill the needs of source documents.	Enable Automatic Breaking Bulk with Directed Put-away and Pick

TO	SEE
Set up the warehouse to automatically suggest items to be picked that expire first.	Enable Picking by FEFO
Get tips on how to reorganize locations, bins, or zones to obtain more efficient warehouse activities.	Restructure Warehouses
Integrate bar code readers to your warehouse management solution. Only for on-premise deployment.	Use Automated Data Capture Systems (ADCS)

Design Details: Warehouse Overview

3/31/2019 • 2 minutes to read

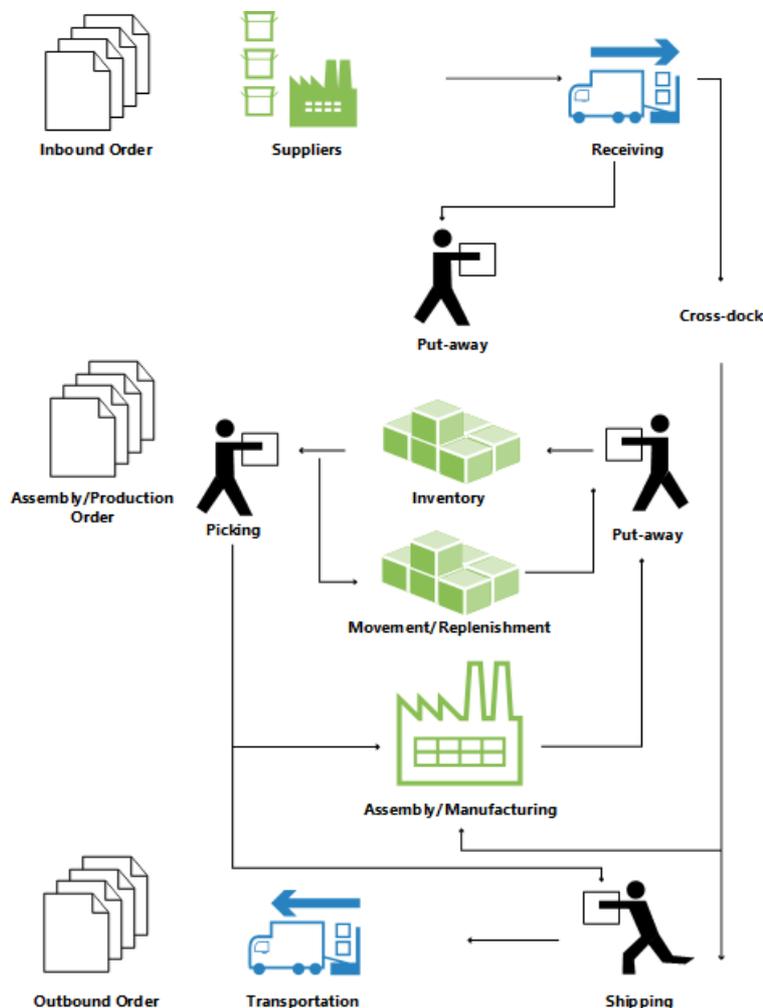

To support the physical handling of items on the zone and bin level, all information must be traced for each transaction or movement in the warehouse. This is managed in the **Warehouse Entry** table. Each transaction is stored in a warehouse register.

Warehouse documents and a warehouse journal are used to register item movements in the warehouse. Every time that an item in the warehouse is moved, received, put away, picked, shipped, or adjusted, warehouse entries are registered to store the physical information about zone, bin, and quantity.

The **Bin Content** table is used to handle all the different dimensions of the contents of a bin per item, such as unit of measure, maximum quantity, and minimum quantity. The **Bin Content** table also contains flow fields to the warehouse entries, warehouse instructions, and warehouse journal lines, which ensures that the availability of an item per bin and a bin for an item can be calculated quickly. For more information, see [Design Details: Availability in the Warehouse](#).

When item postings occur outside the warehouse module, a default adjustment bin per location is used to synchronize warehouse entries with inventory entries. During physical inventory of the warehouse, any differences between the calculated and counted quantities are recorded in the adjustment bin and then posted as correcting item ledger entries. For more information, see [Design Details: Integration with Inventory](#).

The following illustration outlines typical warehouse flows.

Basic or Advanced Warehousing

Warehouse functionality in Business Central can be implemented in different complexity levels, depending on a company's processes and order volume. The main difference is that activities are performed order-by-order in basic warehousing when they are consolidated for multiple orders in advanced warehousing.

To differentiate between the different complexity levels, this documentation refers to two general denominations, Basic and Advanced Warehousing. This simple differentiation covers several different complexity levels as defined by product granules and location setup, each supported by different UI documents. For more information, see [Design Details: Warehouse Setup](#).

NOTE

The most advanced level of warehousing is referred to as "WMS installations" in this documentation, since this level requires the most advanced granule, Warehouse Management Systems.

The following different UI documents are used in basic and advanced warehousing.

Basic UI Documents

- **Inventory Put-away**
- **Inventory Pick**
- **Inventory Movement**
- **Item Journal**
- **Item Reclassification Journal**
- (Various reports)

Advanced UI Documents

- **Warehouse Receipt**
- **Put-away Worksheet**
- **Warehouse Put-away**
- **Pick Worksheet**
- **Warehouse Pick**
- **Movement Worksheet**
- **Warehouse Movement**
- **Internal Whse. Pick**
- **Internal Whse. Put-away**
- **Bin Creation Worksheet**
- **Bin Content Creation Worksheet**
- **Whse. Item Journal**
- **Whse. Item Reclass. Journal**
- (Various reports)

For more information about each document, see the respective page topics.

Terminology

To align with the financial concepts of purchases and sales, Business Central warehouse documentation refers to the following terms for item flow in the warehouse.

TERM	DESCRIPTION
Inbound flow	Items moving into the warehouse location, such as purchases and inbound transfers.
Internal flow	Items moving inside the warehouse location, such as production components and output.
Outbound flow	Items moving out of the warehouse location, such as sales and outbound transfers.

Set Up Bin Types

3/31/2019 • 2 minutes to read

You can direct the flow of items through bins that you have defined for particular warehouse activities. You give each bin its basic flow activities, and thereby define the way the way a bin is used, by assigning it a bin type.

There are six types. You can operate your warehouse with all of the six possible bin types, or you can choose to operate with just the RECEIVE, PUTPICK, SHIP and QC bin types. These four bin types enable suggestions to be made that support the flow of items and allow you to record inventory discrepancies.

To set up the bin types you want to use

1. Choose the  icon, enter **Bin Types**, and then choose the related link.
2. On the **Bin Types** page, create a 10-character code for a bin type.
3. Select the activities that can be performed with each bin type.

NOTE

Bin types are only applicable if you are using directed put-away and pick for your location.

The bin type determines only how a bin is used when processing the flow of items through the warehouse. You can always override the suggestions for any warehouse document, and you can move items in or out of any bin by performing a warehouse movement.

The bin types that you can create are listed below.

BIN TYPE	DESCRIPTION
RECEIVE	Items registered as posted receipts but not yet put away.
SHIP	Items picked for warehouse shipment lines but not yet posted as shipped.
PUT AWAY	Typically, items to be stored in large units of measure but that you do not want to access for picking purposes. Because these bins are not used for picking, either for production orders or shipments, your use of a Put Away type bin might be limited, but this bin type could be useful if you have purchased a large quantity of items. Bins of this type should always have a low bin-ranking, so that when received items are put away, other higher-ranking PUTPICK bins fixed to the item are put away first. If you are using this type of bin, you must regularly perform bin replenishment so that the items stored in these bins are also available in PUTPICK or PICK type bins.
PICK	Items to be used only for picking, for example, for items with an approaching expiration date that you have moved into this type of bin. You would place a high bin ranking on these bins so they are suggested for picking first.

BIN TYPE	DESCRIPTION
PUTPICK	<p>Items in bins that are suggested for both the put-away and pick functions. Bins of this type probably have different bin rankings. You can set up your bulk storage bins as this type of bin with low bin rankings compared to your ordinary pick bins or forward picking area bins.</p>
QC	<p>This bin is used for inventory adjustments if you specify this bin on the location card in the Adjustment Bin Code field. You can also set up bins of this type for defective items and items being inspected. You can move items to this type of bin if you want to make them inaccessible to the usual item flow.</p> <p>NOTE: Unlike all other bin types, the QC bin type has none of the item handling check boxes selected by default. This indicates that any content you place in a QC bin is excluded from item flows.</p>

[Working with Business Central](#)

Create Bins

3/31/2019 • 4 minutes to read

The most effective way to create the bins of your warehouse is to generate groups of similar bins in the bin creation worksheet, but you can also create your bins individually from the location card. You can also use a function on the **Bin Creation Worksheet** page to create bins automatically.

To create a bin from the location card

1. Choose the  icon, enter **Locations**, and choose the related link.
2. Select the location that you want to create a bin from, and then choose the **Bins** action.
3. Choose the **New** action.
4. Fill in the fields as necessary. Hover over a field to read a short description.

The Dedicated field

The **dedicated** field on the **Bins** page specifies that quantities in the bin are protected from being picked for other demands. However, quantities in dedicated bins can still be reserved. Accordingly, the quantities in dedicated bins are included in the **Total Available Quantity** field on the **Reservation** page.

Making a bin dedicated results in similar functionality in basic warehousing to using bin types, which is only available in advanced warehousing. For more information, see [Set Up Bin Types](#).

Example: A work center is set up with a bin code in the **To-Production Bin Code** field. Production order component lines with that bin code require that forward-flushed components are placed there. However, until the components are consumed from that bin, other component demands may pick or consume from that bin because they are still considered available bin contents. To make sure that bin content is only available to component demand that uses that to-production bin, you must select the **Dedicated** field on the line for that bin code.

Caution

Items in dedicated bins are not protected when they are picked and consumed as production or assembly components with the **Inventory Pick** page. For more information, see [Pick for Production or Assembly in Basic Warehouse Configurations](#).

To create bins individually in the bin creation worksheet

1. Choose the  icon, enter **Bin Creation Worksheet**, and choose the related link.
2. Fill in on each line the fields that are necessary to name and characterize the bins you are creating.
3. Choose the **Create Bins** action.

To make bins automatically in the bin creation worksheet

Before you start creating bins automatically, you should determine the kind of bins that are essential for your operations, as well as the most practical flow of items through the physical structure of your warehouse.

NOTE

As soon as you use a bin, you cannot delete it unless it is empty. But if you want to use another bin-naming system, you can use the reclassification journal to in effect move your items to a new bin system. This process is manual and takes time, however, so it is best to set up your bins correctly from the start.

To work with the **Bin Creation Worksheet** page, you must be set up as a warehouse employee at the location where the bins exist. For more information, see [Set Up Warehouse Employees](#).

1. Choose the  icon, enter **Bin Creation Worksheet**, and then choose the related link.
2. Choose the **Calculate Bins** action.
3. On the **Calculate Bins** page, in the **Bin Template Code** field, select the bin template that you want to use as the model for the bins you are creating.
4. Fill in a description for the bins you are in the process of creating.
5. To create the bin codes, fill in the **From No.** and **To No.** fields in the three categories shown on the page: **Rack**, **Section**, and **Level**. The bin code can contain up to 20 characters.

NOTE

The number of characters that you have entered in the three categories for either field, for example, the characters you have entered in the three **From No.** fields, plus the field separators, if any, must be 20 or less.

You can use letters in the code as an identifying combination, but the letter you use must be the same in the **From No.** and **To No.** fields. For example, you might define the Rack part of the code as **From No. A01** and **To No. A10**. The program is not set up to generate codes with letter sequences, for example, from A01 to F05.

6. If you want a character, such as a hyphen, to separate the category fields you have defined as part of the bin code, fill in the **Field Separator** field with this character.
7. If you want the program not to create a line for a bin if it exists already, select the **Check on Existing Bin** field.
8. When you have finished filling in the fields, choose the **OK** Button.

The program creates a line for each bin in the worksheet. You can now delete some of the bins, for example, if you have a rack with a passageway through the first two levels of a couple of sections.

9. When you have deleted all unnecessary bins, choose the **Create Bins** action, and the program will create bins for each line in the worksheet.

Repeat the process for another set of bins until you have created all the bins in your warehouse.

Create Bin Contents

3/31/2019 • 3 minutes to read

After you have set up your bins, you can set up the bin contents. In other words, you can set up the items you want to store in any given bin and set the rules that govern filling the bin with a particular item. You can do this manually on the **Bin Contents** page or automatically with the **Create Bin Content Worksheet** page.

To create bin content manually

1. Choose the  icon, enter **Locations**, and then choose the related link.
2. Select the location where you want to set up bin contents, and then choose the **Bins** action.
3. Select the bin where you want to set up contents, and then choose the **Contents** action.
4. For each item that you want to store in the bin, fill in a line on the **Bin Contents** page with the appropriate information. Some of the fields are filled in already with information about the bin.
5. First fill in the **Item No.** field, and then, if you are using directed put-away and pick, fill in the other fields such as the **Unit of Measure Code**, **Max. Qty.**, and **Min. Qty.** fields.

Select the **Fixed** field if necessary. If the bin is to be used as the default bin for the item, select the **Default Bin** field.

If you are using directed put-away and pick, and if you have entered the correct dimensional information on the item card about each item's units of measure, the maximum quantity that you enter on the **Bin Contents** page is verified against the physical capabilities of the bin. The minimum and maximum quantities are used when calculating bin replenishment and suggested put-aways.

If you select the **Fixed** field, you are fixing the item to the bin, meaning that Business Central will try to put this item in the bin if there is space for it, and it will preserve the record fixing the item to the bin even when the quantity in the bin is 0. Other items can be put into the bin, even though a particular item has been fixed to the bin.

NOTE

You can set up several bin contents at the same time on the **Bin Content Creation Worksheet** page.

To create bin content with a worksheet

When you have created your bins, you can create the bin content that you want for each bin in the bin content creation worksheet.

1. Choose the  icon, enter **Bin Content Creation Worksheet**, and then choose the related link.
2. On the worksheet header, in the **Name** field, select the worksheet of the location where you want to create bin contents.
3. In the **Bin Code** field, select the code of the bin for which you want to define bin content.

If you are using directed put-away and pick in this location, the fields relating to that particular bin, such as **Bin Type**, **Warehouse Class Code**, and **Bin Ranking**, will be filled in automatically. This is information that you need to consider as you define the bin content.

4. Select the item that you want to assign to the bin, and fill in the fields related to the bin content. If you are using directed put-away and pick, and you want to use the **Calculate Bin Replenishment** function, fill in

the **Max. Qty.** and **Min. Qty.** fields.

To set this bin as the preferred bin for the item even if the bin quantity is **0** and all other put-away criteria equal, select the **Fixed** field.

5. Repeat steps 3 through 4 for each item you want to assign to a bin.
6. Choose the **Print** action to preview and print the bin content you have entered in the worksheet. Continue to revise the bin content until you are satisfied.
7. When you are ready, choose the **Create Bin Content** action.

In this worksheet, you can work with a number of bin content lines for a number of bins and thereby obtain a good overview of what you are putting into various bins in a given zone, aisle, or rack.

Assign Default Bins to Items

3/31/2019 • 2 minutes to read

If you are using bins at a location, assigning default bins to your items can make the process of shipping, receiving, and moving your items much easier. When a default bin is assigned to an item, this bin is suggested every time you initiate a transaction for this item. Default bins are defined on the **Bin Content** page.

To assign a default bin to an item

1. Choose the  icon, enter **Bin Content Creation Worksheet**, and choose the related link.
2. Fill in the bin code and item information for each bin that you would like to set up as a default for an item. Make sure to select the **Default** field.
3. Choose the **Create Bin Content** action. Default bins are now assigned for your item.

NOTE

When an item is put away, if the item does not have a default bin assigned, the bin where the item is put away is assigned as the default.

To change the default bin for an item

You may need to change the default bin assignment for an item or assign a default bin to a new item.

1. Choose the  icon, enter **Bin Contents**, and then choose the related link.
2. In the **Location Filter** field, select the appropriate location code.
3. Find the current default bin content entry for the item and clear the **Default Bin** check box.
4. Find the bin content line for the bin that you would like as the new default bin. Select the **Default Bin** check box.

NOTE

When an item is put away for the first time, and the item does not have a default bin assigned, the system will assign the bin where the item is put away as the default bin for the item.

Set Up Put-away Templates

3/31/2019 • 2 minutes to read

With directed put-away and pick functionality, the most appropriate bin for your items at any given time is suggested, according to the put-away template that you have set up for the warehouse, the bin rankings you have given to the bins, and the minimum and maximum quantities that you have set up for fixed bins.

You can set up a number of put-away templates and select one of them to govern put-aways in general in your warehouse. You can also select a put-away template for any item or stockkeeping unit that might have special put-away requirements.

To set up put-away templates

1. Choose the  icon, enter **Put-away Templates**, and then choose the related link.
2. Choose the **New** action.
3. Enter a code that is the unique identifier of the template you are about to create.
4. Enter a short description, if you wish.
5. Fill in the first line with the bin requirements that you want fulfilled first and foremost when suggesting a put-away.
6. Fill in the second line with the bin requirements that would be your second choice to fulfill in finding a bin for put-away. The second line is used only if a bin that meets the requirements of the first line cannot be found.
7. Continue to fill in the lines until you have described all the acceptable bin placements that you want to use in the put-away process.
8. On the last line in the put-away template, select the **Find Floating Bin** check box.

You can create various put-away templates and then apply them as you see fit. The put-away template that you selected for the item or stockkeeping unit, if any is used first. If these fields are not filled in, then the put-away template that you selected for the warehouse on the **Bin Policies** FastTab on the location card is used.

Set Up Warehouse Employees

3/31/2019 • 2 minutes to read

Each user who performs warehouse activities must be set up as a warehouse employee assigned to one default location and potentially more non-default locations. This user setup filters all warehouse activities across the database to the employee's location so that the employee can only perform the warehouse activities at the default location. A user can be assigned to additional non-default locations for which the employee can view activity lines but not perform the activities.

To set up warehouse employees

1. Choose the  icon, enter **Warehouse Employees**, and then choose the related link.
2. Choose the **New** action.
3. Select the **User ID** field, and then select the user to be added as a warehouse employee. Choose the **OK** button.
4. In the **Location Code** field, enter the code of the location where the user will be working.
5. Select the **Default** check box to define the location as the only location where the employee can perform warehouse activities.
6. Repeat these steps to assign other employees to locations or assign non-default locations to existing warehouse employees.

Set Up Locations to Use Bins

3/31/2019 • 2 minutes to read

Bins represent the basic warehouse structure and are used to make suggestions about the placement of items. When you have created your bins, you can define very specifically the contents that you want to place in each bin, or the bin can function as a floating bin without specified contents.

To use the bin functionality at a location, you first activate the functionality on the **Location** card. Then you design the item flow at the location by specifying bin codes in setup fields that represent the different flows.

NOTE

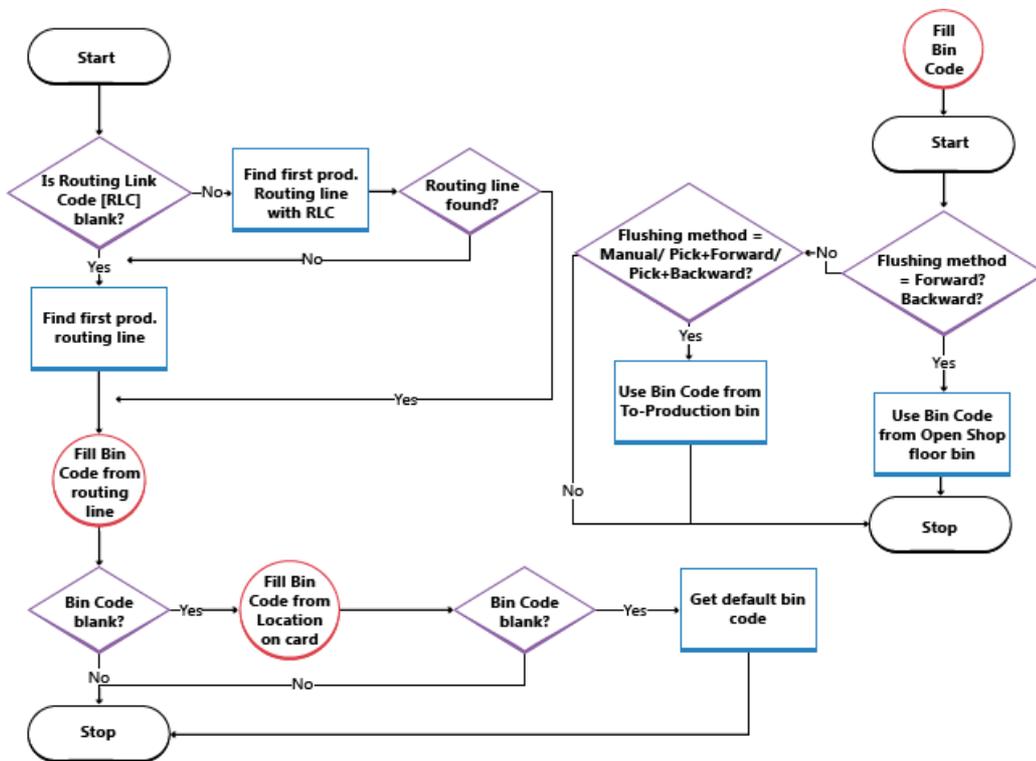

Before you can specify bin codes on the location card, the bin codes must be created. For more information, see [Create Bins](#).

To set up a location to use bins

1. Choose the  icon, enter **Locations**, and then choose the related link.
2. Select the location where you want to use bins.
3. Choose the **Edit** action.
4. On the **Warehouse** FastTab, select the **Bin Mandatory** check box.
5. If you are not using directed put-away and pick for the location, fill in the **Default Bin Selection** field with the method the system should use when assigning a default bin to an item.
6. Open the card for the location that you want to set up bins for.
7. On the **Bins** FastTab, select the bins that you want to use as the default for receipts, shipments, inbound, outbound, and open shop floor bins.
8. The bin codes you fill in here will appear automatically on the headers and on the lines of various warehouse documents. The default bins define all starting or ending placements of items in the warehouse.
9. If you are using directed put-away and pick, select a bin for your warehouse adjustments. The bin code in the **Adjustment Bin Code** field defines the virtual bin in which to record discrepancies in inventory when you register either observed differences registered in the warehouse item journal, or differences calculated when you register a warehouse physical inventory.
10. Fill in the fields on the **Bin Policies** FastTab if they are relevant to your warehouse. The most important fields are **Bin Capacity Policy**, **Allow Breakbulk**, and **Put-away Template Code** fields.
11. On the **Warehouse** FastTab, fill in the **Outbound Whse. Handling Time**, **Inbound Whse. Handling Time**, and the **Base Calendar Code** fields. For more information, see [Set Up Base Calendars](#).

Filling the Consumption Bin

This flow chart shows how the **Bin Code** field on production order component lines is filled according to your location setup.

Convert Existing Locations to Warehouse Locations

3/31/2019 • 2 minutes to read

You can enable an existing inventory location to use zones and bins and to operate as a warehouse location.

The batch job to enable a location for warehouse operation creates initial warehouse entries for the warehouse adjustment bin for all items that have inventory in the location. These initial entries will be balanced when warehouse physical inventory entries are entered after the batch job is run.

You can create zones and bins either before or after the conversion. The only bin that you must create before the conversion is the one that is to be used as the future adjustment bin.

IMPORTANT

To clear all negative inventory and any open warehouse documents before you convert the location for warehouse handling, run a report to identify the items with negative inventory and open warehouse documents for the location. For more information, see [Check on Negative Inventory](#).

To enable an existing location to operate as a warehouse location

1. Choose the  icon, enter **Create Warehouse Location**, and then choose the related link.
2. In the **Location Code** field, specify the location that you want to enable for warehouse processing.
3. In the **Adjustment Bin Code** field, specify the bin at the location where unsynchronized warehouse entries are stored. For more information, see the [To synchronize the adjusted warehouse entries with the related item ledger entries](#).

Using the open item ledger entries for the specified location, warehouse journal lines are created that sum up every combination of Item No., Variant Code, Unit of Measure Code, and, if necessary, Lot No. and Serial No. in the item ledger entries. The warehouse journal lines are then posted. This posting creates warehouse entries that place the inventory in the warehouse adjustment bin. The **Adjustment Bin Code** on the location card is also set.

4. To see which items were added to the adjustment bin during the batch job, run the **Warehouse Adjustment Bin** report.
5. When the **Create Warehouse Location** batch job has completed, perform and post a warehouse physical inventory. For more information, see [Count, Adjust, and Reclassify Inventory Using Journals](#).

NOTE

It is recommended that you run the **Create Warehouse Location** batch job at a time when it will not impact the daily work in the system. This job processes each entry in the **Item Ledger Entry** table, and if there are a large number of item ledger entries, the job can last several hours.

For those locations that did not use warehouse management documents before the conversion, you must re-open and release any source documents that were partially received or partially shipped before the conversion.

Setting Up Warehouse Management

Assembly Management

Design Details: Warehouse Management

Working with Business Central

Set Up Basic Warehouses with Operations Areas

3/31/2019 • 8 minutes to read

If internal operation areas such as production or assembly exist in basic warehouse configurations where locations use the **Bin Mandatory** setup field and possibly the **Require Pick** and **Require Put-away** setup fields, then you can use the following basic warehouse documents to record your warehouse activities for internal operation areas:

- **Inventory Movement** page.
- **Inventory Pick** page.
- **Inventory Put-away** page.

NOTE

Even though the settings are called **Require Pick** and **Require Put-away**, you can still post receipts and shipments directly from the source business documents at locations where you select these check boxes.

To use these pages with internal operations, such as to pick and move components to production, you must make some or all the following setup steps depending on how much control you need:

- Enable the inventory pick, move, and put-away documents.
- Define default bin structures for components and end items flowing to and from operation resources.
- Make to- and from- bins that are dedicated to specific operation resources to prevent the items from being picked for outbound documents.

Bin codes that are set up on location cards define a default warehouse flow for certain activities, such as components in an assembly department. Additional functionality exists to make sure that when items are placed in a certain bin, they cannot be moved or picked to other activities. For more information, see [To create dedicated component bins](#).

The following procedures are based on setting up basic warehouse activities around a production area. The steps are similar for other operation areas, such as assembly, service management, and jobs.

NOTE

In the following procedure, the **Bin Mandatory** setup field on location cards is selected as a precondition because that is considered the foundation for any level of warehouse management.

To enable inventory documents for internal operation activities

1. Choose the  icon, enter **Locations**, and then choose the related link.
2. Open the location card you want to set up.
3. On the **Warehouse** FastTab, select the **Require Put-away** check box to indicate that, when an inbound or internal source document with a bin code is released, an inventory put-away or an inventory movement document can be created.
4. Select the **Require Pick** check box to indicate that when an outbound or internal source document with a bin code is created, an inventory pick or an inventory movement document must be created.

To define a default bin structure in the production area

1. Choose the  icon, enter **Locations**, and then choose the related link.
2. Open the Location you want to set up.
3. On the **Bins** FastTab, in the **Open Shop Floor Bin Code** field, enter the code of the bin in the production area with plenty of components that the machine operator can consume from without requesting a warehouse activity to bring them to the bin. Items that are placed in this bin are typically set up for automatic posting, or flushing. This means that the **Flushing Method** field contains **Forward** or **Backward**.
4. In the **To-Production Bin Code** field, enter the code of the bin in the production area where components that are picked for production at this location are placed by default before they can be consumed. Items that are placed in this bin are typically set up for manual consumption posting. This means that the **Flushing Method** field contains **Manual** or **Pick + Forward** or **Pick + Backward** for warehouse picks and inventory movements.

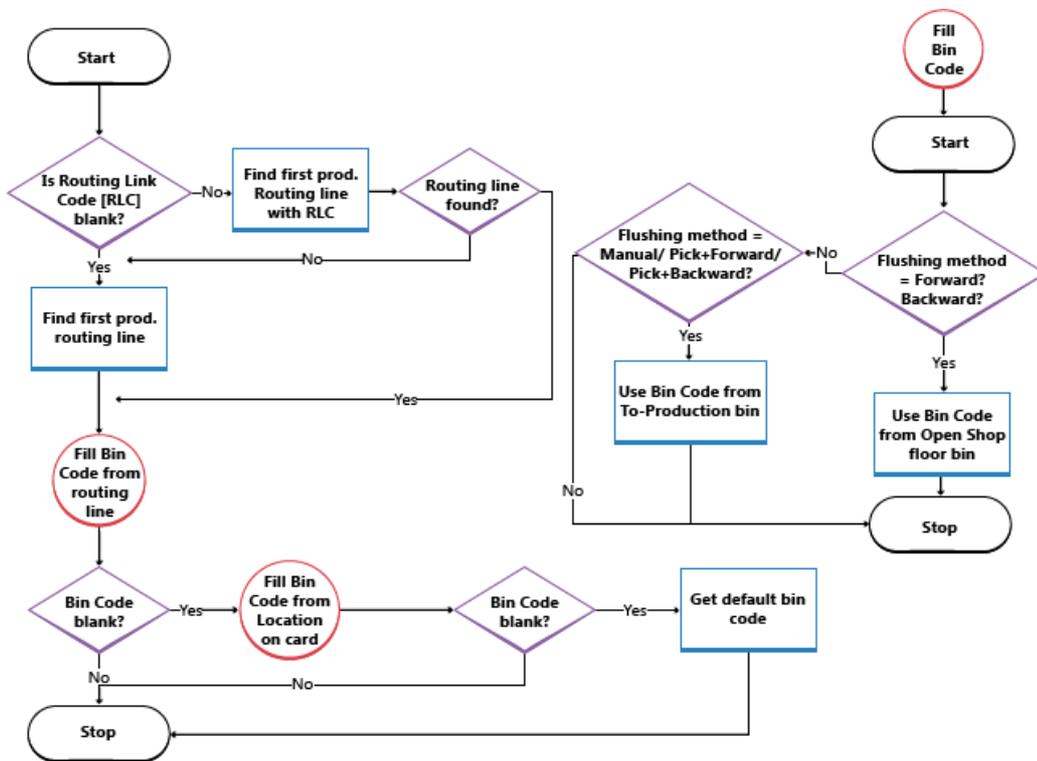

NOTE

When you use inventory picks, the **Bin Code** field on a production order component line defines the *take* bin from where components are decreased when posting consumption. When you use inventory movements, the **Bin Code** field on production order component lines defines the *place* bin in the operation area where the warehouse worker must place the components.

5. On the **Bins** FastTab, in the **From-Production Bin Code** field, enter the code of the bin in the production area where finished end items are taken from by default when the process involves a warehouse activity. In basic warehouse configurations, the activity is recorded as an inventory put-away or an inventory movement.

Now, production order component lines with the default bin code require that forward-flushed components are placed there. However, until the components are consumed from that bin, other component demands may pick or consume from that bin because they are still considered available bin contents. To make sure that bin content is only available to component demand that uses that to-production bin, you must select the **Dedicated** field on the line for that bin code on the **Bins** page that you open from the location card.

This flow chart shows how the **Bin Code** field on production order component lines is filled according to your setup.

To define a default bin structure in the assembly area

Components for assembly orders cannot be picked or posted with inventory picks. Instead, use the **Inventory Movement** page. For more information, see [Move Components to an Operation Area in Basic Warehousing](#).

When picking and shipping sales line quantities that are assembled to the order, you must follow certain rules when creating the inventory pick lines. For more information, see the "Handling Assemble-to-Order Items in Inventory Picks" section in [Pick Items with Inventory Picks](#).

For more information, see [Assembly Management](#).

To set up that an inventory movement is automatically created when the inventory pick for the assembly item is created

1. Choose the  icon, enter **Assembly Setup**, and then choose the related link.
2. Select the **Create Movements Automatically** check box.

To set up the bin in the assembly area where components are placed by default before they can be consumed in assembly

The value in this field is automatically inserted in the **Bin Code** field on assembly order lines when this location is entered in the **Location Code** field on the assembly order line.

1. Choose the  icon, enter **Locations**, and then choose the related link.
2. Open the Location you want to set up.
3. Fill in the **To-Assembly Bin Code** field.

To set up the bin in the assembly area where finished assembly items are posted to when they are assembled to stock

The value in this field is automatically inserted in the **Bin Code** field on assembly order headers when this location code is filled into the **Location Code** field on the assembly order header.

Bin codes that are set up on location cards define a default warehouse flow for specific warehouse activities, such as consumption of components in an assembly area. Additional functionality exists to make sure that when items are placed in a default bin, they cannot be moved or picked to other activities.

NOTE

This setup is only possible for locations where the Bin Mandatory field is selected.

1. Choose the  icon, enter **Locations**, and then choose the related link.
2. Open the Location you want to set up.
3. Fill in the **From-Assembly Bin Code** field.

To set up the bin where finished assembly items are posted to when they are assembled to a linked sales order

From this bin, the assembly items are shipped immediately, via an inventory pick, to fulfill the sales order.

NOTE

This field cannot be used if the location is set up to use directed pick and put-away.

The bin code is copied from the sales order line to the assembly order header to communicate to assembly workers where to place the output to ready it for shipping. It is also copied to the inventory pick line to communicate to warehouse workers where to take it from to ship it.

NOTE

The Assemble-to-Order Shipment bin is always empty. When you post an assemble-to-order sales line, then the bin content is first positively adjusted with the assembly output. Immediately after, it is negatively adjusted with the shipped quantity.

The value in this field is automatically inserted in the Bin Code field on sales order lines that contain a quantity in the **Qty. to Assemble to Order** field or if the item to be sold has **Assemble-to-Order** in the **Replenishment System** field.

If the **Asm.-to-Order Shpt. Bin Code** is blank, then the **From-Assembly Bin Code** field is used instead. If both setup fields are blank, then the last used bin with content is used in the **Bin Code** field on sales order lines.

The same bin code is in turn copied to the **Bin Code** field on the inventory pick line that manages the shipment of the assemble-to-order quantity. For more information, see the "Handling Assemble-to-Order Items in Inventory Picks" section in [Pick Items with Inventory Picks](#).

1. Choose the  icon, enter **Locations**, and then choose the related link.
2. Open the Location you want to set up.
3. Fill in the **Asm.-to-Order Shpt. Bin Code** field.

To create dedicated component bins

You can specify that quantities in a bin are protected from being picked for other demands than demand from their current purpose.

Quantities in dedicated bins can still be reserved. Accordingly, the quantities in dedicated bins are included in the **Total Available Quantity** field on the **Reservation** page.

For example, if a work center is set up with a bin code in the **To-Production Bin Code** field. Production order component lines with that bin code require that forward-flushed components are placed there. However, until the components are consumed from that bin, other component demands may pick or consume from that bin because they are still considered available bin contents. To make sure that bin content is only available to component demand that uses that to-production bin, you must select the **Dedicated** field on the line for that bin code on the **Bins** page that you open from the location card.

Making a bin dedicated provides similar functionality to using bin types, which is only available in advanced warehousing. For more information, see [Set Up Bin Types](#).

Caution

Items in dedicated bins are not protected when they are picked and consumed as production components with the Inventory Pick page.

1. Choose the  icon, enter **Locations**, and then choose the related link. Select the location that you want to update.
2. Choose the **Bins** action.
3. Select the **Dedicated** field for each bin that you want to use exclusively for certain internal operations and where you want quantities to be reserved for that internal operation once placed there.

NOTE

The bin must be empty before you can select or clear the **Dedicated** field.

Set Up Items and Locations for Directed Put-away and Pick

3/31/2019 • 3 minutes to read

When you set up a warehouse location for directed put-away and pick, you have new functionality available to you to help run the warehouse in the most efficient way possible. In order to make full use of this functionality, you provide additional information about the items, which in turn helps to make the calculations necessary to suggest the most efficient and effective ways to conduct warehouse activities. For more information, see [Design Details: Warehouse Setup](#).

To set up an item for directed put-away and pick

1. Choose the  icon, enter **Items**, and then choose the related link.
2. Open the card for the item that you want to set up for directed put-away and pick.
3. On the **Warehouse** FastTab of the item card, fill in the fields to define how the item should be handled in the warehouse.
4. Choose the **Units of Measure** action.
5. On the **Item Units of Measure** page, fill in the fields to define the different units of measure in which the item may be transacted, including the height, width, length, cubage, and weight for the unit of measure.
6. Choose the **Bin Contents** action.
7. On the **Bin Contents** page, define the location and bin to which the item should be associated. The **Default** field is not used when the location is set up for directed put-away and pick.

To activate directed put away and pick functionality

Directed put-away and pick gives you access to advanced warehouse configuration features that can greatly enhance your efficiency and data reliability. In order to use this functionality, you must first set up a number of parameters in your warehouse location.

To use the directed put-away and pick functionality, you must activate the functionality on the location card.

1. Choose the  icon, enter **Locations**, and then choose the related link.
2. Select the location where you want to use directed put-away and pick, and then choose the **Edit** action.
3. On the **Warehouse** FastTab, select the **Directed Put-away and Pick** check box.

You do not need to fill in any other fields on the location card until later in the setup process.

NOTE

You cannot set up the warehouse to use bins when the location has open item ledger entries.

The next step is to define the type of bins you want to operate. For more information, see [Set Up Bin Types](#). The bin type defines how to use a given bin when processing the flow of items through the warehouse. You can assign a bin type to both a zone and to a bin.

You can also define warehouse class codes, if the warehouse carries items that need various storage conditions. Warehouse class codes are used when suggesting item placement in bins. You assign the warehouse class codes to product groups, which are then assigned to items and SKUs, or to zones and bins that can accommodate the storage conditions required by the warehouse class codes.

You are now ready to set up zones, if you want to operate zones in your warehouse. Using zones reduces the number of fields you need to fill in when you set up your bins, because bins created within zones inherit several properties from the zone. Zones can also make it easier for new or temporary employees to orient themselves in your warehouse. Note that flow is controlled by bins, therefore it is possible to operate with bins and only one zone.

To set up a zone in your warehouse

1. Choose the  icon, enter **Locations**, and then choose the related link.
2. Select the location where you want to set up zone and open the location card, and then choose the **Zones** action.
3. On the **Zones** page, fill in the fields as necessary. Hover over a field to read a short description.

When you change a zone parameter, all bins created thereafter in that zone will have the new characteristics, but the original bins will not be changed.

NOTE

If you want to operate without zones, you must still create one zone code that is undefined except for the code.

The next step in setting up the warehouse is to define bins. For more information, see [Set Up Locations to Use Bins](#).

In addition, you must create put-away templates and counting periods. For more information, see [Set Up Put-away Templates](#).

[Design Details: Warehouse Management](#)

[Working with Business Central](#)

Enable Automatic Breaking Bulk with Directed Put-away and Pick

3/31/2019 • 2 minutes to read

For locations that use directed put-away and pick, Business Central can, in various situations, automatically breakbulk, that is, break a larger unit of measure into smaller units of measure, when it creates warehouse instructions that fulfill the needs of source documents, production orders, or internal picks and put-aways. To breakbulk sometimes also means gathering smaller units of measure, if necessary, to meet outbound requests by breaking the larger unit of measure on the source document or production order into the smaller units of measure that are available in the warehouse.

Breakbulking in Picks

If you want to store items in several different units of measure and allow them to be automatically combined as needed in the picking process, select the **Allow Breakbulk** field on the location card.

To fulfill a task, the program automatically looks for an item in the same unit of measure. But if it cannot find this form of the item, and this field is selected, the program will suggest that you break a larger unit of measure into the unit of measure that is needed.

If the system can only find smaller units of measure, it will suggest that you gather items to fulfill the quantity on the shipment or production order. In effect, it breaks the larger unit of measure on the source document into smaller units for picking.

Breakbulking in Put-aways

In the warehouse put-away, the program automatically suggests Place action lines in the put-away unit of measure, for example, pieces, even though the items arrive in a different unit of measure.

Breakbulking in Movements

The program also breakbulks automatically in replenishment movements, if the **Allow Breakbulk** field is selected on the **Option** FastTab on the **Calculate Bin Replenishment** page.

You can view the results of the conversion process from one unit of measure to another as intermediate breakbulk lines in the put-away, pick, or movement instructions.

NOTE

If you select the **Set Breakbulk Filter** field on the warehouse instruction header, the program will hide the breakbulk lines whenever the larger unit of measure is going to be completely used. For example, if a pallet is 12 pieces and you are going to use all 12 pieces, the pick will then direct you to take 1 pallet and place 12 pieces. However, if you have to pick only 9 pieces, then the breakbulk lines will not be hidden, even if you have selected the **Breakbulk Filter** field, because you have to place the remaining three pieces somewhere in the warehouse.

NOTE

If you want your units of measure to perform optimally in the warehouse, also in connection with the breakbulk functionality, you should wherever possible try to:

- Set up the base unit of measure for an item as the smallest unit of measure that you expect to handle in your warehouse processes.
- Set up your alternative units of measure for the item as multiples of the base unit of measure.

[Design Details: Warehouse Management](#)

[Working with Business Central](#)

Enable Picking Items by FEFO

3/31/2019 • 2 minutes to read

First-Expired-First-Out (FEFO) is a sorting method that ensures that the oldest items, those with the earliest expiration dates, are picked first.

This functionality only works when the following criteria are met:

- The item must have a serial/lot number.
- On the item's item tracking code setup, the **SN-Specific Warehouse Tracking** field or the **Lot-Specific Warehouse Tracking** field must be selected.
- The item must be posted to inventory with an expiration date.
- On the location card, the **Require Pick** check box must be selected.
- On the location card, the **Pick According to FEFO** check box must be selected.
- On the location card, the **Bin Mandatory** check box must be selected.

When all the criteria are met, then serial/lot-numbered items to be picked are sorted with the oldest first in all picks and movements, except for items that use SN-specific or lot-specific tracking.

NOTE

If some serial/lot-numbered items use specific tracking, then those are respected first and under them, the remaining, non-specific, serial/lot numbers are listed according to FEFO.

If two serial/lot-numbered items have the same expiration date, then the program selects the item with the lowest serial or lot number.

When picking serial/lot-numbered items in locations set up for directed put-away and pick, only quantities on bins of type *Pick* are picked according to FEFO.

To enable movements according to FEFO, either on the **Inventory Movement** page or the **Movement Worksheet** page, you must leave the **From Bin** field empty.

If the **Strict Expiration Posting** field is selected, then only items that are not expired will be included in the pick. This applies even if you are not using Pick according to FEFO.

Use Automated Data Capture Systems (ADCS)

3/31/2019 • 5 minutes to read

NOTE

In the standard version of Business Central, ADCS only works in on-premise deployments. However, a Microsoft partner can make it work in online deployments by using PowerApps or similar.

You can use your automatic data capture system (ADCS) to register the movement of items in the warehouse and to register some journal activities, such as quantity adjustments in the warehouse item journal and physical inventories.

To use ADCS, you must give each item stored in the warehouse an item identifier. You must also set up miniforms, handheld functions, data exchanges, and specify settings for fields that control ADCS. You specify whether to use ADCS on the location card of a warehouse.

Based on the needs of your warehouse, you define the amount of information displayed in the miniform setup for the particular handheld device. The following are examples of information that you can display:

- Data from tables within Business Central, such as a list of pick documents from which the user can select.
- Text information.
- Messages to show confirmations or errors about activities performed and registered by the handheld device user.

For more information, see [Configuring an Automated Data Capture System](#) in the developer and IT-pro help.

To set up a warehouse to use ADCS

To use ADCS, you must specify which warehouse locations use the technology.

NOTE

We recommend that you do not set up a warehouse to use ADCS if the warehouse also has a bin capacity policy.

1. Choose the  icon, enter **Locations**, and choose the related link.
2. Select a warehouse from the list for which you want to enable ADCS, and then choose the **Edit** action.
3. On the **Location Card** page, select the **Use ADCS** check box.

To specify an item to use ADCS

Each warehouse item that you want to use with ADCS must be assigned an identifier code to link it with its item number. For example, you can use the item's bar code as the identifier code. An item can also have multiple identifier codes. You may find this useful in the case where an item is available in various units of measures, such as pieces and pallets. In this case, assign an identifier code to each.

1. Choose the  icon, enter **Items**, and then choose the related link.
2. Select an item from the list that is part of your ADCS solution, and then choose the **Edit** action.
3. On the **Item Card** page, choose the **Identifiers** action.

4. On the **Item Identifiers** page, choose the **New** action.
5. In the **Code** field, specify the identifier for the item. For example, the identifier could be the item's bar code number.

You can also enter a **Variant Code** and a **Unit of Measure** code.
6. If needed, enter multiple codes for each item.
7. Choose the **OK** button.
8. To review the information, choose the **Identifier Code** field to open the **Item Identifiers** page.

To add an ADCS user

You can add any user as a user of an Automated Data Capture System (ADCS). When you do this, the user must also provide a password. Optionally, you can also provide a connection that identifies the ADCS user as a warehouse employee. The ADCS user password can be different from the Windows logon password of the user. For more information, see [Managing Users and Permissions](#).

1. Choose the  icon, enter **ADCS Users**, and then choose the related link.
2. Choose the **New** action.
3. In the **Name** field, enter a name for the user. The name cannot contain more than 20 characters, including spaces.
4. In the **Password** field, enter a password. The password is masked.

To specify that a warehouse employee is an ADCS user

1. Choose the  icon, enter **Warehouse Employees**, and then choose the related link.
2. If needed, add a new warehouse employee. For more information, see [Set Up Warehouse Employees](#).
3. Choose the **Edit List** action.
4. Select a warehouse employee from the list. In the **ADCS User** field, choose the drop-down arrow, and then select the name of an ADCS user from the list.

NOTE

The default warehouse for the employee must be one that uses ADCS.

To create and customize miniforms

You use miniforms to describe the information that you want to present on a handheld device. For example, you can create miniforms to support the warehouse activity of picking items. After you create a miniform, you can add functions to it for the common actions that a user takes with handheld devices, such as moving up or down a line.

To implement or change the functionality of a miniform function, you must create a new codeunit or modify an existing one to perform the required action or response. You can learn more about ADCS functionality by examining codeunits such as 7705, which is the handling codeunit for logon functionality. Codeunit 7705 shows how a Card-type miniform works.

To create a miniform for ADCS

1. Choose the  icon, enter **Miniforms**, and then choose the related link.
2. Choose the **New** action.
3. In the **Code** field, enter a code for the miniform. Optionally, enter values in all other fields.

Select the **Start Miniform** check box to indicate that the miniform is the first form that the user sees at

logon.

4. On the **Lines** FastTab, define the fields that appear on the miniform. The order in which you enter lines is the order in which the lines appear on the handheld device.

When you have created a miniform, the next steps are to create functions and to associate functionality for various keyboard inputs.

To add support for a function key

1. Add code similar to the following example to the .xsl file for the plug-in. This creates a function for the **F6** key. The key sequence information can be obtained from the device manufacturer.

```
<xsl:template match="Function[.='F6']">
  <Function Key1="27" Key2="91" Key3="49" Key4="55" Key5="126" Key6="0"><xsl:value-of select="."/>
</Function>
</xsl:template>
```

2. In the Business Central development environment, open table 7702 and add a code representing the new key. In this example, create a key that is named **F6**.
3. Add C/AL code to the relevant function of the miniform-specific codeunit to handle the function key.

To customize miniform functions

1. Choose the  icon, enter **Miniforms**, and then choose the related link.
2. Select a miniform from the list, and then choose the **Edit** action.
3. Choose the **Functions** action.
4. In the **Function Code** drop-down list, select a code to represent the function that you want to associate with the miniform. For example, you can select ESC, which associates functionality with the press of the ESC key.

In the Business Central development environment, edit the code for the **Handling Codeunit** field to create or modify code to perform the required action or response.

For more information, see [Configuring an Automated Data Capture System](#) in the developer and IT-pro help.

Restructure Warehouses

3/31/2019 • 4 minutes to read

You may want to restructure your warehouse with new bin codes and new bin characteristics. You will not undertake this kind of activity very often, but situations can occur where a reclassification is necessary to achieve or maintain a more efficient operation. For example:

- You might want to switch to bin codes that support the use of automatic data capture, for example, with hand-held devices.
- The warehouse may have purchased a new rack system that gives new possibilities in item storage.
- The company may have altered its item assortment and moved the warehouse to a new physical location to accommodate this change.

If your warehouse is set up to use bins but not directed put-away and pick, restructure your warehouse by creating the new bins that you want to use in the future.

To restructure a basic warehouse that uses bins only

1. Choose the  icon, enter **Locations**, and then choose the related link.
2. On the **Warehouse** FastTab, set the **Default Bin Selection** field to **Last-Used Bin**.
3. Move all the contents of your current bins to the new bins that you have just created.
 - a. Choose the  icon, enter **Item Reclassification Journal**, and then choose the related link.
 - b. Select a journal line, and then choose the **Get Bin Content** action.
 - c. On the **Bin Content** FastTab, set filters in the **Location Code**, **Bin Code**, and **Item No.** fields to specify the content that you want to move.
 - d. Choose the **OK** button to fill a journal line.
 - e. In the **New Bin Code** field, select the bin to which the items should be moved.
 - f. Repeat steps b through e for all bin content that you want to move.
 - g. Choose the **Post** action.

You have now emptied the bins where the items used to be. The default bins for your items have now been changed to the new bins.

To restructure an advanced warehouse that uses directed put-away and pick

1. Create the new bins that you want to use in the future. For more information, see [Create Bins](#).
2. Move all the contents of your current bins to the new bins that you just created.
 - a. Choose the  icon, enter **Warehouse Reclassification Journal**, and then choose the related link.
 - b. For the bins where no real movement of items is involved, create a line for each of your current bins in the **Warehouse Reclassification Journal** with the old bin code, **From Bin Code**, and the new bin code, **To Bin Code**.
 - c. If some of the movements involve actual physical movements that you want employees to perform, use **Movement Worksheets** to prepare movement instructions instead of using the warehouse reclassification journal. For more information, see [Move Items in Advanced Warehouse Configurations](#).
3. When the old bins are emptied, reclassify them as **QC** type bins to ensure that they are not included in item

flows.

- a. Choose the  icon, enter **Locations**, and then choose the related link.
- b. Select the line with the location, and then choose the **Bins** action.
- c. On the **Bins** page, in the **Bin Type Code** field, enter **QC** for each of the old bins that you emptied in step 3 in the previous procedure.

You have now removed the bins from the warehouse flow, and reclassified them as QC bins. QC bins have none of the activity fields on the **Bin Types** page selected and are therefore not considered by the item flow. For more information, see [Set Up Bin Types](#).

To delete a bin

1. Choose the  icon, enter **Locations**, and then choose the related link.
2. Select the location where you want to delete bins. Choose the **Bins** action.
3. Select the lines for the bins that you want to delete.
4. Choose the **Delete** action.

If you choose the **Yes** button, the bin is deleted for use in the future, but the bin code in all warehouse entries remains the same.

If you want to rename a bin so that all records associated with the bin are also renamed, including bin contents, warehouse activity lines, registered warehouse activity lines, warehouse worksheet lines, warehouse receipt lines, posted warehouse receipt lines, warehouse shipment lines, posted warehouse shipment lines, and warehouse entries, you can do so on the **Bins** page.

To rename a bin and change the bin code in all records

1. Choose the  icon, enter **Locations**, and then choose the related link.
2. Select the location where you want to rename a bin or change the bin code, and then choose the **Bins** action.
3. Select the bin that you want to change and enter a new bin code in the **Code** field.
4. Choose the **Yes** button.

NOTE

If you choose **Yes** and there are many entries concerning this bin, for example, because you have not deleted warehouse documents for some time, it may take some time to rename all the records. Therefore, if you use this method, consider running the batch job **Delete Registered Whse. Documents** before you start the renaming process. Also note that the only documents that are deleted in this batch job are put-aways, picks, and movements.

If you are renaming a receiving bin or a shipping bin, all the posted receipts or shipments that refer to the bin in question are renamed.

Setting Up Manufacturing

3/31/2019 • 2 minutes to read

To convert material into produced end items, production resources, such as bills of material, routings, machine operators, and machinery must be set up in the system.

Operators and machines are represented in the system as machine centers that may be organized in work centers and work center groups. When these resources are established, they can be loaded with operations according to the item's defined material (BOM) and process (routing) structure, and according to the capacity of the machine or work center. You can also set the production capacity of each resource. Capacity is defined by the work time available in the machine and work centers, and is governed by calendars for each level. A work center calendar specifies the working days or hours, shifts, holidays, and absence that determine the work center's gross available capacity (typically measured in minutes). All of this is determined by defined efficiency and capacity values.

When you have set up manufacturing, you can plan and execute production orders. For more information, see [Planning](#) and [Manufacturing](#).

The following table describes a sequence of tasks, with links to the topics that describe them.

TO	SEE
Configure the manufacturing features, such as defining shop floor work hours and selecting planning principles.	The Manufacturing Setup page.
Define a standard working week in the manufacturing department in terms of starting and ending times of each work day and related work shift.	Create Shop Calendars
Organize fixed values and requirements of production resources as work centers or machine centers to govern their output of production performed.	Set Up Work Centers and Machine Centers
Organize production operations in the required order and assign them to work or machine centers with the required work times.	Create Routings
Organize production components or subassemblies under a produced parent item and certify the BOM for execution at work centers.	Create Production BOMs
Make sure that the right component quantity is available when produced items are stocked in one unit of measure but produced in another.	Work With Manufacturing Batch Units of Measure
Define families of production items with similar manufacturing processes to save consumption. For example, four pieces of the same item can be produced from one sheet and 10 pieces of another, different, item at the same time.	Work With Production Families
Use standard tasks to simplify the creation of routings by quickly attaching extra information to recurring operations.	Set Up Standard Routing Lines

TO	SEE
Prepare work centers and routings to represent subcontracted production operations.	Subcontract Manufacturing

Set Up Shop Calendars

3/31/2019 • 4 minutes to read

A work center or machine calendar specifies the working days and hours, shifts, holidays, and absences that determine the center's gross available capacity, measured in time, according to its defined efficiency and capacity values.

As a foundation for calculating a specific work or machine center calendar, you must first set up one or more general shop calendars. A shop calendar defines a standard work week according to start and end times of each working day and the work shift relation. In addition, the shop calendar defines the fixed holidays during a year.

The following describes how to set up work center calendars. The steps are similar when setting up machine center calendars.

To create work shifts

1. Choose the  icon, enter **Work Shifts**, and then choose the related link.
2. On a blank line, enter a number in the **Code** field to identify the work shift, for example, **1**.
3. Describe the work shift in the **Description** field, for example, **1st shift**.
4. Optionally, fill in lines for a second or third work shift.

Even if your work centers do not work in different work shifts, enter at least one work shift code.

To set up a shop calendar

1. Choose the  icon, enter **Shop Calendars**, and then choose the related link.
2. On a blank line, enter a number in the **Code** field to identify the shop calendar.
3. Describe the shop calendar in the **Description** field.
4. Choose the **Working Days** action.
5. On the **Shop Calendar Working Days** page, define a complete work week, with the start and end times for each day.

In the **Work Shift Code** field, select one of the shifts that you previously defined. Add a line for every working day and every shift. For example:

```
Monday 07:00 15:00 1
Tuesday 07:00 15:00 1
```

If you need a shop calendar with two work shifts, you must fill it in in this manner:

```
Monday 07:00 15:00 1
Monday 15:00 23:00 2
Tuesday 07:00 15:00 1
Tuesday 15:00 23:00 2
```

Any week days that you do not define in the shop calendar, such as Saturday and Sunday, are considered non-working days and will have zero available capacity in a work center calendar.

When all the working days of a week are defined, you can close the **Shop Calendar Working Days** page and proceed to enter holidays.

6. On the **Shop Calendars** page, select the shop calendar, and then choose the **Holidays** action.
7. On the **Shop Calendar Holidays** page, define the holidays of the year by entering the start date and time, the end time, and description of each holiday on individual lines. For example:

04/07/14 0:00:00 23:59:00 Summer Holiday

05/07/14 0:00:00 23:59:00 Summer Holiday

06/07/14 0:00:00 23:59:00 Summer Holiday

The defined holidays will have zero available capacity in a work center calendar.

The shop calendar can now be assigned to a work center to calculate the work shop calendar that will govern all operation scheduling at that work center.

To calculate a work center calendar

1. Choose the  icon, enter **Work Centers**, and then choose the related link.
2. Open the work center that you want to update.
3. In the **Shop Calendar Code** field, select which shop calendar to use as the foundation for a work center calendar.
4. Choose the **Calendar** action.
5. On the **Work Center Calendar** page, choose the **Show Matrix** action.

The left side of the matrix page lists the work centers that are set up. The right side shows a calendar displaying the available capacity values for each working day in the defined unit of measure, for example, **480** minutes. Each line represents the calendar of one work center.

NOTE

You can also select to view the capacity values for each week or month by changing the selection in the **View By** field on the **Work Center Calendar** page.

To reflect the new shop calendar as a line on the selected work center, it must first be calculated.

6. Choose the **Calculate** action.
7. On the **Work Center** FastTab, you can set a filter to only calculate for one work center. If you do not set a filter, all existing work center calendars will be calculated.
8. Define the starting and ending dates of the calendar period that should be calculated, for example, one year from 01/01/14 to 31/12/14.
9. Choose the **OK** button to calculate capacity.

Calendar entries are now created or updated displaying the available capacity for each period according to the following three sets of master data:

- The working days and shift defined in the assigned shop calendar.
- The value in the **Capacity** field on the work center card.
- The value in the **Efficiency** field on the work center card.

The calculated work center calendar will now define when and how much capacity is available at this work center. This controls the detailed scheduling of operations performed at the work center.

To record work center absence

1. On the **Work Center Calendar** page, choose the **Show Matrix** action.
2. On the **Work Center Calendar Matrix** page, select the work center and calendar day when the absence time should be recorded, and then choose the **Absence** action.
3. On the **Absence** page, define the starting time, ending time, and description of that day's absence. For example:

25/01/01 08:00 10:00 Maintenance
4. Choose the **Update** action, and then close the **Absence** page.

The capacity of the selected day has now decreased by the recorded absence time.

Set Up Work Centers and Machine Centers

3/31/2019 • 7 minutes to read

The program distinguishes between three types of capacities. These are arranged hierarchically. Each level contains the subordinate levels.

The top level is the work center group. Work centers are assigned to the work center groups. Every work center can only belong to one work center group.

You can assign various machine centers to every work center. A machine center may only belong to one work center.

The planned capacity of a work center consists of the availability of the corresponding machine centers and the additional planned availability of the work center. The planned availability of the work center group is, therefore, the sum of all corresponding availabilities of the machine centers and work centers.

The availability is stored in calendar entries. Before you set up work or machine centers, you must set up shop calendars. For more information, see [Create Shop Calendars](#).

To set up a work center

The following primarily describes how to set up a work center. The steps to set up a machine center calendar are similar except for the **Routing Setup** FastTab.

1. Choose the  icon, enter **Work Centers**, and then choose the related link.
2. Choose the **New** action.
3. Fill in the fields as necessary. Hover over a field to read a short description.
4. In the **Work Center Group** field, select the higher-level resource grouping that the work center is organized under, if relevant. Choose the **New** action in the drop-down list.
5. Select the **Blocked** field if you want to prevent the work center from being used in any processing. This means that output cannot be posted for an item that is produced at the work center. For more information, see [Post Production Output](#).
6. In the **Direct Unit Cost** field, enter the cost of producing one unit of measure at this work center, excluding any other cost elements. This cost is often referred to as the *direct labor rate*.
7. In the **Indirect Cost %** field, enter the general operation costs of using the work center as a percentage of the direct unit cost. This percentage amount is added to the direct cost in the calculation of the unit cost.
8. In the **Overhead Rate** field, enter any non-operational costs, for example maintenance expenses, of the work center as an absolute amount.

The **Unit Cost** field contains the calculated unit cost of producing one unit of measure at this work center, including all cost elements, as follows:

Unit Cost = Direct Unit Cost + (Direct Unit Cost x Indirect Cost %) + Overhead Rate.

9. In the **Unit Cost Calculation** field, define whether the above calculation should be based on the amount of time used: **Time**, or on the number of produced units: **Units**.
10. Select the **Specific Unit Cost** field if you want to define the work center's unit cost on the routing line where it is being used. This may be relevant for operations with dramatically different capacity costs than

what would normally be processed at that work center.

11. In the **Flushing Method** field, select whether output posting at this work center should be calculated and posted manually or automatically, using either of the following methods.

OPTION	DESCRIPTION
Manual	Consumption is posted manually in the output journal or production journal.
Forward	Consumption is calculated and posted automatically when the production order is released.
Backward	Consumption is calculated and posted automatically when the production order is finished.

NOTE

If necessary, the flushing method selected here and on the **Item** card, can be overridden for individual operations by changing the setting on routing lines

12. In the **Unit of Measure Code** field, enter the time unit in which this work center's cost calculation and capacity planning are made. In order to be able to constantly monitor consumption, you must first set up a method of measure. The units you enter are basic units. For example, the processing time is measured in hours and minutes.

NOTE

If you select to use Days then remember that 1 day = 24 hours - and not 8 (working hours).

13. In the **Capacity** field, define whether the work center has more than one machine or person working at the same time. If your Business Central installation does not include the Machine Center functionality, then the value in this field must be **1**.
14. In the **Efficiency** field, enter the percentage of the expected standard output that this work center actually outputs. If you enter **100**, it means that the work center has an actual output that is the same as the standard output.
15. Select the **Consolidated Calendar** check box if you are also using machine centers. This ensures that calendar entries are rolled up from machine center calendars.
16. In the **Shop Calendar Code** field, select a shop calendar. For more information, see [Create Shop Calendars](#).
17. In the **Queue Time** field, specify a fixed time span that must pass before assigned work can begin at this work center. Note that queue time is added to other non-productive time elements such as wait time and move time that you may define on routing lines using this work center.

Example - Different Machine Centers Assigned to a Work Center

It is important to plan which capacities are to make up the total capacity when setting up the machine centers and work centers.

If different machine centers (such as 210 Packing table 1, 310 Painting Cabin ...) are assigned to a work center, the consideration of the single capacities of the machine centers is significant because failure of one machine center can interrupt the entire process. The machine groups can be entered according to their capacity but may not be included in the planning. By deactivating the **Consolidated Calendar** field only the capacity of the work center but not the machine center is assigned in the planning.

If, however, identical machine centers (such as 210 Packing table 1 and 220 Packing table 2) are combined in a work center, the consideration of the work center as a sum of the assigned machine centers is of interest. Therefore, the work center would be listed with zero capacity. By activating the **Consolidated Calendar** field, the common capacity is assigned to the work center.

If capacities of work centers are to make no contribution to the total capacity, you can achieve this with efficiency = 0.

To set up a capacity constrained machine or work center

You must set up production resources that you regard as critical and mark them to accept a finite load instead of the default infinite load that other production resources accept. A capacity-constrained resource can be a work center or machine center that you have identified as a bottleneck and would like to establish a limited, finite load for.

Business Central does not support detailed shop floor control. It plans for a feasible utilization of resources by providing a rough-cut schedule, but it does not automatically create and maintain detailed schedules based on priorities or optimization rules.

On the **Capacity-Constrained Resources** page, you can make setup that avoids overload of specific resources and ensure that no capacity is left unallocated if it could increase the turn-around time of a production order. In the **Dampener (% of Total Capacity)** field, you can add dampener time to resources to minimize operation splitting. This enables the system to schedule load on the last possible day by exceeding the critical load percent slightly if this can reduce the number of operations that are split.

When planning with capacity-constrained resources, the system ensures that no resource is loaded above its defined capacity (critical load). This is done by assigning each operation to the nearest available time slot. If the time slot is not big enough to complete the entire operation, then the operation will be split into two or more parts placed in the nearest available time slots.

1. Choose the  icon, enter **Capacity Constrained Resources**, and then choose the related link.
2. Choose the **New** action.
3. Fill in the fields as necessary.

NOTE

Operations on work centers or machine centers that are set up as constrained resources will always be planned serially. This means that if a constrained resource has multiple capacities, then those capacities can only be planned in sequence, not in parallel as they would be if the work or machine center was not set up as a constrained resource. In a constrained resource, the Capacity field on the work center or machine center is greater than 1.

In case of operation splitting, the setup time is only assigned once because it is assumed that some manual adjustment is done to optimize the schedule.

Create Routings

3/31/2019 • 6 minutes to read

Manufacturing companies use routings to visualize and direct the manufacturing process.

The routing is the basis of process scheduling, capacity scheduling, scheduled assignment of material needs, and manufacturing documents.

As for production BOMs, the routings are assigned to the manufacturing end item. A routing holds master data that captures the process requirements of a given produced item. Once a production order is created for that item, its routing will govern the scheduling of operations as represented on the **Prod. Order Routing** page under the production order.

Before you can set up a routing, the following must be in place:

- Item cards are created for parent items that take part in manufacturing. For more information, see [Register New Items](#).
- Production resources are set up. For more information, see [Set Up Work Centers and Machine Centers](#).

To create a routing

1. Choose the  icon, enter **Routings**, and then choose the related link.
2. Choose the **New** action.
3. Fill in the fields as necessary. Hover over a field to read a short description.
4. In the **Type** field, select **Serial** to calculate the production routing according to the value in the **Operation No.** field.
Select **Parallel** to calculate the operations according to the value in the **Next Operation No.** field.
5. To edit the routing, set the **Status** field to **New** or **Under Development**. To activate it, set the **Status** field to **Certified**.

Proceed to fill in the routing lines.

6. In the **Operation No.** field, enter the number of the first operation, for example, **10**.
7. In the **Type** field, specify which kind of resource is used, for example, **Work Center**.
8. In the **No.** field, select the resource to be used, or type it in the field.
9. In the **Routing Link Code** field, enter a code to connect the component to a specific operation. For more information, see [To create routing links](#).
10. In the **Run Time** and **Setup Time** fields, enter the process times needed to perform the operation.

> [!NOTE]

> Setup time is calculated per production order, whereas run time is calculated per produced item.

11. In the **Concurrent Capacities** field, specify how many units of the selected resource are used to perform the operation. For example, two people allocated to one packing operation will halve the run time.
12. Continue to fill in lines for all operations involved in producing the item in question.
13. To copy lines from an existing routing, choose the **Copy Routing** action to select existing lines.

14. Certify the routing.
15. You can now attach the new routing to the card of the production item in question, by filling in the **Routing No.** field. For more information, see [Register New Items](#).

NOTE

Remember also to recalculate the item's standard cost from the **Item** card: Choose the **Manufacturing** action, select the **Calc. Standard Cost** action, and then select the **All Levels** action.

To create routing links

You can create routing links to connect components to specific operations in order to retain their relationship even though the production BOM or routing is modified. It also facilitates just-in-time flushing of components, namely when the specific linked operation starts, not when the complete production order is released. For more information see [Flush Components According to Operation Output](#).

Another important benefit is that linked components and operations are displayed in a logical process structure when you use the **Production Journal** page for output and consumption posting.

1. Choose the  icon, enter **Routings**, and then choose the related link.
2. Open the routing that contains the operations that you want to link.

Make sure the routing status is **Under Development**.

3. On the relevant routing line, in the **Routing Link Code** field, select a code.
4. Proceed to add different routing link codes to other operations in the routing, if relevant.

NOTE

You should not use the same routing link code in different operations on a routing because you may incorrectly link a component to two different operations, so that it is consumed two times.

It is a good idea to name the routing link code after the operation in order to ensure operation-specific routing links.

5. Set the routing status to **Certified**.

Routing link codes are now assigned to operations. Next, you must create the actual link by assigning the same codes to specific components in the relevant production BOM.
6. Open the **Production BOM** that contains the components that you want to link to the above operations. For more information, see [Create Production BOMs](#).
7. Make sure the BOM status is **Under Development**.
8. On the relevant production BOM line, in the **Routing Link Code** field, select the code that you have just assigned to the relevant operation.
9. Proceed to add routing link codes to other components according to the unique operations where they are used.
10. Set the production BOM status to **Certified**.

NOTE

To enable the routing links on an existing production order, you must refresh the production order. For more information, see [Create Production Orders](#).

The selected components will now be linked to the selected operations when you create or refresh a production order using the production BOM and routing in question. This is visible on the **Prod. Order Components** page under the production order, and here you can also remove and add the defined routing link codes at any time.

To assign personnel, tools, and quality measures to routing operations.

If you require personnel with qualifications, special knowledge, or special authorization for an operation, you can assign these personnel to the operation. In addition, you can assign tools and quality requirements to the operation. This procedure describes how to assign personnel. The steps are similar for other types of operation information.

1. Choose the  icon, enter **Routings**, and then choose the related link.
2. Open the relevant routing.
3. On the **Lines** FastTab, select the line that you want to process, and then choose the **Personnel** action.
4. Fill in the fields on the **Routing Personnel** page.
5. Choose the **OK** button to exit the page. The entered values are copied and assigned to the operation.

To create a new versions of a routing

The version principle enables you to manage several versions of a routing. The structure of the routing version corresponds to the structure of the routing consisting of the routing version header and the routing version lines. The basic difference is defined by the starting date.

1. Choose the  icon, enter **Routings**, and then choose the related link.
2. Select the routing to be copied, and then choose the **Versions** action.
3. On the **Routing Versions** page, choose the **New** action.
4. Fill in the fields as necessary.
5. In the **Version Code** field, enter the unique identification of the version. Any combination of numbers and letters is permitted.

The newly created version is automatically assigned the status **New**.

6. To create operation lines, select the first blank line, and then fill in the **Operation No.** field according to the sequence of operations.

The operation lines are sorted in ascending order by operation numbers. To be able to make changes later, we recommend you to select adequate step widths. The **Next Operation No.** field refers to the following operation. The number of the operation can be entered directly.

7. When the routing version is completed, setting the **Status** field to **Certified**.

The time validity of the version is specified by the **Starting Date** field.

Purchasing

Working with Business Central

Create Production BOMs

3/31/2019 • 5 minutes to read

A production bill of material (BOM) holds master data that describes the components and subassemblies used in the production of a parent item. Once a production order is created for that parent item, its production BOM will govern the calculation of material requirements as represented on the **Prod. Order Components** page.

Business Central also support assembly BOMs. You use assembly orders for making end items from components in a simple process that can be performed by one or more basic resources, which are not machine or work centers, or without any resources. For example, an assembly process could be to pick two wine bottles and one coffee sack and then pack them as a gift item. For more information, see [Assembly BOMs or Production BOMs](#).

Before you can set up a routing, the following must be in place:

- Item cards are created for parent items that take part in manufacturing. For more information, see [Register New Items](#).
- Production resources are set up. For more information, see [Set Up Work Centers and Machine Centers](#).

To create a production BOM

1. Choose the  icon, enter **Production BOM**, and then choose the related link.
2. Choose the **New** action.
3. Fill in the fields as necessary. Hover over a field to read a short description.
4. To edit the BOM, set the **Status** field to **New** or **Under Development**. To activate it, set the **Status** field to **Certified**.

Proceed to fill in the production BOM lines.

5. In the **Type** field, select whether the item on this BOM line is an ordinary item or a production BOM. If the item on the line is a production BOM, then it must already exist as a certified production BOM.
6. In the **No.** field, look up and select the item or production BOM in question, or type it in the field.
7. In the **Quantity Per** field, enter how many units of the item go into the parent item, for example, 4 wheels for 1 car.
8. In the **Scrap %** field you can enter a fixed percentage of components that are scrapped during production. When the components are ready to be consumed in a released production order, this percentage will be added to the expected quantity in the **Consumption Quantity** field in a production journal. For more information, see [Register Consumption and Output](#).

NOTE

This scrap percentage represents components that are scrapped during production when picking from inventory, whereas the scrap percentage on routing lines represents scrapped output before putting on inventory.

9. In the **Routing Link Code** field, enter a code to connect the component to a specific operation. For more information, see [To create routing links](#).
10. To copy lines from an existing production BOM, choose the **Copy BOM** action to select existing lines.

11. Certify the production BOM.
12. You can now attach the new production BOM to the card of the parent item in question. For more information, see [Register New Items](#).

NOTE

To recalculate the item's standard cost from the item card, choose the **Manufacturing** action, and then choose the **Calc. Standard Cost** action.

To create a new versions of a production BOM

New versions of production BOMs are used when, for example, an item is replaced by another item, or when a customer requires a special version of a product. The version principle enables various versions of a production BOM to be managed. The structure of the production BOM version corresponds to the structure of the production BOM. The basic difference is in the time validity of the versions. The validity is defined by the starting date.

The starting date indicates the start of the period in which this version is valid. For all other considerations, the starting date is a filter criterion for calculations and evaluations. The BOM version is valid until the next version becomes valid for its starting date.

1. Choose the  icon, enter **Production BOM**, and then choose the related link.
2. Select the production BOM to be copied, and then choose the **Versions** action.
3. On the **Home** tab, in the **New** group, choose **New**.
4. Fill in the fields as necessary.
5. In the **Version Code** field, enter the unique identification of the version. Any combination of numbers and letters is permitted.

The newly created version is automatically assigned the status **New**.

6. When the BOM version is completed, setting the **Status** field to **Certified**.

The time validity of the version is specified by the **Starting Date** field.

NOTE

Select the **Item** option in the **Type** field to use an item from your item master data in the production BOM. If the item also has a production BOM, whereby the **Production BOM No.** field is filled in on the item card, this production BOM is also considered.

Select the **Production BOM** option if you want to use a phantom production BOM on the line.

Phantom production BOMs serve for structuring products. This production BOM type never leads to a finished product, but is used exclusively for determining the dependent demand. Phantom production BOMs do not have their own item master data.

Quantity Calculation Formula on Production BOMs

The quantity is calculated taking into consideration different dimensions which are also entered on the production BOM lines. The dimensions refer to an order unit of the respective item. The length, width, depth and weight can be entered as dimensions.

The Calculation Formula, Length, Width, Depth and Weight columns are not displayed, because they are only

used by some users. If you wish to use the calculation of the quantity, you must first display these columns.

The relation of the individual components is defined by the calculation formula. The following possibilities are available as a calculation formula:

- **Empty** - No consideration of dimensions. (Quantity = Quantity per.)
- **Length** - Quantity = Quantity per * Length
- **Length x Width** - Quantity = Quantity per * Length x Width
- **Length x Width x Depth** - Quantity = Quantity per x Length x Width x Depth
- **Weight** - Quantity = Quantity per x Weight

Example

In a production BOM, seventy metal parts with the dimensions length = 0.20 m and width = 0.15 m are required. The values are entered as follows: Calculation Formula = Length x Width, Length = 20, Width = 15, Quantity per = 70. The quantity is given by the Quantity per x Length * Width, that is, Quantity = 70 x 0.20 m x 0.15 m = 2.1 m².

Flush Components According to Operation Output

3/31/2019 • 2 minutes to read

For items that are set up with backward flushing method, the default behavior is to calculate and post component consumption when you change the status of a released production order to **Finished**.

If you also define routing link codes, then calculation and posting occurs when each operation is finished, and the quantity that was actually consumed in the operation is posted. For more information, see [Create Routings](#).

For example, if a production order to produce 800 meters requires 8 kg of a component, then when you post 200 meters as output, 2 kg are automatically posted as consumption.

This functionality is useful for the following reasons:

- **Inventory Valuation** - Value entries for output and consumption are created in parallel as the production order progresses. Without routing link codes, the inventory value will increase as output is posted and then decrease at a later point in time when the value of component consumption is posted together with the finished production order.
- **Inventory Availability** - With gradual consumption posting, the availability of component items is more up-to-date, which is important to maintain the internal balance between demand and supply. Without routing link codes, other demands for the component may believe that it is available as long as it is pending a delayed consumption posting.
- **Just-in-Time** – With the ability to customize products to customer requests, you can minimize waste by making sure that work and system changes only occur when it is necessary.

The following procedure shows how to combine backward flushing and routing link codes so that the quantity that is flushed for each operation is proportional to the actual output of the finished operation.

To flush components according to operation output

1. Choose the  icon, enter **Items**, and then choose the related link.
2. Choose the **Edit** action.
3. On the **Replenishment** FastTab, in the **Flushing Method** field, select **Forward**.

NOTE

Select **Pick+ Forward** if the component is used in a location that is set up for directed put-away and pick.

4. Choose the  icon, enter **Routings**, and then choose the related link.
5. Define routing link codes for every operation that consumes the component. For more information, see [Create Routings](#).
6. Choose the  icon, enter **Production BOM**, and then choose the related link.
7. Define routing link codes from each instance of the component to the operation where it is consumed.

IMPORTANT

The component must have a routing link to the last operation in the routing.

Work with Manufacturing Batch Units of Measure

3/31/2019 • 2 minutes to read

If an item is stocked in one unit of measure but produced in another, a production order is created that uses a manufacturing batch unit of measure to calculate the correct quantity of the components during the **Refresh Production Order** batch job. An example of a manufacturing batch unit of measure calculation is when a manufactured item is stocked in pieces but produced in tons.

To create a production BOM using a batch unit of measure

1. The manufacturing batch unit of measure is set up as an alternative unit of measure on the **Item Units of Measure** page on the item to be produced. The batch unit of measure will not replace the base unit of measure on the item.
2. Create a production BOM for the item set up with the manufacturing batch unit of measure. For more information, see [Create Production BOMs](#).
3. In the **Unit of Measure Code** field, select the manufacturing batch unit of measure.
4. For each production BOM line, in the **Quantity Per** field, enter the quantity of this component item that is required to create this batch unit of measure.
5. Open the **Item Card** for the related item.

On the **Replenishment** FastTab, in the **Production BOM No.** field, select the production BOM created above.

6. Create a production order header using the item set up with the manufacturing batch unit of measure. For more information, see [Create Production Orders](#).
7. Choose the **Refresh** action, and then choose the **OK** button.

On the **Lines** FastTab, choose the **Line** action, and then choose the **Components** action to view the result. The program calculates the correct quantity of the components needed to satisfy the production BOM based on the manufacturing batch unit of measure.

To calculate a manufacturing batch unit of measure on a production order

1. Create a production order header using the item set up with the manufacturing batch unit of measure.
2. In the **Item No.** field in the Production Order line, type the same item number used in the header.
3. In the **Quantity** field, enter the same quantity used in the header.
4. In the **Unit of Measure Code** field, select the manufacturing batch unit of measure code.
5. Choose the **Refresh** action.
6. On the **Calculate** FastTab, clear the **Lines** check box.
7. Choose the **OK** button.
8. On the **Lines** FastTab, choose the **Line** action, and then choose the **Components** action to view the result. The correct quantity of the components needed to satisfy the production BOM is calculated based on the manufacturing batch unit of measure.

Work with Production Families

3/31/2019 • 2 minutes to read

A production family is a group of individual items whose relationship is based on the similarity of their manufacturing processes. By forming production families, some items can be manufactured twice or more in one production, which will optimize material consumption.

In the **Quantity** field on the **Family** page, you enter the quantity that will be produced when the whole family has been manufactured once.

Example

In punching processes, four pieces of the same item can be produced from one sheet and 10 pieces of another, different, item at the same time. The punching machine will punch all 14 pieces in one step.

Forming production families reduces the scrap quantity because what would normally be leftover scrap, when producing big pieces, will be used instead to produce small items.

To set up a production family

1. Choose the  icon, enter **Families**, and then choose the related link.
2. Fill in the fields as necessary. Hover over a field to read a short description.

To produce based on a production family

1. Choose the  icon, enter **Firm Planned Prod. Orders**, and then choose the related link.
2. Create a new production order. For more information, see [Create Production orders](#).
3. In the **Source Type** field, select **Family**.
4. In the **Source No.** field, select the relevant production family.

Set Up Standard Routing Lines

3/31/2019 • 2 minutes to read

The use of standard tasks simplifies the creation and maintenance of routings. They allow you to quickly attach extra information to recurring operations.

To set up a standard task

1. Choose the  icon, enter **Standard Tasks**, and then choose the related link.
2. Choose the **New** action.
3. Fill in the fields as necessary. Hover over a field to read a short description.
4. Choose the **Tools, Personnel, Description, or Tools** action.
5. on the page that opens, describe the standard task in question.

To add a standard task to an operation

1. Choose the  icon, enter **Routings**, and then choose the related link.
2. Open the relevant routing.
3. Select a relevant routing line, choose the **Operations** action, and then choose the **Tools, Personnel, Description, or Tools** action.

Subcontract Manufacturing

3/31/2019 • 6 minutes to read

Subcontracting selected operations to vendor is common in many manufacturing companies. Subcontracting can be a rare occurrence or can be an integral part of all production processes.

The program provides several tools for managing subcontract work:

- **Work Centers with assigned vendor:** This feature enables you to set up a work center that is associated with a vendor (subcontractor). This is called a subcontract work center. You can specify a subcontract work center on a routing operation, which allows you to easily process the subcontracted activity. In addition, the cost of the operation can be designated at the routing or the work center level.
- **Work Center cost based on units or time:** This feature enables you to specify whether costs associated with the work center are based on the production time or a flat charge per unit. Although subcontractors commonly use a flat charge per unit to charge for their services, the program can handle both options (production time and flat charge per unit).
- **Subcontracting Worksheet:** This feature allows you to find the production orders with material ready to send to a subcontractor and to automatically create purchase orders for subcontract operations from production order routings. Then the program automatically posts the purchase order charges to the production order during the posting of the purchase order. Only production orders with a status of released can be accessed and used from a subcontracting worksheet.

Subcontract Work Centers

Subcontract Work Centers are set up the same as regular work centers with additional information. They are assigned to routings in the same manner as other work centers.

Subcontract Work Center Fields

This **Subcontractor No.** field designates the work center as a subcontract work center. You can enter the number of a subcontractor who supplies the work center. This field can be used to administer work centers, which are not in-house but perform processing under contract.

If you subcontract with the vendor for a different rate for each process, then select the **Specific Unit Cost** field. This lets you set up a cost on each routing line and saves the time of re-entering each purchase order. The cost on the routing line is used in processing instead of the cost on the work center cost fields. Selecting the **Specific Unit Cost** field calculates costs for the vendor by the routing operation.

If you subcontract at a single rate per vendor, leave the **Specific Unit Cost** field blank. The costs will be set up by filling in **Direct Unit Cost**, **Indirect Cost %**, and **Overhead Rate** fields.

Routings that use Subcontract Work Centers

Subcontract work centers can be used for operations on routings in the same way as regular work centers.

You can set up a routing that uses an outside work center as a standard operational step. Alternatively, you can modify the routing for a particular production order to include an outside operation. This might be needed in an emergency such as a server not working correctly, or during a temporary period of higher demand, where the work generally performed in-house must be sent to a subcontractor.

For more information, see [Create Routings](#).

Calculate Subcontracting Worksheets and Create Subcontract Purchase

Orders

Once you have calculated the subcontracting worksheet, the relevant document, in this case a purchase order, is created.

The **Subcontracting Worksheet** page functions like the **Planning Worksheet** by calculating the needed supply, in this case purchase orders, which you review in the worksheet and then create with the **Carry Out Action Message** function.

NOTE

Only production orders with status **Released** can be accessed and used from a subcontracting worksheet.

To calculate the subcontracting worksheet

1. Choose the  icon, enter **Subcontracting Worksheet**, and then choose the related link.
2. To calculate the worksheet, choose the **Calculate Subcontracts** action.
3. On the **Calculate Subcontracts** page, set filters for the subcontracted operations, or the work centers where they are performed, to calculate only the relevant production orders.
4. Choose the **OK** button.

Review the lines on the **Subcontracting Worksheet** page. The information in this worksheet comes from the production order and production order routing lines and flows to the purchase order when that document is created. You can delete a row from the worksheet without affecting the original information, just as you can with the other worksheets. The information will reappear the next time you run the **Calculate Subcontracts** function.

To create the subcontract purchase order

1. Choose the  icon, enter **Subcontracting Worksheet**, and then choose the related link.
2. On the **Actions** tab, in the **Process** group, choose **Carry Out Action Message**.
3. Select the **Print Orders** field to print the purchase order as it is created.
4. Choose the **OK** button.

If all subcontracted operations are sent to the same vendor location, then only one purchase order is created.

The worksheet line that was turned into a purchase order is deleted from the worksheet. Once a purchase order is created, it will not appear in the worksheet again.

Posting Subcontract Purchase Orders

Once the Subcontractor Purchase Orders have been created, they can be posted. Receiving the order posts a Capacity Ledger Entry to the production order and invoicing the order posts the direct cost of the purchase order to the production order.

When the purchase is posted as received, then an output journal entry is automatically posted for the production order. This only applies if the subcontract operation is the last operation on the production order routing.

Caution

Posting output automatically for an ongoing production order when subcontracted items are received may not be desired. Reasons for this could be that the expected output quantity that is posted may be different from the actual quantity and that the posting date of the automatic output is misleading.

To avoid that the expected output of a production order is posted when subcontract purchases are received, make sure the subcontracted operation is not the last one. Alternatively, insert a new last operation for the final output quantity.

To post a subcontract purchase order

1. Choose the  icon, enter **Purchase Orders**, and then select the related link.
2. Open a purchase order that is created from the subcontracting worksheet.

On the purchase order lines, you see the same information that was in the worksheet. The **Prod. Order No.**, **Prod. Order Line No.**, **Operation No.**, and **Work Center No.** fields are filled in with the information from the source production order.

3. Choose the **Post** action.

When the purchase is posted as received, then an output journal entry is automatically posted for the production order. This only applies if the subcontract operation is the last operation on the production order routing.

Caution

Posting output automatically for an ongoing production order when subcontracted items are received may not be desired. Reasons for this could be that the expected output quantity that is posted may be different from the actual quantity and that the posting date of the automatic output is misleading.

To avoid that the expected output of a production order is posted when subcontract purchases are received, make sure the subcontracted operation is not the last one. Alternatively, insert a new last operation for the final output quantity.

When the purchase order is posted as invoiced, then the direct cost of the purchase order is posted to the production.

Setting Up Service Management

3/31/2019 • 2 minutes to read

Before you can start using Service Management features in Business Central, there are a few things to set up. For example, you can establish coding for standard services, symptoms, and fault codes, and the service items and service item types that your company's customer service needs require.

When you set up Service Management, you must decide what services to offer customers and the schedule for those services. A service is a type of work performed by one or more resources and provided to a customer. For example, a service could be a type of computer repair. A service item is the equipment or item needing servicing, for example, the computer needing repair, installed at a specific customer. You can set up services as part of a group of related repair or maintenance items.

When you define a service, you can associate it with the skills required to perform the service. To help your service representatives be efficient, you can also set up real time troubleshooting guidelines and assign typical startup costs, such as travel costs or other fees.

The following table describes a sequence of tasks, with links to the topics that describe them.

TO	SEE
Set up codes that automatically assign lines on service documents for services you deliver often.	Set Up Codes for Standard Services
Establish general settings that control aspects of Service Management Processes.	Configure Service Processes
Define how your organization works with fault reporting.	Set Up Fault Reporting

[Service Management](#)

[Getting Started](#)

Create Service Items

3/31/2019 • 3 minutes to read

In Business Central, the term "service item" refers to equipment or items that require service. When you create a service order, you specify the items that need service. In the order, you can link a service item to an item in inventory or a service item group.

When you receive an item that needs service, you can register it as a service item. There are several ways to do so. For example, you can create a service item on the **Service Items** page, or as part of another process, such as when working with a service order.

To create a service item

1. Choose the  icon, enter **Service Items**, and then choose the related link.
2. Fill in the fields as necessary. Hover over a field to read a short description.

To create service items within a service order

When you receive items for service that you want to register as service items, you can create them as service items in the **Service Order** or **Service Quote** pages.

1. Choose the  icon, enter **Service Orders**, and then choose the related link.
2. Fill in the fields as necessary. Hover over a field to read a short description.
3. Choose the **Create Service Item** action.

A number is assigned to the service item and a service item card is created. The **Service Item No.** field is filled in with the number of the new service item.

To create a service item when shipping items

When you ship items by posting either service orders or service invoices, the shipped items are automatically registered as service items if the following condition is met. The items must belong to a service item group with the **Create Service Item** check box selected. If the items have serial numbers registered in the Item Tracking Lines page, this information is copied automatically to the **Serial No.** field on the service item card when creating service items.

The following procedure shows how to create service items when you ship items on service orders.

1. Choose the  icon, enter **Service Orders**, and then choose the related link.
2. Open the relevant service order.
3. Choose the **Post** or **Post and Print** action.
4. Choose the **Ship** or **Ship and Invoice** action.
5. The service items are automatically created for the items on the order, provided these belong to a service item group that you have set up to create service items. If you registered specific serial numbers on the **Item Tracking Lines** page, they will be assigned to these service items.

NOTE

If an item is a BOM and you have exploded the BOM, the exploded BOM items are processed in the same way as regular items. Service items are created based on the service items group condition and, optionally, the serial numbers condition. Additionally, if a service item is created for an exploded BOM item that is made up of other BOM components, these items are created as service item components for the exploded BOM service item.

If an item is a BOM and you have not exploded the BOM, a service item is created for it based on the service item group condition and, optionally, the serial numbers condition.

To insert a starting fee for a service item

1. Choose the  icon, enter **Service Tasks**, and then choose the related link.
2. Choose the **Item Worksheet** action.
3. Choose the service line, and then choose **Actions**, choose **Functions**, and then choose **Insert Starting Fee** action.

A service line of type **Cost** is inserted with the starting fee. The starting fee applies to the selected service item.

Set Up Standard Service Codes

3/31/2019 • 2 minutes to read

When you perform typical service, you often have to create service documents that use service lines that contain similar information. To make it easy to create these lines, you can set up standard service codes that have a predefined set of service lines. When you choose the code on a service document, the lines are entered automatically. You can set up any number of standard service codes, and each code can have an unlimited number of service lines of different types, including item, resource, cost, or standard text linked to it. You create service lines of each standard service code on the **Standard Service Code** card. You then assign standard service codes to service item groups on the **Standard Serv. Item Gr. Codes** page. Later, when you create a service document, you can use the **Get Standard Service Codes** action to add service lines.

TIP

You can use the same concept to create lines on sales and purchase documents. For more information, see [Create Recurring Sales and Purchase Lines](#).

To set up a standard service code

1. Choose the  icon, enter **Standard Service Codes**, and then choose the related link.
2. Fill in the fields as necessary. Hover over a field to read a short description.
3. Fill in the service lines linked to this service code.

To assign a standard service code to a service item group

1. Choose the  icon, enter **Service item Groups**, and then choose the related link.
2. Fill in the fields as necessary. Hover over a field to read a short description.
3. Fill in the service lines linked to this service code.

See Also

[Service Management](#)

Configure Service Processes

3/31/2019 • 2 minutes to read

The following are some examples of the settings that you can apply to service management processes:

- Some overall settings for various processes, such as warnings, next service calculations for service items, the starting fee to assess, the fault reporting level to use, and so on.
- The types of information that a technician must enter on service documents. For example, you can require them to specify the type of order, the start and/or end dates for the work, and the type of work that was done.
- Some default settings for response times and warranties. These include a default response time for starting service, warranty discount percentages for parts and labor, and how long warranties are valid for.
- Settings for contracts, such as the maximum number of days that you can use for contract service orders, whether to use reason codes when a contract is canceled, standard texts for contract descriptions, and contract values.
- The number sequences to use for service-related documents and items.

To enter general and mandatory settings

1. Choose the  icon, enter **Service Setup**, and then choose the related link.
2. Fill in the fields as necessary. Hover over a field to read a short description.

[Service Management](#)

Set Up Fault Reporting

3/31/2019 • 2 minutes to read

Fault reporting lets you establish standards for recording fault information for service items. For example, you can specify what the problem is, the symptoms you see, the reason for the problem, and how to resolve it.

Fault codes describe the typical service item faults or the actions taken on service items. Depending on the level of fault reporting in your company, you might need to set up fault area codes and symptom codes before you set up fault codes. Fault areas describe areas of service item faults. Fault reason codes describe the reason for service item faults and, if needed, whether to exclude warranty and contract discounts. For example, you might want to exclude warranty and contract discounts if the customer was somehow responsible for the fault in the service item. You assign fault reason codes to service orders. For more information, see [Work on Service Tasks](#).

To specify the overall level of fault reporting to use

1. Choose the  icon, enter **Service Setup**, and then choose the related link.
2. In the **Fault Reporting Level** field, choose one of the options described in the following table.

FAULT LEVEL	DESCRIPTION
None	No reporting codes are used.
Fault	Codes are listed in the Fault Codes table. These codes identify service item faults or actions to take on service items. You can cluster related codes into Fault Area Code groupings.
Fault + Symptom	You provide a combination of codes in the Fault Codes and Symptom Codes tables. Typical symptom codes include indicators that a customer might use to describe a problem, such as a noise or a quality.
Fault + Symptom + Area	You use fault, symptom, and fault area codes as an implementation of the International Repair Coding System (IRIS).

To complete the setup of fault reporting, you can also specify what repairs or resolutions are associated with a fault or defect. You set that up on the **Fault/Resolution Code Relationships** page, where you set up combinations of codes for the service item group of the service item from which you accessed the window and the number of occurrences for each one.

To create fault and resolution code relationships

To be able to see the most common methods of repair for particular item faults when you are servicing the items, you need to build up information on fault/resolution codes relationships. Use the **Insert Fault/Resol. Codes Relationships** batch job to find all the combination of fault and resolution codes in posted service orders and record them on the **Fault/Resol. Codes Relationships** page.

1. Choose the  icon, enter **Insert Fault/Resol. Codes Relationships**, and then choose the related link.
2. Enter dates to define the period you want to include in the batch job.
3. To group the relationships by service item group, choose the **Relation Based on Service Item Group** check

box.

4. To retain the records that you have already inserted manually on the **Fault/Resol. Codes Relationships** page, choose the **Retain Manually Inserted Rec.** check box.

[Setting Up Service Management](#)

Setting Up Troubleshooting for Service Items

3/31/2019 • 2 minutes to read

You can set up troubleshooting guidelines that help technicians solve problems when providing service. For example, guidelines might be a list of steps to perform a repair, or a series of questions to ask about the items. After you set up troubleshooting guidelines, you can assign them to service item groups, service items, and items. There is an inheritance hierarchy for guidelines. If you assign them to a service item group, the items included in the group will inherit the guidelines unless you specify them for the items. Similarly, service items will inherit guidelines from items.

To set up troubleshooting guidelines

1. Choose the  icon, enter **Troubleshooting**, and then choose the related link.
2. Fill in the fields as necessary. Hover over a field to read a short description.

To assign troubleshooting guidelines to items, service items, or service item groups

1. Choose the  icon, enter **Items**, **Service Items**, or **Service Item Groups**, and then choose the related link.
2. Choose the relevant entity, and then choose the **Troubleshooting** action.

[Service Management](#)

Set Up Resource Allocation

3/31/2019 • 3 minutes to read

To ensure that a service task is performed well, it's important to find a resource who is qualified to do the work. You can set up Business Central so that it's easy to allocate someone who has the right skills for the job. In Business Central, we call this *resource allocation*. You can allocate resources based on their skill, availability, or whether they are in the same service zone as the customer.

To use resource allocation, you must set up:

- The skills required to repair and maintain service items. You assign these to service items and resources.
- Geographic regions, called zones, that you define for your market. For example, East, West, Central, and so on. You assign these to customers and resources.
- Whether to display resource skills and zones, and whether to display a warning if someone chooses unqualified resource, or a resource that is not in the customer zone.

To set up skills

1. Choose the  icon, enter **Skills**, and then choose the related link.
2. Fill in the fields as necessary. Hover over a field to read a short description.

To assign skills to service items and resources

1. Choose the  icon, enter **Service Items** or **Resources**, and then choose the related link.
2. Open the card for the service item or resource, and then choose one of the following:
 - For service items, choose **Resource Skills**.
 - For resources, choose **Skills**.

To set up zones

1. Choose the  icon, enter **Zones**, and then choose the related link.
2. Fill in the fields as necessary. Hover over a field to read a short description.

To assign zones to customers and resources

1. Choose the  icon, enter **Customers** or **Resources**, and then choose the related link.
2. Open the card for the service item or resource, and then choose one of the following:
 - For customers, choose a zone in the **Service Zone Code** field.
 - For resources, choose the **Service Zones** action.

To specify what to show when a resource is chosen

1. Choose the  icon, enter **Service Setup**, and then choose the related link.
2. In the **Resource Skills Option** field, choose one of the options described in the following table.

OPTION	DESCRIPTION
Code Shown	Displays the code only.
Warning Displayed	Shows the information and displays a warning if you choose a resource that is not qualified.
Not Used	Does not show this information.

To update resource capacity

You may need to change the capacity of resources.

1. Choose the  icon, enter **Resource Capacity**, and then choose the related link.
2. Choose the resource, and then choose the **Set Capacity** action.
3. Make the changes, and then choose **Update Capacity**.

To update skills for items, service items, or service item groups

If you want to change the skill codes assigned to items, for example from **PC** to **PCS**, you can do so either for an item, service item, or for all items in a service item group.

1. Choose the  icon, enter **Items** or **Service Item**, or **Service Item Group**, and then choose the related link.
2. Choose the entity to update, and then choose the **Resource Skills** action.
3. On the line with the code to be changed, in the **Skill Code** field, choose the relevant skill code.
4. If the item has associated service items, a dialog box opens with the following two options:
 - Change the skill codes to the selected value: Select this option if you want to replace the old skill code with the new one on all the related service items.
 - Delete the skill codes or update their relation: Select this option if you want to change the skill code on this item only. The skill code on the related service items will be reassigned, that is, the **Assigned From** field will be updated.

Set Up Pricing and Additional Costs for Services

3/31/2019 • 3 minutes to read

You can use the Business Central pricing features to set up and customize your application so that you apply and adjust pricing on service items, repairs, and orders. These pricing decisions are then easily transmitted to the invoicing process.

As your implementation requires, you can set up pricing groups and map them to specific time periods, customers, or currency. You can set up fixed, minimum, or maximum pricing, depending on the service contracts that you have with customers. Finally, as you adjust your prices, you can view and approve the changes before committing them to the ledger.

To set up a service price group

You can set up groups containing service items that you want to receive the same special service pricing. You assign service price groups to service items on service item lines. You can also assign service price groups to service item groups.

1. Choose the  icon, enter **Service Price Groups**, and then choose the related link.
2. Create a new service price group.
3. Fill in the **Code** and **Description** fields.
4. Choose the **Setup** action.
5. Fill in the fields as necessary. Hover over a field to read a short description.

TIP

The **Adjustment Type** and **Amount** fields work together to specify whether an adjustment concerns a fixed amount, or applies only when the total service price exceeds or is lower than the amount in the **Amount** field.

To set up a service price adjustment group

You can set up price adjustment groups to adjust service pricing of service items. For example, you can set up price adjustment groups that adjust price of freight or spare parts.

1. Choose the  icon, enter **Service Price Adjustment Groups**, and then choose the related link.
2. Create a new service price adjustment group.
3. Fill in the **Code** and **Description** fields.
4. In the **Type** field, enter the type of the entry that you want to adjust.
 - To adjust only one specific entry, enter the number of this entry in the **No.** field. When you leave this field blank, your adjustment group will adjust all entries of the type defined in the **Type** field.
 - To adjust service prices related to only one specific service, fill in the **Work Type** field. When you leave this field blank, it will just be ignored.
5. In the **Description** field, enter a short description of the service price adjustment.
6. To adjust service prices related to only one specific general product posting group, fill in the **Gen. Prod. Posting Group** field.

TIP

You can choose **Details** to add additional information about the adjustment group. For example, you can specify which item belongs to the service price adjustment group, and whether this is an item, a resource, a resource group, or a service charge.

To set up additional costs for services

When you work with service items and service orders, you may need to register additional costs, such as travel costs to particular service zones or starting fees. When you create a service order, you can insert these costs and a line with the type **Cost** will be added to the order. Alternatively, if you want to apply the cost to all service orders, you can set up a default cost. For example, if you always want to apply a starting fee.

To set up service costs

1. Choose the  icon, enter **Service Costs**, and then choose the related link.
2. Fill in the fields as necessary. Hover over a field to read a short description.

To specify a default cost for service orders

1. Choose the  icon, enter **Service Setup**, and then choose the related link.
2. In the **Service Order Starting Fee** field, choose the appropriate service cost.

Set Up Service Items and Service Item Components

3/31/2019 • 2 minutes to read

To work with service items, you must set up the following

- Service item groups.
- Optional

To set up service item groups

You can set up groups of items that are related in terms of repair and maintenance. You can define default values for service items in a service item group, such as response time, contract discount percent, and service price group. For items in a service item group, you can select whether you want them to be automatically registered as service items when they are sold.

You assign service item groups to items on the **Item** card, and to service items on the **Service Item** card.

1. Choose the  icon, enter **Service Item Groups**, and then choose the related link.
2. Create a new service item group.
3. Fill in the **Code** and **Description** fields.
4. In the **Default Contract Discount %** field, enter the default contract discount percentage that you want the service items in the group to have.
5. In the **Default Serv. Price Group Code** field, enter the default service price group code that you want the service items in the group to have.
6. In the **Default Response Time (Hours)** field, enter the default response time in hours that you want the service items in the group to have.
7. If you want to register the items in the group as service items when they are sold, select the **Create Service Item** field.

To set up service item components

A service item can consist of several components, which can be replaced with spare parts when the item is serviced. These components are set up on the **Service Item Component List** page. Additionally, if you want to set up components for service items that are BOMs, you can copy the BOM items and create them as service item components.

1. Choose the  icon, enter **Service Items**, and then choose the related link.
2. Open the service item for which you want to set up components.
3. Choose the **Components** action. The **Service Item Component List** page opens.
4. Add a new component.
5. In the **Type** field, choose **Service Item** if the component itself is a registered service item. Otherwise, select **Item**.
6. In the **No.** field, choose the item or service item that is a component of the service item.

To set up service item components from a BOM

1. Choose the  icon, enter **Service Items**, and then choose the related link.
2. Open the service item for which you want to set up components from a BOM.

3. Choose the **Components** action. The **Service Item Component List** page opens.

4. Choose the **Copy from BOM** action.

If the item that the service item is linked to is a BOM, the components for all the items in the BOM are created automatically.

To set up a service shelf

You can set up service shelves that identify where you store your service items. You assign service shelves to service items on the **Service Order** and **Service Item Worksheet** pages.

1. Choose the  icon, enter **Service Shelves**, and then choose the related link.
2. Fill in the fields as necessary.

Set Up Work Hours and Service Hours

3/31/2019 • 2 minutes to read

Typically, a service management system tracks resource hours and service order status in order to forecast workloads and service needs. Business Central has built-in tools that you can customize to record this kind of information.

After you set the default service hours of your company, you can calculate response times for service orders or send warnings or alerts when service calls come in. The alert feature is implemented together with the job scheduler.

As you work on a service order, you will want to update it's status so that you can monitor progress. The service order status reflects the repair status of all the service items in the service order. For more information, see [Understanding Service Order and Repair Status](#).

To set up default service hours

You use the **Default Service Hours** page to set up the usual service working hours in your company. These service hours are used to calculate the response date and time for service orders and quotes and to send response time warnings. The default service hours are used for service contracts unless you specify special service hours for a contract.

1. Choose the  icon, enter **Default Service Hours**, and then choose the related link.
2. Fill in the fields as necessary. Hover over a field to read a short description.

IMPORTANT

If you leave the lines on the **Default Service Hours** page empty, the default value is 24 hours, valid only for calendar working days.

To set up work-hour templates

You can use the **Work-Hour Template** page to set up templates that contain the typical working hours in your company. For example, you can create templates for full time technicians and part time technicians. You can use work-hour templates when you add capacity to resources.

1. Choose the  icon, enter **Work Hour Templates**, and then choose the related link.
2. Fill in the fields as necessary. Hover over a field to read a short description.

NOTE

After you enter work hours for each day, the value in the **Total per Week** field is calculated automatically.

To set up contract specific service hours

You can use the **Service Hours** page to set up specific service hours for the customer that owns the service contract. Service hours are used to calculate the response date and time for service orders and quotes that belong to the service contract.

If you do not set up specific service hours for the service contract, the default service hours for service contracts

are used.

1. Choose the  icon, enter **Service Contracts**, and then choose the related link.
2. Open the service contract you want to set up specific service hours for, and choose **Service Hours**.
3. To set up service hours based on default service hours, choose the **Copy Default Service Hours** action.
4. Edit the fields in the service hours entries. Insert or delete entries to set up the service hours for the contract.
Note that the fields **Day**, **Starting Time** and **Ending Time** are required for each line.
5. If you want the service hours to be valid from a specific date, fill in the **Starting Date** field.
6. If you want the service hours to be valid on holidays, select the check box in the **Valid on Holidays** field.

[Understanding Service Order and Repair Status](#)

Set Up Statuses for Service Orders and Repairs

3/31/2019 • 2 minutes to read

You must set up repair status options that identify the progress of repair and maintenance of service items in service orders. You must set up at least nine repair status options that identify situations or actions taken when servicing service items.

You can set the priority level for service order status options. There four priorities are High, Medium High, Medium Low, and Low.

When you change the repair status of a service item in a service order, the service order status is updated. The repair status of each service item is linked to the service order status. If the service items are linked to two or more service order status options, the service order status with the highest priority is selected.

To set up a repair status

1. Choose the  icon, enter **Repair Status**, and then choose the related link.
2. Create a new repair status.
3. Fill in the **Code** and **Description** fields.
4. In the **Service Order Status** field, choose the order status to link the repair status to. The **Priority** field displays the priority of the service order status you have chosen.
5. Choose a repair status. You can choose only one.
6. To be able to post service orders, including service items, with this repair status, choose the **Posting Allowed** field.
7. To be able to manually change the service order status option to **Pending** in service orders including service items with this repair status, choose the **Pending Status Allowed** check box.
8. Choose the **In Process Status Allowed**, **Finished Status Allowed**, and **On Hold Status Allowed** check boxes in the same way.

To set up service status priorities

1. Choose the  icon, enter **Service Order Status**, and then choose the related link.
2. Select the service order status you want to set a priority for.
3. In the **Priority** field, choose the priority you want for this service order status. Repeat this step for each status.

Set Up a Loaner Program

3/31/2019 • 2 minutes to read

Sometimes you must provide a customer a loaner item for use when your customer service team makes a repair. In Business Central, you can set up a loaner program, loan items to your customers, and track receipts when customers return the items. Additionally, you can add comments about loaners in one of two ways:

- Enter a note or comment about the loaner itself.
- Enter a note on a service item about the need for a loaner.

To set up a loaner

1. Choose the  icon, enter **Loaners**, and then choose the related link.
2. Create a new loaner card.
3. In the **No.** field, enter a number for the loaner. Alternatively, if you have set up number series for loaners on the **Service Mgt. Setup** page, you can press the Enter key to enter the next available loaner number.
4. Fill in the **Description**, **Description 2**, and **Serial No.** fields.
5. In the **Unit of Measure Code** field, choose the relevant unit of measure.

Set Up Service Contracts

3/31/2019 • 2 minutes to read

Before you can work with contracts, you must set up the following:

- **Service contract groups**, which gather service contracts that are related in some way.
- **Service contract account groups**, which are used to group the service contract accounts together for service invoices created for service contracts. You assign these groups to service contracts.
- **Contract templates** that define contract layouts of contracts that include the most commonly used service contract details. When you create service contract quotes, you can create them by using templates. When you create a contract quote, the fields automatically contain the contents of the template fields.
- **Customer templates** that let you create quotes for contacts or potential customers who are not registered as customers in Business Central.

To set up a service contract group

1. Choose the  icon, enter **Service Contract Groups**, and then choose the related link.
2. Fill in the fields as necessary. Hover over a field to read a short description.
3. Choose the **Disc. on Contr. Orders Only** check box if you want contract or service discounts to be valid only for contract service orders, such as maintenance.

To set up a service contract account group

1. Choose the  icon, enter **Serv. Contract Account Groups**, and then choose the related link.
2. Create a new service contract account group.
3. Fill in the **Code** and **Description** fields. These fields describe the service account group.
4. Fill in the **Non-Prepaid Contract Acc.** field, choose general ledger account number for the non-prepaid account.
5. In the **Prepaid Contract Acc.** field, choose the general ledger account number for the prepaid account.

To set up a contract template

1. Choose the  icon, enter **Service Contract Templates**, and then choose the related link.
2. Create a new service contract template.
3. In the **No.** field, enter a number for the contract template.

Alternatively, if you have set up number series for contract templates on the **Service Mgt. Setup** page, you can press the Enter key to enter the next available contract template number. Fill in the other fields if appropriate.

4. On the **Invoice** FastTab, fill in the **Serv. Contract Acc. Group Code** field, the **Invoice Period**, and so on. Fill in the other fields if appropriate.
5. Choose the **Service Discounts** action to add contract discounts.

To set up a customer template

1. Choose the  icon, enter **Customer Templates**, and then choose the related link.
2. Create a new customer template card.

3. On the **General** FastTab, enter a code and a description for the customer template in the **Code** and **Description** fields respectively.
4. To define search criteria, fill in the other fields, such as **Country/Region Code**, **Territory Code**, and **Language Code**.
5. Fill in the **Gen. Bus. Posting Group** and **Customer Posting Group** fields.

Set Up Complex Application Areas Using Best Practices

3/31/2019 • 2 minutes to read

Entering the correct setup values from the start is important to the success of any new business software.

Whether you use Rapid Start to implement setup values or you manually enter them in the new company, you can support your setup decisions with some general recommendations for selected setup fields that are known to potentially cause the solution to be inefficient if defined incorrectly.

Help in Business Central includes best-practice information about how to set up key fields in the following application areas:

- [Setup Best Practices: Supply Planning](#)

Setup Best Practices: Supply Planning

3/31/2019 • 2 minutes to read

Supply planning is a critical business area. When set up and used correctly, supply planning helps a company avoid stock out and reduce both ordering costs and inventory costs.

It is not possible to prescribe one optimal setup of all planning fields as this varies from company to company because of business variables, such as market situation and business strategy. However, there are best practices for selecting options in items cards and global setup fields to help get the company started with timely and cost-effective inventory flows.

The following topics provide best-practice information about how to set up selected planning fields that are key to inventory and supply planning.

TO	SEE
Learn the best practices for selecting the best reordering policy to plan efficiently and economically for an item according to carrying costs and demand patterns.	Setup Best Practices: Reordering Policies
Learn the best practices for specifying selected planning parameters under the defined reordering policy to plan efficiently and economically for an item according to critical elements, such as lead time, carrying costs, and seasonality.	Setup Best Practices: Planning Parameters
Learn the best practices for applying a general supply strategy to all item cards, such as always receiving items one day before they are needed or dampening the system's reaction to small demand fluctuations.	Setup Best Practices: Global Planning Setup

Setup Best Practices: Planning Parameters

3/31/2019 • 3 minutes to read

The **Planning** FastTab on the item card is the center of a company's supply chain. Setting the correct planning parameters is very important for cost-effective inventory control and high customer service.

The following table provides best practices on how to set up selected planning parameter fields. For more information about a field, choose the link in the **Setup field** column.

SETUP FIELD	BEST PRACTICE	COMMENT
Reordering Policy		For more information, see Setup Best Practices: Reordering Policies .
Reserve	<p>Select Never when the item is planned using a reorder point.</p> <p>In manufacturing, select Never to allow the planning system to cover all demands.</p> <p>Select Optional for items that you may want to reserve for top-priority customers.</p> <p>Select Always for non-unique items, such as items of type miscellaneous that are inbound for specific demands.</p>	<p>Reservations generally counteract the purpose of planning, which is to balance demand and supply. Therefore, items that are set up for planning should generally not be reserved.</p> <p>If the user reserves an inventory quantity for future demand, then the planning foundation will be disturbed, and the reorder point may not work correctly. Even if the projected inventory level is acceptable with regard to the reorder point, the quantities may not be available because of the reservation.</p>
Dampener Period	<p>Set with regard to the supplier's flexibility.</p> <p>A longer period enables you to provide better customer service, but will also cause more rescheduling actions.</p>	<p>If the supplier accepts last-minute changes to orders, then use a longer period, but be prepared for more rescheduling actions. If the supplier requires firm planning, then shorten the period as much as possible.</p> <p>For information about the Dampener Period field, see Design Details: Planning Parameters.</p>
Include Inventory	<p>Always select when you are using the Lot-for-Lot reordering policy.</p>	<p>Do not select only in special situations, such as when inventory items are not sellable.</p>

SETUP FIELD	BEST PRACTICE	COMMENT
Safety Lead Time	<p>Set between 1D and 6D.</p> <p>Set a safety lead time of at least one day to make sure that supplies are available on the day before they are needed.</p> <p>If using a new supplier, define a longer time until their delivery performance is known.</p> <p>In manufacturing, define longer safety lead times for critical components.</p>	<p>Supply that is planned by the system to avoid a stock-out will arrive on the same day that the stock-out occurs. This may be several hours too late if, for example, the demand is needed in the morning and the supply arrives in the afternoon. Note: The Safety Lead Time field uses the base calendar. Therefore, 14D is not necessarily two weeks.</p>
Safety Stock Quantity	<p>Use for items with large demand fluctuations.</p> <p>In manufacturing, use for critical components.</p> <p>Use for items that are subject to service agreements.</p>	<p>If the Reorder Point field is not filled, then the safety stock quantity also functions as a reorder point.</p>
Lot Accumulation Period	<p>If you want only few big orders and you accept to carry inventory, then set a long lot accumulation period.</p> <p>If you want multiple small orders and minimal inventory, then set a short lot accumulation period.</p>	<p>The lot accumulation period is generally the longest period that you will carry inventory.</p>
Reorder Point	<p>Base the reorder point on the item's demand profile.</p>	<p>If historical data shows that the item's average demand is 100 units during a lead time of seven days, then the reorder point can be set to 100 as a minimum.</p> <p>This means that when the inventory level falls below 100 units, then the planning system will suggest to replenish because it takes seven days to supply the item, and there must be enough to cover the demand within those seven days.</p>
Time Bucket	<p>Leave blank, meaning that the inventory level is checked every day.</p>	<p>Checking the inventory level every day ensures optimal reorder point planning. Note: A time bucket of 1W means that the inventory level may be below the reorder point for one week before a supply order is suggested.</p>
Rounding Precision	<p>In expensive manufacturing, set to 0.00001.</p>	<p>Large rounding quantities of scrap or material consumption can amount to very large inventory costs. It may therefore be relevant to set the smallest rounding precision to minimize this potential cost.</p>

NOTE

The best practices for planning parameters on item cards also apply to the same fields on SKU cards.

If companies plan for demand at different locations, then it is strongly advised to define SKUs for each location and that all demand is created by using a value in the **Location Code** field. For more information, see [Design Details: Demand at Blank Location](#).

Setup Best Practices: Global Planning Setup

3/31/2019 • 2 minutes to read

The **Planning** FastTab on the **Manufacturing Setup** page contains several fields that define global rules for supply planning.

The following table provides best practices on how to set up selected global planning parameter fields. For more information about a field, choose the link in the **Setup field** column.

SETUP FIELD	BEST PRACTICE	COMMENT
Use Forecast on Locations	Select if you have forecasts for specific locations.	
Components at Location	If items are not defined as SKUs, select the location code of your main warehouse.	This also applies if you only use the requisition worksheet.
Blank Overflow Level	Select Allow Default Calculation if you are migrating from Microsoft Dynamics NAV 5.0 or earlier.	Use only if you want to allow all or some of your items to overflow the reorder point.
Default Dampener Period	Set between 1D and 5D. If new to planning in Business Central, then set a longer period.	When users are more familiar with the different reasons for action messages, then shorten the dampener period to allow more change suggestions.
Default Dampener Quantity	Set between 5 and 20 percent of the item's lot size.

Setup Best Practices: Reordering Policies

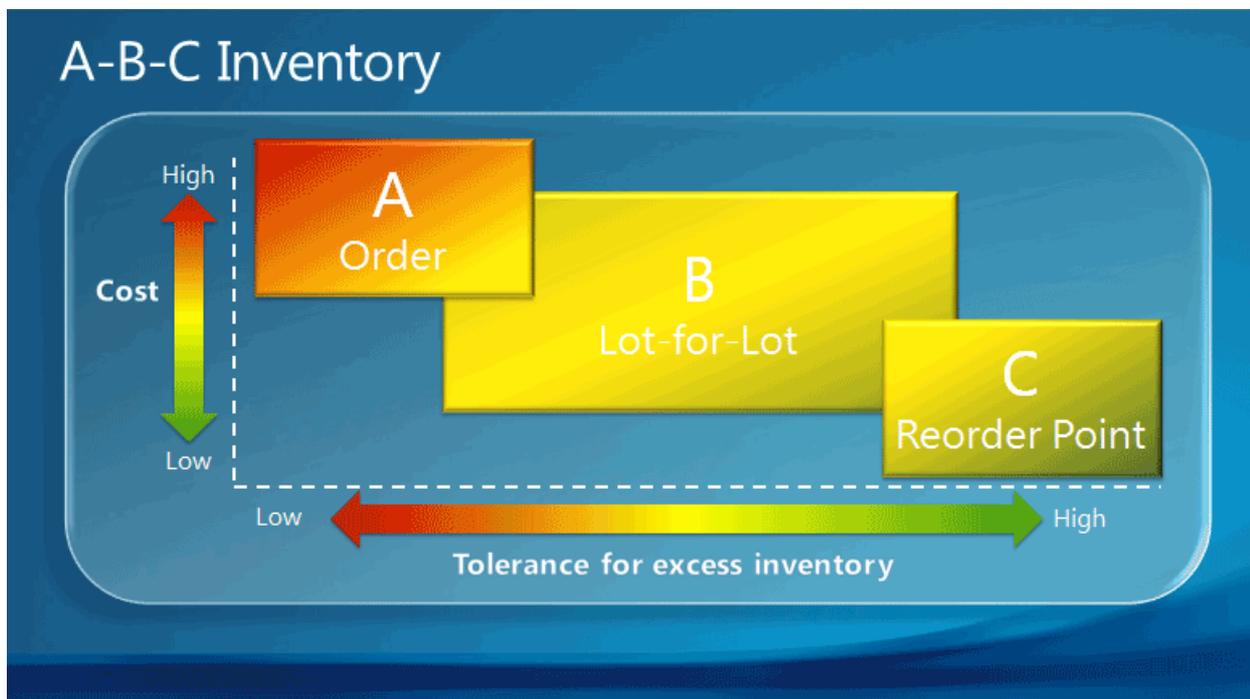

3/31/2019 • 3 minutes to read

The **Reordering Policy** field on item cards offers four different planning methods that determine how the individual planning parameters interact.

One best-practice foundation for selecting a reordering policy is the item's ABC classification. When you use ABC classification for inventory control and supply planning, items are managed according to three different classes depending on their value and volume relative to the total stock. The value-volume distribution of the three classes is shown in the following table.

CLASS	PERCENT OF TOTAL STOCK VOLUME	PERCENT OF TOTAL STOCK VALUE
A	10-20	50-70
B	20	20
C	60-70	10-30

The ABC classification states that effort and money can be saved by applying looser control to items of low value-volume than to items of high value-volume. The following illustration shows which reordering policy in Business Central is best suited for A, B, and C items respectively.

The following table provides best practices for selecting between the four policies.

SETUP OPTION	BEST PRACTICE	COMMENT
--------------	---------------	---------

SETUP OPTION	BEST PRACTICE	COMMENT
Order	<p>Use for A items.</p> <p>Use for make-to-order items.</p> <p>In manufacturing, use for top-level items and for expensive components and subassemblies.</p> <p>Use for items that are purchased as drop shipments and special orders.</p> <p>Do not use if you do not accept automatic reservation.</p>	<p>A items, such as leather couches in a furniture store, are high-value items with low and irregular order velocity where inventory is unacceptable, or the required attributes vary. The best reordering policy is therefore one that plans specifically for each demand.</p>
Lot-for-Lot	<p>Use for B items.</p> <p>In manufacturing, use for components that occur in multiple BOMs. This ensures that purchase orders are combined for the same vendor, so better prices can be negotiated.</p> <p>Use if you are not sure about which reordering policy to select.</p>	<p>B items, such as dining chairs, have a regular and fairly high order velocity, but also high carrying costs. The best reordering policy for B items is therefore one that is economical by bundling demand in the reorder cycle.</p> <p>80 percent of items can use this policy.</p> <p>Can be used successfully without planning parameters.</p>
Fixed Reorder Qty.	<p>Use for C items.</p> <p>Combine with reorder-point parameters.</p> <p>In manufacturing, use for lowest-level components.</p> <p>Do not use if the item is often reserved.</p>	<p>C items, such as tea cups, are low-value items with high and regular order velocity. The best reordering policy for C items is therefore one that guarantees constant availability by always staying above a reorder point.</p> <p>If the user reserves a quantity for some distant demand, then the planning foundation will be disturbed. Even if the projected inventory level is acceptable with regard to the reorder point, the quantities may not be available because of the reservation.</p>
Maximum Qty.	<p>Use for C items with high carrying costs or storing limitations.</p> <p>Combine with one or more order modifiers (Minimum/Maximum Order Quantity or Order Multiple).</p>	<p>C items, such as tea cups, are low-value items with high and regular order velocity. The best reordering policy for C items is therefore one that guarantees constant availability by always staying above a reorder point, but below a maximum inventory quantity.</p> <p>To modify the suggested order, you may want the order quantity to be decreased to a specified maximum order quantity, increased to a specified minimum order quantity, or rounded up to meet a specified order multiple.</p> <p>Note: If used with a reorder point, then inventory stays between the reorder point and the maximum quantity.</p>

Setup Best Practices: Costing Method

3/31/2019 • 2 minutes to read

The **Costing Method** on the item card defines item's cost flow is recorded and whether an actual or budgeted value is capitalized and used in the cost calculation.

Setting the correct costing method according to item type and business environment is important to ensure economical inventories.

The following table provides best practices on how to set up the **Costing Method** field. For more information, see [Design Details: Costing Methods](#).

SETUP OPTION	BEST PRACTICE	COMMENT
FIFO	<p>Use where the product cost is stable.</p> <p>Use for items with a limited shelf life, because the oldest goods need to be sold before they pass their sell-by date.</p>	<p>An item's unit cost is the actual value of any receipt of the item, selected by the FIFO rule.</p> <p>In inventory valuation, it is assumed that the first items placed in inventory are sold first. Note: When prices are rising, the balance sheet shows greater value. This means that tax liabilities increase, but credit scores and the ability to borrow cash improve.</p>
LIFO	<p>Use where levels of inventories are consistently maintained or increased over time.</p>	<p>An item's unit cost is the actual value of any receipt of the item, selected by the LIFO rule.</p> <p>In inventory valuation, it is assumed that the last items placed in inventory are sold first. Note: When prices are rising, the value on the income statement decreases. This means that tax liabilities decrease, but the ability to borrow cash deteriorates. Important: Disallowed in many countries/regions, as it can be used to depress profit.</p>
Average	<p>Use where the product cost is unstable.</p> <p>Use where inventories are piled or mixed together and cannot be differentiated, such as chemicals.</p>	<p>An item's unit cost is the exact cost at which the particular unit was received.</p>
Specific	<p>Use in production or trade of easily identifiable items with fairly high unit costs.</p> <p>Use for items that are subject to regulation.</p> <p>Use for items with serial numbers.</p>	<p>An item's unit cost is calculated as the average unit cost at each point in time after a purchase.</p> <p>For inventory valuation, it is assumed that all inventories are sold simultaneously.</p>

SETUP OPTION	BEST PRACTICE	COMMENT
Standard	<p>Use where cost control is critical.</p> <p>Use in repetitive manufacturing, to value the costs of direct material, direct labor, and manufacturing overhead.</p> <p>Use where there is discipline and staff to maintain standards.</p>	<p>An item's unit cost is preset based on estimated.</p> <p>When the actual cost is realized later, the standard cost must be adjusted to the actual cost through variance values.</p>

Setting Up a Company With RapidStart Services

3/31/2019 • 2 minutes to read

You can set up a new company in Business Central with RapidStart Services, which is a tool designed to shorten deployment times, improve quality of implementation, introduce a repeatable approach to implementations, and enhance productivity by automating and simplifying recurring tasks.

RapidStart Services helps you gain an overview of the setup process of your new company by providing a worksheet in which you can set up the tables often involved in the configuration process of new companies. As you do this, you can create a questionnaire to guide your customers through the collection of setup information. Your customers have the option of using the questionnaire to set up application areas, or they can open the setup page directly and do the setup there. Most importantly, RapidStart Services helps you, as a customer, prepare the company with default setup data that you can fine-tune and customize. Lastly, when you use RapidStart Services, you can configure and migrate existing customer data, such as a list of customers or items, into the new company.

You can use the following components to speed up your company setup:

- Configuration wizard
- Configuration worksheet
- Configuration packages
- Configuration templates
- Configuration questionnaire

NOTE

There are areas of Business Central that you must set up manually. These include adding users, setting up accounting periods, and setting up dimensions for business intelligence. For more information, see [Setting Up Business Central](#).

The following table describes a sequence of tasks with links to topics that describe them.

TO	SEE
Set up the main user interface of RapidStart Services.	Use the RapidStart Services Implementer Role Center
Create a new company and import basic setup data and templates.	Set Up Company Configuration
Deploy the configured package to your customer for implementation.	Apply Configurations to New Companies

[Set Up Complex Application Areas Using Best Practices](#)

Use the RapidStart Services Implementer Role Center

3/31/2019 • 2 minutes to read

When you use RapidStart Services, we recommend that you use the RapidStart Services Implementer Role Center as it provides the correct context for your configuration work. For more information, see [To change Role Center](#).

As you continue with your work, you can assign each table the status that reflects where you are in the process. Business Central then keeps track of the table status in the **Activities** part on the Role Center.

By default, when you add a table to the configuration worksheet, its status is set to blank. This means that configuration of the table has not begun. This is reflected in the **Not Started** count in the **Activities** tile.

To update the status of a configuration table

1. Choose the  icon, enter **Configuration Worksheet**, and then choose the related link.
2. Choose the **Edit List** action.
3. Select a table, and in the **Status** field, choose the appropriate status.
4. Choose the **OK** button.

When you return to the Role Center, the tiles in the **Activities** part are updated to reflect your changes.

To track the status of a configuration project

- Open the RapidStart Services Role Center.

In the **Configuration Areas** part, completion statistics are shown for the areas and groups that you have set up. If you have not set up any groups or areas, this part has no data.

To see a filtered view of table status

1. Choose the **Tables** action.
2. Select the appropriate filtered view.

[Setting Up a Company With RapidStart Services Administration](#)

Set Up Company Configuration

3/31/2019 • 2 minutes to read

The implementation process begins with the Microsoft partner. The partner is responsible for thinking through the configuration details and creating a package that a customer can easily apply. Before you create a new company, you should plan how it will be configured. You must consider basic setup data and the types of data that your Business Central solution will require. You bundle all of this information in configuration packages.

RapidStart Services also provides you with the tools that you will use to migrate your legacy data, such as customers and vendors.

We recommend that you create configuration packages with most of the setup tables already filled in, so that customers only have to change a few settings after the package is applied. For example, when you create a new company, the **No. Series** and the **No. Series Line** tables are filled in with a set of number series and starting numbers. The corresponding **No. Series** fields in the setup tables are also filled in automatically. You do not have to do the work of entering number series and other basic setup data. You can also manually change all default data that is used with RapidStart Services by using the configuration worksheet.

The configuration packages are built on a preconfigured company. After you have set up a company that meets your needs, you can create a configuration package that contains relevant data from this company. You can then use it when you create a new company that is to be configured in the same way.

To facilitate the import of master data, such as customer and vendor information, you can use configuration templates. Configuration templates contain a set of default settings that are automatically assigned to the records imported into Business Central.

The following table describes a sequence of tasks with links to topics that describe them.

TO	SEE
Plan a company configuration by filling in the configuration worksheet.	Manage Company Configuration in a Worksheet
Create a configuration package, customize a package, assign tables to a package, review or edit existing customer data, create the new company and then move test data to the production environment.	Prepare a Configuration Package

Manage Company Configuration in a Worksheet

3/31/2019 • 8 minutes to read

The configuration worksheet is the central location in which you can plan, track, and perform your configuration work. You can create a worksheet for each company that you are working with or create a standard configuration worksheet that can be used for configuring multiple identical companies.

The first step in preparing a configuration package is to select a company that you have already set up and modified to suit most of your solution needs. This company serves as the baseline for your configuration work on new companies. In the worksheet, you designate the tables that you want your configuration to control and handle. Since most tables in Business Central have relationships and dependencies to other tables, you should also include those related tables as necessary. Together, these tables will then serve as the structure around which you will build a new company. Subsequent steps help you package and then deploy your configuration.

To aid you in tracking and reviewing your work, use the **Config. Package Table** FactBox to see information about records. Use the **Config. Related Tables** FactBox to monitor table relationships.

The following procedures demonstrate how to add and customize table information for your configuration.

To open the configuration worksheet

1. In Business Central, open the company that is the baseline for configuration, and then open its RapidStart Services Implementer Role Center.
2. Choose the  icon, enter **Configuration Worksheet**, and then choose the related link.

To add a table to the worksheet

1. On the **Config. Worksheet** page, choose the **Edit List** action.
2. On the first line, in the **Line Type** field, select **Table**.
3. In the **Table ID** field, select the table that you want to add to your configuration.
4. In the **Page ID** field, enter the ID of the page that is associated with the table. For standard tables, this value is automatically filled in. For custom tables, you must provide the ID.
5. In the **Reference** field, enter the URL of a documentation page, for example in Help, that provides best-practice information or instructions on setting up the table.
6. To add related tables, choose the **Get Related Tables** action.

NOTE

Related tables will not be added with the **Get Related Tables** action if either of the following is true:

- The relation is conditional.
Example: If you get related tables for the **Customer** table, then the **Location** table will not be added, since it is only conditionally related to the **Customer** table, namely if the **Location Code** field in the **Customer** table is filled in.
- The related table is filtered.
Example: A field in the related table has a WHERE clause. The reason for this is that the involved relations information is stored in the **Field** system table, which is not fully accessible to the application.
You must add such types of tables manually by following step 4 in this procedure.

7. To modify the resulting list of tables, select a table that you want to remove, and then choose the **Delete** action.
8. Repeat the steps for each table that you want to add to the configuration.
9. To remove duplicate table information that can result from using the **Get Related Tables** action, choose the **Delete Duplicate Lines** action. This will remove duplicate tables that have the same package code.

To add multiple tables to the configuration worksheet

1. Choose the **Get Tables** action. The **Get Config. Tables** batch job page opens.
2. On the **Options** FastTab, specify the types of tables that you want to add to the configuration, as described in the following table.

OPTION	DESCRIPTION
Include with Data Only	Select the check box to include only those tables that contain data. For example, you may want to include a table that already defines the typical payment terms that your solution supports.
Include Related Tables	Select the check box to include all related tables. To add a subset of related tables, see step 3 in this procedure.
Include Dimension Tables	Select the check box to include dimension tables.
Include Licensed Tables Only	Select the check box to include only those tables for which the license under which you are creating the worksheet allows you access.

3. On the **Object** FastTab, set filters as appropriate to specify the types of tables you want to include or exclude.
4. Choose the **OK** button. Business Central tables are added to the worksheet. Each entry in the list has a line of type **Table**.
5. To remove duplicate table information that can result from using the **Get Tables** action, choose the **Delete Duplicate Lines** action. This will remove duplicate tables that have the same package code.
6. You can add tables to the worksheet that are related to a table you have selected. Review the information in the **Related Tables** FactBox to see whether there are missing tables. To add related tables for a specific table, select the table in the list, and then choose the **Get Related Tables** action.

NOTE

Related tables will not be added with the **Get Related Tables** action if either of the following is true:

- The relation is conditional.
Example: If you get related tables for the **Customer** table, then the **Location** table will not be added, since it is only conditionally related to the **Customer** table, namely if the **Location Code** field in the **Customer** table is filled in.
- The related table is filtered.
Example: A field in the related table has a WHERE clause. The reason for this is that the involved relations information is stored in the **Field** virtual table and is not available in pages such as the configuration worksheet for performance reasons.
You must add related tables with such complex relationships manually by following step 4 in [To add a table to the worksheet](#).

7. To delete tables in the resulting list of tables, select a table to remove, and then choose the **Delete** action.

Use the next procedure to specify which table fields to include. After you make this specification, you can export the table to Excel, and use the table structure as a template for gathering customer data. For more information, see [Prepare to Migrate Customer Data](#).

To specify a set of fields and records for a configuration table

1. Select a table in the list of configuration tables, and then choose the **Edit List** action.
2. Select a table for which you want to specify field information, and then choose the **Fields** action.
3. To select just the fields that you want to include, choose the **Clear Included** action. To add all fields, choose the **Set Included** action.
4. To specify that the field data should not be validated, clear the **Validate Field** check box for the field.
5. Choose the **OK** button.
6. To filter to a certain set of records to include in the configuration worksheet, choose the **Filters** action, and then specify the appropriate filter values.

You can create areas of functionality and groups of tables in the worksheet in order to put similar functionality together. For example, in setting up the chart of accounts for your configuration, you may decide to create a group of posting tables. Typically, areas are used to group a set of tables that correspond to a functional area. Each area can contain groups. A group can be used to arrange tables that have a common meaning together.

The following procedure describes how to add area and group designations, after you have created the initial list of tables. After you have added these categories, you can continue to add and modify your list of tables.

To categorize and group functionality in the worksheet

1. At the beginning of an area, insert a new line in the worksheet.
2. In the **Line Type** field, choose **Area**. In the **Name** field, enter a name for the area.
3. At the beginning of a grouping of tables, insert a new line in the worksheet.
4. In the **Line Type** field, choose **Group**. In the **Name** field, enter a name for the area. The group name is automatically indented.
5. To move tables to the appropriate category, select a table to move, and then choose the **Move Up** or **Move Down** action. Alternatively, you can delete a worksheet line and insert the table again in the required location.

Some Business Central tables are standard and the data in these is not likely to change from implementation to implementation. Consequently, to help your customer focus, you can remove these tables from the worksheet after you have included them in the configuration package. Once added, the tables remain part of the configuration

package.

To remove a standard table in the worksheet

After you have added all necessary tables to a configuration package, determine which tables will not require customer attention.

1. Select the tables, and then delete them by choosing the **Delete** action.

NOTE

The tables remain in the package even though they are deleted from the worksheet.

To review and customize existing database data

As you create a configuration package for a solution, you can view and customize the available database data to suit your customer needs. The database table has to have an associated page.

To customize data in the database

1. On the **Configuration Worksheet** page, identify the tables whose data that you want to view or customize.

NOTE

Make sure that each table has a page ID assigned to it. For standard Business Central tables, this value is automatically filled in. For custom tables, you have to provide the ID.

2. Choose the **Database Data** action.

The Business Central page for the page opens.

3. Review the available information. Modify it as necessary by deleting records that are not relevant or by adding new ones.

[Setting Up a Company With RapidStart Services](#)

[Administration](#)

Prepare a Configuration Package

3/31/2019 • 8 minutes to read

When you configure a new company, table relations are recognized and processed. Data is imported and applied in the correct order. Dimension tables are also imported if they are included in the configuration package. For more information, see [To import customer data](#).

To help your customer use the configuration package, you may want to add a questionnaire or a set of questionnaires to the package. The questionnaire can help the customer in understanding the various setup options. Typically, questionnaires are created for the major setup tables where a customer may require additional guidance about how to select an appropriate setting. For more information, see [Gather Customer Setup Values](#).

Make sure that you are on the RapidStart Services Implementer Role Center. For more information, see [Use the RapidStart Services Implementer Role Center](#).

IMPORTANT

When exporting and importing configuration packages between two company databases, the databases should have the same schema to ensure that all data is transferred successfully. This means that the databases should have the same table and field structure, in which the tables have the same primary keys and fields have the same IDs and data types.

You can import a configuration package that has been exported from a database that has a different schema than that target database. However, any tables or fields in the configuration package that are missing in the target database will not be imported. Tables with different primary keys and fields with different data types will also not successfully import. For example, if the configuration pack includes table **50000, Customer** that has primary key **Code20** and the database to which you import the pack includes table **50000, Customer Bank Account** that has the primary key **Code20 + Code 20**, then data will not be imported.

To create a configuration package

1. Choose the  icon, enter **Configuration Packages**, and then choose the related link.
2. Choose the **New** action.
3. On the **General** FastTab, fill in the fields as appropriate. Hover over a field to read a short description.
4. To exclude the configuration questionnaires, configuration templates, and configuration worksheet tables from the package, select the **Exclude Configuration Tables** check box. Otherwise, these tables will be added to the list of package tables automatically when you export the package.
5. Choose the **Get Tables** action. The **Get Package Tables** batch job page opens.
6. Choose the **Select Tables** field. The **Config. Selection** page opens.
7. Choose the **Select All** action to add all tables to the package, or select the **Selected** check box for each table in the list that you want to add.
8. Choose the **OK** button. The count of tables that you have selected is indicated in the **Select Tables** field. Specify additional options, and then choose the **OK** button. Business Central tables are added to the lines of the **Config. Package** page.

NOTE

You can also do this in the configuration worksheet. Select the tables you want to include in the package, and then choose the **Assign Package** action.

- To select the fields that you want to include from a table, select the table, and then, on the **Lines** tab, choose the **Fields** action. Specify which fields are included in the package. By default, all fields are included.
 - To select just the fields you want to include, choose the **Clear Included** action. To add all fields, choose the **Set Included** action.
 - To specify that the field data should not be validated, clear the **Validate Field** check box for the field.
- Determine whether you have introduced potential errors, by choosing the **Validate Package** action. This can occur when you do not include tables that your configuration relies on.
- Choose the **OK** button.

After you have refined the list of fields to include from a table, you can check your results in Excel.

To filter and review your dataset

- To filter to a certain set of records to include in the package, on the **Lines** tab, choose the **Filters** action, and then specify the appropriate filter values.
- On the package card, on the **Lines** tab, choose the **Export to Excel** action.
- Confirm the messages that enable the export of data to Excel. The named .xlsx file opens. Review the records that have been exported.
- Close Excel.

To include a template for application to a table

For certain tables, such a table that will contain master data, you can specify a template to apply to the data. The template can include the required fields that you want to apply to all master data and that you never want to vary. For example, you can create a template that can be used with customer data. The template can contain all the required fields, which then enables consistent import of standardized information. Information that cannot be standardized, such as customer name, is then treated when you do an import of customer data.

- On the **Config. Package Card** page, select a table, and then choose the **Data Template** field. A list of templates based on the table is displayed.
- Select a template, and then choose the **OK** button.

After the package is complete, follow the next procedure to save the package to a file. You can then give the package to a customer or partner to use.

To save and export a configuration package

- On the **Config. Package Card** page, choose the **Export Package** action.

The package is created in a .rapidstart file, which delivers the package contents in a compressed format. Configuration questionnaires, configuration templates, and the configuration worksheet are added to the package automatically unless you specifically decide to exclude them.

You can save the file with a name that is meaningful to you, but you cannot change the extension of the file. It must be .rapidstart.

To copy a configuration package

After you have created a package that meets most of your needs, you can use it as a basis for creating similar packages. This can speed up implementation time and enhances the repeatability of RapidStart Services.

- Choose the  icon, enter **Configuration Packages**, and then choose the related link.

2. Select a package from the list, and then choose the **Copy Package** action.
3. In the **New Package Code** field, enter a code for the new package.
4. Select the **Copy Data** check box if you also want to copy database data from the existing package.
5. Choose the **OK** button.

To customize a configuration package

Use the configuration worksheet to gather and categorize the information that you want to use to configure a new company, and arrange tables in a logical way. Formatting in the worksheet is based on a simple hierarchy: Areas contain groups, which in turn contain tables. Areas and groups are optional, but are necessary to enable an overview of the configuration process on the RapidStart Services Role Center.

1. Choose the  icon, enter **Configuration Worksheet**, and then choose the related link.
2. In the **Line Type** field, choose **Area**. In the **Name** field, enter a descriptive name.
3. In the **Line Type** field, choose **Group**. In the **Name** field, enter a descriptive name.
4. In the **Line Type** field, choose **Table**. In the **Table ID** field, select the table you want to include in the worksheet.

You can now assign the tables to specific configuration packages that you have created or plan to create. For more information, see [To assign a table to a configuration package](#).

To work with promoted tables

1. Select the **Promoted Table** check box to indicate a table that is frequently used during the setup process by a typical customer, for example, the **G/L Account** table. When a table has this designation, a customer will be able to easily filter his worksheet to see just the list of promoted tables that require attention.
2. To see the filtered view, choose the **Promoted Only** action. The list of tables contains only those tables that have the check box selected.

To assign a table to a configuration package

After you have defined the tables that you want to treat as part of your configuration, you can easily assign the tables to configuration packages. You can assign a table to one package only. In the following procedure, you assign the package from within configuration worksheet.

NOTE

You can also create a package directly, and add tables to it. For more information, see [To create a configuration package](#).

1. Choose the  icon, enter **Configuration Worksheet**, and then choose the related link.
2. In the configuration worksheet, select a line or group of lines that you want to assign to a configuration package, and then choose the **Assign Package** action.
3. Select a package from the list, or choose the **New** action to create a new package, and then choose the **OK** button.

If a table is not already included in the package, it will now be added. The package code field on the worksheet line will be filled in with the code of the package that the table is assigned to.

4. If you choose an existing package, you can see how many tables are already in the package by reviewing the information in the **No. of Tables** field.

To review or customize existing database data

As you create a configuration package for a solution, you can view and customize the available database data to suit your customer needs. The database table must have an associated page.

1. Choose the  icon, enter **Configuration Worksheet**, and then choose the related link.
2. In the configuration worksheet, identify the tables whose data that you want to view or customize.

NOTE

Make sure that each table has a page ID assigned to it. For standard Business Central tables, this value is automatically filled in. For custom tables, you must provide the ID.

3. Choose the **Database Data** action. The page for the related page opens.
4. Review the available information. Modify it as necessary by deleting records that are not relevant or by adding new ones.

To copy data from a test environment to a production environment

After you have vetted and tested all your setup information, you can proceed to copy data to your production environment. You create a new company in the same database.

1. Open and initialize the new company.
2. Choose the  icon, enter **Configuration Worksheet**, and then choose the related link.
3. Choose the **Copy Data from the Company** action.
4. On the **Copy Company Data** page, choose the **Copy From** field. The **Companies** page opens.
5. Select the company from which you want to copy data, and then choose the **OK** button. A list of tables selected on the configuration worksheet opens. Only tables that contain records are included in this list.
6. Select the tables that you want to copy data from, and then choose the **Copy Data** action. On the **Copy Company Data** page, choose the **OK** button.

Create a New Company

3/31/2019 • 2 minutes to read

To use RapidStart Services for Business Central, you first create a new company for which you want to perform a customer implementation. When you create a new company, the standard Business Central tables and pages are created, but there is no data in them.

In addition, you can apply specific setup data to your company after you initialize it. The information is provided in a configuration package, a .rapidstart file, which delivers content in a compressed format.

Example configuration packages, including country/region-specific files, are included with the CRONUS demonstration company. Use the following procedures to use the example configuration package with a new company.

To use the sample BASICCONFIG configuration package

1. Open the CRONUS International Ltd. company. For more information, see [Changing Basic Settings](#).
2. Choose the  icon, enter **Configuration Packages**, and then choose the related link.
3. Choose the BASICCONFIG package from the list, and then choose the **Export Package** action.

Use the following procedure to create a new company, and use the BASICCONFIG package as part of the process.

To create a new company

1. Create a new company. For more information, see [Creating New Companies in Business Central](#).
2. From the RapidStart Services Implementer Role Center, you can now import the configuration package that you exported from the CRONUS International Ltd. company.

After you create a new company, some tables are automatically filled in, even if no company template is applied. For example, you can review the standard codes for posting and batch transactions on the **Source Code** page. If you provide a local version of Business Central, you should review this table and consider any local language issues.

About Data Tables

Business Central, data tables come in two basic types: Master and Setup. When you are setting up a company configuration, you can use these types to focus your configuration strategy.

Master Data Tables

The following table lists some of the master data tables. When you initialize a new company, these tables are empty.

TABLE NO.	TABLE NAME
15	G/L Account
18	Customer
23	Vendor

TABLE NO.	TABLE NAME
27	Item
5050	Contact

Setup Data Tables

The following table lists some of the setup data tables, in which you capture setup information in the configuration questionnaire. These tables contain baseline information when the company is created.

TABLE NO.	TABLE NAME
98	General Ledger Setup
311	Sales & Receivables Setup
312	Purchases & Payables Setup
313	Inventory Setup

In addition to setup data tables, Business Central also has setup-type data tables that specify core information about the company and its business processes. The following table lists some of them.

TABLE NO.	TABLE NAME
3	Payment Terms
4	Currency
6	Customer Price Groups
5700	Stockkeeping Unit

[Apply Configurations to New Companies](#)
[Setting Up a Company With RapidStart Services Administration](#)

Configure New Companies

3/31/2019 • 3 minutes to read

To configure a new company in your solution implementation, you typically follow three phases. In the first phase, you import the configuration package, a .rapidstart file with the configuration information. In the second phase, you modify the configuration information and then apply it to your new company. In the final phase, you review and fix any errors.

The following procedures assume that you have created and saved a configuration package. For more information, see [Prepare a Configuration Package](#).

The following procedures assume that you have initialized and opened your new company and that you are using the RapidStart Services Implementer Role Center.

To import a configuration package

1. Open the new company in the Business Central database.
2. Choose the  icon, enter **Configuration Packages**, and then select the related link.
3. Choose the **Import Package** action.
4. Navigate to the location where you have saved the .rapidstart configuration package file, and then choose the **Open** button.
5. Choose the  icon, enter **Company Information**, and then choose the related link. Enter information about the company in the company information card. Include information, such as bank details. You can also provide a logo for the company.

All the tables that you have designated for inclusion in the new company are imported. At this point, you can apply the package data to the database, or adjust and modify the table data to meet your customer specifications.

To apply package data

1. Choose the  icon, enter **Configuration Worksheet**, and then select the related link.
2. Select a table that you want to modify data for, and then choose the **Apply Data** action. Choose the **Yes** button to confirm the application.
3. To confirm that the data is now in the database and that the application has succeeded, return to the **Config. Worksheet** page and choose the **Database Data** action.

NOTE

After you apply data, you can only see it in the database. It is no longer in the package.

To modify and apply package data

1. Choose the  icon, enter **Configuration Worksheet**, and then select the related link.
2. Select a table that you want to modify data for, and then choose the **Package Data** action.
3. On the **Config. Package Records** page, make your modifications. For example, you can delete options that do not apply.
4. Choose the **Apply Data** action, and then choose the **OK** button.
5. To confirm that the data is now in the database and that the application has succeeded, return to the **Config.**

Worksheet page and choose the **Database Data** action.

To locate and identify a configuration error

There are certain types of errors that may occur when you apply data to a database. The most common error is that required related tables were not included. You fix such errors in the configuration worksheet.

1. Choose the  icon, enter **Configuration Packages**, and then select the related link.
2. Select the package you want to review, and then choose the **Edit** action.

Any table that has errors is highlighted. The number of package errors is displayed in the **No. of Package Errors** field.

3. Choose the **No. of Package Errors** field to open the **Config. Package Records** page, which lists the records with errors.

To fix an error

1. Open the company that is based on your configuration package.
2. Choose the  icon, enter **Configuration Worksheet**, and then select the related link.
3. Fix errors, such as add missing related tables to the worksheet.
4. Add the tables to the existing configuration package, or create a new package that only contains the new tables. For more information, see [Prepare a Configuration Package](#).
5. Reopen the new company that you are implementing the configuration for.
6. Import the configuration package.

NOTE

If you import the same package again, you may overwrite any data modifications that you have already made. For that reason, you may want to add any new tables in a new package and import that instead.

7. Apply the data to the database, as described in [To modify and apply package data](#).

[Apply Configurations to New Companies](#)
[Setting Up a Company With RapidStart Services Administration](#)

Configure a Company with the RapidStart Wizard

3/31/2019 • 2 minutes to read

You can quickly configure a new company that you have created by using the RapidStart Services configuration wizard.

In the following procedure, you have provided the customer with the configuration package, which is then installed on a computer. The customer opens the new company, which contains no customer data. You or the customer then follows the steps in the RapidStart Services wizard, which are described in this procedure, to provide basic information about the company. The wizard imports the configuration package and then applies the package to the company.

To configure a new company

1. On the RapidStart Services Implementer Role Center, choose the **RapidStart Wizard** action.
2. Expand the **Step 1** FastTab, which contains general information about the new company. Enter the appropriate information about the new company in the fields. There is one field that you are required to fill out, **Name**. The rest of the fields are optional.
3. Expand the **Step 2** FastTab, which contains communication and contact information for the new company. Enter the appropriate information about the new company in the fields.
4. Expand the **Step 3** FastTab, which contains bank account and payment information for the new company. Enter the appropriate information about the new company in the fields.
5. Expand the **Step 4** FastTab. Choose the **AssistEdit** button to select the configuration package you want to apply. The name of the configuration package is displayed. You can then perform the following actions, in the listed order:
 - a. Apply the configuration by choosing the **Apply Package** action. This imports the configuration package and applies the package database data all at the same time.
 - b. Review the configuration after it has been applied. This option lets you review configuration details and questionnaires provided by the partner and import some master data that is required for your company. Choose the **Configuration Worksheet** action. For more information, see [To complete the configuration questionnaire](#).
6. Expand the **Step 5** FastTab. Specify which Role Center that you want to be the default for the new company.

IMPORTANT

Only change your Role Center after you have completed configuration of the company. If you have more setup details to consider and modify, first use the configuration worksheet to continue your work. Then, return to the wizard to update your Role Center profile, or choose the **Complete Setup** action.

7. Choose the **OK** button.
8. To verify that the configuration information has been applied to the new company, Choose the  icon, enter **Company Information**, and then choose the related link.

The **Company Information** page contains information that you have specified.

You have now configured the company and applied data to it.

Copy Data to New Companies

3/31/2019 • 2 minutes to read

You can copy commonly used values from an existing company to a new one, as long as both companies are in the same database. For example, if you have a standard list of symptom codes that is common to all your service management implementations, you can copy the codes easily from one company to another.

To copy data to a new company using RapidStart Services

1. Open the new company.
2. Choose the  icon, enter **Configuration Worksheet**, and then choose the related link.
3. Choose the **Copy Data from Company**.
4. On the **Copy Company Data** page, choose a company to copy from in the **Copy From** field, and then choose the **OK** button.
5. Select a table from one of the configuration packages that you have imported, and then choose the **Copy Data** action.

Create Journal Opening Balances

3/31/2019 • 2 minutes to read

Business Central includes several batch jobs that are provided to help in the transfer of legacy account balances to a newly configured company. You can easily transfer this data with the customer journal, the vendor journal, the item journal, or the G/L journal.

The first step is to create a configuration package that includes the setup tables for those journals. The following procedure assumes that this step is completed. For more information, see [Set Up Company Configuration](#). This procedure describes the subsequent steps, which include applying the package that is provided by a partner.

Before you start, make sure that you are on the RapidStart Services Implementer Role Center page as it provides the correct context for your configuration work. For more information, see [Changing Basic Settings](#).

To apply the entries in a journal to a new company

1. Configure a new company and apply a configuration package to it. For more information, see [Configure a Company with the RapidStart Wizard](#).

The new company does not contain information about journal opening balances.

2. Open the configuration worksheet and import existing data about customers, items, vendors, and the general ledger. For more information, see [Migrate Customer Data](#).
3. Choose, for example, the **Create G/L Journal Lines** action.
4. Fill in the **Options** FastTab as appropriate, and set filters as needed. For example, in the **Journal Template** field, enter a name.
5. Choose the **OK** button. The records are now in the journal, but the amounts are empty.
6. Export the journal table to Excel and manually enter the posting and balancing account information from the legacy data.
7. Import and apply the table information into the new company. The journal lines are ready for posting.
8. In the configuration worksheet, select the journal line table, and then choose the **Database Data** action.
9. Review the information, and then choose the **Post** action.
10. Repeat the steps to import and post any other opening balances.

Gather Customer Setup Values

3/31/2019 • 5 minutes to read

You use the configuration questionnaire to help reduce your implementation workload by streamlining the task of setting up the new company. You can generate the configuration questionnaire in Business Central and then provide it to your customer as an Excel or XML file.

You can change all default values in a questionnaire to more closely match customer needs.

TIP

For more information about defining setup values in supply planning fields, see [Setup Best Practices: Supply Planning](#).

When your customer completes the questionnaire, you import the file into the customer's new Business Central company. You and your customer validate the questionnaire answers before you apply them to the company.

To create a configuration questionnaire

You can use a questionnaire to help you determine the scope and needs of configuration. You can create a new questionnaire, or modify an existing questionnaire by adding new questions or question areas.

You can create questionnaires for setup-type tables only. For example you can use the tool to provide information to the following pages:

- Company Information
- Fixed Asset Setup
- General Ledger Setup
- Inventory Setup
- Assembly setup
- Manufacturing Setup
- Purchases and Payables Setup
- Marketing Setup
- Service Setup
- Sales and Receivables Setup
- Warehouse Setup

NOTE

To see a complete list of setup tables, choose the  icon, enter **Setup**, and then choose the related link. To determine the scope of migration of records data, use migration functionality. For more information, see [Migrating Customer Data](#).

1. Choose the  icon, enter **Configuration Questionnaire**, and choose the related link.
2. Choose the **New** action. The **Config. Questionnaire** page opens.
3. Choose the **Questions Areas** action. The **Question Areas** page opens.
4. Choose the **New** action. The **Config. Question Area** page opens.
5. In the **Table ID** field, choose the ID of the table for which you want to collect information. The **Table Name** field is automatically filled in.
6. Choose the **Update Questions** action. Each field in the table is added to the questionnaire with a question

mark following its label.

You can rephrase the label to make it clear how the question should be answered. For example, if a field is called "Name," you could edit it to state "What is the name of ." You can also provide guidance in the **Reference** field, including a URL to a page that provides additional information.

You can also delete any questions that you do not want to include in the questionnaire.

NOTE

The **Answer Option** field describes the type and format of the answer of the data that is appropriate. The **Answer** field contains user-supplied information.

As needed, you can also define default answers in the **Answer** field. These values are used by default for custom setup. However, the person filling in the questionnaire can modify and update the answer.

To complete the configuration questionnaire

You use the configuration questionnaire to structure and document a detailed discussion about the customer's specific needs. You also use it to collect setup data from the customer to configure the relevant Business Central setup tables, such as the general ledger, inventory, and customers.

NOTE

You can also create your own configuration questionnaire to meet your needs.

1. Open the company that you want to complete the questionnaire for.
2. Choose the  icon, enter **Configuration Questionnaire**, and then choose the related link.
3. Select the questionnaire for the company, and then choose the **Export to Excel** action, optionally the **Export to XML** action.
4. Have the customer complete the configuration questionnaire by entering the answers in the Excel workbook. There are worksheets for each of the question areas that have been created for the questionnaire.
5. Choose the **Import from Excel** action, and select the .xlsx file with the customer's answers.
6. Choose the **Question Areas** action to begin the process of validating and applying the answers to the configuration questionnaire.

To complete a questionnaire from the configuration worksheet

The following procedure provides an alternative way of accessing configuration questionnaires. It assumes that the configuration package that you have been provided includes questionnaires.

1. After you import a configuration package, open the configuration worksheet.
2. For each table for which there is a question area, choose the **Questions** action. The questionnaire page opens.
3. Answer the questions, and then choose the **Apply Answers** action.
4. Choose the **OK** button to close the questionnaire.

To validate the configuration questionnaire

It is important to validate the configuration questionnaire before you apply it to the Business Central format. It is also a way to make sure that data formatting is preserved during the import from Excel.

A common validation task is to check that text strings are not entered in date fields. This review process is necessary because the format of the answer in the questionnaire is not validated automatically when you run the

Apply Answers function.

NOTE

In general, validation of the configuration questionnaire is a manual process. However, there are checks for regional formatting inconsistencies. In addition, you will get errors if the structure of your Business Central database does not match the structure of the migration database.

1. On the **Configuration Questionnaire** page, select the relevant questionnaire, and then choose the **Question Areas** action.
2. Open the relevant question area.
3. For each question, validate that the value in the **Answer** field corresponds to the format provided in the **Answer Option** field. For example, validate that the address of a company is in text format.
4. If you find errors, you can troubleshoot and make corrections in Excel by exporting the questionnaire, and then importing it again. Alternatively, you can correct errors directly in Business Central as you review the answers on the **Config. Question Area** page.
5. Repeat these steps for each question area.

When you have completed your validation, the data is ready to be applied to the database.

To apply answers from the configuration questionnaire

After you have imported and validated information from a configuration questionnaire, you can transfer, or apply the setup data to the corresponding tables in the Business Central database.

1. Choose the  icon, enter **Configuration Questionnaire**, and then choose the related link. The **Config. Questionnaire** page opens.
2. Select a configuration questionnaire from the list, and then choose the **Edit List** action.
3. You can apply answers in one of two ways.
 - To apply the whole questionnaire, choose the **Apply Answers** action.
 - To apply answers for a specific **Question Area** only, choose the **Question Areas** action, select a **Question Area** in the list, and then choose the **Apply Answers** action.

To verify that answers have been applied successfully

1. Check setup pages for the various functional areas of Business Central. To locate the page, choose the  icon, enter the name of the setup page, and then choose the related link.
2. Verify that the fields have been populated with the correct data from the various question areas in the configuration questionnaire.

You have now configured setup with the customer's business information and rules.

[Setting Up a Company With RapidStart Services Administration](#)

Prepare to Migrate Customer Data

3/31/2019 • 7 minutes to read

After you import and apply setup data in the new database, you can start migrating the customer's existing master data, such as item and customer numbers and names. To make sure that this data is created quickly and accurately in the new company, you should use templates to structure the data.

Typically, you create data templates for the following master data tables:

- **Contact**
- **Customer**
- **Item**
- **Vendor**

However, you can create a template structure for and apply it to any table in Business Central.

TIP

You can also use data templates for daily operations to create new records that are based on templates. These data templates only work for the supported master data tables. For more information, see, for example, [Register New Items](#).

When you import customer data, such as for items, from a file, the mandatory field data that you have specified is taken from the linked data template. When you create a new item, you only enter general information such as item name, description, and price and then collect the rest of the mandatory field data from a selected data template.

When you create a new master data record, such as a customer card, some fields are mandatory and must be filled in. You can group most mandatory fields, such as posting groups and payment terms, to make creating master data records easier and more stable. For example, you can group mandatory fields for table 18, **Customer**, as **Domestic**, **Foreign**, or **Export** types.

To select a data template

When you select an existing data template, you must evaluate if the templates that you created for the new company are sufficient for the customer. Review the provided fields and values to determine which templates are appropriate for a new company.

TIP

You can also use data templates to create new records quickly. Use them for faster and more accurate data creation. For more information, see [Register New Items](#).

1. Choose the  icon, enter **Configuration Templates**, and then choose the related link.
2. On the **Configuration Templates** page, select a data template from the list, and then choose the **Edit** action.

If the default templates do not meet your needs, you can create new templates or add fields to an existing template. If the default templates are sufficient, you can use them to create records based on master data templates.

To create a new data template

You can create a new data template if the default templates do not meet the needs of your new company. If you are creating more than one, you may find it useful to adopt a naming convention for the **Code** field.

Each template consists of a header and lines. When you create a template, you can specify which fields to always apply to data of a certain type. For example, you can create different customer templates to apply to different customer types. When you create the customer using a template, you can use template data to prepopulate certain fields.

To copy an existing data template

You can quickly create a new data template by copying information from an existing data template, which you then edit.

1. Open the **Configuration Templates** page.
2. Choose the **New** action.
3. Fill in the **Code** field.
4. Choose the **Copy Config. Template** action.
5. On the **Configuration Templates** page, select an existing template to copy, and then choose the **OK** button.

The table ID, table name, and lines of the existing data template are inserted in the new template.

To create a data template header manually

1. Open the **Configuration Templates** page.
2. Choose the **New** action.
3. Fill in the **Code** field.
4. In the **Table ID** field, enter the table to which this template applies. The **Table Name** field is automatically filled in when the **Table ID** field is set.

To create a data template line manually

1. On the first line, select the **Field Name** field. The **Field List** page displays the list of fields in the table.
2. Select a field, and then choose the **OK** button. The **Field Caption** field is filled in with the field name.
3. In the **Default Value** field, enter an appropriate value. In some cases, you may want to use a value that is not a value that is available in the database. In that case, you can select the **Skip Relation Check** check box, to make it possible to apply data without error.

TIP

Since the **Default Value** field does not have a look up to the corresponding Business Central field options, you copy and paste the value that you want from the related page into the template.

4. Select the **Mandatory** check box if users must fill in the field in question.

NOTE

The check box is informational only. No business logic is enforced. For example, users cannot post an invoice if posting groups have not been set up. You can select the **Mandatory** check box for those fields to have the user fill them in and thereby avoid a posting error later.

5. In the **Reference** field, enter information about the field as needed.
6. Choose the **OK** button

To export to a template in Excel

You can create an Excel workbook to serve as a template that is based on the structure of an existing database table quickly. You can then use the template to gather together customer data in a consistent format for later import into Business Central.

1. Choose the  icon, enter **Configuration Worksheet**, and then choose the related link.
2. Add a table to the list, or select an existing table. For more information, see [Manage Company Configuration in a Worksheet](#).
3. Define the fields from the table that you want to include in the template.
4. Choose the **Export to Template** action.
5. Name and save the Excel file. The Excel workbook is automatically opened.

You can now enter customer data in the Excel worksheet. If you have exported multiple tables, each table will be on its own worksheet. Save the workbook before you continue with the next procedure.

NOTE

You may encounter the following error when you run an English version of Excel, but have your regional settings configured for a non-English language: "Old format or invalid type library." To fix this error, make sure that the language pack for the non-English language is installed.

To import from a template in Excel

1. On the **Configuration Worksheet** page, and then choose the **Import from Template** action.
2. Navigate to the template worksheet that you have created, and then choose the **Open** action.
3. To add the collected customer data to the database, choose the **Apply Data** action.

When you apply data from a template in Excel to a table that also has a configuration template linked to it in the configuration package, the default field values from the configuration template are also applied.

Any record whose data is applied in this manner is complete, because it consists of data entered by a user in Excel, plus the default values specified by the configuration template.

To create a record from a configuration template

You can use the structure of data that is contained in the data templates to convert your information into records in the database, one-by-one. To do so, you use the **Create Instance** function. This is a miniature version of the data migration process and can be useful for prototyping or treating smaller data creation tasks.

The following steps illustrate how to create an item card from an item data template. You can create a record from any data template using the same procedure.

1. Choose the  icon, enter **Configuration Templates**, and then choose the related link.
2. Select the **Item** template, and then choose the **Edit** action. For more information, see [To create a data template](#).
3. Choose the **Create Instance** action. An item card is created.
4. Choose the **OK** button.
5. To review the new item card, choose the  icon, enter **Items**, and then choose the related link.
6. Open the new item card.
7. Expand various FastTabs, and verify that the information was created correctly on them.

To use a configuration template on a record

You can apply a data template to any record that is in Business Central and use this technique to change or modify a record. However, when you do this, you overwrite existing values in the record with those of the template.

Consequently, you should be careful when you apply a template to existing records.

WARNING

The **Apply Template** function overwrites existing data in a record. If this function is used in master data migration, it will overwrite the imported data when you create records.

The following procedure is based on a new customer card.

1. Create a customer. For more information, see [Register New Customers](#).
2. On the **Customer Card** page, choose the **Apply Template** action.
3. On the **Customer Templates** page, select one of the templates, and then choose the **OK** button.

The default values from the chosen customer template are inserted on the customer card.

[Register New Customers](#)

Migrate Customer Data

4/4/2019 • 12 minutes to read

You can migrate existing customer data from an existing ERP system to Business Central using the data migration tools of RapidStart Services. You can use Excel files as the data carrier. You can also manually move the data by entering it directly in the company.

The **Migration Overview** and **Config. Worksheet** pages provide access to the functions and views to perform all the tasks that relate to data migration. We recommend that you migrate one table at a time, to handle dependencies in your data. In migration, you will also touch the master data tables, which contain information about customers, vendors, items, contacts, and the general ledger.

To import configuration packages

When you create a new company, you can import company settings for the new company. You import the settings from a .rapidstart file, which delivers the package contents in a compressed format. A corresponding set of default data migration tables are imported. The data set contains master data tables and the setup data tables. Your first task in data migration is to evaluate if the default migration setup meets the needs of the new company.

NOTE

You cannot rename a file that is not already a RapidStart Services configuration package as a .rapidstart configuration package file and then try to import it. If you try to do so, you will receive an error message.

Before you start, make sure that you are on the RapidStart Services Implementer Role Center.

IMPORTANT

When exporting and importing configuration packages between two company databases, the databases should have the same schema to make sure that all data is transferred successfully. This means that the databases should have the same table and field structure, in which the tables have the same primary keys and fields have the same IDs and data types.

You can import a configuration package that has been exported from a database that has a different schema than that target database. However, any tables or fields in the configuration package that are missing in the target database will not be imported.

Tables that have different primary keys and fields that have different data types will also not be successfully imported. For example, if the configuration pack includes table **50000 Customer** that has primary key **Code20** and the database to which you import the pack includes table **50000 Customer Bank Account** that has the primary key **Code20 + Code 20**, data will not be imported.

1. Open the new company.
2. Choose the  icon, enter **Configuration Packages**, and then choose the related link.
3. Choose the **Import Package** action. Navigate to the .rapidstart package file that you want to import, and then choose the **Open** action. During import, the package contents are decompressed and the package record is created.

When the import is complete, you can see the number of configuration tables that have been imported in the **No. of Tables** field.

4. To review the list of configuration tables, choose the **View** action.
5. To apply the package, choose the **Apply Package** action.

NOTE

The data migration information is based on configuration templates, if you specify one. You must update the template first to change the list of fields.

6. To review the field selections, select a table, and then, on the **Lines** tab, choose the **Fields** action. Compare and review the number of fields that are available to the number of fields whose data has been applied.

If the selection of tables does not meet your needs, you can create one or more new data migration files. If the files are sufficient, you can continue with the data migration using Excel or XML files.

To create a data migration file

You can create new data migration files and customize them to support your business. Note that a file can only be used to migrate a field that has its **FieldClass** property set to **Normal**.

1. Choose the  icon, enter **Configuration Package**, and then choose the related link.
2. Select and open the package that you want to use to migrate data, and then choose the **Get Tables** action. The **Get Package Table** page opens.
3. In the **TableID** field, enter a table number or select a table from the list, for example, table 18, **Customer**. The **Table Name** field is automatically filled in.
4. Select the new migration table, and then, on the **Tables** tab, choose the **Fields** action. The **Migration Fields** page opens.
5. Clear the **Include Field** check box for any field that you do not want to import, and then choose the **Set Included** or the **Clear Included** action.

IMPORTANT

If the **Include Field** check box is selected by default, that field is part of the primary key. The selection should not be cleared, or errors will be introduced and the record cannot be imported.

If you include a field that has a relationship with another table, the **Validate Field** check box is automatically selected. Validation can result in the update of other fields in this and other tables and is executed in the order of the field number.

A new migration table is created.

To export data migration files

When you have determined the tables that you want to transfer customer data to, you export the files.

1. Choose the  icon, enter **Configuration Packages**, and then choose the related link.
2. Select and open the package that you want to use for export.
3. Select the table or tables that you want to export, and then choose the **Export to Excel** action.
4. Save the exported Excel file.
5. Repeat this procedure for all the relevant data migration tables. If you select multiple tables at the same time, the export of their data is into a common workbook.

If the table is empty, the resulting data migration file contains empty cells for the fields you selected when you chose or created migration tables for your new company. If the selected data migration table contains data, it will be exported.

To map values to be used during import

When you apply data that you have imported from Excel or from a RapidStart package, Business Central treats and handles the mapping based on table relations:

- If you define a mapping directly for a field in a table, then Business Central uses it.
- If the field has a relation to another table, Business Central searches for the mapping defined for the primary key field in the related table. The related table, however, must be part of the configuration package.
- If mapping information is defined in both places, for the field directly and for the primary key in the related table, then Business Central will search for the mapping in both places.
- If the same mappings are defined directly for a field and in the related table, but have different new values, the mapping that is defined directly for the field takes priority over the mapping that is defined for the table that the field is referencing.

In the following procedures, you should review in advance which values you want to retain during the migration process. To perform the following procedures, you need data migration files (.xlsx) that you have exported from Business Central. For more information, see [To export data migration files](#).

1. Choose the  icon, enter **Configuration Packages**, and then choose the related link.
2. Open the package for the company in question.
3. Select the table for which you want to map values, and then, on the **Tables** tab, choose the **Fields** action.
4. For each field that you want to map, choose the **Mapping** action.
5. In the **Old Value** field, enter the value that you want to change. In the **New Value** field, enter the value that you want the old value to be changed to. Choose the **OK** button.
6. Import the customer data. For more information, see [To import customer data](#).
7. In the **No. of Package Errors** field, see if there are any errors reported. If there are, drill down to see the errors. The **Config. Package Records** page opens.
8. Choose the **Show Error** action. You will receive the following error: **XX is not a valid option. Valid options are: XX**. Choose the **OK** button.
9. To apply the mapping that you have set up, choose the **Apply Data** action.

Mapping Example

The following example illustrates how Business Central implements mapping definitions.

1. Create a configuration table that has a **Salesperson/Purchaser** table. Define a mapping for the **Code** field.
2. Add additional tables to the package, for example, **Customer** and **Vendor**. These tables both reference the **Salesperson/Purchaser** table through the **Salesperson Code** and **Purchaser Code** fields respectively.
3. When you apply data, the mapping that you provided for the **Code** field in the **Salesperson/Purchaser** table will also be considered during the processing of the **Salesperson Code** and **Purchaser Code** fields.

To add additional values to Business Central

1. Choose the  icon, enter **Configuration Packages**, and then choose the related link.
2. Select the table for which you want to add additional values, and then, on the **Tables** tab, choose the **Fields** action.
3. For the fields for which you want Business Central to permit additional values during migration, select the **Create Missing Codes** check box.
4. Import the customer data. For more information, see [To import customer data](#).

To clean up and process data before applying data

In some cases, you may want to clean up customer data and process it before you apply it to the database. To do that, you can use the **Config. Package - Process** batch job to fix issues, such as:

- Convert dates and decimals to the format required by the regional settings on a user's computer.
- Remove leading/trailing spaces or special characters.

When you have run the batch job, use the following procedure to process the data.

1. Open the configuration package for the company.
2. Choose the **Process Data** action.
3. To apply the mapping that you have set up, choose the **Apply Data** action.

To migrate customer data

When you have exported a migration table, your next step is to enter the customer's legacy data. To simplify your tasks, you can take advantage of the XML manipulation tools that are built into Excel. You can also use Excel built-in functions to help with data formatting and to put data in the correct cell.

For assistance with XML, enable the **Developer** tab of the Excel ribbon, and then choose the **Source** action to see the XML schema of your migration table as represented in Excel.

The following procedure is based on an Excel worksheet that you have created for migration. For more information, see [To export data migration files](#).

IMPORTANT

Do not change the columns in the Excel worksheets. If they are moved, changed, or deleted, the worksheet cannot be imported into Business Central.

1. In Excel, open the exported data file. There is a worksheet with the name of the table.
2. Rename Sheet1 to indicate that the worksheet will be used to transform the data. Copy the header row without its formatting from the exported table to the new worksheet.
3. On a third worksheet, copy all your customer data. Rename the sheet to be called e.g. Legacy Data.
4. Make an Excel formula to map data in the transformation worksheet between the fields in the exported worksheet and customer legacy data.
5. When you have mapped all of the data, copy the range of data onto the table worksheet.
6. Save the file and make sure that you do not change the file type.

You are now ready to import the data migration files that contain customer legacy data into Business Central.

To import customer data

When the customer data has been entered in the data migration files in Excel, you import the files into Business Central.

1. Open the **Config. Package Card** page.
2. Select the table for which you want to import data, and then, on the **Tables** tab, choose the **Import from Excel** action.
3. Locate and open the file that you want to import data from.
4. On the **Config. Package Import Preview** page, review the content that will be imported.

The **Config. Package Import Preview** page provides an overview of the Excel file content to be imported. It also indicates if a new configuration package is created or the existing one is updated, and if new

configuration package lines (tables) are created or existing ones are updated.

5. Choose the **Import** action

Data from the file is imported into the configuration package tables. In the **No. of Package Records** field, you can see the number of records that have been imported. In addition, you can see the number of migration errors.

To validate customer data

Customer data must be validated before you apply the records to the Business Central database.

NOTE

In most cases, invalid data is not created in the database. However, the application can occasionally be blocked if an imported migration table contains errors.

1. On the **Migration Overview** page, review the **No. of Migration Errors** field to see whether any errors occurred during import.
2. If there are errors, select the migration table, and then, on the **Tables** tab, choose the **Errors** action. The **Invalid** check box is selected for each record that has an error.
3. To review errors, select a line, and then choose the **Show Error** action.

The **Error Text** field contains the reason for the error. The **Field Caption** field contains the caption of the field that contains the error.

4. To correct an error or otherwise make an update, on the **Migration Overview** page, choose the **Migration Record** action, and then, on the **Migration Record** page, correct the record with the error.

When you make a correction, the record is removed from the list of records on the **Migration Data Errors** page.

You are now ready to apply the customer's data to the database.

To apply customer data

When you have imported all data migration records that are valid and have no errors, you can apply the records to the Business Central database.

1. Open the **Configuration Packages** page.
2. Select the table for the data migration file that you want to apply, and then choose the **Apply Data** action.

You can see the number of database records that have been created in the **No. of Database Records** field. You can verify that the correct records have been created by choosing the link in the **No. of Database Records** field.

The customer's company database is now set up and basic data is imported. Your next steps in the implementation process are to train users, define processes, create additional data, customize reports, and so on.

[Setting Up a Company With RapidStart Services Administration](#)

Create Custom Company Configuration Packages

3/31/2019 • 2 minutes to read

As you grow your business, you will likely come to rely on a set of company types that you use with most of your customers. You can streamline your implementation process by turning these types into company configuration packages that are available for reuse.

In general, create a configuration package per functional area, for example, create a package for your manufacturing functionality. That lets you apply and set up new areas in a company as you need them.

Another approach would be to create a package that includes the tables that define setup, such as the following:

- Fixed Asset Setup
- General Ledger Setup
- Inventory Setup
- Manufacturing Setup
- Purchases and Payables Setup
- Marketing Setup
- Service Setup
- Sales and Receivables Setup
- Warehouse Setup
- General Posting Setup
- VAT Posting Setup
- Inventory Posting Setup

To see a complete list of setup tables, Choose the  icon, enter **Manual Setup**, and then choose the related link.

To create a custom company configuration package

1. Create a new company. For more information, see [Creating New Companies in Business Central](#).
2. Set up the new company in the way you need. Fill in all required setup tables.
3. Open the new company.
4. Open the **Configuration Worksheet** page.
5. Add the tables that you want to transfer to another company to the worksheet. Assign the worksheet lines to the package.
6. Create a questionnaire for the most frequently used setup tables.
7. Create configuration templates to make it easier to create master data, such as customers or items.
8. Export your package as a .rapidstart file.

Tips and Tricks: RapidStart Services

3/31/2019 • 2 minutes to read

When you configure companies using RapidStart Services, there are some tips and tricks that you can take advantage of to help your implementation go smoothly.

Take advantage of configuration templates

Configuration templates can help you streamline your implementation process. By using them, you can include similar customers in segments and then develop an implementation protocol that treats all customers in a segment in a similar manner. In that way, you can apply a level of preconfiguration to each segment and continue with a rapid implementation.

Configuration questionnaires

To aid the process of filling out a configuration questionnaire, consider defining default answers to indicate best practices.

Batch creation of journal lines

We recommend that you use the data migration tools provided to migrate journal entries. Otherwise, if you use a batch job to create journal lines, that has a limited scope and only generates pre-default fields into a journal. The rest of the journal then has to be completed manually.

Migrating transactions

We recommend that you migrate opening balances in the following order.

1. Migrate general ledger opening balances without using the general ledger account subledgers. Use specific opening balance offsetting accounts, one set up for each subledger. Set up the offsetting accounts to enable direct postings.
2. Migrate open customer ledger entries.
3. Migrate open item ledger entries.
4. Migrate open fixed asset entries.

Using Business Central as your Business Inbox in Outlook

3/31/2019 • 4 minutes to read

Business Central introduces the ability to manage business interactions with your customers and vendors, directly in Microsoft Outlook. With the Business Central Outlook add-ins, you can see financial data related to customers and vendors, as well as create and send financial documents, such as quotes and invoices.

Getting the Add-in

It is easy to get started with the Business Central add-in for Outlook. In the **Set up your Business Inbox in Outlook** assisted setup guide, you can set up the connection for yourself or for your organization. If your organization uses Office 365, you must specify your Office 365 user name and password. If your organization does not use Office 365, you must specify information about the Exchange Server that you use. The Business Central add-ins are then automatically added to your Outlook.

Then, when you open Outlook, you will see an email message from Dynamics 365 Business Central Admin. The new add-ins are added to the Outlook ribbon, and in Outlook Web App, you can see the Business Central add-ins immediately above or below the body of the email message. The add-ins are updated periodically, and you'll get notified that a new version is ready for you in Outlook.

Some companies using Office 365 restrict users' permissions to deploy add-ins. So you must make sure that you have an Office 365 subscription that includes email and allows you to deploy add-ins. If you want to try out the add-in anyway, you can [try Office 365 for free](#).

Using the Contact Insights Add-in

Let's say that you get an email from a customer that wants to get a quote on some items. Directly in Outlook, you can open the Business Central add-in, which recognizes the sender as a customer, and opens the customer card for his company. From this dashboard, you can see overview information for the customer, as well as drill down for more detail on specific documents. You can also dig into the sales history for the customer. If it's a new customer, you can create them as a new customer in Business Central without leaving Outlook.

In the add-in, you can create a sales quote and send it back to this customer without leaving Outlook. All of the information that you need to send the sales quote is available in your business inbox in Outlook.

Once you have the data entered, you can post the quote. You can then send it by email. Business Central generates a .PDF file with the sales quote and attaches it to the email message that you draft in the add-in.

Similarly, if you get an email from a vendor, you can use the add-in to work with vendors and purchase invoices.

Sometimes you want to see more fields than you can see in the add-in, such as when you want to fill in lines in an invoice. To give you a bit more space to work with, you can pop out the add-in to a separate page. It's still part of Outlook, but you have more space. As you enter data for the document in the pop-out view, the changes are automatically saved. When you are done entering data for the document, you can choose the **OK** button. Choosing the add-in frame in Outlook automatically refreshes the document with the changes you made in the pop-out view.

Creating Invoices from Your Meeting Appointments

Some businesses record all billable appointments in the Outlook calendar. With Business Central, you can create

the invoice for the customer right from the calendar item: Open the appointment, and then you can open the Business Central add-in, look up existing information or create an invoice or another sales document right there.

Doing Quick Document Lookup

The Business Central Document Links add-in gives you quick access to documents mentioned in email messages. The add-in is available for an email message if a document number is recognized in the body of the message. Opening the add-in provides quick access to the document.

For example, if you receive an email message that mentions the text *S-QUO100*, Business Central identifies that as a sales quote, and so you can open this document in Outlook. In Outlook, choose the **Document Links** button immediately above the body of the email message. In the Outlook Web App, choose the *S-QUO1001* text in the body of the email message.

In the Document Links add-in, you can modify and take actions with the document, just like you can in Business Central.

Adding the Add-ins Manually

In some cases, the add-ins do not get added automatically to Outlook. Even if you or a colleague ran the assisted setup guide on behalf of the company, Business Central might not show up in Outlook. If you experience this issue, you can add the Business Central add-ins manually.

First, you must verify that you have access to the add-ins in your Office 365 account. Quite simply open your Outlook Web Access in a browser, and then add `/owa/#path=/options/manageapps` to the URL in the address bar. This opens the **Manage add-ins** page, where you can enable Business Central for your Outlook. Then, when you navigate back to Outlook, Business Central should be available.

Similarly in the Outlook desktop client, you can verify that Business Central is listed on the **Manage Add-ins** page.

In both cases, if Business Central is still not available, you have to get the add-in manifest files. For more information, please contact your Office 365 administrator.

Synchronize Contacts in Business Central with Contacts in Microsoft Outlook

3/31/2019 • 2 minutes to read

You can see the same contacts in Business Central as you see in Outlook if you set up contact synchronization. For example, if you are a sales person, you might do some of your work in Outlook and some of your work in Business Central. If the contacts are the same in both places, your work is more straightforward.

A dedicated folder in Outlook makes contacts easy to find, and you can set a filter to synchronize only the contacts from Business Central that you want to see in Outlook. Once the contact synchronization is set up, you can start synchronization manually or set up an automatic synchronization that will keep the contacts in sync on a scheduled basis.

Set Up Synchronization

You set up how you want to synchronize contacts with Outlook on the **Exchange Sync. Setup** page in Business Central. As a prerequisite, your user profile in Business Central must specify your Office 365 email account. You can check this in the **Office 365 Authentication** section of your user profile in the **Users** list.

Then, on the **Exchange Sync. Setup** page, you can validate that the connection to Exchange is working and then set up contact synchronization. Open the **Contact Sync. Setup** page and start the synchronization. Optionally, set a filter for which contacts to synchronize between Business Central and Outlook. For example, you can set a filter on name, type, company, or similar. You can also change the default name of the folder that the contacts will synchronize to in Outlook. The default name is *Business Central*.

Once this synchronization has been set up, any changes to that you make to the contact in either Outlook or in Business Central is synchronized to the other.

Each of your coworkers can also set up their own Exchange synchronization and set their own filter on which contacts to synchronize.

Synchronize Contacts

If you are used to working with contacts in Business Central, then you will find it easy to start the synchronization manually whenever it suits you from the **Contacts** list. Simply choose the **Sync with Office 365** action, and then decide if you want to change the filter that you have set up. When you choose the OK button, the synchronization starts immediately, and the latest changes are applied to your contacts in Outlook.

In the **Contacts** list, you can synchronize contacts in two ways:

- **Sync with Office 365**

This action synchronizes all changes from Business Central to Office 365 since the previous synchronization, based on the last modified date. Any new contacts from Office 365 will be synchronized back to Business Central as well. This is typically faster than doing a full sync.

- **Full Sync with Office 365**

This action synchronizes all contacts in both directions regardless of the last sync date and last modified date.

In both cases, contacts are only synchronized from Outlook if they have the required fields filled in. The required

fields to synchronize to Office 365 are **Name, Email address** and they must be of type Person. Business Central is the master of the contact information, so the Business Central contact information will be saved in the event of duplicates.

In Outlook, the contacts from Business Central are shown in a folder under **Other contacts** in the **People** view. If you are not familiar with the People view in Outlook, then you can get to it from the navigation options in the bottom left corner of Outlook.

Using Business Central without Outlook

3/31/2019 • 2 minutes to read

Business Central has deep integration with Office 365, and you can use Business Central as your business inbox in Outlook. But if you do not have Outlook, you can work with Business Central in the browser or on your mobile device.

Sending Email

You can send documents such as invoices as email using your business email address. From your Role Center, you can access an assisted setup guide that helps you set up email. If you do not use an Office 365 email account, you must specify technical information about your mail server. If you do not have this information available, please contact your IT support staff.

Enabling Your Business Data for Power BI

6/6/2019 • 4 minutes to read

Getting insights into your Business Central data is easy with Power BI and the Business Central content packs. Power BI retrieves your data and then builds an out-of-the-box dashboard and reports based on that data.

You must have a valid account with Business Central and with Power BI. Also, you must download [Power BI Desktop](#) if you wish to create your own Power BI reports. Power BI content packs require permissions to the tables where data is retrieved from. More details on the requirements are described below.

IMPORTANT

The content packs that are described in this article are designed to use Azure Active Directory as the authentication mechanism. If you use Business Central on-premises and use a different authentication mechanism, then Power BI cannot connect to your data.

Microsoft has published the following content packs:

- Dynamics 365 Business Central - CRM
- Dynamics 365 Business Central - Finance
- Dynamics 365 Business Central - Sales

Using the Dashboards

Each content pack provides reports that you can drill into:

- Choose any visual on the dashboard to bring up one of the underlying reports.
- Filter the report or add fields that you want to monitor.
- Pin this customized view to the dashboard to continue tracking.

You can refresh data manually, and you can set up a refresh schedule. For more information, see [Configuring scheduled refresh](#).

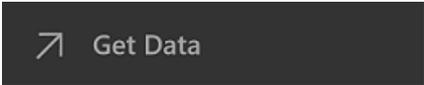

The content packs are preconfigured to work with data from the demonstration company that you get when you sign up for Business Central. When you install the apps in Power BI, and you connect to your own data, some reports may not work because they rely on data that your company does not have. In those cases, you can simply remove that report from your dashboard.

NOTE

You can also build your own reports and dashboards in Power BI based on your Business Central data. For more information, see [Connecting Your Business Data to Power BI](#).

How to Connect

1. Select **Get Data** at the bottom of the left navigation pane.

A dark grey rectangular button with a white right-pointing arrow icon and the text "Get Data" in white.

You may also get starting from within Business Central. From the role center, navigate to **Report Selection** in the Power BI Role Center part. Select either **Service** or **My Organization** from the ribbon. When either of these

actions are selected, you will be taken to either the Organization gallery in Power BI or to the services library in Power BI, which will also be filtered to only display content packs related to Business Central.

2. In the **Services** box, select **Get**. This will open a page with the **AppSource** and **Apps for Power BI apps**.

Services

Choose content packs
from online services that
you use.

3. Select **Apps** from the **Apps for Power BI apps** tab, choose the **Microsoft Dynamics 365 Business Central** content pack that you want to use, and then select **Get it now**.

A screenshot of a content pack card for "Microsoft Dynamics 365 Business Central - Finance". The card has a dark blue header with a white icon of a network or flow diagram. Below the header, the title "Microsoft Dynamics 365 Business Central - Finance" is displayed in large black font. Underneath the title, it says "By Microsoft Power BI apps". A descriptive text reads "Immediately gain access to business financial insights". Below this is a rating of four blue stars and one grey star, followed by "(30)". At the bottom of the card is a blue button that says "Get it now".

Microsoft Dynamics 365 Business Central – Finance

By Microsoft
Power BI apps

Immediately gain access to
business financial insights

★★★★☆ (30)

[Get it now](#)

4. When prompted, enter the name of *your company* in Dynamics 365 Business Central. This is not the display name. The company name can be found on the 'Companies' page within your Dynamics 365 Business Central instance.

Connect to Microsoft Dynamics 365 Business Central – Finance

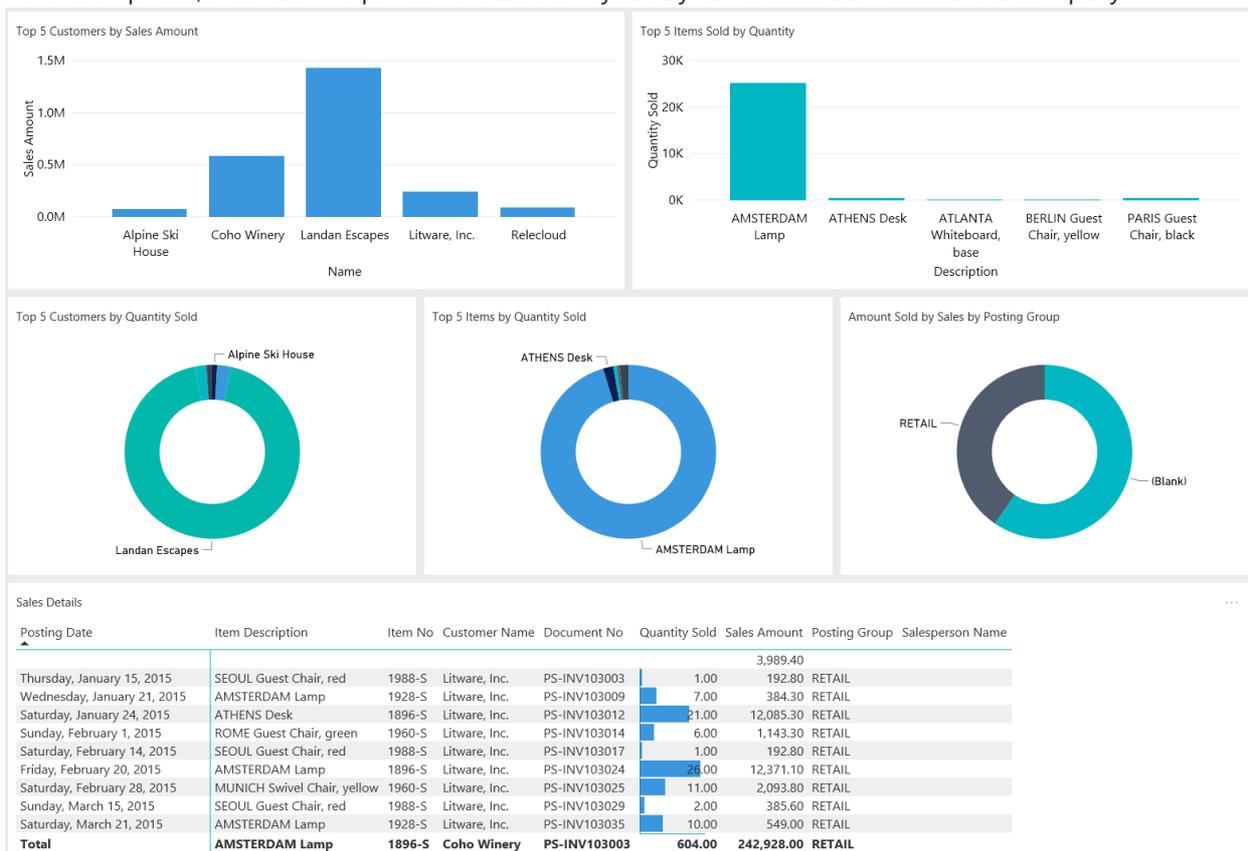

Company Name

Enter the name of the company you want to connect to.

Next

Cancel

5. Once connected, a dashboard, report and dataset will automatically be loaded into your Power BI workspace. When completed, the tiles will update with data from your Dynamics 365 Business Central company.

What Now?

- Try [asking a question in the Q&A box](#) at the top of the dashboard.
- [Change the tiles](#) in the dashboard.
- [Select a tile](#) to open the underlying report.
- While your dataset will be scheduled to refresh daily, you can change the refresh schedule or try refreshing it on demand using **Refresh Now**.

System Requirements

To import your Dynamics 365 Business Central data into Power BI, you need to have permissions to the web services used to retrieve data. The web services required for each content pack include:

Role Center Reports

Microsoft Dynamics 365 Business Central – CRM

- Sales Opportunities
- Excel Template View Company
- Power BI Report Labels

Microsoft Dynamics 365 Business Central – Finance

- PowerBIFinance
- Excel Template View Company
- Power BI Report Labels

Microsoft Dynamics 365 Business Central - Sales

- Sales Dashboard
- Excel Template View Company
- Power BI Report Labels

Web Services

An easy way to find the web services is to search for web services in Dynamics 365 Business Central. In the list make sure the Publish box is marked for the web services listed above.

Troubleshooting

The Power BI dashboard relies on the published web services that are listed above, and it will show data from the demonstration company or your own company if you import data from your current finance solution. However, if something goes wrong, this section provides a workaround for the most typical issues.

Incorrect Company Name

A common mistake is to enter the company display name instead of the company name. To find the company name search for **Companies**. Then use the **Name** field when entering your company name.

Incorrect User Name and Password

The user name and password used to sign into Power BI will be the same as what is used to connect to your Microsoft Office 365 account.

The content packs also require that you have a Microsoft Dynamics 365 Business Central account. Once you enter your credentials, we will auto discover any Microsoft Dynamics 365 Business Central tenants you have access to. If you do not have a licensed or trial Microsoft Dynamics 365 Business Central account, you will receive an error message.

The Key Didn't Match Any Rows in the Table

If you enter a non-valid company name during the connection process, you may get the error message "The key didn't match any rows in the table". Provide the correct company name and try connecting again.

Viewing List Data in Power BI Reports in Business Central

3/31/2019 • 4 minutes to read

Business Central includes a FactBox control element on a number of key list pages that provides additional insight into the data in the list. As you move between rows in the list, the report is updated and filtered for the selected entry. You can create custom reports to display in this control, but there are a few rules to follow when creating the reports to ensure they provide the desired behavior.

NOTE

You must have a valid account with Business Central and with Power BI. Also, you must download [Power BI Desktop](#). For more information, see [Using Business Central as a Power BI Data Source](#).

Report Data Set

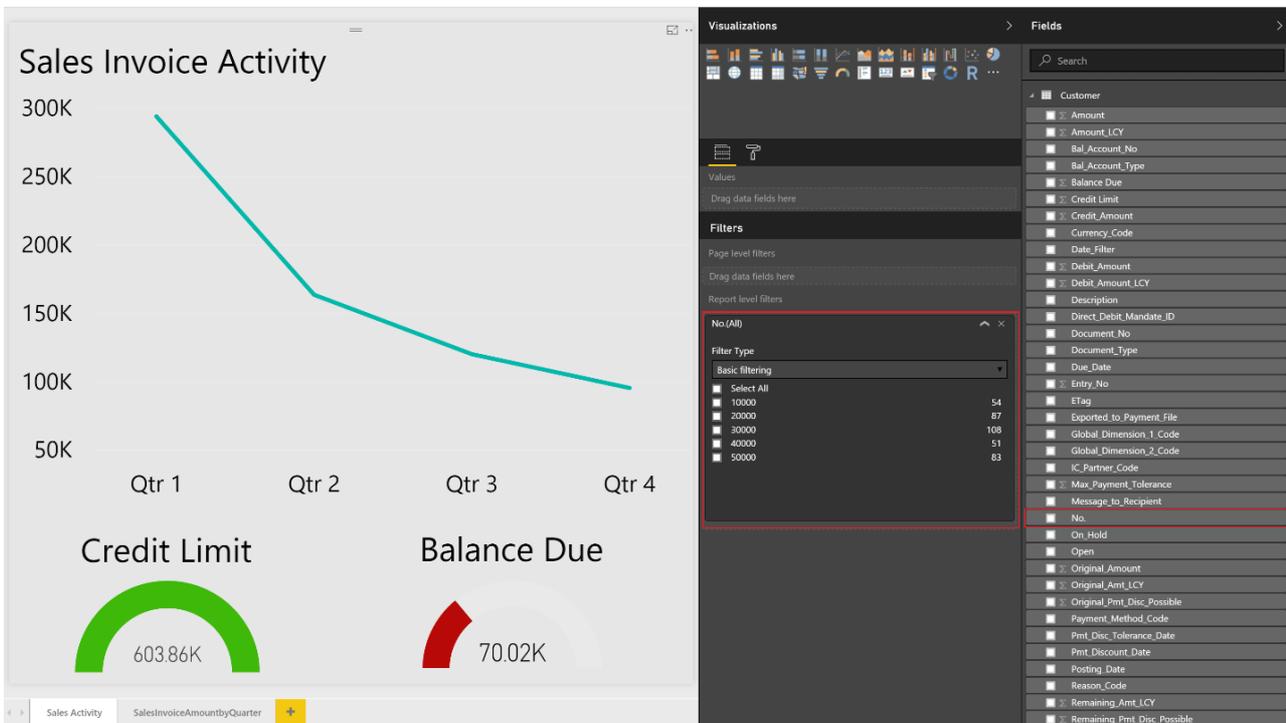

When you create the report in Power BI Desktop, specify the data source or web service that contains the data related to the list that you want to associate the report with. For example, if you want to create a report for the Sales List, ensure that the data set contains information related to sales.

To filter data on the reports based upon the record selected from the list page, the primary key must be used as a report filter. The primary keys will need to be part of your data set in order for the reports to filter correctly. In most cases, the primary key for a list is the **No.** field.

Defining the Report Filter

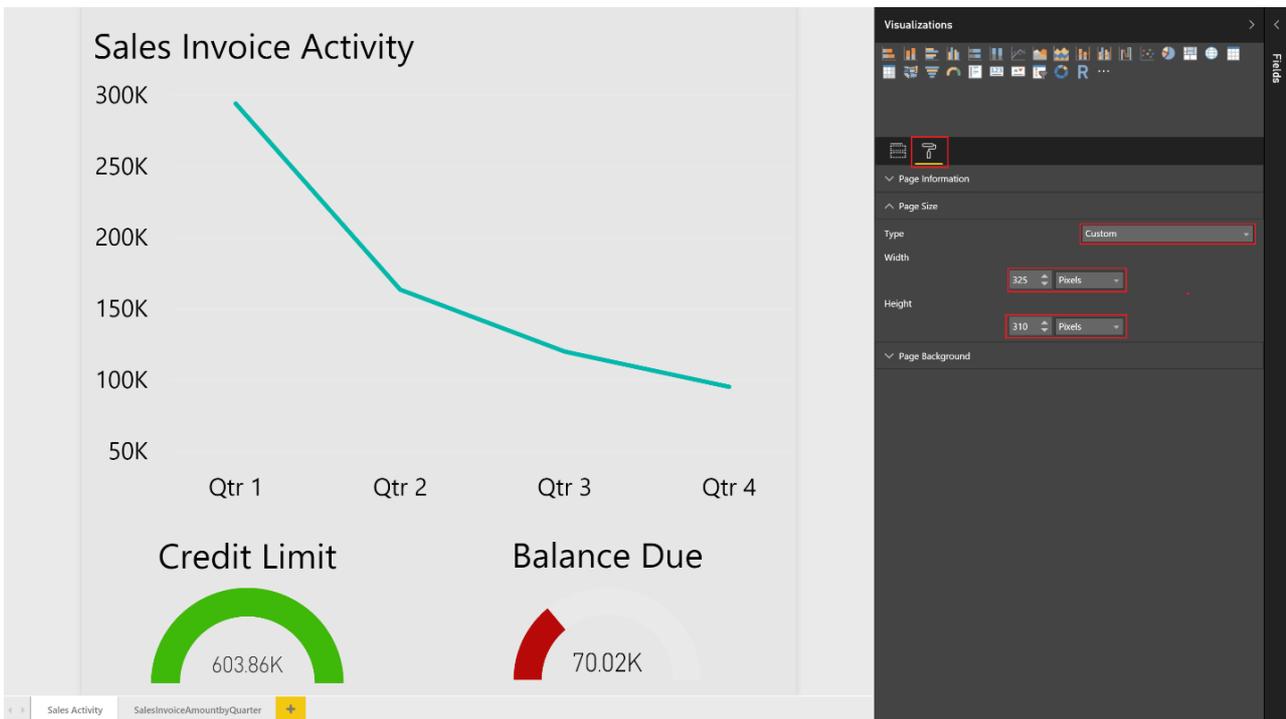

The report is required to have a basic report filter (not a page or visual filter and not advanced filter) to filter correctly in the Power BI Fact Box Control. The filter that is passed to the Power BI report from each list page will be based on the primary key as described in the previous section.

To define a filter for the report, select the primary key from the list of available fields, and then drag and drop that field into the **Report Filter** section.

Report Size and color

The size of the report must be set to 325 pixels by 310 pixels. This is required for the proper scaling of the report in the available space allowed by the Power BI Fact Box control. To define the size of the report, place focus outside of the report layout area, and then choose the paint roller icon.

You can change the width and height of the report by choosing **Custom** in the **Type** field.

Similarly, if you want to have the background of the report blend into the background color of the Power BI Fact Box control, define a custom report background color of `E5E5E5`. This is optional.

Reports with Multiple Pages

With Power BI, you can create a single report with multiple pages. The visuals that you want to see in the Business Central list pages must be on the first page of the report in Power BI.

NOTE

The Power BI Fact Box can show only the first page of your report; if you want to see other pages, you must expand the report and use tabs at the bottom of the report to navigate to other pages.

Saving Your Report

When you save your report, it's a best practice that the name of the report contains the name of the list page that you want to display the report in. For example, the word *Vendor* must be contained somewhere in the report name for reports that you want to make available on the Vendor list.

This is not a requirement; however, it will make the process of selecting reports quicker. When the report selection page is opened from a list page, we will pass in a filter based on the page name to limit the reports that are displayed. You may remove the filter to get a full list of reports available to you in Power BI.

Troubleshooting

This section provides a workaround for the most typical issues that can occur when you create the Power BI report.

User does not see a report on the Select Report page they want to select If you cannot select a report, a possible solution is to verify the name of the report to ensure it contains the name of the list page. You can also clear the filter to get a full list of Power BI reports available.

Report is loaded but blank, not filtered or filtered incorrectly Verify that the report filter contains the right primary key. In most cases, this is the **No.** field, but in the **G/L Entry** table, for example, you must use the **Entry No.** field.

Report is loaded, but it shows the page you have not expected Verify that the page you want displayed is the first page in your report.

Report appears with unwanted gray borders, is too small or too large

Verify that the report size is set to 325 pixels x 310 pixels. Save the report, and then refresh the list page.

Using Dynamics 365 Business Central as Power BI Data Source for Building Reports

3/31/2019 • 2 minutes to read

You can make your Dynamics 365 Business Central data available as a data source in Power BI and build powerful reports of the state of your business.

You must have a valid account with Dynamics 365 Business Central and with Power BI. Also, you must download [Power BI Desktop](#).

To add Dynamics 365 Business Central as a data source in Power BI Desktop

1. In Power BI Desktop, in the left navigation pane, choose **Get Data**.
2. On the **Get Data** page, choose **Online Services**, choose **Microsoft Dynamics 365 Business Central**, and then choose the **Connect** button.
3. Power BI displays a wizard that will guide you through the [connection process](#). You will be prompted to sign into the service. Select **Sign in** and choose the account you would like to sign in as. This should be the same account you sign into Dynamics 365 Business Central with.
4. Choose the **Connect** button to continue. The Power BI wizard shows a list of Microsoft Business Central companies and data sources. These data source represent all the web services that you have published from each company in Microsoft Dynamics 365 Business Central.
5. Alternatively, create a new web service URL in Dynamics 365 Business Central by using the **Create Data Set** action on the **Web Services** page, using the **Set Up Reporting** Assisted Setup guide, or by choosing the **Edit in Excel** action in any lists.
6. Specify the data you want to add to your data model, and then choose the **Load** button.
7. Repeat the previous steps to add additional Microsoft Dynamics 365 Business Central, or other data, to your Power BI data model.

NOTE

Once you have successfully connected to Microsoft Dynamics 365 Business Central, you will not be prompted again to sign in.

Once the data is loaded it will appear in the right navigation on the page. At this point, you have successfully connected to your Microsoft Dynamics 365 Business Central data and are ready to begin building your Power BI report.

Before building your report, we recommend that you import the Microsoft Dynamics 365 Business Central theme file. The theme file will create a color palette so that you can build reports with the same color styling as the Microsoft Dynamics 365 Business Central content packs without requiring you to define custom colors for each visual.

For more information, see the [Power BI documentation](#).

Connecting Power BI to Business Central

Using Business Central in an Automated Workflow

3/31/2019 • 2 minutes to read

You can use your Business Central data as part of a workflow in Microsoft Flow.

NOTE

In addition to Microsoft Flow, you can use the Workflow functionality within Business Central. Note that although they are two separate workflow systems, any Flow template that you create with Microsoft Flow is added to the list of workflow templates within Business Central. For more information, see [Workflow](#).

NOTE

You must have a valid account with Business Central and with Flow.

To add Business Central as a data source in Flow

1. In your browser, navigate to flow.microsoft.com, and then sign in.
2. Choose **My Flows** from the ribbon at the top of the page.
3. There are 2 ways to create a Flow; **Create from template** and **Create from blank**. A template is a predefined Flow that has been created for you. To use a template, simply select it and create a connection for each service the template uses. A blank template enables you to create a new Flow completely from scratch.
4. To Create from blank, on the **My Flows** page, choose the **Create from blank** option.
5. Search for **Microsoft Dynamics 365 Business Central** connector.
6. From the list of available triggers, select one of the Business Central triggers available:
When a customer approval is requested,
When a general journal batch approval is requested,
When a general journal line approval is requested,
When an item approval is requested,
When a purchase document approval is requested,
When a sales document approval is requested, or
When a vendor approval is requested.
7. Flow will prompt you to select a company within your Business Central tenant, as well as any conditions in your data that you want to listen for.

At this point, you have successfully connected to your Business Central data and are ready to begin building your flow.

8. To Create from a template, choose the **Create from template** option.
9. Search for **Microsoft Dynamics 365 Business Central** templates.
10. From the list of available templates, select one of the templates.
Request Approval for Microsoft Dynamics 365 Business Central sales order,
Request Approval for Microsoft Dynamics 365 Business Central sales quote,
Request Approval for Microsoft Dynamics 365 Business Central sales invoice,
Request Approval for Microsoft Dynamics 365 Business Central sales credit memo,
Request Approval for Microsoft Dynamics 365 Business Central customer,
Request Approval for Microsoft Dynamics 365 Business Central purchase order,
Request Approval for Microsoft Dynamics 365 Business Central purchase invoice,

*Request Approval for Microsoft Dynamics 365 Business Central purchase credit memo,
Request Approval for Microsoft Dynamics 365 Business Central item,
Request Approval for Microsoft Dynamics 365 Business Central vendor,
Request Approval for Microsoft Dynamics 365 Business Central general journal batch,
Request Approval for Microsoft Dynamics 365 Business Central general journal lines.*

11. Flow will prompt you to select a company within your Business Central tenant. Because each step in the flow is independent of the next, you may be required to define the company multiple times when using a Business Central Flow template.

For more information, see the [Flow Documentation](#).

For troubleshooting your Microsoft Flow, see [Troubleshooting Integration with Microsoft Flow](#).

Troubleshooting Integration with Microsoft Flow - Request URL Too Long

3/31/2019 • 2 minutes to read

You can use your Business Central data as part of a workflow in Microsoft Flow.

NOTE

You must have a valid account with Business Central and with Flow.

If you are creating a Microsoft Flow using the Business Central connector, you may receive an error message stating that the requested URL is too long after creating the flow, such as the following: **RequestUriTooLong**.

Cause

For a flow to trigger, it looks for changes in your data. When determining if your data has changed, the connectors compare the cached data to the new data requested from the source.

If the data request creates a URL that is too long, it will fail. Common causes may include:

- Generally, any source table with over 250 rows
- Source tables containing multiple thousands of records

Workaround

Follow these steps as a workaround.

1. Choose to edit the flow that is failing.
2. Expand the **Show advanced options** on the flow trigger.
3. In the **Skip Count** field, enter the number of records to skip.
For example, if the table that you are using as a data source has 4,000 records, enter 4,000 as the number of records to skip.
4. Update your flow.

NOTE

The connector is currently in Beta. Updates to how data changes are targeted for a future release.

Connecting to Your Business Central Data to Build a Business App Using PowerApps

5/13/2019 • 2 minutes to read

You can make your Business Central data available as a data source in PowerApps.

NOTE

You must have a valid account with Business Central and with PowerApps.

To add Business Central as a data source in PowerApps

1. In your browser, navigate to powerapps.microsoft.com, and then sign in.
2. On the Home page, choose the **Start from data** template to create a new canvas app. This app will be designed for use on a mobile device, but you can also choose to use another template.

The next step to create a PowerApp is to select your data. Choose the Arrow icon then choose the **New connection** option in the upper left side of the page.

3. In the list of available connections, choose **Business Central**, and then choose the **Create** button.

PowerApps will connect to your Business Central using the credentials that you are signed in with. If you are not an administrator of your Business Central, you may have to sign in with another account.

4. If you have more than one company in your Business Central, you must choose the company to connect to. Then, PowerApps displays a list of *tables* that are available from Business Central. These so-called tables are part of the Business Central API. You do not have to configure the end points yourself - the Business Central connector for PowerApps does it for you.

If you want to include data from other tables in Business Central in your app, then you must work with a developer to define a custom API in Business Central and then consume that custom API through a custom connector in PowerApps. For more information, see [Create a custom connector from scratch](#).

At this point, you have successfully connected to your Business Central data and are ready to begin building your PowerApp. You can add additional screens and connect to additional data from your Business Central. For more information, see [Create a canvas app from a template in PowerApps](#).

When you have designed and built your app, you can share it with your colleagues. For more information, see [Save and publish a canvas app in PowerApps](#).

NOTE

If you want to connect to Business Central on-premises, then you must choose the **Business Central (on-premises)** connector in step 3.

Getting Started Developing Connect Apps for Dynamics 365 Business Central

Changing from a QuickBooks App to Dynamics 365 Business Central

3/31/2019 • 2 minutes to read

More and more growing businesses are changing from finance apps like QuickBooks Desktop and QuickBooks Online, which are designed for startups and other small businesses, to Business Central, which also supports larger, more complex organizations.

As they transition, companies typically want to bring their business data with them so they don't start from scratch. To help transfer data, Business Central offers built-in extensions that migrate data such as customers, vendors, inventory items, and general ledger accounts. The following extensions are installed and ready to go as an integrated part of the **Data Migration** assisted setup guide:

- QuickBooks Data Migration
- QuickBooks Online Data Migration

For more information, read about the extension that suits your QuickBooks app:

- [The QuickBooks Desktop Data Migration Extension](#)
- [The QuickBooks Online Data Migration Extension](#)

Ready now?

If you are ready to get started now, choose the  icon, enter **Assisted Setup**, and then choose the related link. Choose **Migrate business data**, and then follow the steps in the guide.

Getting Business Central on Your Mobile Device

3/31/2019 • 2 minutes to read

Access your Business Central data from your mobile device. You can navigate through your business data, use features such as send to Excel or Office 365, view up-to-date charts and KPIs, email sales quotes and invoices, and shoot and attach pictures with your camera. Follow the steps below to download the app and get started.

To get the app on my mobile device

1. Install the Business Central app on your mobile device by downloading the app from the Windows Store, App Store, or Google Play.

2. Launch the app from your mobile device.
3. Enter your user name and password that you created during sign-up for Business Central and follow the instructions on the screen.

You should now have access to Business Central and be able to view and edit data.

[Working with Business Central](#)

Bulk Invoicing for Microsoft Bookings in Business Central

3/31/2019 • 2 minutes to read

If your company uses the Bookings app in Office 365, you can do bulk invoicing for appointments. The **Uninvoiced Bookings** page in Business Central provides a list of the company's completed bookings. In this page you can quickly select the appointments that you want to invoice and create draft invoices for the services provided.

Connect to Bookings

To connect your Business Central with Bookings, you must specify your Bookings company, what to synchronize with Bookings, how often to synchronize, and which templates to use. You set up this information on the **Booking Sync. Setup** page, which you can launch from the **Exchange Sync. Setup** page, which you can find through [Search](#).

For example, if you want to synchronize customers between Bookings and Business Central, you must specify the default template to use to add new customers in Business Central based on the customers in your Bookings company.

NOTE

The Bookings app is designed to book appointments for individual customers rather than companies. The synchronization with Business Central will, therefore, only synchronize customer contacts with a Type of "Person". An email address is also required for the contact to synchronize.

Similarly, if you want to synchronize service items between Bookings and Business Central, you must specify the default template to use to add new service items in Business Central based on the services in our Bookings company.

NOTE

Only items of type *Service* will synchronize between Bookings and Business Central. The template that you set up in the **Configuration Templates** page so it can be used for the item synchronization must define the type as *Service*.

Invoice Appointments

When it is time to send invoices for the completed bookings, you go to the **Uninvoiced Bookings** page. Depending on how often the information is synchronized, the list is long or short. You can create invoices for all bookings in the list or one booking at a time. You can select one or more entries in the list and invoice those only.

The support for invoicing appointments from Bookings is simpler than the fuller workflow of working with sales quotes, sales orders, and sales invoices. For more information, see [Invoice Sales](#). You can choose to sell your services using Business Central or choose to use Bookings, depending on your business needs.

Using the same Office 365 Account in Dynamics 365 Business Central and Microsoft Invoicing

3/31/2019 • 2 minutes to read

When you sign up for a trial with Business Central, you can move to a 30-day evaluation phase, you can start a subscription, or you can stop using Business Central. In all cases, if you sign in to the Office Portal, you might see a tile called **Microsoft Invoicing** and click it. This is part of the Office 365 Business Premium subscription, so not everyone will see that tile in the Office Portal.

If you access Microsoft Invoicing, you will see a message that you cannot access Microsoft Invoicing because your account is used in Business Central.

You see a similar message if you install the mobile app for Invoicing.

Workaround

Invoicing and Business Central have a shared platform. That means that you are recognized as an existing user of Business Central when you click Invoicing in the Office Portal. The reason is that Invoicing cannot use the same company as Business Central.

So you will have to sign in to Business Central and rename your existing company, and then create a new company that you can then use in Invoicing. No data is moved or overwritten during this workaround.

To rename your company

1. Sign in to Business Central.
2. In the top right corner, choose the **Settings** icon , and then choose **My Settings**.
3. In the **Company** field, choose a different company.
4. Choose the  icon, enter **Companies**, and then choose the related link.
5. On the **Companies** page, choose **Edit List**.
6. Change the name of the *My Company* entry to something else.

Wait a number of minutes. We'll be making a number of changes in the underlying database, and that takes a while.

7. When the system is ready again, choose the **Create New Company** button.
8. In the dialog that appears, specify the name as *My Company*, and choose the **Production – Setup Data Only** option.

This again takes a number of minutes. When the process completes, you will be able to access Invoicing as part of your Office 365 Business Premium experience.

What about my data?

When you rename the original My Company, the database tables that store your existing Business Central data are renamed, but the data itself is not touched.

If you use both Invoicing and Business Central, the data is stored in two different containers (the two companies). Nothing is shared, so you'll have to manage customers and items in both companies.

[Frequently Asked Questions](#)
[Administration](#)

Importing Business Data from Other Finance Systems

3/31/2019 • 3 minutes to read

When you sign up for Business Central, you can choose to create an empty company so that you can upload your own data and to test your new Business Central company. Depending on the finance solution that your business uses today, you can transfer information about customers, vendors, inventory, and bank accounts.

From the Role Center, you can start an assisted setup guide that helps you transfer the business data from an Excel file or from other formats. The type of files you can upload depends on the extensions that are available. For example, you can migrate data from QuickBooks because Business Central includes an extension that handles the conversion from QuickBooks. If you want to migrate data from other finance solutions, you must either check if an extension is available for that solution or import from Excel.

Business Central includes templates for accounts, customers, vendors, and inventory items that you can choose to apply when you import your data.

You can import master data and some transactional data from other finance systems based on the default configuration package in Business Central. On the **Configuration Packages** page, you can work with the package to import and validate the data before you apply the package.

TIP

Alternatively, use data migration wizards to import data from QuickBooks or Dynamics GP. For more information, see [QuickBooks Data Migration](#) or [Dynamics GP Data Migration](#).

NOTE

For larger implementation work, you can use RapidStart Services for Business Central, which is an extensive toolkit for setting up new solutions based on customers' business requirements and setup data. RapidStart Services also offers functionality for import of business data. For more information, see [Setting Up a Company With RapidStart Services](#).

To import item pictures, you can use a dedicated function on the **Inventory Setup** page. For more information, see [Import Multiple Item Pictures](#).

Importing Data from Configuration Packages

Business Central includes a configuration package that you can export to Excel and set up your data there. Then, you can import the data from Excel again. The package consists of 27 tables, including master data such as customers, vendors, items, and accounts, other basic setup tables such as shipping methods, and transactions tables such as sales header and lines.

NOTE

Working with configuration packages is advanced functionality, and we recommend that you contact your administrator. For more information, see [Importing Data from Legacy Accounting Software using a Configuration Package](#).

Working with Data in Excel

When you export the default configuration package to Excel, the generated workbook contains a worksheet for each table in the package. To simplify your tasks, you can take advantage of the XML manipulation tools that are built into Excel. You can also use Excel built-in functions to help with data formatting and to put data in the correct cell. For example, add a blank worksheet and copy the legacy data to it. Then make an Excel formula to map data in the transformation worksheet between the fields in the exported worksheet and customer legacy data. After you have mapped all of the data, copy the range of data onto the table worksheet.

IMPORTANT

Do not change the columns in the worksheets. If they are moved, changed, or deleted, the worksheet cannot be imported into Business Central.

Tables in the Default Configuration Package

The default configuration package supports the following tables:

- Payment Terms
- Customer Price Group
- Shipment Method
- Salesperson/Purchaser
- Location
- GL Account
- Customer
- Vendor
- Item
- Sales Header
- Sales Line
- Purchase Header
- Purchase Line
- Gen. Journal Line
- Item Journal Line
- Customer Posting Group
- Vendor Posting Group
- Inventory Posting Group
- Unit of Measure
- Gen. Business Posting Group
- Gen. Product Posting Group
- General Posting Setup
- Territory
- Item Category
- Sales Price
- Purchase Price

Set Up Email Manually or Using the Assisted Setup

3/31/2019 • 2 minutes to read

To send and receive emails from within Business Central, you must fill in the fields on the **SMTP Mail Setup** page.

NOTE

Instead of entering the SMTP server details, you can use a function to enter them with information from your Office 365 subscription.

You can either set email up manually or you can get help by using the **Email Setup** assisted setup guide. For more information, see [Getting Ready for Doing Business](#).

To set up email

1. Choose the  icon, enter **SMTP Email Setup**, and then choose the related link.
2. Fill in the fields as necessary. Hover over a field to read a short description.
3. Alternatively, choose the **Apply Office 365 Server Settings** action to insert any information that is already defined for your Office 365 subscription.
4. When all the fields are correctly filled in, choose the **Test Email Setup** action.
5. When the test succeeds, close the page.

Create Number Series

3/31/2019 • 4 minutes to read

For each company that you set up, you need to assign unique identification codes to things such as general ledger accounts, customer and vendor accounts, invoices, and other documents. Numbering is important not only for identification. A well-designed numbering system also makes the company more manageable and easy to analyze, and can reduce the number of errors that occur in data entry.

NOTE

We recommend that you use the same number series codes as you see listed on the **No. Series List** page in the CRONUS demonstration company. Codes such as *P-INV+* might not make immediate sense to you, but Business Central has a number of default settings that depend on these number series codes.

You create a numbering system by setting up one or more codes for each type of master data or document. For example, you can set up one code for numbering customers, another code for numbering sales invoices, and another code for numbering documents in general journals. After you have set up a code, you must set up at least one number series line. The number series line contains information such as the first and last number in the series and the starting date. You can set up more than one number series line per number series code, with a different starting date for each line. The series will be used consecutively, starting each series on the respective starting date.

You typically set up your number series to automatically insert the next consecutive number on new cards or documents that you create. However, you can also set a number series up to allow that you manually enter the new number. You specify this with the **Manual Nos.** check box.

If you want to use more than one number series code for one type of master data - for example, if you want to use different number series for different categories of items - you can use number series relationships.

Behavior of the No. field on Documents and Cards

On sales, purchase, and transfer documents and on all cards, the **No.** can be filled in automatically from a number series or manually, and it can be set up to be invisible.

The **No.** field can be filled in three ways:

1. If only one number series for the type of document or card exists where the **Default Nos.** check box is selected and the **Manual Nos.** check box is not selected, then the field is automatically filled with the next number in the series, and the **No.** field will not be visible.

NOTE

If the number series does not function, for example because it has run out of numbers, then the **No.** field will be visible and you can manually enter a number or resolve the issues on the **No. Series List** page.

2. If more than one number series for the type of document or card exist, and the **Default Nos.** check box is not selected for the number series that is currently assigned, then the **No.** field is visible, and you can look up to the **No. Series List** page and select the number series you want to use. The next number in the series is then inserted in the **No.** field.
3. If you have not set up a number series for the type of document or card, or if the **Manual Nos.** field is

selected for the number series, then the **No.** field is visible and you must enter any number manually. You can enter a maximum of 20 characters, both numbers and letters.

When you open a new document or card that a number series exists for, then the relevant **No. Series Setup** page opens so that you can set up a number series for that type of document or card before you proceed with other data entry.

NOTE

If you need to enable manual numbering on, for example, new item cards that have been created with a data migration process that has hidden the **No.** by default, then go to the **Inventory Setup** page and choose the **Item Nos.** field to open and set the related number series to **Manual Nos.**

To create a new number series

1. Choose the  icon, enter **No. Series**, and then choose the related link.
2. Choose the **New** action.
3. On the new line, fill in the fields as necessary. Hover over a field to read a short description.

To set up where a number series is used

The following procedure shows how to set number series up for the Sales area. The steps are similar for other areas.

1. Choose the  icon, enter **Sales & Receivables**, and then choose the related link.
2. On the **Sales & Receivables** page, on the **Number Series** FastTab, select the desired number series for each sales card or document.

The selected number will now be used to fill in the **No.** field on the card or document in question, according to the settings you made on the number series line.

To create relationships between number series

If you have set up more than one number series code for the same kind of basic information or transactions, you can create relationships between the codes. This feature can assist you in deciding among the codes when you use a number.

1. Choose the  icon, enter **No. Series**, and then choose the related link.
2. Select the line with the number series you want to create relationships for and then choose **Relationships**.
3. In the **Series Code** field, enter the code for the number series that you want to relate to the series you selected in step 2.
4. Add a line for each code that you want to relate to the selected number series.
5. Close the page.

Now when you set up something that requires a number, you can use the relationships you created to select among the related number series.

Set Up Base Calendars

3/31/2019 • 6 minutes to read

You can assign a base calendar to your company and its business partners, such as customers, vendors, or locations. Delivery and receipt dates on future sales order, purchase order, transfer order, and production order lines are calculated according to the calendar's specified working days. The main task in setting up a new base calendar is to specify and define the non-working days that you want to apply.

To set up a base calendar

1. Choose the  icon, enter **Base Calendar**, and then choose the related link.
2. Choose the **New** action.
3. Fill in the **Code** field.
4. Choose the **Maintain Base Calendar Changes** action.
5. On the **Base Calendar Changes** page, use the **Recurring System** field to mark a particular date or day as a recurring nonworking day. You can select either the **Annual Recurring** or **Weekly Recurring** option.

If you select **Annual Recurring**, you must also enter the relevant date in the **Date** field.

If you select **Weekly Recurring**, you must also select the relevant day of the week in the **Day** field. If you leave the field empty, you must fill in the **Date** field. The **Day** field is filled in automatically.

When you make an entry, the **Nonworking** field is selected. You can choose to clear the check mark to make it a working day.

When you return to the base calendar card, you will observe that the nonworking day entries that you made have been updated. These entries now appear in red and the **Nonworking** field is selected.

NOTE

When setting up a new base calendar, you can select and copy lines from an existing calendar. You do this in the relevant **Base Calendar Changes** page.

IMPORTANT

Any base calendar defined for the vendor or the location affects how the dates are calculated and rounded to working days. Specifies a date formula for the time that it takes to replenish the item. It is used to calculate the **Planned Receipt Date** field, if calculating forward, and **Order Date** field, if calculating backwards. See [Lead Time Calculation](#).

Lead Time Calculation

Any base calendar defined for the vendor or the location affects how the dates are calculated and rounded to working days. Accordingly, the two date fields on purchase order lines are calculated as follows under different conditions.

CALCULATION DIRECTION	VENDOR CALENDAR DEFINED	VENDOR CALENDAR NOT DEFINED
-----------------------	-------------------------	-----------------------------

CALCULATION DIRECTION	VENDOR CALENDAR DEFINED	VENDOR CALENDAR NOT DEFINED
Forward	planned receipt date = order date + vendor lead time (per the vendor calendar and rounded to the next working day in first the vendor calendar and then the location calendar)	planned receipt date = order date + vendor lead time (per the location calendar)
Backward	order date = planned receipt date - vendor lead time (per the vendor calendar and rounded to the previous working day in first the vendor calendar and then the location calendar)	order date = planned receipt date - vendor lead time (per the location calendar)

NOTE

In addition to the lead time calculation that affects the planned receipt date and order date, as shown in the above table, warehouse handling time and safety lead time may be added to the formulas to make up the value in the **Expected Receipt Date** field, as follows: Planned Receipt Date + Safety Lead Time + Inbound Warehouse Handling Time = Expected Receipt Date.

IMPORTANT

If your location uses a significantly different calendar than your vendors do, then it is important that you set up specific calendars for those vendors, to calculate optimal vendor lead times. For information about how to set up vendor calendars, see [To assign a base calendar](#).

The contents of the **Lead Time Calculation** field is copied from either the item card or the SKU card, if the lead time is defined for the item, or on the **Item Vendor Catalog** page, if the lead time is defined for the vendor.

To customize a calendar

The main task in customizing a base calendar for your company, or one of its business partners, is to enter any changes to working and nonworking day status.

For example, while a base calendar would typically list all Saturdays as non-working days, the customized calendar for a particular location may list all Saturdays during the months of November and December, and leading up to the holiday season, as working days.

The following procedure uses the case of the location as an example. Note that at this point, you have already assigned a base calendar to the location.

1. Choose the  icon, enter **Locations**, and then choose the related link.
2. Open the location that you want to update, and then select the **Customized Calendar** field. Note that a calendar must be selected in the **Base Calendar Code** field.
3. On the **Customized Calendar Entries** page opens, choose the **Maintain Customized Calendar Changes** action.
4. In the **Customized Calendar Changes**, add lines for customized calendar entries.

When you enter a line, the **Nonworking** check box is selected. You can clear the check box if you want to change the status to a working day.

You can use the **Recurring System** field to set a particular date or day as a recurring nonworking day. You

can select either the **Annual Recurring** or **Weekly Recurring** option.

If you select **Annual Recurring**, you must also enter the relevant date in the **Date** field. If you select **Weekly Recurring**, you must also select the relevant day of the week in the **Day** field. If you leave the field empty, you must fill in the **Date** field. The **Day** field is then filled in automatically. This could be useful if you want to mark an individual date as a nonworking or working day.

5. Choose the **OK** button.

On the **Customized Calendar Entries** page, you will observe that the date entries are updated with the changes that you made.

On the Location card, you will observe that the **Customized Calendar** field contains **Yes**, indicating that a customized calendar has been set up.

IMPORTANT

If you do not fill in the **Location Code** field on an order line, your company's calendar is used.

If you do not fill in the **Shipping Agent Code** field on the order line, your company's calendar is used.

NOTE

If you make changes to a base calendar for which customized calendar changes exist, all existing customized calendars are updated automatically.

To assign a base calendar

The following procedure schedules delivery dates on sales order lines for a customer as an example.

Base calendars are assigned to your own company, customers, vendors, locations, and shipping agents as follows:

- On the **Company Information** and **Customer** cards, the base calendar is assigned on the **Shipping** FastTab.
- On the **Vendor** card, the base calendar is assigned on the **Receiving** FastTab.
- On the **Location** card, the base calendar is assigned on the **Warehouse** FastTab.
- On the **Shipping Agents** page, the base calendar is assigned on the **Shipping Agent Services** page.

1. Choose the  icon, enter **Customers**, and then choose the related link.
2. Open the **Customer** card for whom you will assign a base calendar.
3. On the **Shipping** FastTab, in the **Base Calendar Code** field, select the base calendar that you want to assign.

IMPORTANT

- If you do not assign a base calendar to a company, all dates are calculated as working days.
- If you enter a blank location on an order line, all dates are calculated as working days.
- Any base calendar defined for the vendor or the location affects how the dates are calculated and rounded to working days.

NOTE

Before you can make customized calendar entries, you must first assign a base calendar to the company.

General Business Functionality

3/31/2019 • 2 minutes to read

Business Central provides dedicated functionality for typical business areas, such as finance and sales. For more information, see [Business Functionality](#).

To support those business area-specific tasks, you can use a variety of general business functionality, such as defining extended text for document lines and organizing connecting business tasks in workflows.

NOTE

In addition to the business-related functions described in this section, you will use general UI functions every day to interact with the system. For more information, see [Working with Business Central](#).

The following table lists these general business areas with links to topics that describe them.

TO	SEE
Add extra information to accounts, customers cards, or sales orders to communicate agreements, such as a special price or delivery method, to other users.	Add Comments to Cards and Documents
View ongoing, posted, or archived documents that are related to sales and purchase order lines.	Track Document Lines
Communicate the contents of business documents quickly to your business partners, such as the payment information on sales documents to customers.	Send Documents by Email
Archive sales and purchase orders, quotes, return orders, and blanket orders, and you use the archived document to recreate the document that it was archived from.	Archive Documents
Set up standard text codes so you can extend standard text by adding extra lines, and set up conditions for use of the extra lines.	Add Extended Item Text
Create tasks to remind you of work to be done. You can create tasks for yourself, but you can also assign tasks to others or be assigned a task by someone else in your organization.	Define User Tasks
Attach pictures, documents, and other types of files to all cards, such as the item card and job card, and attach files to all types of sales and purchase documents.	Attach Files to Cards and Documents
Work with your Business Central data in Excel.	Exporting Your Business Data to Excel
Understand what happens when you choose the Post action.	Posting Documents and Journals
Review the result of posting before you post.	Preview Posting Results

TO	SEE
Learn how to work with general journals, which are used to post to general ledger accounts and other accounts such as bank, customer, vendor, and fixed assets accounts.	Working with General Journals
Schedule a report to run at a specific date and time.	Scheduling a Report to Run
Let the system help you complete tasks quicker and more correctly by prefilling fields or complete lines with data that you would otherwise have to calculate and enter yourself.	Letting Business Central Suggest Values
Record external documents, including their file attachments, and then manually create the related documents or automatically convert the files to electronic documents.	Incoming Documents
Set up and use workflows that connect tasks performed by different users or by the system, such as automatic posting. Requesting and granting approval to create or post documents are typical workflow steps.	Workflow
Set up data exchange definitions so you can send and receive electronic documents.	Exchanging Data Electronically

Add Comments to Cards and Documents

3/31/2019 • 2 minutes to read

You can add extra information to G/L accounts, customers cards, or sales orders to communicate exceptions or special agreements to other users. Practically all cards and document have a **Comments** action, which opens the **Comment Sheet** page where you can write or read comments. On documents, you can also add comments to individual lines.

Comments on ongoing documents are transferred to the related posted document. For example, a comment on a sales order is transferred to a resulting posted sales shipment.

In addition, you can specify if you want comments to be transferred from one type of document to another resulting type of document, such as from a sales order to a sales invoice. You do this in the **Sales & Receivables** and the **Purchases & Payables** pages respectively.

NOTE

Comments are not printed or output to reports or externally-facing documents.

The following describes how to add a comment to an item card. The steps are similar for all other cards and documents, except on document lines, the **Comments** action is placed on a lines action menu.

To add a comments to an item card

1. Choose the  icon, enter **Items**, and then choose the related link.
2. Open the relevant item card.
3. Choose the **Comments** action.
4. On the **Comment Sheet** page, enter any text, and then choose the **OK** button.

Track Document Lines

3/31/2019 • 2 minutes to read

You can view documents that are related to sales order lines and purchase order lines, including from archived order lines. Related documents that you can track include quotes, shipments, receipts, and blanket orders. This helps you to identify documents used to process orders.

To track documents related to a sales order line

The following procedure describes how to track from a sales order line. The steps are similar for purchase order and blanket order lines.

1. Choose the  icon, enter **Sales Orders**, and then choose the related link.
2. Open a sales order that you want to track from.
3. Select a line, and then choose the **Document Line Tracking** action.
4. On the **Document Lines Tracking** page, select the document that you want to view, and then choose the **Show** action to see the related line.
5. To view the entire document for the selected document line, choose the **Show Document** action.

Send Documents by Email

5/22/2019 • 3 minutes to read

To communicate the contents of business documents quickly to your business partners, such as the payment information on sales documents to customers, you can use the Report Layout feature to define document-specific content that gets inserted in email bodies automatically. For more information, see [Managing Report and Document Layouts](#).

To enable emails from within Business Central, start the **Set Up Email** assisted setup guide on the Role Center.

You can email practically all document types as attachments to email messages directly from the page that shows the document. In addition to the attachment, you can set up document-specific email bodies with core information from the document preceded by standard text that greets the mail recipient and introduces the document in question. To offer your customers to pay for sales electronically using a payment service, such as PayPal, you can also have the PayPal information and hyperlink inserted in the email body.

From all supported documents, you initiate emailing by choosing the **Send** action, on posted documents, or the **Post and Send** action, on non-posted documents.

If the **Email** field on the **Send Document to** page is set to **Yes (Prompt for Settings)**, then the **Send Email** page opens prefilled with the contact person in the **To:** field and the document attached as a PDF file. In the **Body** field, you can either enter text manually or you can have the field filled with a document-specific email body that you have set up.

The following procedure describes how to set the **Sales - Invoice** report up to be used for document-specific email bodies when you email posted sales invoices.

To set up a document-specific email body for sales invoices

1. Choose the  icon, enter **Report Selections Sales**, and then choose the related link.
2. On the **Report Selection - Sales** page, in the **Usage** field, select **Invoice**.
3. On a new line, in the **Report ID** field, select, for example, standard report 1306.
4. Select the **Use for Email Body** check box.
5. Choose the **Email Body Layout Code** field, and then select a layout from the drop-down list.

Report layouts define both the style and the content of the email body, including the standard text that precedes the core document information in the email body. You can see all available report layouts if you choose the **Select from full list** button in the drop-down list.

6. To view or edit the layout that the email body is based on, select the layout on the **Custom Report Layouts** page, and then choose the **Edit Layout** action.
7. If you want to offer customers to pay for sales electronically, you can set up the related payment service, such as PayPal, and then have the PayPal information and hyperlink inserted in the email body as well. For more information, see [Enable Customer Payments Through PayPal](#).
8. Choose the **OK** button.

Now, when you choose, for example, the **Send** action on the **Posted Sales Invoice** page, the email body will contain the document information of report 1306 preceded by styled standard text according to the report

layout that you selected in step 5.

The following procedure describes how to send a posted sales invoice as an email message with the document attached as a PDF file and with a document-specific email body.

To send documents by email

1. Choose the  icon, enter **Posted Sales Invoices**, and then choose the related link.
2. Select the relevant posted sales invoice, and then choose the **Send** action. The **Send Document to** page opens.
3. In the **Email** field, select **Yes (Prompt for Settings)**. For more information, see [Set Up Document Sending Profiles](#).
4. Choose the **OK** button. The **Send Email** page opens.
5. In the **To:** field, enter a valid email address. The default value is the customer email address.
6. In the **Subject** field, enter a descriptive subject text. The default value is the customer name and invoice number.
7. In the **Attachment** field, the generated invoice is attached by default as a PDF file.
8. In the **Body** field, enter a short message to the recipient.

If a document-specific email body is set up on the **Report Selection - Sales** page, then the **Body** field is filled in automatically. For more information, see [To set up a document-specific email body for sales invoices](#).

9. Choose the **OK** button to send the email message.

NOTE

If you do not want to specify email settings each time you email a document, you can select the **Yes (Use Default Settings)** option in the **Email** field on the **Send Document to** page. In that case, the **Send Email** page will not open. See Step 4. For more information, see [Set Up Document Sending Profiles](#).

Archive Documents

3/31/2019 • 2 minutes to read

You can archive sales and purchase orders, quotes, return orders, and blanket orders, for example because you want to save a copy of a document for reuse later. You can archive a sales or purchase document several times, saving a different archived version each time.

For archived documents where the original still exists and is not posted, you can use the **Restore** function to overwrite the original with the archived version of the document. This is practical if you need to restore the contents of a document to an earlier state.

For archived documents where the original is deleted, you can only reuse the content by copying the data, for example with the **Copy Document** function.

To set up automatic document archiving

You can set up automatic archiving of sales and purchase orders, quotes, blanket orders, and return orders, before you delete documents.

The following procedure describes how to set up automatic archiving of sales documents. The steps are similar for purchase documents.

1. Choose the  icon, enter **Sales & Receivables Setup**, and then choose the related link.
2. On the **Sales & Receivables Setup** page, fill in the fields as follows.

FIELD	DESCRIPTION
Archiving Sales Quotes	Never to never archive sales quotes when they are deleted. Question to prompt the user to choose whether to archive sales quotes when they are deleted. Always to archive sales quotes automatically when they are deleted.
Archiving Blanket Sales Orders	Select to archive blanket sales orders automatically each time they are deleted.
Arch. Orders and Ret. Orders	Select to automatically archive sales orders each time they are deleted.

To archive a sales order

The following procedure describes how to archive a sales order. The steps are similar for all orders, blanket orders, return orders, and quotes.

1. Choose the  icon, enter **Sales Orders**, and then choose the related link.
2. Open a sales order that you want to archive.
3. Choose the **Archive Document** action.

The sales order is archived. You can view it on the **Archived Sales orders** page.

To restore a non-posted sales order from the archive

The following procedure describes how to bring the contents of an archived sales order back to the original sales

order. This is only possible when the original document has not been posted. The steps are similar for all orders, blanket orders, return orders, and quotes.

1. Choose the  icon, enter **Archived Sales Orders**, and then choose the related link.
2. Select the archived sales order, or version of it, that you want to restore, and then choose the **Restore** action.

The contents of the original sales order is replaced with that of the selected archived version.

To delete archived sales orders

The following procedure describes how to delete archived sales orders. The steps are similar for other archived sales and purchase documents.

1. Choose the  icon, enter **Delete Archived Sales Order Versions**, and then choose the related link.
2. On the **Delete Archived Sales Order Versions** page, select the appropriate filters.
3. Choose the **OK** button.

Add Extended Item Text

3/31/2019 • 2 minutes to read

You can extend a standard text for items by adding extra lines, and you can set up conditions for use of the extra lines. You do this from item cards.

To define extended text for an item description

1. Open the card for an item that you want to add extended text to, and then choose the **Extended Text** action.
2. Fill in the **Code** and **Description** fields.
3. Choose the **New**.
4. Fill in the **Language Code** field or select the **All Language Codes** check box if you use language codes.
5. Fill in the **Starting Date** and **Ending Date** fields if you want to limit the dates on which the extended text is used.
6. In the **Text** field, write the extended text.
7. Select relevant check boxes for the document types where you want the extended text printed.
8. Close the page.

To add an extended item text on a sales order line

1. Open a sales order with a sales line for an item that has extended text defined. For more information, see [Sell Products](#).
2. Select the line in question, and then choose the **Insert Ext. Text** action.

Define User Tasks

3/31/2019 • 2 minutes to read

In Business Central, you can create tasks to remind you of work to be done. You can create tasks for yourself, but you can also assign tasks to others or be assigned a task by someone else in your organization.

Managing User Tasks

The **User Tasks** page shows all tasks, and you can easily create and assign new tasks. When you create a task, you can specify the start date and due date, and you can add a link to the page in Business Central where the user must do the work.

For example, you can create a task for yourself to view all posted sales invoices. In that case, you link the task to page 143, Posted Sales Invoices.

EDIT - USER TASK ✕

Check posted sales invoices

[General](#) Show more

Subject	Check posted sales invoices
Task Description	Take a look at the list

[Status](#) Show more

Assigned To	>	Start Date		...
Due Date	10-20-2017 11:30	Priority		▼
% Complete	0			

[Description](#)

Link Task To	Page ▼	Resource Name	Posted Sales Invoices
Page	143 ...		

TIP

Use the look-up in the **Page** field and then use the **Search for Page or Report** field to find the page that you want. For more information, see [Searching for a Page or Report](#).

Picking Up User Tasks

In the Business Manager, Bookkeeper, and Accountant Role Centers, a tile shows pending tasks that are assigned to that user. To pick up a task, simply choose it from the list of pending user tasks. In the ribbon, the link **Go to Task Item** opens the page where you can do the work.

When you have completed a task, simply mark it as completed.

Deleting User Tasks

If you want to bulk delete all or some user tasks, you can use the **Delete User Tasks** report. In the request page, you can set filters to determine which tasks must be deleted.

Add Links to Websites, Documents, or Programs on Records

6/13/2019 • 2 minutes to read

On a specific record, such as a customer, document, or sales order, you can add a link to an external document, website, or program. Or, you may want a link that opens a new empty email to a specific recipient when you select it. The card page for some records, such as customer and vendor cards, include a **Home Page** field where you can enter an Internet address (URL). To include other links, you can use the method described in this article.

IMPORTANT

Currently, this capability is available only in Business Central on-premises deployments with the legacy Dynamics NAV Windows client.

Another example could be when you receive printed invoices from vendors. You can scan them and store them as .pdf files on a SharePoint site. Then you can make a link from a purchase invoice in Business Central to the corresponding invoice on SharePoint. Or, you can make a link from an item card to the corresponding page in your vendor's online catalog.

To add a link on a record

1. Open the record that you want to attach the link to, such as a customer card or sales order. If you want to attach the link to a specific line, such as a journal line, select the line.
2. Choose the **Links** action to open the **Links** pages that shows all the current links that are added to the record.
3. To add a new link, choose **+new**.
4. In the **Link Address** field, enter
 - To link to a file on your computer or network, enter the full path and file name, such as **C:\My Documents\invoice1.doc**.
 - To link to website, enter the Internet address (URL), such as **www.microsoft.com**.
 - To link to a program, enter a specific string to open the program. For example, to open OneNote with a specific page, enter **onenote:///C:\My Documents/test.one**. Or, to open Outlook with a new empty email to a specific alias, enter **mailto:testalias**.
5. Fill in the **Description** field with information about the link.
6. Choose the **Save** button.

To delete a link from a record

To delete a link, on the **Links** page, you can select ... and then **Delete**.

If you delete a single record, such as a sales order line, a sales order, or a customer, then all the links attached to the record are deleted. However, if you delete records using a batch job, such as the **Delete Invoiced Sales Orders** batch job, then the links are still stored in the database. To delete the links from the database, run the **Delete Orphaned Record Links** codeunit. To do this, choose the  icon, enter **Delete Orphaned Record Links**, and then choose the related link.

Attaching Files to Cards and Documents

3/31/2019 • 2 minutes to read

You can attach pictures, documents, and other types of files to all cards, such as the item card and job card, and you can attach files to all types of sales and purchase documents.

NOTE

In general, the maximum file size for attachments is 150 MB. However, the limit can be lower for some features.

To attach a file to a sales order

The following procedure is based on a sales order. The steps are similar for all other sales and purchase documents and for all cards.

1. Choose the  icon, enter **Sales Orders**, and then choose the related link.
2. Open the sales that you want to attach a file to.
3. Choose the **Attachments** action.
4. On the **Attached Documents** page, in the **Attachment** field, choose the **Select File** button.
5. Select a file from any location, and then choose the **Open** button.

Exporting Your Business Data to Excel

3/31/2019 • 2 minutes to read

If you want to work with your data from Business Central in Excel, you can open all lists in Excel and work with it there. Similarly, if you want to cancel your subscription for Business Central, you can export your data to Excel so that you can take it with you.

Opening Lists in Excel

You can open data in Excel from any journal, list, or worksheet. You just open the page that you want, and then choose **Open in Excel**. For example, open the list of customers (search for **Customers**), and then choose **Open in Excel**. Your browser will prompt you to open or save the generated Excel workbook.

NOTE

Use this option when you do not want to make changes and publish those changes back to Business Central.

Each list includes a number of columns, and the export to Excel will include any columns that are in your current view. If you want to add or remove columns before you open the list in Excel, you simply open the shortcut menu for any column and then specify which columns that you want to see. This list of columns is different for most lists, and it reflects the structure in the database where your data is stored. If you are not sure what type of data a certain column contains, you can add it to your view and then decide if you want to remove it again.

Edit Data in Excel

Your Business Central experience includes an add-in for Excel so you can edit data in Excel. For more information, see [Analyzing Financial Statements in Microsoft Excel](#).

Exporting Data to Other Finance Systems

If you decide to cancel your subscription for Business Central, you can export your data to Excel and take it with you to your next finance system.

You can export all pages, of course, but that might be more than you really need. So consider exporting the following essential pages, and remember to add all columns as described earlier:

- Chart of Accounts
- Customers
- Vendors
- Banks
- Items

If you want all your financial transactions as well, this is a large amount of data, so the export will often take more than a few minutes of time. The financial transactions are shown on the **General Ledger Entries** page.

We recommend that you also consider exporting data from the following pages:

- Customer Ledger Entries
- Vendor Ledger Entries
- Bank Account Ledger Entries
- Item Ledger Entries

- General Posting Setup
- Customer Posting Groups
- Vendor Posting Groups
- Item Posting Groups
- Bank Posting Group
- G/L Budgets
- G/L Budget Entries
- Sales Quotes
- Sales Invoices
- Purchase Invoices
- Contacts
- Salespeople

NOTE

If you have set up more than one company in Business Central, you must export the relevant data from each company.

Post Documents and Journals

3/31/2019 • 2 minutes to read

Posting represents the accounting action of recording business transactions in the various company ledgers.

Practically every document and journal in Business Central offers a **Posting** group from which you can choose between different posting actions, such as **Post**, **Preview Posting**, **Post and Send**, **Post and Email**.

The following table describes related tasks, with links to the topics that describe them.

TO	SEE
Learn about posting purchase documents.	Posting Purchases
Learn about posting sales documents.	Posting Sales
Learn about posting general journals.	Working with General Journals
Preview, in a page, the entries that will be created when you post.	Preview Posting Results
Preview, in a report, the entries that will be created when you post.	View Test Reports Before Posting

Preview Posting Results

3/31/2019 • 2 minutes to read

On every document and journal that can be posted, you can choose the **Preview Posting** button to review the different types of entries that will be created when you post the document or journal.

To preview G/L entries that will result from posting a purchase invoice

1. Choose the  icon, enter **Purchase Invoices**, and then choose the related link.
2. Create a purchase invoice. For more information, see [Record Purchases](#).
3. Choose **Preview Posting**.
4. On the **Posting Preview** page, select **G/L Entry**, and then choose **Show Related Entries**.
The **G/L Entries Preview** page shows which entries will be created when you post the purchase invoice.

[Post Documents and Journals](#)
[Working with Business Central](#)
[General Business Functionality](#)

Working with General Journals

3/31/2019 • 12 minutes to read

Most financial transactions are posted to the general ledger through dedicated business documents, such as purchase invoices and sales orders. But you can also process business activities such as purchasing, paying, or refunding employee expenses by posting journal lines in the various journals in Business Central.

Most journals are based on the *General Journal*, and you can process all transactions on the **General Journal** page. For more information, see [Post Transactions Directly to the General Ledger](#).

For example, you can use post employees' expenditure of own money on business-related expenses, for later reimbursement. For more information, see [Record and Reimburse Employees' Expenses](#).

But in many cases, you will want to use the journals that are optimized for specific types of transactions, such as the **Payment Journal** for registering payments. For more information, see [Record Payments and Refunds in the Payment Journal](#).

You use general journals to post financial transactions directly to general ledger accounts and other accounts, such as bank, customer, vendor, and employee accounts. Posting with a general journal always creates entries on general ledger accounts. This is true even when, for example, you post a journal line to a customer account, because an entry is posted to a general ledger receivables account through a posting group.

The information that you enter in a journal is temporary and can be changed while it is in the journal. When you post the journal, the information is transferred to entries on individual accounts, where it cannot be changed. You can, however, unapply posted entries, and you can post reversing or correcting entries. For more information, see [Reverse Postings](#).

NOTE

The general journal only shows a limited number of fields on the journal line by default. If you want to see additional fields, such as the **Account Type** field, choose the **Show More Columns** action. To hide the additional fields again, choose the **Show Fewer Columns** action.

Using Journal Templates and Batches

There are several general journal templates. Each journal template is represented by a dedicated page with particular functions and the fields that are required to support those functions, such as the **Payment Reconciliation Journal** page to process bank payments and the **Payment Journal** page to pay your vendors or reimburse your employees. For more information, see [Make Payments](#) and [Reconcile Customer Payments with the Cash Receipt Journal or from Customer Ledger Entries](#).

For each journal template, you can set up your own personal journal as a journal batch. For example, you can define your own journal batch for the payment journal that has your personal layout and settings. The following tip is an example of how to personalize a journal.

TIP

If you select the **Suggest Balancing Amount** check box on the line for your batch on the **General Journal Batches** page, then the **Amount** field on, for example, general journal lines for the same document number is automatically prefilled with the value that is required to balance the document. For more information, see [Letting Business Central Suggest Values](#).

Understanding Main Accounts and Balancing Accounts

If you have set up default balancing accounts for the journal batches on the **General Journals** page, the balancing account will be filled in automatically when you fill in the **Account No.** field. Otherwise, fill in both the **Account No.** field and the **Bal. Account No.** field manually. A positive amount in the **Amount** field is debited to the main account and credited to the balancing account. A negative amount is credited to the main account and debited to the balancing account.

NOTE

VAT is calculated separately for the main account and the balancing account, so they can use different VAT percentage rates.

Working with Recurring Journals

A recurring journal is a general journal with specific fields for managing transactions that you post frequently with few or no changes, such as rent, subscriptions, electricity, and heat. Using these fields for recurring transactions, you can post both fixed and variable amounts. You can also specify automatic reversal entries for the day after the posting date. You can also use allocation keys to divide the recurring entries among various accounts. For more information, see [Allocating Recurring Journal Amounts to Several Accounts](#).

With a recurring journal, entries that will be posted regularly need to be typed in only once. That is, the accounts, dimensions and dimension values and so on that you enter will remain in the journal after posting. If any adjustments are necessary, you can make them with each posting.

Recurring Method field

This field determines how the amount on the journal line is treated after posting. For example, if you will use the same amount every time you post the line, you can let the amount remain. If you will use the same accounts and text on the line but the amount will vary every time you post, you can choose to delete the amount after posting.

TO	SEE
Fixed	The amount on the journal line will remain after posting.
Variable	The amount on the journal line will be deleted after posting.
Balance	The posted amount on the account on the line will be allocated among the accounts specified for the line in the Gen. Jnl. Allocation table. The balance on the account will thus be set to zero. Remember to fill in the Allocation % field on the Allocations page. For more information, see Allocating Recurring Journal Amounts to Several Accounts .
Reversing Fixed	The amount on the journal line will remain after posting, and a balancing entry will be posted on the next day.
Reversing Variable	The amount on the journal line will be deleted after posting, and a balancing entry will be posted on the next day.
Reversing Balance	The posted amount on the account on the line will be allocated among the accounts specified for the line on the Allocations page. The balance on the account will be set to zero, and a balancing entry is posted on the next day.

NOTE

The VAT fields can be filled in on either the recurring journal line or on the allocation journal line but not on both. That is, they can be filled in on the **Allocations** page only if the corresponding lines in the recurring journal are not filled in.

Recurring Frequency field

This field determines how often the entry on the journal line will be posted. It is a date formula field, and it must be filled in for recurring journal lines. For more information, see [Using Date Formulas](#).

Examples

If the journal line must be posted every month, enter "1M". After every posting, the date in the **Posting Date** field will be updated to the same date in the next month.

If you want to post an entry on the last day of every month, you can do one of the following:

- Post the first entry on the last day of a month by entering 1D+1M-1D (1 day + 1 month - 1 day). With this formula, the posting date is calculated correctly regardless of how many days there are in the month.
- Post the first entry on any arbitrary day of a month by entering 1M+CM. With this formula, the posting date will be after one full month + the remaining days of the current month.

Expiration Date field

This field determines the date on which the line will be posted for the last time. The line will not be posted after this date.

The advantage of using the field is that the line will not be deleted from the journal immediately and you can always replace the present expiration date with a later one so that you can use the line further into the future.

If the field is blank, the line will be posted every time you post until it is deleted from the journal.

Allocating Recurring Journal Amounts to Several Accounts

On the **Recurring General Journal** page, you can choose the **Allocations** action to see or manage how amounts on the recurring journal line are allocated to several accounts and dimensions. Note that an allocation functions as balancing account line to the recurring journal line.

Just as in a recurring journal, you need to enter an allocation only once. The allocation will remain in the allocation journal after posting, so you do not need to enter amounts and allocations every time you post the recurring journal line.

If the recurring method in the recurring journal is set to **Balance** or **Reversing Balance**, then any dimension value codes in the recurring journal are disregarded when the account is set to zero. So if you allocate a recurring line to various dimension values on the **Allocations** page, then only one reversing entry will be created. Therefore, if you allocate a recurring journal line that contains a dimension value code, then you must not enter the same code on the **Allocations** page. If you do, the dimension values will be incorrect.

Example: Allocating Rent Payments to Different Departments

You pay rent every month, so you have entered the rent amount on the cash account on a recurring journal line. On the **Allocations** page, you can divide the expense among several departments (Department dimension) according to the number of square feet that each one occupies. The calculation is based on the allocation percentage on each line. You can enter various accounts on different allocation lines (if rent will also be divided among several accounts), or you can enter the same account but with various dimension value codes for the Department dimension on each line.

Working with Standard Journals

When you have created journal lines which you know you are likely to create again later, you can save them as a

standard journal before you post the journal. This functionality applies to item journals and general journals.

NOTE

The following procedure refers to the item journal, but the information also applies to the general journal.

To save a standard journal

1. Choose the  icon, enter **Item Journals**, and then choose the related link.
2. Enter one or more journal lines.
3. Select the journal lines that you want to reuse.
4. Choose the **Save as Standard Journal** action.
5. In the **Save as Standard Item Journal** request page, define a new or existing standard item journal that the lines should be saved in.

If you have already created one or more standard item journals and you want to replace one of these with the new set of item journal lines, in the Code field, select the code you want.

6. Choose the **OK** button to verify that you want to overwrite the existing standard item journal and replace all its content.
7. Select the **Save Unit Amount** field if you want to save the values in the **Unit Amount** field of the standard item journal.
8. Select the **Save Quantity** field if you want the program to save the values in the **Quantity** field.
9. Choose the **OK** button to save the standard item journal.

When you have finished saving the standard item journal, the Item Journal page is displayed so you can proceed to post it, knowing that it can easily be recreated next time you need to post the same or similar lines.

To reuse a standard journal

1. Choose the  icon, enter **Item Journals**, and then choose the related link.
2. Choose the **Get Standard Journals** action.

The Standard Item Journals page opens showing codes and descriptions for all existing standard item journals.

3. To review a standard item journal before you select it for reuse, choose the **Show Journal** action.

Any changes you make in a standard item journal are implemented right away. They will be there next time you open or reuse the standard item journal in question. You should therefore be sure that the change is important enough to apply generally. Otherwise, make the specific change in the item journal after the standard item journal lines have been inserted. See step 4 below.

4. On the **Standard Item Journals** page, select the standard item journal you want to reuse, and then choose the **OK** button.

Now the item journal is filled with the lines you saved as the standard item journal. If journal lines already existed in the item journal, the inserted lines will be placed under the existing journal lines.

If you did not check the **Save Unit Amount** field when you used the **Save as Standard Item Journal** function job, then the **Unit Amount** field on lines that are inserted from the standard journal is automatically filled with the item's current value, copied from the **Unit Cost** field on the item card.

NOTE

If you selected the **Save Unit Amount** or **Save Quantity** fields, you should now make sure the inserted values are correct for this particular inventory adjustment before you post the item journal.

If the inserted item journal lines contain saved unit amounts that you do not want to post, you can quickly adjust it to the current value of the item as follows.

5. Select the item journal lines you want to adjust, and then choose the **Recalculate Unit Amount** action. This will update the Unit Amount field with the current unit cost of the item.
6. Choose the **post** action.

To renumber document numbers in journals

To make sure that you do not receive posting errors because of the document number order, you can use the **Renumber Document Numbers** function before you post a journal.

In all journals that are based on the general journal, the **Document No.** field is editable so that you can specify different document numbers for different journal lines or the same document number for related journal lines.

If the **No. Series** field on the journal batch is filled, then the posting function in general journals requires that the document number on individual or grouped journal lines be in sequential order. To make sure that you do not receive posting errors because of the document number order, you can use the **Renumber Document Numbers** function before you post the journal. If related journal lines were grouped by document number before you used the function, they will remain grouped but may be assigned a different document number.

This function also works on filtered views.

Any renumbering of document numbers will respect related applications, such as a payment application that has been made from the document on the journal line to a vendor account. Accordingly, the **Applies-to ID** and **Applies-to Doc. No.** fields on the affected ledger entries may be updated.

The following procedure is based on the **General Journal** page, but applies to all other journals that are based on the general journal, such as the **Payment Journal** page.

1. Choose the  icon, enter **General Journals**, and then choose the related link.
2. When you are ready to post the journal, choose the **Renumber Document Numbers** action.

Values in the **Document No.** field are changed, where required, so that the document number on individual or grouped journal lines are in sequential order. After documents are renumbered, you can proceed to post the journal.

Use Job Queues to Schedule Tasks

3/31/2019 • 7 minutes to read

Job queues in Business Central enables users to schedule and run specific reports and codeunits. You can set jobs to run one time, or on a recurring basis. For example, you might want to run the **Salesperson - Sales Statistics** report weekly, to track sales by salesperson each week, or you might want to run the **Process Service E-mail Queue** codeunit daily, to make sure pending email messages to customers regarding their service orders are sent out in a timely manner.

The **Job Queue Entries** page lists all existing jobs. If you add a new job queue entry that you want to schedule, you must specify information about the type of object you want to run, such as a report or codeunit, and the name and object ID of the object that you want to run. You can also add parameters to specify the behavior of the job queue entry. For example, you can add a parameter to only send posted sales orders. You must have permission to run the particular report or codeunit, or an error will be returned when the job queue is run.

A job queue can have many entries, which are the jobs that the queue manages and runs. Information in the entry specifies what codeunit or report is run, when and how often the entry is run, in what category the job runs, and how it runs.

To set up background posting with job queues

Job queues are an effective tool to schedule the running of business processes in the background, such as when multiple users are trying to post sales orders, but only one order can be processed at a time. Alternatively, you may want to schedule postings for hours when it is convenient for your organization. For example, it may make sense in your business to run certain routines when most of the data entry for the day has concluded.

You can achieve this by setting the job queue up to run various batch-posting reports, such as the **Batch Post Sales Orders**, **Batch Post Sales Invoices**, **Batch Post Sales Return Orders**, and **Batch Post Sales Credit Memos** reports. For more information, see [To create a job queue entry for background sales order posting](#).

Business Central supports background posting for all sales, purchasing, and service documents.

The following procedure explains how to set up background posting of sales orders. The steps are similar for purchasing and service.

1. Choose the  icon, enter **Sales & Receivables Setup**, and then choose the related link.
2. On the **Sales & Receivables Setup** page, choose the **Post with Job Queue** check box.
3. To filter to job queue entries for sales order posting, choose the **Job Queue Category Code** field, and then select the **SalesPost** category.

A job queue object, codeunit 88 **Sales Post via Job Queue**, is created. Proceed to enable it on the **Job Queue Entries** page.

4. Choose the  icon, enter **Job Queue Entries**, and then choose the related link.
5. On the **Job Queue Entries** page, choose the **New** action.
6. In the **Object Type to Run** field, select **Codeunit**.
7. In the **Object ID to Run** field, select 88, **Sales Post via Job Queue**.

No other fields are relevant for this scenario.

8. Choose the **Set Status to Ready** action.
9. To verify that the job queue is working as expected, post a sales order. For more information, see [Sell Products](#).
10. Review on the **Job Queue Log Entries** page if the sales order was posted successfully. For more information, see [To view status or errors in the job queue](#).

If you also want sales documents to be printed when they are posted, select the **Post & Print with Job Queue** check box on the **Sales & Receivables Setup** page.

IMPORTANT

If you set up a job that will post and print documents, and the printer displays a dialog box, such as a request for credentials or a warning about low printer ink, your document is posted but not printed. The corresponding job queue entry eventually times out and the **Status** field is set to **Error**. Accordingly, we recommend that you do not use a printer setup that requires interaction with the display of printer dialog boxes in conjunction with background posting.

To create a job queue entry for batch posting of sales orders

The following procedure shows how to set the **Batch Post Sales Orders** report up to automatically post released sales orders at 4 PM on week days.

1. Choose the  icon, enter **Job Queue Entries**, and then choose the related link.
2. Choose the **New** action.
3. In the **Object Type to Run** field, select **Report**.
4. In the **Object ID to Run** field, select 296, **Batch Post Sales Orders**.
5. Select the **Report Request Page** check box.
6. In the **Batch Post Sales Orders** request page, define what is included during automatic posting of sales orders, and then choose the **OK** button.
7. Select all check boxes from **Run on Mondays** through **Run on Fridays**.
8. In the **Starting Time** field, enter 4 PM.
9. Choose the **Set Status to Ready** action.

Sales orders that are ready to post will now be posted every week day at 4 PM.

NOTE

If the job queue cannot post the sales order, the status is changed to **Error** and the sales order is added to the list of sales orders that the user must handle manually. For more information, see [To view status or errors in the job queue](#).

After job queues are set up and running, the status can change as follows within each recurring period:

- **On Hold**
- **Ready**
- **In Process**
- **Error**
- **Finished**

After a job has finished successfully, it is removed from the list of job queue entries unless it is a recurring job. If it is a recurring job, the **Earliest Start Time** field is adjusted to show the next time that the job is expected to run.

To view status or errors in the job queue

Data that is generated when a job queue is run is stored in the database, so that you can troubleshoot job queue errors.

To view status for any job

1. Choose the  icon, enter **Job Queue Entries**, and then choose the related link.
2. On the **Job Queue Entries** page, select a job queue entry, and then choose the **Log Entries** action.

To view status from a sales or purchase document

1. From the document that you have tried to post with the job queue, choose the **Job Queue Status** field, which will contain **Error**.
2. Review the error message and fix the problem.

The My Job Queue Part

The **My Job Queue** part on your Role Center shows the job queues entries that you have started, but which are not yet finished. By default, the part is not visible, so you have to add it to your Role Center. For more information, see [Changing Basic Settings](#).

The part shows which documents with your ID in the **Assigned User ID** field are being processed or are queued, including those related to background posting. The part can tell you at a glance whether there has been an error in the posting of a document or if there are errors in a job queue entry. The part also lets you cancel a document posting if it is not running.

To view an error from the My Job Queue part

1. On an entry with the status **Error**, choose the **Show Error** action.
2. Review the error message and fix the problem.

Security

Job queue entries run based on permissions. Those permissions must allow the execution of the report or codeunit.

When a job queue is activated manually, it is run with the credentials of the user. When a job queue is activated as a scheduled task, it is run with the credentials of the server instance. When a job is run, it is run with the credentials of the job queue that activates it. However, the user who created that job queue entry must also have permissions. When a job is "run in user session" (such as during background posting), it is run with the credentials of the user who created that job.

IMPORTANT

If you use the SUPER permissions set that comes with Business Central, you and your users have permissions to run all objects. In this case, access for each user is only limited by permissions for data.

Using Job Queues Effectively

The job queue entry record has many fields whose purpose is to carry parameters into a codeunit that you have specified to be run with a job queue. This also means that codeunits that are to be run via the job queue must be specified with the Job Queue Entry record as a parameter in the **OnRun** trigger. This helps provide an extra level of security, as this prevents users from running random codeunits via the job queue. If the user must pass parameters to a report, the only way to do this is by wrapping the report execution into a codeunit, which then parses the input parameters and enters them into the report before executing it.

Changing Basic Settings

Letting Business Central Suggest Values

3/31/2019 • 2 minutes to read

Business Central can help you complete tasks quicker and more correctly by prefilling fields or complete lines with data that you would otherwise have to calculate and enter yourself. Although such automatic data entry is always correct, you can change it afterwards if you want to.

Functionality that enters field values for you is typically offered for tasks where you enter large volumes of transactional data and want to avoid errors and save time. This topic contains a selection of such functionality. More sections will be added in future updates of Business Central.

The **Suggest Balancing Amount** check box on the **General Journal Batches** page

When, for example, you are entering general journal lines for multiple expenses that must all be posted to the same bank account, then each time you enter a new journal line for an expense, you can have the **Amount** field on the bank account line automatically updated to the amount that balances the expenses. For more information about working with general journals, see [Working with General Journals](#).

To have the **Amount** field on balancing general journal lines filled automatically

1. Choose the  icon, enter **General Journals**, and then choose the related link.
2. On the line for your preferred general journal batch, choose the **Suggest Balancing Amount** check box.
3. Open the general journal and proceed to register and post transactions using the described functionality for automatic entry of a field value.

For information about how to set up a personal general journal batch, for example, for expense handling, see [Working with General Journals](#).

The **Automatically Fill Date Received** field on the **Payment Registration** page

The **Payment Registration** page shows outstanding incoming payments as lines that represent sales documents where an amount is due for payment. For more information about applying customer payments, see [Reconcile Customer Payments from a List of Unpaid Sales Documents](#).

Your main actions on the page are to fill in the **Payment Made** check box and the **Date Received** field. You can set Business Central up to automatically enter work date in the **Date Received** field when you select the **Payment Made** check box.

To have the **Date Received** field on the **Payment Registration** page filled automatically

1. Choose the  icon, enter **Payment Registration Setup**, and then choose the related link.
2. Select the **Automatically Fill Date Received** check box.
3. Open the **Payment Registration** page and proceed to process incoming customer payments using the described functionality for automatic entry of a field value.

Incoming Documents

3/31/2019 • 2 minutes to read

Some business transactions are not recorded in Business Central from the outset. Instead, an external business document comes into your company as an email attachment or a paper copy that you scan to file. This is typical of purchases, where such incoming document files represent payment receipts for expenses or small purchases.

From PDF or image files representing incoming documents, you can have an external OCR service (Optical Character Recognition) generate electronic documents that can then be converted to document records inside Business Central.

On the **Incoming Documents** page, you can use different functions to review expense receipts, manage OCR tasks, and convert incoming document files, manually or automatically, to the relevant documents or journal lines. The external files can be attached at any process stage, including to posted documents and to the resulting vendor, customer, and general ledger entries.

The incoming document process can consist of the following main activities:

- Record the external documents inside Business Central by creating lines on the **Incoming Documents** page in either of the following ways:
 - Manually, by using simple functions, either from a PC or from a mobile device, in one of the following ways:
 - Use the **Create from File** button, and then fill relevant fields on the **Incoming Document** page. The file is automatically attached.
 - Use the **New** button, and then fill relevant fields on the **Incoming Document** page and manually attach the related file.
 - From a tablet or phone, use the **Create from Camera** button to create a new incoming document record, and then send the image to the OCR service, for example.
 - Automatically, by receiving the document from the OCR service as an electronic document after you have emailed the related PDF or image file to the OCR service. The **Financial Information** FastTab is automatically filled on the **Incoming Document** page.
- Use the OCR service to have PDF or image files turned into electronic documents that can be converted to document records in Business Central.
- Create new documents or general journal lines for incoming document records by entering the information as you read it from incoming document files.
- Attach incoming document files to purchase and sales documents of any status, including to the vendor, customer, and general ledger entries that result from posting.
- View incoming document records and their attachments from any purchase and sales document or entry, or find all general ledger entries without incoming document records from the **Chart of Accounts** page.

Set Up Incoming Documents

3/31/2019 • 2 minutes to read

If you create general journal lines from incoming document records, you must specify on the **Incoming Documents Setup** page which journal template and batch to use.

If you do not want users to create invoices or general journal lines from incoming document records unless the documents are first approved, you must set up approvers on the **Incoming Document Approvers** page.

To turn PDF and image files into electronic documents that you can convert to, for example, purchase invoices inside Business Central, you must first set up the OCR feature and enable the service.

When the Incoming Documents feature is set up, you can use different functions to review expense receipts, manage OCR tasks, and convert incoming document files, manually or automatically, to the relevant documents or journal lines. The external files can be attached at any process stage, including to posted documents and to the resulting vendor, customer, and general ledger entries. For more information, see [Processing Incoming Documents](#).

To set up the Incoming Documents feature

1. Choose the  icon, enter **Incoming Document Setup**, and then choose the related link.
2. Fill in the fields as necessary. Hover over a field to read a short description.

To set up approvers of incoming document records

1. Choose the  icon, enter **Incoming Document Setup**, and then choose the related link.
2. On the **Incoming Documents Setup** page, choose the **Approvers** action.

The **Incoming Document Approvers** page shows all users that are set up in Business Central.

3. Select one or more users that can approve an incoming document before a related document or journal line can be created.

When approvers have been set up on the **Incoming Document Approvers** page, only those users can approve an incoming document if the **Require Approval To Create** check box on the **Incoming Documents Setup** page is selected.

NOTE

This approval setup is not related to approval workflows. For more information, see [Use Approval Workflows](#).

To set up an OCR service

1. Choose the  icon, enter **OCR Service Setup**, and then choose the related link.
2. Fill in the fields as necessary. Hover over a field to read a short description.

NOTE

Your login data is automatically encrypted.

Processing Incoming Documents

3/31/2019 • 2 minutes to read

To record an external document in Business Central, you must first create or complete an incoming document record. You can do this manually, or you can take a photo of the external document and then create the incoming document record with the image file attached.

From PDF or image files that you receive from your trading partners, you can have an external OCR service (Optical Character Recognition) generate electronic documents that can be converted to document records in Business Central. For example, when you receive an invoice in PDF format from your vendor, you can send it to the OCR service from the **Incoming Documents** page. Alternatively, you can send the file to the OCR service by email. Then, when you receive the electronic document back, a related incoming document record is created automatically. After some seconds, you receive the file back from the OCR service as an electronic invoice that can be converted to a purchase invoice for the vendor.

Create Incoming Document Records

3/31/2019 • 2 minutes to read

On the **Incoming Documents** page, you can use different functions to review expense receipts, manage OCR tasks, and convert incoming document files, manually or automatically, to the relevant documents or journal lines. The external files can be attached at any process stage, including to posted documents and to the resulting vendor, customer, and general ledger entries.

To record an external document in Business Central, you must first create or complete an incoming document record. You can do this manually, or you can take a photo of the external document and then create the incoming document record with the image file attached.

Before you can use the Incoming Documents feature, you must perform the required setup. For more information, see [Set Up Incoming Documents](#).

To approve or reject an incoming document

If you do want to allow users to create invoices or general journal lines from incoming document records unless they are approved, you can set up approvers who must approve the records before they can be processed.

1. Choose the  icon, enter **Incoming Documents**, and then choose the related link.
2. Select the line with the document that you want to approve or reject, and then choose the **Approve** or **Reject** actions.

If you approve the incoming document record, the **Released** check box on the incoming document line is selected. The user in charge of creating, for example, purchase invoices can proceed to process the record.

To create an incoming document record by taking a photo

NOTE

The following procedure only applies to the Business Central Tablet and Phone clients.

1. On the app bar, choose the **Create Incoming Document from Camera** tile, and then go to step 4.
2. Alternatively, on the app bar, choose the options button, choose **Incoming Documents**, and then choose **All**.
3. On the **Incoming Documents** page, choose the ellipsis button, and then choose **Create from Camera**. The camera on the tablet or phone is activated.
4. Take a photo of a document, such as a purchase receipt, that you want to process as an incoming document, and then choose the **OK** button.

A new incoming document record is created, with the image attached.

To attach an image to an incoming document record by taking a photo

NOTE

The following procedure only applies to the Business Central Tablet and Phone clients.

1. On the app bar, choose the options button, choose **Incoming Documents**, and then choose **All**.
2. Open the card for an existing incoming document record.
3. On the **Incoming Document** page, choose the ellipsis button, and then choose **Attach Image from Camera**. The camera on the tablet or phone is activated.
4. Take a photo of a document, such as a purchase receipt, that you want to process as an incoming document, and then choose the **OK** button.

The image is attached to the incoming document record.

To create an incoming document record manually

1. Choose the  icon, enter **Incoming Documents**, and then choose the related link.
2. Choose the **Create from File** action.
3. On the **Insert File** page, select a file, and then choose **Open**. The file is automatically attached.
4. Alternatively, choose the **New** action.
5. To attach a file, choose the **Attach File** action.
6. On the **Insert File** page, select the file that represents the incoming document in question, and then choose the **Open** button.
7. On the **Incoming Document** page, fill in the fields as necessary. Hover over a field to read a short description.

Use OCR to Turn PDF and Image Files into Electronic Documents

3/31/2019 • 9 minutes to read

From PDF or image files that you receive from your trading partners, you can have an external OCR service (Optical Character Recognition) generate electronic documents that can be converted to document records in Business Central. For example, when you receive an invoice in PDF format from your vendor, you can send it to the OCR service from the **Incoming Documents** page. This is described in the first procedure.

As an alternative to sending the file from the **Incoming Documents** page, you can send the file to the OCR service by email. Then, when you receive the electronic document back, a related incoming document record is created automatically. This is described in the second procedure.

After some seconds, you receive the file back from the OCR service as an electronic invoice that can be converted to a purchase invoice for the vendor. This is described in the third procedure.

Because OCR is based on optical recognition, it is likely that the OCR service will interpret characters in your PDF or image files wrongly when it first processes a certain vendor's documents, for example. It may not interpret the company logo as the vendor's name or it may misinterpret the total amount on a receipt because of its layout. To avoid these errors going forward, you can correct the errors in a separate version of the **Incoming Document** page. Then you send the corrections back to the OCR service to train it to interpret the specific characters correctly next time it processes a PDF or image document for the same vendor. For more information, see [To train the OCR service to avoid errors](#).

The traffic of files to and from the OCR service is processed by a dedicated job queue entry, which are created automatically when you enable the related service connection. For more information, see [Set Up Incoming Documents](#).

To send a PDF or image file to the OCR service from the **Incoming Documents** page

1. Choose the  icon, enter **Incoming Documents**, and then choose the related link.
2. Create a new incoming document record and attach the file. For more information, see [Create Incoming Document Records](#).
3. On the **Incoming Documents** page, select one or more lines, and then choose the **Send to Job Queue** action.

The value in the **OCR Status** field changes to **Ready**. The attached PDF or image file is sent to the OCR service by the job queue according to the schedule, provided that no errors exist.

4. Alternatively, on the **Incoming Documents** page, select one or more lines, and then choose the **Send to OCR Service** action.

The value in the **OCR Status** field changes to **Sent**, provided that no errors exist.

To send a PDF or image file to the OCR service by email

From your email application, you can send an email to the OCR service provider with the PDF or image file attached. For information about the email address to send to, see the OCR service provider's web site.

Because no incoming document record exists for the file, a new record will be created automatically on the **Incoming Documents** page when you receive the resulting electronic document from the OCR service. For more information, see [Create Incoming Document Records](#).

NOTE

If you work on a tablet or phone, you can send the file to the OCR service as soon as you have taken a photo of the document, or you can create an incoming document directly. For more information, see [To create an incoming document record by taking a photo](#).

To receive the resulting electronic document from the OCR service.

The electronic document that is created by the OCR service from the PDF or image file is automatically received into the **Incoming Documents** page by the job queue entry that is set up when you enable the OCR service.

If you are not using a job queue, or you want to receive a finished OCR document sooner than per the job queue schedule, you can choose the **Receive from OCR Service** button. This will get any documents that are completed by the OCR service.

NOTE

If the OCR service is set up to require manual verification of processed documents, then the **OCR Status** field will contain **Awaiting Verification**. In that case, perform the following steps to log in to the OCR service website to manually verify an OCR document.

1. In the **OCR Status** field, choose the **Awaiting Verification** hyperlink.
2. On the OCR service website, log in using the credentials of your OCR service account. These are the credentials you also used when setting up the service. For more information, see [To set up an OCR service](#).

Information for the OCR document is displayed, showing both the source content of the PDF or image file and the resulting OCR field values.
3. Review the various field values and manually edit or enter values in fields that the OCR service has tagged as uncertain.
4. Choose the **OK** button. The OCR process is completed and the resulting electronic document is sent to the **Incoming Documents** page in Business Central, according to the job queue schedule.
5. Repeat step 4 for any other OCR document to be verified.

Now you can proceed to create document records for the received electronic documents in Business Central, manually or automatically. For more information, see the next procedure. You can also connect the new incoming document record to existing posted or non-posted document so that the source file is easy to access from Business Central. For more information, see [Process Incoming Documents](#).

To create a purchase invoice from an electronic document received from the OCR service

The following procedure describes how to create a purchase invoice record from a vendor invoice received as an electronic document from the OCR service. The procedure is the same when you create, for example, a general journal line from an expense receipt or a sales return order from a customer.

NOTE

The **Description** and **No.** fields on the created document lines will only be filled if you have first mapped text found on the OCR document to the two fields in Business Central. You can do this mapping as item cross-references, for document lines of type Item. For more information, see [Use Item Cross References](#). You can also use the Text-to-Account Mapping function. For more information, see [To map text on an incoming document to a specific vendor, G/L, or bank account](#).

1. Select the line for the incoming document, and then choose the **Create Document** action.

A purchase invoice will be created in Business Central based on the information in the electronic vendor document that you received from the OCR service. Information will be inserted in the new purchase invoice based on the mapping that you have defined as a cross-reference or as text-to-account mapping.

Any validation errors, typically related to wrong or missing master data in Business Central, will be shown on the **Errors and Warnings** FastTab. For more information, see [To handle errors when receiving electronic documents](#).

To map text on an incoming document to a specific vendor account

For incoming documents, you typically use the **Map Text to Account** action to define that a certain text on a vendor invoice received from the OCR service is mapped to a certain vendor account. Going forward, any part of the incoming document description that exists as a mapping text means that the **No.** field on resulting document or journal lines of type G/L Account are filled with the vendor in question.

In addition to mapping to a vendor account or G/L accounts, you can also map to a bank account. This is practical, for example, for electronic documents for expenses that are already paid where you want to create a general journal line that is ready to post to a bank account.

1. Select the relevant incoming document line, and then choose the **Map Text to Account** action. The **Text-to-Account Mapping** page opens.
2. In the **Mapping Text** field, enter any text that occurs on vendor invoices that you want to create purchase documents or journal lines for. You can enter up to 50 characters.
3. In the **Vendor No.** field, enter the vendor that the resulting purchase document or journal line will be created for.
4. In the **Debit Acc. No.** field, enter the debit-type G/L account that will be inserted on resulting purchase document or journal line of type G/L Account.
5. In the **Credit Acc. No.** field, enter the credit-type G/L account that will be inserted on resulting purchase document or journal line of type G/L Account.

NOTE

Do not use the **Bal. Source Type** and **Bal. Source No.** fields in connection with incoming documents. They are used for automatic payment reconciliation only. For more information, see [Map Text on Recurring Payments to Accounts for Automatic Reconciliation](#).

6. Repeat steps 2 through 5 for all text on incoming documents that you want to automatically create documents for.

To handle errors when receiving electronic documents

1. On the **Incoming Documents** page, select the line for an electronic document received from the OCR service with errors. This is indicated by the Error value in the **OCR Status** field.
2. Choose the **Edit** action to open the **Incoming Document** page.

3. On the **Errors and Warnings** FastTab, select the message, and then choose the **Open Related Record** action.
4. The page that contains the wrong or missing data, such as a vendor card with a missing field value, opens.
5. Correct the error or errors as described in each error message.
6. Proceed to process the incoming electronic document by choosing the **Create Manually** action again.
7. Repeat steps 5 and 6 for any remaining errors until the electronic document can be received successfully.

To train the OCR service to avoid errors

Because OCR is based on optical recognition, it is likely that the OCR service will interpret characters in your PDF or image files wrongly when it first processes documents from a certain vendor, for example. It may not interpret the company logo as the vendor's name or it may misinterpret the total amount on an expense receipt because of its layout. To avoid such errors going forward, you can correct data received by the OCR service and then send the feedback to the service.

The **OCR Data Correction** page, which you open from the **Incoming Document** page, shows the fields from the **Financial Information** FastTab in two columns, one with the OCR data editable and one with the OCR data read-only. When you choose the **Send OCR Feedback** button, the content of the **OCR Data Correction** page is sent to the OCR service. Next time the service processes PDF or image files that contain the data in question, your corrections will be incorporated to avoid the same errors.

1. Choose the  icon, enter **Incoming Documents**, and then choose the related link.
2. Open an incoming document record that contains data received from OCR service, which you want to correct.
3. On the **Incoming Document** page, choose the **Correct OCR Data** action.
4. On the **OCR Data Correction** page, overwrite the data in the editable column for each field that has an incorrect value.
5. To undo corrections that you have made since you opened the **OCR Data Correction** page, choose the **Reset OCR Data** action.
6. To send the corrections to the OCR service, choose the **Send OCR Feedback** action.
7. To save the corrections, close the **OCR Data Correction** page.

The fields on the **Financial Information** FastTab on the **Incoming Document** page are updated with any new values that you entered in step 4.

Create Incoming Document Records Directly from Documents and Entries

3/31/2019 • 2 minutes to read

You can store external business documents in Business Central by attaching the document files to the related incoming document records. If the document, such as a purchase invoice, did not start its existence as an incoming document record, you can still create and connect an incoming document record to it later. You can also attach incoming document files to posted purchase and sales documents and to vendor, customer, and general ledger entries by using the **Incoming Document Files** FactBox in, for example, the **Posted Purchase Invoices** and **Vendor Ledger Entries** pages.

From the **Chart of Accounts** and **General Ledger Entries** pages, you can use a search function to find general ledger entries for posted purchase and sales documents that do not have incoming document records and then centrally link to existing records or create new ones with attached document files. For more information, see [Find Posted Documents without Incoming Document Records](#).

The following procedures show how to attach a file to an existing purchase invoice that was not created from an incoming document record and how to attach a file to a vendor ledger entry. Attaching a file to posted purchase or sales documents works in a similar way.

To create and connect an incoming document record from a purchase invoice

1. Choose the  icon, enter **Purchase Invoices**, and then choose the related link.
2. Select the line for a purchase invoice that you want to attach a file to, and then choose the **Create Incoming Document from File** action.
3. Alternatively, select the line for a purchase invoice that you want to attach a file to, and then choose the **Attach File** action.
4. On the **Insert File** page, select the file that represents the incoming document in question, and then choose the **Open** button.

To create and connect an incoming document record from a vendor ledger entry

1. Choose the  icon, enter **Vendor Ledger Entries**, and then choose the related link.
2. Select a line for a vendor ledger entry that you want to attach a file to, and then choose the **Create Incoming Document from File** action.
3. Alternatively, select a line for a vendor ledger entry that you want to attach a file to, and then choose the **Attach File** action.
4. On the **Insert File** page, select the file that represents the incoming document in question, and then choose the **Open** button.

To remove a connection from an incoming document record to a posted document

You can remove file attachments from non-posted documents at any time by deleting the related incoming document record. If the document is posted, then you must first remove the connection from the incoming

document record.

1. Choose the  icon, enter **Incoming Documents**, and then choose the related link.
2. Select the line for an incoming document record connected to a posted document that you want to remove, and then choose the **Remove Reference to Record** action.

The connection to the posted document is removed. You can now proceed to connect another incoming document record to the posted document as described in this topic.

Find Posted Documents without Incoming Document Records

3/31/2019 • 2 minutes to read

From the **Chart of Accounts** and **General Ledger Entries** pages, you can use a search function to find general ledger entries for posted purchase and sales documents that do not have incoming document records and then centrally link to existing records or create new ones with attached document files.

To find posted documents without incoming document records

1. Choose the  icon, enter **Chart of Accounts**, and then choose the related link.
2. Select a line for a G/L account for whose general ledger entries you want to see posted purchase and sales documents without incoming document records, and then choose the **Posted Documents without Incoming Document** action.
3. Alternatively, choose the **Ledger Entries** action.
4. On the **General Ledger Entries** page, choose the **Posted Documents without Incoming Documents** action.

The **Posted Documents without Incoming Document** page opens showing posted purchase and sales documents without incoming document records represented by general ledger entries on the G/L account that you opened the page for. The page can show a maximum of 1000 lines. By default, the **Date Filter** field therefore contains a filter that limits the lines to entries with posting dates from the beginning of the accounting period to the work date.

To connect found documents to existing incoming document records

1. On the **Posted Documents without Incoming Document** page, select the line for a posted document that you want to connect to an existing incoming document record, and then choose the **Select Incoming Document** action.
2. On the **Incoming Documents** page, select the incoming document record that you want to connect to posted document found, and then choose the **OK** button.
3. On the **Posted Documents without Incoming Document** page, the selected incoming document record is now connected to the posted document, as you can see in the **Incoming Document Files** FactBox.

If a relevant incoming document record does not exist on the **Incoming Documents** page, then you can create it. For more information, see [Create Incoming Document Records](#).

Manage Many Incoming Document Records

3/31/2019 • 2 minutes to read

As you create or process incoming document records, the number of lines on the **Incoming Documents** page may grow to an extent where you lose overview. Therefore, you can set incoming document records to Processed to remove them from the default view. When you choose the **Show All** action, you can view both processed and unprocessed records.

NOTE

You cannot edit information, attach files, or perform other processes on incoming document records that are set to Processed. You must first set it to Unprocessed.

The **Processed** check box is automatically selected on incoming document records that have been processed, but you can also select or deselect the check box manually. Depending on your business process, an incoming document record may be processed when a related document has been created for it or a file has been attached.

NOTE

When you open the **Incoming Documents** page with the **My Incoming Documents** action on the Role Center, only unprocessed incoming document records are shown by default. This is referred to in this topic as "the default view".

To remove incoming document records from the default view

1. On the **Incoming Documents** page, select one or more lines for incoming document records that you want to remove from the default view.
2. Choose the **Set to Processed** action.

The incoming document records are removed from the default view, and the **Processed** check box is selected on the lines.

NOTE

You can also perform this action for the individual record on the **Incoming Document Card** page.

To view all incoming document records

1. On the **Incoming Documents** page, choose the **Show All** action.

All incoming document records are displayed, including those where the **Processed** check box is not selected.

To add incoming document records to the default view

1. On the **Incoming Documents** page, choose the **Show All** action.
2. Select one or more lines for incoming document records that you want to appear in the default view.
3. Choose the **Set to Unprocessed** action.

NOTE

You can also perform this action for the individual record on the **Incoming Document Card** page.

Workflow

3/31/2019 • 2 minutes to read

You can set up and use workflows that connect business-process tasks performed by different users. System tasks, such as automatic posting, can be included as steps in workflows, preceded or followed by user tasks. Requesting and granting approval to create new records are typical workflow steps.

On the **Workflow** page, you create a workflow by listing the involved steps on the lines. Each step consists of a workflow event, moderated by event conditions, and a workflow response, moderated by response options. You define workflow steps by filling fields on workflow lines from fixed lists of event and response values representing scenarios that are supported by the application code.

The generic version of Business Central includes a number of preconfigured workflows represented by workflow templates that you can copy to create workflows. The code for workflow templates that are added by Microsoft are prefixed with "MS-". For more information, see the list of workflow templates in the [Workflow Templates](#) page.

If a business scenario requires a workflow event or response that is not supported, a Microsoft partner must implement them by customizing the application code. For more information, see [Walkthrough: Implementing New Workflow Events and Responses](#) in the developer and IT-pro help.

NOTE

In addition to the Workflow functionality within Business Central, you can integrate to Microsoft Flow to define workflows for events in Business Central. Note that although they are two separate workflow systems, any Flow template that you create with Microsoft Flow is added to the list of workflow templates within Business Central. For more information, see [Using Business Central in an Automated Workflow](#).

The following table describes a sequence of tasks, with links to the topics that describe them.

TO	SEE
Set up workflow users, specify how users get notified, and create new workflows. For new workflows for unsupported scenarios, implement the required workflow elements by customizing the application code.	Setting Up Workflows

Setting Up Workflows

3/31/2019 • 2 minutes to read

You can set up and use workflows that connect business-process tasks performed by different users. System tasks, such as automatic posting, can be included as steps in workflows, preceded or followed by user tasks. Requesting and granting approval to create new records are typical workflow steps. For more information, see [Using Workflows](#).

Before you begin to use workflows, you must set up workflow users and approval users, specify how users receive notifications about workflow steps, and then create the workflows, potentially preceded by code customization.

On the **Workflow** page, you create a workflow by listing the involved steps on the lines. Each step consists of a workflow event, moderated by event conditions, and a workflow response, moderated by response options. You define workflow steps by filling fields on workflow lines from fixed lists of event and response values representing scenarios that are supported by the application code.

If a business scenario requires a workflow event or response that is not supported, a Microsoft partner must implement them by customizing the application code. For more information, see [Walkthrough: Implementing New Workflow Events and Responses](#) in the developer and IT-pro help.

The following table describes a sequence of tasks, with links to the topics that describe them.

TO	SEE
Set up workflow users and user groups.	Set Up Workflow Users
Set up workflow users who take part in approval workflows.	Set Up Approval Users
Specify how workflow users are notified of workflow steps, including approval requests.	Setting Up Workflow Notifications
Specify if users are notified by email or note and how often notifications are sent.	Specify When and How to Receive Notifications
Customize the content of the email notification by modifying report 1320, Notification Email.	Create and Modify a Custom Report or Document Layout

Set Up Workflow Users

3/31/2019 • 2 minutes to read

Before you can create workflows, you must set up the users who take part in workflows. This is necessary, for example, to specify who will receive a notification to act on a workflow step.

On the **Workflow User Group** page, you set up users under workflow user groups, and you specify the users' number in a process sequence, such as an approver chain.

Workflow users that function as approval users, both approval requesters and approvers, must also be set up on the **Approval User Setup** page. For more information, see [Set Up Approval Users](#).

NOTE

To define that an approval request is not approved until multiple approvers in an approval chain have approved it, set up approvers in a hierarchy. For approver type **Approver**, set approvers up on the **Approval User Setup** page. For approver type, **Workflow User Group**, set approvers up on the **Workflow User Groups** page and define the hierarchy by assigning incremental numbers to each approver in the **Sequence No.** field. For more information, see [Set Up Approval Users](#) and this topic.

To define that an approval request is not approved until multiple equal approvers have approved it, regardless of a hierarchy, set up a flat workflow user group. For approver type, **Workflow User Group**, set up approvers on the **Workflow User Groups** page and assign the same number to each approver in the **Sequence No.** field. For more information, see this topic.

To set up a workflow user

1. Choose the  icon, enter **Workflow User Groups**, and then choose the related link.
2. Choose the **New** action. The **Workflow User Group** page opens.
3. In the **Code** field, enter a maximum of 20 characters to identify the workflow.
4. In the **Description** field, describe the workflow.
5. On the **Workflow User Group Members** FastTab, fill the fields on the first line as described in the following table.

FIELD	DESCRIPTION
User Name	Specify the user who will take part in workflows. The user must exist on the User Setup page. For more information, see Managing Users and Permissions .
Sequence No.	Specify the order in which the workflow user engages in a workflow relative to other users. This field can be used, for example, to specify when the user approves relative to other approvers when you use the Workflow User Group option in the Approver Type field on the related workflow response. TIP: To define that an approval request is not approved until multiple equal approvers have approved it, irrespective of a hierarchy, set up a flat workflow user group by assigning the same sequence number to the relevant approvers.

6. Repeat step 5 to add more workflow users to the user group.
7. Repeat steps 2 through 6 to add more workflow user groups.

[Walkthrough: Setting Up and Using a Purchase Approval Workflow Workflow](#)

Set Up Approval Users

3/31/2019 • 3 minutes to read

Before you can create workflows that involve approval steps, you must set up the workflow users who are involved in approval processes. On the **Approval User Setup** page, you also set amount limits for specific types of requests and define substitute approvers to whom approval requests are delegated when the original approver is absent.

NOTE

Approval users, both approval requesters and approvers, must first be set up as workflow users on the **Workflow User Group** page. For more information, see [Set Up Workflow Users](#).

When you have set up approval users, you can use the setup to create workflow responses for approval workflows. For more information, see step 9 in [Create Workflows](#).

NOTE

To define that an approval request is not approved until multiple approvers in an approval chain have approved it, set up approvers in a hierarchy. For approver type **Approver**, set approvers up on the **Approval User Setup** page. For approver type, **Workflow User Group**, set approvers up on the **Workflow User Groups** page and define the hierarchy by assigning incremental numbers to each approver in the **Sequence No.** field. For more information, see this topic and [Set Up Workflow Users](#).

To define that an approval request is not approved until multiple equal approvers have approved it, regardless of a hierarchy, set up a flat workflow user group. For approver type, **Workflow User Group**, set up approvers on the **Workflow User Groups** page and assign the same number to each approver in the **Sequence No.** field. For more information, see [Set Up Workflow Users](#).

To set up an approval user

1. Choose the  icon, enter **Approval User Setup**, and then choose the related link.
2. Create a new line on the **Approval User Setup** page, and then fill the fields as described in the following table.

FIELD	DESCRIPTION
User ID	Select the user ID of the user who is involved in the approval process.
Salespers./Purch. Code	Specify the salesperson or purchaser code that applies to the user in the Salespers./Purch. Code field. You typically fill the Salespers./Purch. Code field if the salesperson or purchaser who is responsible for the customer or vendor is also the person who must approve the sales or purchase request in question.
Approver ID	Select the user ID of the user who must approve requests made by the user in the User ID field.

FIELD	DESCRIPTION
Sales Amount Approval Limit	Specify the maximum sales amount in LCY that the user in the User ID field can approve.
Unlimited Sales Approval	Specify that the user in the User ID field can approve all sales requests regardless of their amount. If you select this check box, then you cannot fill the Sales Amount Approval Limit field.
Purchase Amount Approval Limit	Specify the maximum purchase amount in LCY that the user in the User ID field can approve.
Unlimited Purchase Approval	Specify that the user in the User ID field can approve all purchase requests regardless of their amount. If you select this check box, then you cannot fill the Sales Amount Approval Limit field.
Request Amount Approval Limit	Specify the maximum amount in LCY that the user in the User ID field can approve for purchase quotes. To use this field, you must select the Approver Chain option in the Approver Limit Type field on the Workflow Response page.
Unlimited Request Approval	Specify that the user in the User ID field can approve all purchase quotes regardless of their amount. If you select this check box, then you cannot fill the Request Amount Approval Limit field.
Substitute	Select the user ID of the user who must approve requests made by the user in the User ID field if the user in the Approver ID is not available. Note: The substitute can either be the user in the Substitute field, the direct approver, or the approval administrator, in that order of priority. For more information, see Use Approval Workflows .
Email	Specify the email address of the user in the User ID field.
Approval Administrator	Specify the user who has rights to unblock approval workflows, for example, by delegating approval requests to new substitute approvers and deleting overdue approval requests.

NOTE

The behavior of **Approver Limit Type** field only applies to application areas where limits can be defined, namely sales and purchase approvals. Any other type of approval where limits do not apply will always behave as described for the **Direct Approver** option.

- To test the approval user setup, choose the **Approval User Setup Test** action.
- Repeat steps 2 and 3 for every user who you want to set up as an approval user.

[Setting Up Workflows](#)

[Walkthrough: Setting Up and Using a Purchase Approval Workflow
Workflow](#)

Setting Up Workflow Notifications

3/31/2019 • 2 minutes to read

Many workflow responses are about notifying a user that an event has occurred that they must act on. For example, on one workflow step, the event can be that User 1 requests approval of a new record, and the response is that a notification is sent to User 2, the approver. On the next workflow step, the event can be that User 2 approves the record, and the response is that a notification is sent to User 3 to start a related processing of the approved record. For workflow steps that are about approval, each notification is tied to an approval entry. For more information, see [Workflow](#).

NOTE

The generic version of Business Central supports notifications as email and as internal notes.

IMPORTANT

All workflow notifications are sent through a job queue. Make sure that the job queue in your installation is set up to handle workflow notifications, and that the **Start Automatically From Server** check box is selected. For more information, see [Use Job Queues to Schedule Tasks](#).

You set up different aspects of workflow notifications in the following places:

1. For approval workflows, you set up the recipients of workflow notifications by filling a line on the **Approval User Setup** page for each user that takes part in the workflow. For example, if User 2 is specified in the **Approver ID** field on the line for User 1, then the approval request notification is sent to User 1. For more information, see [Set Up Approval Users](#).
2. You set up when and how users receive workflow notifications by filling the **Notification Schedule** page for each workflow user. For more information, see [Specify When and How to Receive Notifications](#).
3. If you want, you can customize the content of the email notification by modifying report 1320, Notification Email. For more information, see [Create and Modify a Custom Report or Document Layout](#).
4. You set up specific content and rules of a workflow notification when you create the workflow in question. You do this by selecting options on the **Workflow Response Options** page for the workflow response that represents the notification. For more information, see step 9 in [Create Workflows](#).

[Set up Email](#)

[Walkthrough: Setting Up and Using a Purchase Approval Workflow](#)

Specify When and How to Receive Notifications

3/31/2019 • 3 minutes to read

When you set up users in approval workflows, you must specify in the **Notification Setup** and **Notification Schedule** pages how and when each user receives notifications about approval workflow steps. Individual users can also change their notification setup by choosing the **Change Notification Settings** button on any notification.

Before you can set up an approval user's notification preferences, you must set the user up as an approval user. For more information, [Set Up Approval Users](#).

You can define the layout of email notifications by customizing Report 1320, Notification Email. For more information, see [Create and Modify a Custom Report or Document Layout](#).

Many approval workflow steps are about notifying users that an event has occurred that they must act on. For example, on one workflow step, the event can be that User 1 requests approval of a new record. The related response is that a notification is sent to User 2, the approver. On the next workflow step, the event can be that User 2 approves the record. The related response is that a notification is sent to User 3 to start a process with the approved record. For workflow steps that are about approval, each notification is tied to an approval entry. For more information, see [Workflow](#).

Specify when and how users receive notifications

1. Choose the  icon, enter **Approval User Setup**, and then choose the related link.
2. Select the line for the user that you want to set up notification preferences for, and then choose the **Notification Setup** action.
3. On the **Notification Setup** page, fill the fields as described in the following table.

FIELD	DESCRIPTION
Notification Type	Specify what type of event the notification is about. Select one of the following options: <ul style="list-style-type: none">- New Record specifies that the notification is about a new record, such as a document, that the user must act on.- Approval specifies that the notification is about one or more approval requests.- Overdue specifies that the notification is to remind users that they are late in acting on an event.
Notification Method	Specify if the notification is an email or an internal note.

You can define the layout of email notifications by customizing Report 1320, Notification Email. For more information, see [Create and Modify a Custom Report or Document Layout](#).

You have now specified how the user receives notifications. Proceed to specify when the user receives notifications.

4. Choose the **Notification Schedule** action.

5. On the **Notification Schedule** page, fill the fields as described in the following table.

FIELD	DESCRIPTION
Recurrence	Specify the recurrence pattern in which the user receives notifications.
Time	Specify what time of the day the user receives notifications when the value in the Recurrence field is different from Instantly .
Daily Frequency	Specify on which type of days the user receives notifications when the value in the Recurrence field is Daily . Select Weekday to receive notifications every work day of the week. Select Daily to receive notifications every day of the week, including weekends.
Monday through Sunday	Specify on which days the user receives notifications when the value in the Recurrence field is Weekly .
Date of Month	Specify if the user receives notifications on the first, last, or a specific date of the month.
Monthly Notification Date	Specify the date of the month on which the user receives notifications when the value in the Date of Month field is Custom .

Change when and how you receive notifications

1. On one of the notifications that you have received, either as email or note, choose the **Change Notification Settings** button.
2. On the **Notification Setup** page, change your notification preferences as described in the previous procedure.

Create and Modify a Custom Report or Document Layout

3/31/2019 • 5 minutes to read

By default, a report will have a built-in report layout, which can be either an RDLC report layout or Word report layout, or both. You cannot modify built-in layouts. However, you can create your own custom layouts that enable you to change the appearance of report when it is viewed, printed or saved. You can create multiple custom report layouts for the same report, and then switch the layout that is used by a report as needed.

NOTE

In Business Central, the term "report" also covers externally-facing documents, such as sales invoices and order confirmations that you send to customers as PDF files.

To create a custom layout, you can either make a copy of an existing custom layout or add a new custom layout, which in most cases is based on a built-in layout. When you add a new custom layout, you can choose to add an RDLC report layout type, Word report layout type, or both. The new custom layout will automatically be based on the built-in layout for the report if one is available. If there is no built-in layout for the type, then a new blank layout is created, which you will have to modify and design from scratch. For more information about RDLC and Word report layouts, built-in and custom layouts, and more, see [Manage Report Layouts](#).

To create a custom layout

1. Choose the  icon, enter **Report Layout Selection**, and then choose the related link.

The **Report Layout Selection** page lists all the reports that are available in the company that is specified in the **Company** field at the top of the page.

2. Set the **Company** field to the company in which you want to create the report layout.
3. Select the row for the report that you want to create the layout for, and then choose the **Custom Layouts** action.

The **Custom Report Layouts** page appears and lists all the custom layouts that are available for the selected report.

4. If you want to create a copy of an existing custom layout, select the existing custom layout in the list, and then choose the **Copy** action.

The copy of the custom layout appears on the **Custom Report Layouts** page and has the words *Copy of* in the **Description** field.

5. If you want to add a new custom layout that is based on a built-in layout, do the following:

- a. Choose the **New** action. The **Insert Built-in Layout for a Report** page appears. The **ID** and **Name** fields are automatically filled in.
- b. To add a custom Word report layout type, then select the **Insert Word Layout** check box.
- c. To add a custom RDLC report layout type, then select the **Insert RDLC Layout** check box.
- d. Choose the **OK** button.

The new custom layouts appear on the **Custom Report Layouts** page. If a new layout is based on a built-in layout, then it has the words **Copy of a Built-in Layout** in the **Description** field. If there was no built-in layout for the report, then the new layout has the words **New Layout** in the **Description**

field, which indicates that custom layout is blank.

6. By default, the **Company Name** field is blank, which means that the custom layout will be available for the report in all companies. To make the custom layout available in a specific company only, choose **Edit**, and then set the **Company Name** field to the company that you want.

The custom layout has been created. You can now modify the custom layout as needed.

Modifying a custom layout

To modify a report layout, you must first export the report layout as a file to a location on your computer or network, and then open the exported document and make the changes. When you are finished making the changes, you import the report layout.

To modify a custom layout

1. You export a custom layout from the **Custom Report Layouts** page. If this page is not already open, search for and open the **Report Layout Selection** page, select the report that has the layout that you want to modify, and then choose the **Custom Layouts** action.
2. On the **Custom Report Layouts** page, select the layout that you want to modify, choose the **Export Layout** action, and then choose **Save** or **Save As** to save the report layout document to a location on your computer or network.
3. Open the report layout document that you just saved, and then make changes.

If you are changing a Word layout, open the layout document in Word. For editing details, see the next section [Making Changes to the Report Layout](#).

RDLC report layouts are more advanced than Word report layouts. For more information about modifying an RDLC report layout, see [Designing RDLC Report Layouts](#).

Remember to save you changes when done.

4. Return to the **Custom Report Layouts** page, select the report layout that you exported and modified, and then choose the **Import Layout** action.
5. In the **Import** dialog box, select **Choose** to find and select the report layout document, and then choose **Open**.

Making changes to a Word report layout

To can make general formatting and layout changes, such as changing text font, adding and modifying a table, or removing a data field, just use the basic editing features of Word, like you do with any Word document.

If you are designing a Word report layout from scratch or adding new data fields, then start by adding a table that includes rows and columns that will eventually hold the data fields.

TIP

Show the table gridlines so that you see the boundaries of table cells. Remember to hide the gridlines when you are done editing. To show or hide table gridlines, select the table, and then under **Layout** on the **Table** tab, choose **View Gridlines**.

Embedding Fonts in Word Layouts for Consistency

To ensure that reports always display and print with the intended fonts, regardless of where users open or print the reports, you can embed the fonts in the Word document. However, be aware that embedding fonts can significantly increase the size of the Word files. For more information about embedding fonts in Word, see

[Embed fonts in Word, PowerPoint, or Excel.](#)

Removing Label and Data Fields in Word Layouts

Label and data fields of a report are contained in content controls in Word. The following figure illustrates a content control when it is selected in the Word document.

The name of the label or data field name displays in the content control. In the example, the field name is CompanyAddr1.

To remove a label or data field

1. Right-click the field that you want to delete, and then choose **Remove Content Control**.

The content control is removed, but the field name remains as text.

2. Delete the remaining text as needed.

Adding data fields

Adding data fields from a report dataset is a more advanced and requires some knowledge of the report dataset. For information about adding fields for data, labels, data, and images, see [Add Fields to a Word Report Layout](#).

Set Up Email Manually or Using the Assisted Setup

3/31/2019 • 2 minutes to read

To send and receive emails from within Business Central, you must fill in the fields on the **SMTP Mail Setup** page.

NOTE

Instead of entering the SMTP server details, you can use a function to enter them with information from your Office 365 subscription.

You can either set email up manually or you can get help by using the **Email Setup** assisted setup guide. For more information, see [Getting Ready for Doing Business](#).

To set up email

1. Choose the  icon, enter **SMTP Email Setup**, and then choose the related link.
2. Fill in the fields as necessary. Hover over a field to read a short description.
3. Alternatively, choose the **Apply Office 365 Server Settings** action to insert any information that is already defined for your Office 365 subscription.
4. When all the fields are correctly filled in, choose the **Test Email Setup** action.
5. When the test succeeds, close the page.

Create Workflows

3/31/2019 • 6 minutes to read

You can create workflows that connect business-process tasks performed by different users. System tasks, such as automatic posting, can be included as steps in workflows, preceded or followed by user tasks. Requesting and granting approval to create new records are typical workflow steps.

On the **Workflow** page, you create a workflow by listing the involved steps on the lines. Each step consists of a workflow event moderated by event conditions and a workflow response with response options. You define workflow steps by filling fields on workflow lines from fixed lists of event and response values representing scenarios that are supported by the application code.

When you create workflows, you can copy the steps from existing workflows or from workflow templates. Workflow templates represent non-editable workflows that exist in the generic version of Business Central. The code for workflow templates that are added by Microsoft are prefixed with "MS-", such as in "MS-PIW". For more information, see [Create Workflows from Workflow Templates](#).

If your business scenario requires workflow events or responses that are not supported, a Microsoft partner must implement them by customizing the application code.

NOTE

All notifications about workflow steps are sent through a job queue. Make sure that the job queue in your installation is set up to handle workflow notifications, and that the **Start Automatically From NAS** check box is selected. For more information, see [Use Job Queues to Schedule Tasks](#).

To create a workflow

1. Choose the  icon, enter **Workflows**, and then choose the related link.
2. Choose the **New** action. The **Workflow** page opens.
3. In the **Code** field, enter a maximum of 20 characters to identify the workflow.
4. To create the workflow from a workflow template, on the **Workflows** page, choose the **Create Workflow from Template** action. For more information, see [Create Workflows from Workflow Templates](#).
5. In the **Description** field, describe the workflow.
6. In the **Category** field, specify which category the workflow belongs to.
7. In the **When Event** field, specify the event that must occur to start the workflow step.

When you choose the field, the **Workflow Events** page opens where you select from all the workflow events that exist.

8. In the **Condition** field, specify one or more conditions that must be met before the event in the **When Event** field can occur.

When you choose the field, the **Event Conditions** page opens where you choose from a list of filter fields that are relevant as conditions for the event in question. You can add new filter fields that you want to use as event conditions. You set event condition filters just as you set filters on report request pages.

If the workflow event is the change of a specific field on a record, then the **Event Conditions** page opens with options to select the field and the type of change.

- a. To specify a field change for the event, on the **Event Conditions** page, in the **Field** field, select the field that changes.
 - b. In the **Operator** field, select either **Decreased**, **Increased**, or **Changed**.
9. In the **Then Response** field, specify the response that will follow when the workflow event occurs.

When you choose the field, the **Workflow Responses** page opens where you select from all workflow responses that exist and set response options for the selected response.

10. On the **Options for the Selected Response** FastTab, specify options for the workflow response, by selecting values in the different fields that appear, as follows:
- a. To specify options for a workflow response that involves sending a notification, fill the fields as described in the following table.

FIELD	DESCRIPTION
Recipient User ID	Specify the user who the notification must be sent to. Note: This option is only available for workflow responses with a placeholder for a specific user. For workflow responses without placeholders for users, the notification recipient is typically defined by the approval user setup.
Link Target Page	Specify another page in Business Central that the link in the notification opens instead of the default page.
Custom Link	Specify the URL of a link that is added to the notification in addition to the link to page in Business Central.

- b. To specify options for a workflow response that involves creating an approval request, fill the fields as described in the following table.

FIELD	DESCRIPTION
Due Date Formula	Specify in how many days the approval request must be resolved from the date when it was sent.
Delegate After	Specify if and when an approval request will automatically be delegated to the relevant substitute. You can select to automatically delegate one, two, or five days after the date when the approval was requested.

FIELD	DESCRIPTION
Approver Type	<p>Specify who the approver is, according to the setup of approval users and workflow users.</p> <p>The following options exist:</p> <ul style="list-style-type: none"> - Salesperson/Purchaser specifies that the user who is set up in the Salespers./Purch. Code field on the Approval User Setup page determines the approver. Approval request entries are then created according to the value in the Approver Limit Type field. <p>For more information, see Set Up Approval Users.</p>
Show Confirmation Message	Specify if a confirmation message is shown to users after they request an approval.
Approver Limit Type	<p>Specify how approvers' approval limits affect when approval request entries are created for them. A qualified approver is an approver whose approval limit is above the value on the request being made.</p> <p>The following options exist:</p> <ol style="list-style-type: none"> 1. Approver Chain specifies that approval request entries are created for all the requester's approvers up to and including the first qualified approver. 2. Direct Approver specifies that an approval request entry is only created for the requester's immediate approver, regardless of the approver's approval limit. 3. First Qualified Approver specifies that an approval request entry is only created for the requester's first qualified approver.

- c. To specify options for a workflow response that involves creating journal lines, fill the fields as described in the following table.

FIELD	DESCRIPTION
General Journal Template Name	Specify the name of the general journal template that the specified journal lines are created in.
General Journal Batch Name	Specify the name of the general journal batch that the specified journal lines are created in.

11. Choose the **Increase Indent** and **Decrease Indent** buttons to indent the event name in the **When** field to define the step's position in the workflow.
- Indicate that the step is the next in the workflow sequence by indenting the event name under the event name of the previous step.
 - Indicate that the step is one of more alternative steps that may start depending on its condition by placing the event name at the same indentation as the other alternative steps. Order such optional steps according to priority by placing the most important step first.

NOTE

You can only change the indent of a step that does not have a subsequent step.

12. Repeat steps 7 through 11 to add more workflow steps, either before or after the step that you have just created.
13. Select the **Enabled** check box to specify that the workflow will start as soon as the event on the first step of type **Entry Point** occurs. For more information, see [Using Workflows](#).

NOTE

Do not enable a workflow until you are sure that the workflow is completed and that the involved workflow steps can start.

TIP

To see relations between tables that are used in workflows, Choose the  icon, and then enter **Workflow – Table Relations**.

Create Workflows from Workflow Templates

3/31/2019 • 2 minutes to read

To save time when creating new workflows, you can create workflows from workflow templates.

Workflow templates are non-editable workflows that exist in the generic version of Business Central. The codes for workflow templates that are added by Microsoft are prefixed with "MS-".

Another way to quickly create a workflow is to import an existing workflow that you have on a file outside of Business Central. For more information, see [Export and Import Workflows](#).

On the **Workflow** page, you create a workflow by listing the involved steps on the lines. Each step consists of a workflow event, moderated by event conditions, and a workflow response, moderated by response options. You define workflow steps by filling fields on workflow lines from fixed lists of event and response values representing scenarios that are supported by the application code. For more information, see [Create Workflows](#).

To create a workflow from workflow template

1. Choose the  icon, enter **Workflows**, and then choose the related link.
2. Choose the **Create Workflow from Template** action. The **Workflow Templates** page opens.
3. Select a workflow template, and then choose the **OK** button.

The **Workflow** page opens for a new workflow containing all the information of the selected template. The value in the **Code** field is extended with, for example, "-01" to indicate that this is the first workflow that is created from the workflow template.

4. Proceed to create the workflow by editing the workflow steps or add new steps. For more information, see [Create Workflows](#).

Export and Import Workflows

3/31/2019 • 2 minutes to read

To transfer workflows to other Business Central databases, for example to save time when creating new workflows, you can export and import workflows.

Another way to quickly create workflows is to create workflows from workflow templates. For more information, see [Create Workflows from Workflow Templates](#).

On the **Workflow** page, you create a workflow by listing the involved steps on the lines. Each step consists of a workflow event, moderated by event conditions, and a workflow response, moderated by response options. You define workflow steps by filling fields on workflow lines from fixed lists of event and response values representing scenarios that are supported by the application code. For more information, see [Create Workflows](#).

To export a workflow

1. Choose the  icon, enter **Workflows**, and then choose the related link.
2. Select a workflow, and then choose the **Export to File** action.
3. On the **Export File** page, choose the **Save** button.
4. On the **Export** page, select a file location, and then choose the **Save** button.

To import a workflow

1. Choose the  icon, enter **Workflows**, and then choose the related link.
2. Choose the **Import from File** action.
3. On the **Import** page, choose the XML file that contains the workflow, and then choose the **Open** button.

Caution

If the workflow code already exists in the database, the workflow steps will be overwritten with the steps in the imported workflow.

Walkthrough: Setting Up and Using a Purchase Approval Workflow

3/31/2019 • 6 minutes to read

You can automate the process of approving new or changed records, such as documents, journal lines, and customer cards, by creating workflows with steps for the approvals in question. Before you create approval workflows, you must set up an approver and substitute approver for each approval user. You can also set approvers' amount limits to define which sales and purchase records they are qualified to approve. Approval requests and other notifications can be sent as email or internal note. For each approval user setup, you can also set up when they receive notifications.

NOTE

In addition to the Workflow functionality within Business Central, you can integrate to Microsoft Flow to define workflows for events in Business Central. Note that although they are two separate workflow systems, any Flow template that you create with Microsoft Flow is added to the list of workflow templates within Business Central. For more information, see [Using Business Central in an Automated Workflow](#).

You can set up and use workflows that connect business-process tasks performed by different users. System tasks, such as automatic posting, can be included as steps in workflows, preceded or followed by user tasks. Requesting and granting approval to create new records are typical workflow steps. For more information, see [Workflow](#).

About This Walkthrough

This walkthrough illustrates the following tasks:

- Setting up approval users.
- Setting up notifications for approval users.
- Modifying and enabling an approval workflow.
- Requesting approval of a purchase order, as Alicia.
- Receiving a notification and then approving the request, as Sean.

Prerequisites

To complete this walkthrough, you will need the CRONUS International Ltd. demonstration company.

Story

Sean is a super user at CRONUS. He creates two approval users. One is Alicia who represents a purchasing agent. The other is himself representing Alicia's approver. Sean then gives himself unlimited purchase approval rights and specifies that he will receive notifications by internal note as soon as a relevant event occurs. Last, Sean creates the required approval workflow as a copy of the existing Purchase Order Approval Workflow workflow template, leaves all existing event conditions and response options unchanged, and then enables the workflow.

To test the approval workflow, Sean first logs into Business Central as Alicia, and then requests approval of a purchase order. Sean then logs in as himself, sees the note on his Role Center, follows the link to the approval request for the purchase order, and approves the request.

Setting Up Sample Data

Before you can set up approval users and their notification method, you must make sure that two users exist in Business Central: One user will represent Alicia. The other user, yourself, will represent Sean. For more information, see [Managing Users and Permissions](#).

Setting Up Approval Users

When logged in as yourself, set Alicia up as an approval user whose approver is yourself. Set up your approval rights and specify how and when you are notified of approval requests.

To set up yourself and Alicia as approval users

1. Choose the  icon, enter **Approval User Setup**, and then choose the related link.
2. On the **Approval User Setup** page, choose the **New** action.

NOTE

You must set up an approver before you can set up users who require that approver's approval. Therefore, you must set up yourself before you set up Alicia.

3. Set up the two approval users by filling the fields as described in the following table.

USER ID	APPROVER ID	UNLIMITED PURCHASE APPROVAL
YOU		Selected
ALICIA	YOU	

Setting Up Notifications

In this walkthrough, the user is notified by internal note about requests to approve. Approval notification can also be by email. For more information, see [Specify When and How to Receive Notifications](#).

To set up how and when you are notified

1. On the **Approval User Setup** page, select the line for yourself, and then choose the **Notification Setup** action.
2. On the **Notification Setup** page, in the **Notification Type** field, choose **Approval**.
3. In the **Notification Method** field, choose **Note**.
4. On the **Notification Setup** page, choose the **Notification Schedule** action.
5. On the **Notification Schedule** page, in the **Occurrence** field, select **Instantly**.
6. Choose the **OK** button.

Creating the Approval Workflow

Create the purchase order approval workflow by copying the steps from the Purchase Order Approval Workflow workflow template. Leave the existing workflow steps unchanged, and then enable the workflow.

To create and enable a purchase order approval workflow

1. Choose the  icon, enter **Workflows**, and then choose the related link.
2. On the **Workflows** page, choose the **Create Workflow from Template** action.
3. On the **Workflow Templates** page, select the workflow template named Purchase Order Approval Workflow, and then choose the **OK** button.

The **Workflow** page opens for a new workflow containing all the information of the selected template. The value in the **Code** field is extended with "-01" to indicate that this is the first workflow that is created from

the Purchase Order Approval Workflow workflow template.

4. On the header of the **Workflow** page, select the **Enabled** check box.

Using the Approval Workflow

Use the new Purchase Order Approval Workflow workflow by first logging into Business Central as Alicia to request approval of a purchase order. Then log in as yourself, view the note on the Role Center, follow the link to the approval request, and then approve the request.

To request approval of a purchase order, as Alicia

1. Log in as Alicia.
2. Choose the  icon, enter **Purchase Orders**, and then choose the related link.
3. Select the line for open purchase order 104001, and then choose the **Edit** action.
4. On the **Purchase Order** page, choose the **Send Approval Request** action.

Notice that the value in the **Status** field has changed to **Pending Approval**.

To approve the purchase order, as Sean

1. Log in as Sean.
2. On the Role Center, on the **My Notifications** page, look for a new note from Alicia.
3. When the note appears on the **My Notifications** page, choose the **Approval Entry: XX, XX** value in the **Page** field. The **Requests to Approve** page opens with Alicia's request for the purchase order highlighted.
4. On the **Requests to Approve** page, choose the **Approve** action.

The value in the **Status** field on Alicia's purchase order changes to **Released**.

You have now set up and tested a simple approval workflow based on the first two steps of the Purchase Order Approval Workflow workflow. You can easily extend this workflow to automatically post Alicia's purchase order when Sean approves it. To do this, you must enable the Purchase Invoice Workflow workflow, in which the response to a released purchase invoice is to post it. First you must change the event condition on the first workflow step from (purchase) **Invoice** to **Order**.

The generic version of Business Central includes a number of workflow templates for scenarios that are supported by the application code. Most of these are for approval workflows.

You define variations of workflows by filling fields on workflow lines from fixed lists of event and response values representing scenarios that are supported by the application code. For more information, see [Create Workflows](#).

If a business scenario requires a workflow event or response that is not supported, a Microsoft partner must implement them by customizing the application code. For more information, see [Walkthrough: Implementing New Workflow Events and Responses](#) in the developer and IT-pro help.

Using Workflows

3/31/2019 • 2 minutes to read

You can set up and use workflows that connect business-process tasks performed by different users. System tasks, such as automatic posting, can be included as steps in workflows, preceded or followed by user tasks. Requesting and granting approval to create new records are typical workflow steps.

Before you can begin to use workflows, you must set up workflow users, create the workflows, potentially preceded by code customization and specify how users receive notifications. For more information, see [Setting Up Workflows](#).

NOTE

Typical workflow steps are about users who request approval of tasks and approvers accepting or rejecting approval requests. Therefore, many topics about how to use workflows refer to approvals.

The following table describes a sequence of tasks, with links to the topics that describe them.

TO	SEE
Set a workflow to start when the first entry-point event occurs.	Enable Workflows
Request approval of a task, as an approver, accept, decline, or delegate approvals, and send or view approval notifications.	Use Approval Workflows
Create workflow steps that restrict a certain record type from being used before a certain event occurs, for example that the record is approved.	Restrict and Allow Usage of a Record
View workflow step instances of status Completed.	View Archived Workflow Step Instances
Delete a workflow that you are sure will no longer be used.	Delete Workflows

Enable Workflows

3/31/2019 • 2 minutes to read

When you have created a workflow and you are sure that it is ready to start, you must enable the workflow.

On the **Workflow** page, you create a workflow by listing the involved steps on the lines. Each step consists of a workflow event, moderated by event conditions, and a workflow response, moderated by response options. You define workflow steps by filling fields on workflow lines from fixed lists of event and response values representing scenarios that are supported by the application code. For more information, see [Create Workflows](#).

To enable a workflow

1. Choose the  icon, enter **Workflows**, and then choose the related link.
2. Open the workflow that you want to enable.
3. On the **Workflow** page, select the **Enabled** check box.

[Walkthrough: Setting Up and Using a Purchase Approval Workflow Workflow](#)

Use Approval Workflows

3/31/2019 • 4 minutes to read

When a record, such as a purchase document or a customer card, needs to be approved by someone in your organization, you send an approval request as part of a workflow. Based on how the workflow is set up, the appropriate approver is then notified that the record requires their approval.

You set up approval workflows on the **Workflow** page. For more information, see [Setting Up Workflows](#).

In addition to approval workflows described in this topic, you can perform various other workflow tasks. For more information, [Using Workflows](#).

Core approval workflows for purchases documents, sales documents, payment journals, customer cards, and item cards are ready to start as guides. For more information, see [Getting Started](#).

To request approval of a record

The following task is performed by an approval user.

1. on the page that presents the record, choose the **Send Approval Request** action.
2. To see all your approval requests, choose the  icon, enter **Approval Request Entries**, and then choose the related link.

The status of the approval entry is updated from **Created** to **Open**. The status of the record, for example a purchase invoice, is updated from **Open** to **Pending Approval** and remains locked for processing until all approvers have approved the record.

When the approver has approved the record, the status changes to **Released**. You can then continue your tasks with the record.

To cancel requests for approval

The following task is performed by an approval user with approver rights.

A customer may want to change an order after it has been submitted for approval. In this case, you can cancel the approval process and make the necessary changes to the order before you request approval again.

- on the page that displays the record, choose the **Cancel Approval Request** action.

When the approval request has been canceled, the status of the related approval entry is changed to **Canceled**. The status of the record is updated from **Pending Approval** to **Open**. The approval process can then start again.

To approve or reject requests for approval

The following task is performed by an approval user with approver rights.

You can process approval requests on the **Requests to Approve** page, for example to approve multiple requests at a time. Alternatively, you can process each request on the related record, such as the **Purchase Invoice** page, by choosing the link in the notification that you receive.

1. Choose the  icon, enter **Requests to Approve**, and then choose the related link.
2. Select one or more lines for the record or records that you want to approve or reject.
3. Choose the **Approve**, **Reject**, or **Delegate** actions.

When a record has been approved or rejected, the approval status in the **Status** field changes to **Approved** or **Rejected**.

If an approver hierarchy is set up, the record status will be **Pending Approval** until all approvers have approved the record. Then the record status will change to **Released**.

At the same time, the approval status changes from **Created** to **Open** as soon as an approval request for the record is created. If the request is rejected, the approval status changes to **Rejected**. The status remains **Open** or **Rejected** until all approvers have approved the request.

To delegate requests for approval

The following task is performed by an approval user with approver rights.

To prevent documents from piling up or otherwise block the workflow, the approver and the approval administrator can delegate an approval request to a substitute approver. The substitute can either be a designated substitute, the direct approver, or the approval administrator, in that order of priority. You typically use this feature if an approver is out of office and is unable to approve requests before the due date.

1. Choose the  icon, enter **Requests to Approve**, and then choose the related link.
2. Select one or more lines for the approval requests that you want to delegate to a substitute approver, and then choose the **Delegate** action.

A notification to approve the request is sent to the substitute approver.

To manage overdue approval requests

The following task is performed by an approval user with approver rights.

At regular intervals, you must remind approval workflow users of overdue approval requests that they must react on. You use the **Send Overdue Approval Notifications** function for this.

The **Send Overdue Approval Notifications** function checks for all open approval requests that are currently overdue. Each approver that has at least one overdue approval entry receives a notification with the list of all their overdue approval requests. The notification is also sent to their approver and all the requesters of the overdue approvals. This helps if the overdue approval entry must be delegated to a substitute.

1. Choose the  icon, enter **Overdue Approval Requests**, and then choose the related link.
2. On the **Overdue Approval Requests** page, choose the **Send Overdue Approval Notifications** action.

[Working with Business Central](#)

Restrict and Allow Usage of a Record

3/31/2019 • 2 minutes to read

If you want to restrict a record from being used in certain activities, for example, until the record has been approved, you can incorporate two workflow responses in a workflow that controls the usage of the record. One workflow response will restrict usage of the record as defined by the workflow event and conditions. Another workflow response will allow usage of the record as defined by the workflow event and conditions. Two responses exist in the generic version of Business Central for this purpose: **Restrict usage of a record.** and **Allow usage of a record.**

NOTE

The generic version of Business Central offers support for restricting a record from being posted, from being exported as a payment, and from being printed as a check. To support other restrictions, a Microsoft partner must customize the application code.

NOTE

The workflow functionality to restrict and allow records from being used is not related to the functionality to block item, customer, and vendor records from being posted.

The following procedure describes how to restrict purchase orders from being posted until they have been approved. The new workflow will be based on the existing Purchase Invoice Approval Workflow workflow template.

To create a workflow step that restricts posting of unapproved purchase orders

1. Choose the  icon, enter **Workflows**, and then choose the related link.
2. On the **Workflows** page, create a new workflow named Purchase Order Approval Workflow. For more information, see [Create Workflows](#).
3. Choose the **Copy From Workflow Template** action.
4. Choose the **Source Workflow Code** field, and then, on the **Workflow Templates** page, choose the Purchase Invoice Approval Workflow workflow template.

Notice that the first two workflow steps are about restricting and then allowing usage of purchase invoices. Proceed to change the event condition on the first step of the new workflow to specify that it applies to purchase orders.

5. On the **Workflow Steps** FastTab, choose the **Event Conditions** field, and then, for the **Document Type** filter, select **Order**.
6. Proceed to edit, delete, or add other workflow steps to fit a business process that begins by restricting unapproved purchase orders from being posted.

View Archived Workflow Step Instances

3/31/2019 • 2 minutes to read

All completed workflow step instances are saved on the **Archived Workflow Step Instances** page.

On the **Workflow** page, you create a workflow by listing the involved steps on the lines. Each step consists of a workflow event, moderated by event conditions, and a workflow response, moderated by response options. You define workflow steps by filling fields on workflow lines from fixed lists of event and response values representing scenarios that are supported by the application code. For more information, see [Create Workflows](#).

To view archived workflow step instances

1. Choose the  icon, enter **Workflows**, and then choose the related link.
2. Open the workflow for which you want to view all archived workflow step instances.
3. On the **Workflow** page, choose the **Archived Workflow Step Instances** action.

The **Archived Workflow Step Instances** page opens showing the archived workflow step instances of the selected workflow.

4. Alternatively, Choose the  icon, enter **Archived Workflow Step Instances**, and then choose the related link.

The **Archived Workflow Step Instances** page opens showing all archived workflow step instances. In the **Workflow Code** field, you can see which workflow the archived workflow step instance belonged to.

Exchanging Data Electronically

3/31/2019 • 5 minutes to read

You can use the Data Exchange Framework to exchange business documents, bank files, currency exchange rates, and any other data files with your business partners.

Electronic Documents

As an alternative to emailing as file attachments, you can send and receive business documents electronically. By electronic document is meant a standard-compliant file representing a business document, such as an invoice from a vendor that you can receive and convert to a purchase invoice in Business Central . The exchange of electronic documents between two trading partners is performed by an external provider of document exchange services. The generic version of Business Central supports sending and receiving electronic invoices and credit memos in the PEPPOL format, which is supported by the largest providers of document exchange services. A major provider of document exchange services is preconfigured and ready to be set up for your company. To provide support for other electronic document formats, you must create new data exchange definitions using the Data Exchange Framework.

From PDF or image files representing incoming documents, you can have an external OCR service (Optical Character Recognition) create electronic documents that you can then convert to document records in Business Central, like for electronic PEPPOL documents. For example, when you receive an invoice in PDF format from your vendor, you can send it to the OCR service from the **Incoming Documents** page. After a few seconds, you receive the file back as an electronic invoice that can be converted to a purchase invoice for the vendor. If you send the file to the OCR service by email, then a new incoming document record is automatically created when you receive the electronic document back.

To send, for example, a sales invoice as an electronic PEPPOL document, you select the **Electronic Document** option in the **Post and Send** dialog box. From here, you can also set up the customer's default document sending profile. First, you must set up various master data, such as company information, customers, items, and units of measure. These are used to identify the business partners and items when you convert data in fields in Business Central to elements in the outgoing document file. The data conversion and sending of the PEPPOL sales invoice are performed by dedicated codeunits and XMLports, represented by the **PEPPOL** electronic document format.

To receive, for example, an invoice from a vendor as an electronic PEPPOL document, you process the document on the **Incoming Documents** page to convert it to a purchase invoice in Business Central. You can either set up the Job Queue feature to process such files regularly or you can start the process manually. First, you must set up various master data, such as company information, vendors, items, and units of measure. These are used to identify the business partners and items when you convert data in elements in the incoming document file to fields in Business Central. The receiving and data conversion of PEPPOL invoices are performed by the Data Exchange Framework, represented by the **PEPPOL - Invoice** data exchange definition.

To receive, for example, an invoice as an electronic OCR document, you process it as when you receive an electronic PEPPOL document. The receiving and conversion of electronic documents from OCR are performed by the Data Exchange Framework, represented by the **OCR - Invoice** data exchange definition.

Bank Files

The formats of files for exchange of bank data with ERP systems vary depending on the supplier of the file and on the country/region. The generic version of Business Central supports import and export of SEPA bank files (Single Euro Payments Area) and a bank data conversion service provided by external provider, AMC Consult.

To provide support for other electronic document formats, you use the Data Exchange Framework.

To export SEPA credit transfers, you choose **Export Payments to File** button on the **Payment Journal** page and then upload the file to process the payments in your bank. First you must set up various master data, such as bank account, vendors, and payment methods. The data conversion and export of SEPA bank data is performed by a dedicated codeunit and XMLport, represented by the **SEPA Credit Transfer** bank export/import setup. Alternatively, you can set up the bank data conversion service to perform the export, represented by the **Bank Data Conversion Service - Credit Transfer** data exchange definition.

To export SEPA direct debit instructions, you choose the **Export Direct Debit File** button on the **Direct Debit Collections** page and then send to your bank to automatically collect the involved customer payments. First you must set up bank accounts, customers, direct-debit mandates, and payment methods. The data conversion and export of SEPA bank data is performed by dedicated a codeunit and XMLport, represented by the **SEPA Direct Debit** bank export/import setup.

To import SEPA bank statements, you choose the Import Bank Statement button in the **Payment Reconciliation Journal** and **Bank Acc. Reconciliation** pages and then you proceed to apply each bank statement entry to payments or bank ledger entries, manually or automatically. First you must set up bank accounts. The import and data conversion of SEPA bank data is performed by the Data Exchange Framework, represented by the **SEPA CAMT** data exchange definition. Alternatively, you can set up the bank data conversion service to perform the import, represented by the **Bank Data Conversion Service – Bank Statement** data exchange definition.

In addition, the local versions of Business Central support various other file formats for import/export of bank data, payroll transactions, and other data. For more information, see the "Local Functionality" Help section in your country version of Business Central .

Currency Exchange Rates

You can set up an external service to keep your for currency exchange rates up to date. The service that provides updated currency exchange rates is enabled by a data exchange definition. Accordingly, the **Exch. Rate Update Setup Card** page is a condensed view of the **Data Exchange Definition** page for the data exchange definition in question.

For all exchanges of data in XML files, you can prepare the data exchange setup by loading the related XML schema file on the **XML Schema Viewer** page. Here you select the data elements that you want to exchange with Business Central and then you either initialize a data exchange definition or generate an XMLport.

The following table describes a sequence of tasks, with links to the topics that describe them.

TO	SEE
Learn how the Data Exchange Framework works.	About the Data Exchange Framework
Prepare to exchange data in a file by reusing the file's XML schema. Set up data exchange definitions. Set up master data for electronic document sending. Set up various bank import/export fields.	Setting Up Data Exchange
Based on data exchange definitions, send PEPPOL invoices, receive PEPPOL invoices, import bank statements, and export bank payment files.	Exchanging Data

General Business Functionality

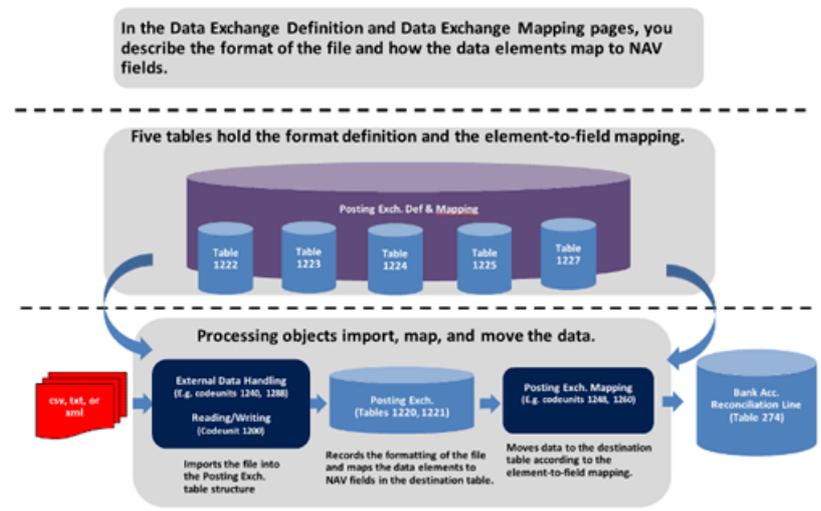

About the Data Exchange Framework in Business Central

3/31/2019 • 2 minutes to read

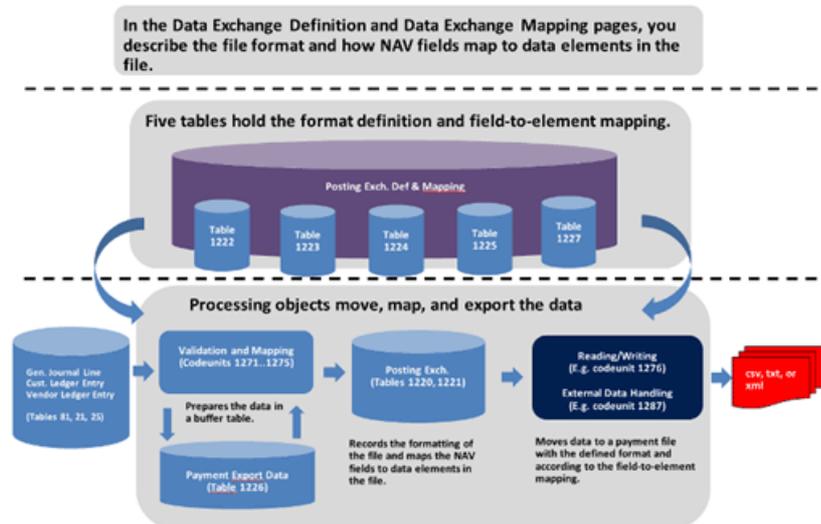

The format of files for exchange of data in bank files, electronic documents, currency exchange rates, and other with ERP systems vary depending on the provider of the data file or stream and on the country/region. Business Central supports various bank file formats and data service standards. To provide support for other electronic document formats, you use the data exchange framework. For more information, see [Exchanging Data Electronically](#).

The following diagrams show the architecture of the data exchange framework.

Architecture of the Data Exchange Framework - Import

Architecture of the Data Exchange Framework - Export

Setting Up Data Exchange

3/31/2019 • 2 minutes to read

Before you can send and receive electronic documents or import and export bank files, you must set up the data exchange framework to process the involved files. In addition, you must set up related areas, such as master data for customers that you send electronic invoices to or the bank data conversion service in case you use the external service provider to convert your bank files. For more information, see [Exchanging Data Electronically](#).

When Business Central is set up to exchange data with external files, users can use the setup in common business tasks, such as sending and receiving electronic documents and importing and exporting bank files.

The following table describes a sequence of tasks, with links to the topics that describe them.

TO	SEE
Set up the preconfigured document exchange service to enable sending and receiving electronic documents from and to Business Central.	Set Up a Document Exchange Service
Set up the preconfigured OCR service to turn PDF or image files into electronic documents that can be converted to document records in Business Central	Set Up Incoming Documents
Set up one of two preconfigured services for updated exchange rates to get the latest currency exchange rates into the Currencies page.	Update Currency Exchange Rates
Set up various master data, such as company information, customers, vendors, items, and units of measure, related to mapping data in Business Central	Set Up Electronic Document Sending and Receiving
Set up a bank account, a vendor, and a payment journal for SEPA credit transfer.	Set Up SEPA Credit Transfer
Prepare bank account formats, payment methods, and customer agreements for SEPA direct debit.	Set Up SEPA Direct Debit
Set up user authentication and the URL of the bank data conversion service provider that is required to have bank files converted to your bank's format.	Set Up the Bank Data Conversion Service
Set up and enable an external service that enables you to import bank statements directly as bank feeds.	Set Up the Bank Statement Service
After the Bank Statement service is enabled, link bank accounts in Business Central	Set Up Bank Accounts
Prepare to set up a new data exchange definition for a data file or stream by using the file's XML schema to prefill the Column Definitions FastTab on the Posting Exchange Definition page.	Use XML Schemas to Prepare Data Exchange Definitions

TO	SEE
Set up the Data Exchange Framework to enable users to receive a new purchase document format, send a new sales document format, import a new bank file, or other data exchange.	Set Up Data Exchange Definitions

Set Up a Document Exchange Service

3/31/2019 • 2 minutes to read

You use an external service provider to exchange electronic documents with your trading partners. For more information, see [Exchanging Data Electronically](#).

To set up a document exchange service

1. Choose the  icon, enter **Doc. Exch. Service Setup**, and then choose the related link.
2. Fill the fields as described in the following table.

FIELD	DESCRIPTION
User Agent	Enter any text that can be used to identify your company in document exchange processes.
Doc. Exch. Tenant ID	Enter the tenant in the document exchange service that represents your company. This is provided by the document exchange service provider.
Enabled	Specify if the service is enabled. Note: As soon as you enable the service, at least two job queue entries are created to process the traffic of electronic documents in and out of Business Central. When you disable the service, the job queue entries are deleted.
Signup URL	Specify the web page where you sign up for the document exchange service.
Service URL	Specify the address of the document exchange service, which will be called when you send and receive electronic documents.
Login URL	Specify the logon page for the document exchange service, which is where you enter your company's user name and password to log on to the service.
Consumer Key	Enter the 3-legged OAuth key for the consumer key. This is provided by the document exchange service provider.
Consumer Secret	Enter the secret that protects the consumer key. This is provided by the document exchange service provider.
Token	Enter the 3-legged OAuth key for the token. This is provided by the document exchange service provider.
Token Secret	Enter the secret that protects the token. This is provided by the document exchange service provider.

NOTE

You login data is automatically encrypted.

Set Up Incoming Documents

3/31/2019 • 2 minutes to read

If you create general journal lines from incoming document records, you must specify on the **Incoming Documents Setup** page which journal template and batch to use.

If you do not want users to create invoices or general journal lines from incoming document records unless the documents are first approved, you must set up approvers on the **Incoming Document Approvers** page.

To turn PDF and image files into electronic documents that you can convert to, for example, purchase invoices inside Business Central, you must first set up the OCR feature and enable the service.

When the Incoming Documents feature is set up, you can use different functions to review expense receipts, manage OCR tasks, and convert incoming document files, manually or automatically, to the relevant documents or journal lines. The external files can be attached at any process stage, including to posted documents and to the resulting vendor, customer, and general ledger entries. For more information, see [Processing Incoming Documents](#).

To set up the Incoming Documents feature

1. Choose the  icon, enter **Incoming Document Setup**, and then choose the related link.
2. Fill in the fields as necessary. Hover over a field to read a short description.

To set up approvers of incoming document records

1. Choose the  icon, enter **Incoming Document Setup**, and then choose the related link.
2. On the **Incoming Documents Setup** page, choose the **Approvers** action.

The **Incoming Document Approvers** page shows all users that are set up in Business Central.

3. Select one or more users that can approve an incoming document before a related document or journal line can be created.

When approvers have been set up on the **Incoming Document Approvers** page, only those users can approve an incoming document if the **Require Approval To Create** check box on the **Incoming Documents Setup** page is selected.

NOTE

This approval setup is not related to approval workflows. For more information, see [Use Approval Workflows](#).

To set up an OCR service

1. Choose the  icon, enter **OCR Service Setup**, and then choose the related link.
2. Fill in the fields as necessary. Hover over a field to read a short description.

NOTE

Your login data is automatically encrypted.

Update Currency Exchange Rates

6/6/2019 • 4 minutes to read

As companies operate in increasingly more countries/regions, it becomes more important that they be able to trade and report financials in more than one currency. You must set up a code for each currency you use if you buy or sell in currencies other than your local currency, have receivables or payables in other currencies, or record G/L transactions in different currencies.

Your general ledger is set up to use your local currency (LCY), but you can set it up to also use another currency with a current exchange rate assigned. By designating a second currency as a so-called additional reporting currency, Business Central will automatically record amounts in both LCY and this additional reporting currency on each G/L entry and other entries, such as VAT entries. For more information, see [Set Up an Additional Reporting Currency](#).

Adjusting Exchange Rates

Because exchange rates fluctuate constantly, additional currency equivalents in your system must be adjusted periodically. If these adjustments are not done, amounts that have been converted from foreign (or additional) currencies and posted to the general ledger in LCY may be misleading. In addition, daily entries posted before a daily exchange rate is entered into the program must be updated after the daily exchange rate information is entered.

The **Adjust Exchange Rates** batch job is used to manually adjust the exchange rates of posted customer, vendor and bank account entries. It can also update additional reporting currency amounts on G/L entries. You can also have the exchange rates adjusted automatically by using a service. For more information, see [To set up a currency exchange rate service](#).

Effect on Customers and Vendors

For customer and vendor accounts, the batch job adjusts the currency by using the exchange rate that is valid on the posting date that is specified in the batch job. The batch job calculates the differences for the individual currency balances and posts the amounts to the general ledger account that is specified in the **Unrealized Gains Acc.** field or the **Unrealized Losses Acc.** field on the **Currencies** page. Balancing entries are automatically posted to the receivables/payables account in the general ledger.

The batch job processes all open customer ledger entries and vendor ledger entries. If there is an exchange rate difference for an entry, the batch job creates a new detailed customer or vendor ledger entry which reflects the adjusted amount on the customer or vendor ledger entry.

Dimensions on Customer and Vendor Ledger Entries

The adjustment entries are assigned the dimensions from the customer/vendor ledger entries, and the adjustments are posted per combination of dimension values.

Effect on Bank Accounts

For bank accounts, the batch job adjusts the currency by using the exchange rate that is valid on the posting date specified in the batch job. The batch job calculates the differences for each bank account that has a currency code and posts the amounts to the general ledger account that is specified in the **Realized Gains Acc.** field or the **Realized Losses Acc.** field on the **Currencies** page. Balancing entries are automatically posted to the general ledger bank accounts that are specified in the bank account posting groups. The batch job calculates one entry per currency per posting group.

Dimensions on Bank Account Entries

The adjustment entries for the bank account's general ledger account and for the gain/loss account are assigned the

bank account's default dimensions.

Effect on G/L Accounts

If you post in an additional reporting currency, you can have the batch job create new general ledger entries for currency adjustments between LCY and the additional reporting currency. The batch job calculates the differences for each general ledger entry and adjusts the general ledger entry depending on the contents of the **Exchange Rate Adjustment** field for each general ledger account.

Dimensions on G/L Account Entries

The adjustment entries are assigned the default dimensions from the accounts they are posted to.

IMPORTANT

Before you can use the batch job, you must enter the adjustment exchange rates that are used to adjust the foreign currency balances. You do so on the **Currency Exchange Rates** page.

To set up a currency exchange rate service

You can use an external service to keep your currency exchange rates up to date, such as FloatRates.

1. Choose the  icon, enter **Currency Exchange Rate Services**, and then choose the related link.
2. Choose the **New** action.
3. On the **Currency Exchange Rate Service** page, fill in the fields as necessary. Hover over a field to read a short description.
4. Choose the **Enabled** check box to enable the service.

To update currency exchange rates through a service

1. Choose the  icon, enter **Currencies**, and then choose the related link.
2. Choose the **Update Exchange Rates** action.

The value in the **Exchange Rate** field on the **Currencies** page is updated with the latest currency exchange rate.

Set Up Electronic Document Sending and Receiving

3/31/2019 • 10 minutes to read

As an alternative to emailing as file attachments, you can send and receive business documents electronically. By electronic document is meant a standard-compliant file representing a business document, such as an invoice from a vendor that can be received and converted to a purchase invoice in Business Central. The exchange of electronic documents between two trading partners is performed by an external provider of document exchange services. The generic version of Business Central supports sending and receiving electronic invoices and credit memos in the PEPPOL format, which is supported by the largest providers of document exchange services. A major provider of document exchange services is preconfigured and ready to be set up for your company.

From PDF or image files representing incoming documents, you can have an external OCR service (Optical Character Recognition) create electronic documents that you can then convert to document records in Business Central, like for electronic PEPPOL documents. For example, when you receive an invoice in PDF format from your vendor, you can send it to the OCR service from the **Incoming Documents** page. After a few seconds, you receive the file back as an electronic invoice that can be converted to a purchase invoice for the vendor. If you send the file to the OCR service by email, then a new incoming document record is automatically created when you receive the electronic document back.

The **PEPPOL** electronic document format is preconfigured to enable you to send electronic invoices and credit memos in the PEPPOL format. First, you must set up various master data, such as company information, customers, items, and units of measure. These are used to identify the business partners and items when converting data in fields in Business Central to elements in the outgoing document file. Last, you must select the format on the **Electronic Document Format** page for each customer who you will send electronic PEPPOL documents to. For more information, see [Send Electronic Documents](#).

The **PEPPOL – Invoice** and **PEPPOL – Credit Memo** data exchange definitions are preconfigured to enable you to receive electronic invoices and credit memos in the PEPPOL format. First, you must set up various master data, such as company information, vendors, items, and units of measure. These are used to identify the business partners and items when converting data in elements in the incoming document file to fields in Business Central. Last, you must select the data exchange definition on the **Incoming Documents** page for each incoming electronic document that you want to convert to a purchase document in Business Central.

The **OCR – Invoice** data exchange definition is preconfigured to enable you to receive electronic documents that are generated by the OCR service. To receive, for example, an invoice as an electronic OCR document, you set up master data and then process the document just as when receiving an electronic PEPPOL document. For more information, see [Use OCR to Turn PDF and Image Files into Electronic Documents](#).

The preconfigured services for document exchange and OCR must be enabled before you send or receive. For more information, see [Set Up a Document Exchange Service](#).

The topic contains the following procedures:

- To set up the company for electronic document sending and receiving
- To set up VAT posting for electronic document sending and receiving
- To set up countries/regions for electronic document sending and receiving
- To set up items for electronic document sending and receiving
- To set up units of measure for electronic document sending and receiving
- To set up customers for electronic document sending
- To select the **PEPPOL** electronic document format for electronic document sending
- To set up vendors for electronic document receiving

- To select the **PEPPOL – Invoice** data exchange definition for electronic document receiving
- To set up the G/L account to use on new purchase invoice lines for non-identifiable items and non-items

To set up the company for electronic document sending and receiving

1. In the **Search** box, enter **Company Information**, and then choose the related link.
2. On the **General** FastTab, fill the fields as described in the following table.

FIELD	DESCRIPTION
GLN	Identify your company. For example, when you send electronic invoices in the PEPPOL format, the value in this field is used to populate the EndPointID element under the AccountingSupplierParty node in the file. The number is based on the GS1 standard, which is compliant with ISO 6523.
VAT Registration No.	Specify your company's VAT registration number.
Responsibility Center	If your company is set up with a responsibility center, make sure that the Country/Region Code field is filled.

To set up VAT posting for electronic document sending and receiving

1. In the **Search** box, enter **VAT Posting Setup**, and then choose the related link.
2. For each VAT posting setup line that you will use for electronic documents, fill the field as described in the following table.

FIELD	DESCRIPTION
Tax Category	Specify the VAT category. For example, when you send electronic invoices in the PEPPOL format, the value in this field is used to populate the TaxApplied element under the AccountingSupplierParty node in the file. The number is based on the UNCL5305 standard.

To set up countries/regions for electronic document sending and receiving

1. In the **Search** box, enter **Country/Regions**, and then choose the related link.
2. For each country/region that you will exchange electronic documents with, fill the field as described in the following table.

FIELD	DESCRIPTION
-------	-------------

FIELD	DESCRIPTION
VAT Scheme	<p>Identify the national body that issues the VAT registration number for the country/region in connection with electronic document sending.</p> <p>For example, when you send electronic invoices in the PEPPOL format, the value in this field is used to populate the SchemeID attribute for the EndPointID element under both the AccountingSupplierParty node and the AccountingCustomerParty in the file.</p> <p>The VAT Scheme field is only used if the GLN field on the Company Information page is not filled. Note: The value in the Code field on the Countries/Regions page must comply with ISO 3166-1:Alpha2.</p>

To set up items for electronic document sending and receiving

1. In the **Search** box, enter **Items**, and then choose the related link.
2. For each item that you buy or sell on electronic documents, fill the field as described in the following table.

FIELD	DESCRIPTION
GTIN	<p>Identifies the item in connection with electronic document sending and receiving. For the PEPPOL format, the field is used as follows:</p> <p>If the StandardItemIdentification/ID element has the SchemeID attribute set to GTIN, then the element is mapped to the GTIN field on the item card.</p>

To set up units of measure for electronic document sending and receiving

1. In the **Search** box, enter **Units of Measure**, and then choose the related link.
2. For each unit of measure that you will use for items on electronic documents, fill the field as described in the following table.

FIELD	DESCRIPTION
International Standard Code	<p>Specify the unit of measure code expressed according to the UNECERec20 standard in connection with sending of electronic documents.</p> <p>For example, when you send electronic invoices in the PEPPOL format, the value in this field is used to populate the unitCode attribute of the InvoicedQuantity element under the InvoiceLine node. Note: If the Unit of Measure field on the sales line is empty, the UNECERe20 standard value for "Piece" (H87) is inserted by default. For more information and a list of valid unit of measure codes, see Recommendation No. 20 - Units of Measure used in International Trade.</p>

To set up customers for electronic document sending

1. In the **Search** box, enter **Customers**, and then choose the related link.
2. For each customer who you will send electronic documents to, fill the fields as described in the following table.

FIELD	DESCRIPTION
GLN	<p>Identify the customer.</p> <p>For example, when you send electronic invoices in the PEPPOL format, the value in this field is used to populate the EndPointID element under the AccountingCustomerParty node in the file. The number is based on the GS1 standard, which is compliant with ISO 6523.</p> <p>If the GLN field is blank, the value in the VAT Registration No. field is used.</p>
VAT Registration No.	<p>Specify the customer's VAT registration number. Tip: Choose the DrillDown button to use the web service that verifies if the number exists in the country's company register.</p>
Responsibility Center	<p>If the customer is set up with a responsibility center, make sure that the Country/Region Code field is filled.</p>

You can set up each customer with a preferred method of sending business documents, so that you do not have to select a sending option every time that you send a document to the customer. For more information, see [Set Up Document Sending Profiles](#).

To select the PEPPOL electronic document format for electronic document sending

1. In the **Search** box, enter **Document Sending Profiles**, and then choose the related link.
2. Open an existing document sending profile, or create a new one. For more information, see [Set Up Document Sending Profiles](#).
3. On the **Document Sending Profile** page, choose the **Electronic Format**, select the line for PEPPOL, and then choose **OK**.
4. In the **Electronic Document** field, select **Yes (Through Document Exchange Service)**.

NOTE

Business Central automatically detects if the document is an invoice or a credit memo and applies the PEPPOL format accordingly.

5. To make this document sending profile apply to all customers, select the **Default** check box on the **General** FastTab. To make it apply to specific customers only, fill the **Document Sending Profile** field on the customer cards in question. For more information, see [Set Up Document Sending Profiles](#).

You can now send the electronic document containing the converted data. For more information, see [Send Electronic Documents](#).

To set up vendors for electronic document receiving

1. In the **Search** box, enter **Vendors**, and then choose the related link.
2. For each vendor that you will receive electronic documents from, fill the fields as described in the following table.

FIELD	DESCRIPTION
GLN	<p>Identify the vendor.</p> <p>For example, when you receive electronic invoices in the PEPPOL format, the value in this field is used to populate the EndPointID element under the AccountingSupplierParty node in the file. The number is based on the GS1 standard, which is compliant with ISO 6523.</p> <p>If the GLN field is blank, the value in the VAT Registration No. field is used.</p>
VAT Registration No.	<p>Specify the vendor's VAT registration number. Tip: Choose the DrillDown button to use the web service that verifies if the number exists in the country's company register.</p>
Responsibility Center	<p>If the vendor is set up with a responsibility center, make sure that the Country/Region Code field is filled.</p>

To select the PEPPOL - Invoice data exchange definition for electronic document receiving

1. In the **Search** box, enter **Incoming Documents**, and then choose the related link.
2. On the line for the electronic document that you want to receive and convert, choose the **Data Exchange Type** field, and then select **PEPPOLINVOICE**.

If the document to receive is a credit memo, select **PEPPOLCREDITMEMO**.

You can now receive the electronic document by starting the data conversion process on the **Incoming Documents** page. For more information, see [Receive and Convert Electronic Documents](#).

To set up the G/L account to use on new purchase invoice lines for non-identifiable items and non-items

1. In the **Search** box, enter **Purchases & Payables Setup**, and then choose the related link.
2. On the **Default Accounts** FastTab, fill the field as described in the following table.

FIELD	DESCRIPTION
G/L Account for Non-Item Lines	<p>Specifies the G/L account that is automatically inserted on purchase lines that are created from electronic documents when the incoming document line does not contain an identifiable item. Any incoming document line that does not have a GTIN or the vendor's item number will be converted to a purchase line of type G/L Account, and the No. field on the purchase line will contain the account that you select in the G/L Account for Non-Item Lines field.</p> <p>If you leave the G/L Account for Non-Item Lines field blank, and the incoming document has lines without identifiable items, then the purchase document will not be created. An error message will instruct you to fill the G/L Account for Non-Item Lines field before you can complete the task.</p>

Set Up SEPA Credit Transfer

2 minutes to read

From the **Payment Journal** page, you can export payments to a file for upload to your electronic bank for processing of the related money transfers. Business Central supports the SEPA Credit Transfer format, but in your country/region, other formats for electronic payments may be available.

To enable export of a bank file formats that are not supported out of the box in Business Central, you can set up a data exchange definition by using the data exchange framework. For more information, see [Set Up Data Exchange Definitions](#).

Before you can process payment electronically by exporting payment files in the SEPA Credit Transfer format, you must perform the following setup steps:

- Set up the bank account in question to handle the SEPA Credit Transfer format
- Set up vendor cards to process payments by exporting files in the SEPA Credit Transfer format
- Set up the related general journal batch to enable payment export from the **Payment Journal** page
- Connect the data exchange definition for one or more payment types with the relevant payment method or methods

To set up a bank account for SEPA Credit Transfer

1. In the **Search** box, enter **Bank Accounts**, and then choose the related link.
2. Open the card of the bank account from which you will export payment files in the SEPA Credit Transfer format.
3. On the **Transfer** FastTab, in the **Payment Export Format** field, choose **SEPADD**.
4. In the **SEPA CT Msg. ID No. Series** field, choose a number series from which numbers are assigned to SEPA credit transfer entries.
5. Make sure the **IBAN** field is filled.

NOTE

The **Currency Code** field must be set to **EUR**, because SEPA credit transfers can only be made in the EURO currency.

To set up a vendor card for SEPA Credit Transfer

1. In the **Search** box, enter **Vendors**, and then choose the related link.
2. Open the card of the vendor whom you will pay electronically by export payment files in the SEPA Credit Transfer format.
3. On the **Payment** FastTab, in the **Payment Method Code** field, choose **BANK**.
4. In the **Preferred Bank Account** field, choose the bank to which the money will be transferred when it is processed by your electronic bank.

The value in the **Preferred Bank Account** field is copied to the **Recipient Bank Account** field on the **Payment Journal** page.

To set the payment journal up to export payment files

1. In the **Search** box, enter **Payment Journals**, and then choose the related link.

2. Open the payment journal that you use to process payments by exporting files in the SEPA Credit Transfer format.
3. In the **Batch Name** field, choose the drop-down button.
4. On the **General Journal Batches** page, on the **Home** tab, in the **Manage** group, choose **Edit List**.
5. On the line for the payment journal that you will use to export payments, select the **Allow Payment Export** check box.

To connect the data exchange definition for one or more payment types with the relevant payment method or methods

1. In the **Search** box, enter **Payment Methods**, and then choose the related link.
2. On the **Payment Methods** page, select the payment method that is used to export payments from, and then choose the **Pmt. Export Line Definition** field.
3. On the **Pmt. Export Line Definitions** page, select the code that you specified in the **Code** field on the **Line Definitions** FastTab in step 4 in the "To describe the formatting of lines and columns in the file" section in the [Set Up Data Exchange Definitions](#) procedure.

Set Up SEPA Direct Debit

3 minutes to read

From the **Direct Debit Collections** page, you can export instructions to your electronic bank to perform a direct debit collection from the customer's bank account to your bank account. Business Central supports the SEPA direct debit format, but in your country/region, other formats for electronic payments may be available.

To enable export of a bank file formats that are not supported out of the box in Business Central, you can set up a data exchange definition by using the data exchange framework. For more information, see [Set Up Data Exchange Definitions](#).

Before you can process customer payments electronically by exporting direct debit instructions in the SEPA Direct Debit format, you must perform the following setup steps:

- Set up the export format of the bank file that instructs your bank to perform a direct debit collection from the customer's bank account to your bank account.
- Set up the customer's payment method.
- Set up the direct-debit mandate that reflects your agreement with the customer to collect their payments in a certain agreement period.

To set up your bank account for SEPA direct debit

1. In the **Search** box, enter **Bank Accounts**, and then choose the related link.
2. Open the bank account that you want to use for direct debit.
3. On the **Transfer** FastTab, in the **SEPA Direct Debit Export Format** field, choose the option for SEPA direct debit.

To set up the customer's payment method for SEPA direct debit

1. In the **Search** box, enter **Payment Methods**, and then choose the related link.
2. Choose the **New** action.
3. Set up a payment method. Fill in the direct debit-specific fields as described in the following table.

FIELD	DESCRIPTION
Direct Debit	Specify if the payment method is for SEPA direct debit collection.
Direct Debit Pmt. Terms Code	Specify the payment terms, such as DON'T PAY, that are displayed on sales invoices that are paid with SEPA direct debit to indicate to the customer that the payment will be collected automatically. Alternatively, leave the field empty.

NOTE

Do not enter a value in the **Bal. Account No.** field.

4. Choose the **OK** button to close the **Payment Methods** page.
5. In the **Search** box, enter **Customers**, and then choose the related link.
6. Open the customer card for the customer that you want to set up for SEPA direct debit collection.

- Choose the **Payment Method Code** field, and then select the payment method code that you specified in step 3.
- Repeat steps 6 and 7 for all customers that you want to set up for SEPA direct debit collection.

To set up the direct-debit mandate that represents the customer agreement

- In the **Search** box, enter **Customers**, and then choose the related link.
- Open the card for the customer that you want to set up for SEPA direct debits.
- Choose the **Bank Accounts** action.
- On the **Customer Bank Account List** page, select the customer bank account that will use direct debits, and then, on the **Home** tab, in the **Process** group, choose **Direct Debit Mandates**.
- On the **SEPA Direct Debit Mandates** page, fill in the fields as described in the following table.

FIELD	DESCRIPTION
Customer Bank Account Code	Specifies the bank account from which direct-debit payments are collected. This field is filled automatically.
Valid From	Specify the date when the direct-debit mandate starts.
Valid To	Specify the date when the direct-debit mandate ends.
Date of Signature	Specify the date when the customer signed the direct-debit mandate.
Sequence Type	Specify if the agreement covers multiple (Recurring) or a single (One Off) direct debit collection.
Expected Number of Debits	Specify how many direct debit collections you expect to make. This field is only relevant if you selected Recurring in the Sequence Type field.
Debit Counter	Specifies how many direct debit collections have been made using this direct-debit mandate. This field is automatically updated.
Blocked	Specify that direct debit collections cannot be made using this direct-debit mandate.

- Repeat steps 1 through 5 for all customers that you want to set up for SEPA direct debits.

The direct-debit mandate is automatically inserted in the **Direct Debit Mandate ID** field when you create a sales invoice for the customer that you selected in step 2. For more information, see [Create Recurring Sales and Purchase Lines](#).

Set Up the Bank Data Conversion Service

3/31/2019 • 3 minutes to read

A global provider of services to convert payment information to any data format that your bank requires is connected and ready to be enabled in Business Central. This is referred to in Business Central as the bank data conversion service.

You can export payment lines from the **Payment Journal** page to a file or a data stream that you then upload to your bank for automatic processing so that you do not have to make electronic payments individually. For more information, see [Export Payments to a Bank File](#).

You can import bank statement files into the **Payment Reconciliation Journal** page by using the bank data conversion service to convert a file that you receive from your bank to a data stream that Business Central can import. For more information, see [Applying Payments Automatically and Reconciling Bank Accounts](#).

As an alternative to importing bank statements with the bank data conversion service, you can use the Envestnet Yodlee Bank Feeds service. For more information, see [Set Up the Envestnet Yodlee Bank Feeds Service](#).

To import or export bank files, you must set up your own bank account and your vendors' bank accounts. For more information, see [Set Up Bank Accounts](#).

NOTE

The bank data conversion service may impose a limit on the number of lines that can be exported in one file. You will receive an error message if the limit is exceeded. It is recommended that bank statement files do not exceed 1000 lines as the processing time in the bank data conversion service may otherwise increase significantly.

To sign your company up for the bank data conversion service

1. Choose the  icon, enter **Bank Data Conv. Service Setup**, and then choose the related link.
2. The **Bank Data Conv. Service Setup** page opens with three fields prefilled with relevant URLs of the provider of bank data conversion service.

NOTE

In the CRONUS International Ltd. demonstration database, the User Name and Password fields are prefilled with demonstration logon information, which you will replace with your company's actual information as you sign up for the bank data conversion service.

3. In the **Sign-up URL** field, choose the browser button to open the service provider's sign-up page.
4. On the sign-up page of the bank data service provider, enter the user name and password for your company's subscription to the service, and then complete the sign-up process as instructed by the service provider.

Your company is now signed up for the bank data conversion service. Proceed to enter the user name and password that you specified for the service in the related setup fields in Business Central.

5. On the **Bank Data Conv. Service Setup** page, in the User **Name** field, enter the same value that you entered as logon name on the service provider's page in step 4.

6. In the **Password** field, enter the same value that you entered in the **Password** field on the service provider's page in step 4.

NOTE

You login data is automatically encrypted.

To view or update the list of currently supported bank data formats

1. Choose the  icon, enter **Bank Data Conv. Service Setup** , and then choose the related link.
2. On the **Bank Data Conv. Service Setup** page, choose the **Bank Name - Data Conversion List** action to open the list of bank names representing bank data formats that are supported by the conversion service.
3. On the **Bank Name - Data Conversion List** page, choose the **Update Bank Name List** action.

The list of bank data formats that are supported by the bank data conversion service is now updated. This is the list of bank names, filtered by the country/region, that you can select from in the **Bank Name - Data Conversion** field on the **Bank Account Card** page.

NOTE

The update of supported bank data formats also occurs when you select or enter a value in the **Bank Name - Data Conversion** field on the bank account.

You have now signed up for the bank data conversion service. Proceed to reflect the sign-up information on every bank account that will use the service.

Set Up the Envestnet Yodlee Bank Feeds Service

3/31/2019 • 6 minutes to read

You can import electronic bank statements from your bank to quickly fill on the **Payment Reconciliation Journal** page so you can apply payments and reconcile the bank account. For more information, see [Applying Payments Automatically and Reconciling Bank Accounts](#).

NOTE

The Envestnet Yodlee Bank Feeds service is only supported in the online version of Business Central. To use this functionality on-premises, you must obtain a cobrand account from Envestnet Yodlee.

The Envestnet Yodlee Bank Feeds service is only supported in the US, Canada, and UK.

The Envestnet Yodlee Bank Feeds service is installed as an extension to Business Central online and is ready to be enabled in the supported countries. For more information, see [Customizing Business Central Using Extensions](#).

After you enable the bank feed service, you must link a bank account to the online bank account that the feed will come from. You link bank accounts to online bank accounts in the following different scenarios:

- A bank account does not exist in Business Central for your online bank account. Therefore, you create the bank account by linking from the online bank account.
- A bank account exists in Business Central, which you want to link to an online bank account.
- A linked bank account must be unlinked because you want to stop using the bank feed service for the account.
- Online bank accounts have changed and you want to update the information on bank accounts in Business Central.

When the bank feed service is enabled, you can set a bank account up to automatically import new bank statements into the **Payment Reconciliation Journal** page every two hour. Transactions for payments that have already been posted as applied and/or reconciled on the **Payment Reconciliation Journal** page will not be imported. For more information, see the "To enable automatic import of bank statements" section.

NOTE

If you use the Set Up Company assisted setup guide, some of the steps in the following procedures happen automatically when you get to the company bank account setup. For more information, see [Getting Started](#).

To enable the bank feed service

1. Choose the  icon, enter **Bank Accounts**, and then choose the related link.
2. Open the bank account that you will use for the bank feed service.
3. On the **Bank Account** page, in the **Bank Statement Import Format** field, select YODLEEBANKFEED.

The bank feed service will be enabled when you link a bank account to its related online bank account. See the next procedure.

NOTE

If you use the **Company Setup** assisted setup guide, then you enable the service by selecting the **Use a bank feed service** check box. For more information, see [Creating New Companies in Business Central](#).

To create a new linked bank account

1. Choose the  icon, enter **Bank Accounts**, and then choose the related link.
2. Select the relevant bank account, and then choose the **Create New Linked Bank Account**. The **Bank Account Linking** page opens after a few moments.

NOTE

This page shows the actual web page of the Envestnet Yodlee Bank Feeds service. Terminology and functionality on the page may not match instructions provided in this topic.

3. On the **Online Bank Account Linking** page, in the **Link Account** pane, use the Search function to find the bank where you have one or more online bank accounts.
4. Choose the bank name. The **Log In** pane opens.
5. Enter the username and password that you use to log on to the online bank, and then choose the **Next** button.
6. The bank feed service prepares to link the first online bank account at the specified bank to a new bank account in Business Central.

NOTE

If you have more than one online bank account at the bank, you must create additional bank accounts in Business Central for them. See steps 8 through 10.

After the process completes, the bank name will appear in the **My Accounts** pane on the **Linked** tab. The number in brackets indicates how many online bank accounts were linked.

7. Choose the **OK** button.

If you are only linking one online bank account, the **Bank Account Card** page opens and displays the name of the online bank account. In this case, the bank account linking task is completed. All that's left to do is to set up the bank account. For more information, see [Set Up Bank Accounts](#).

If you are linking more than one online bank accounts, the **Bank Account Linking** page opens and lists the online bank accounts that are not yet linked to bank accounts in Business Central. In that case, follow the next step.

8. On the **Bank Account Linking** page, select the line for an online bank account, and then choose the **Link to New Bank Account** action.

The **Bank Account Card** page for a new bank account opens and displays the name of the online bank account.

If a bank account already exists in Business Central that you want to link the additional online bank account to, follow the next step.

9. On the **Bank Account Linking** page, select the line for an online bank account, and then choose the **Link to**

Existing Bank Account action.

10. On the **Bank Account List** page, select the bank account that you want to link to, and then choose the **OK** button.

To link a bank account to an online bank account

1. Choose the  icon, enter **Bank Accounts**, and then choose the related link.
2. Select the line for a bank account that is not linked to an online bank account, and then choose the **Link to Online Bank Account** action. The **Online Bank Account Linking** page opens with the name of the bank prefilled in the **Link Account** pane.
3. Choose the bank name. The **Log In** pane opens.
4. Enter the username and password that you use to log on to the online bank, and then choose the **Next** button.

The bank feed service prepares to link your bank account in Business Central to the related online bank account.

When the process has completed successfully, the bank name will appear in the **My Accounts** pane on the **Linked** tab. If the bank has more than one bank account, only the bank account that you selected in step 2 is linked.

5. Choose the **OK** button.

On the **Bank Account List** page, the **Linked** check box is selected.

To unlink a bank account

1. Choose the  icon, enter **Bank Accounts**, and then choose the related link.
2. Select the line for a linked bank account that you want to unlink from its related online bank account, and then choose the **Unlink Online Bank Account** action.

NOTE

If you choose **Yes** on the confirmation dialog, the link to the online bank account is removed, and the log-in details are cleared. To link the bank account to the online bank account again, you must log on to the bank again. For more information, see the "To link a bank account to an online bank account" section.

To update bank account linking

1. Choose the  icon, enter **Bank Accounts**, and then choose the related link.
2. Select the relevant bank account, and then choose the **Update Bank Account Linking** action.

If issues exist for any of the linked bank accounts on the **Bank Account List** page, the **Bank Account Linking** page opens specifying which bank accounts have issues. Issues can best be resolved by unlinking the online bank account and then re-creating the link. For more information, see the "To link a bank account to an online bank account" section.

To enable automatic import of bank statements

1. Choose the  icon, enter **Bank Accounts**, and then choose the related link.
2. Select the line for a linked bank account, and then choose the **Automatic Bank Statement Import Setup**

action.

3. On the **Automatic Bank Statement Import Setup** page, in the **Number of Days Included** field, specify how far back in time to get new bank transactions for.

NOTE

It is recommended that you set this value to 7 days or more.

4. Select the **Enabled** check box.

Every hour, the **Payment Reconciliation Journal** page will display new payments that are made on the online bank account.

NOTE

Transactions for payments that have already been posted as applied and/or reconciled on the **Payment Reconciliation Journal** page will not be imported.

[Working with Business Central](#)

Set Up Bank Accounts

3/31/2019 • 2 minutes to read

You use bank accounts in the Business Central to keep track of your banking transactions. Accounts can be denominated in your local currency or in a foreign currency. After you have set up bank accounts, you can also use the check printing option.

To set up bank accounts

1. Choose the  icon, enter **Bank Accounts**, and then choose the related link.
2. On the **Bank Accounts** page, choose the **New** action.
3. Fill in the fields as necessary. Hover over a field to read a short description.

NOTE

To fill in the **Balance** field with an opening balance, you must post a bank account ledger entry with the amount in question. You can do this by performing a bank account reconciliation. For more information, see [Reconcile Bank Accounts Separately](#). Alternatively, you can implement the opening balance as a part of general data creation in new companies by using the **Migrate Business Data** assisted setup guide. For more information, see [Getting Started](#).

To set up your bank account for import or export of bank files

Fields on the **Transfer** FastTab on the **Bank Account Card** page are related to import and export of bank feeds and files. For more information, see [Set Up the Bank Data Conversion Service](#) and [Set Up the Envestnet Yodlee Bank Feeds Service](#).

1. Choose the  icon, enter **Bank Accounts**, and then choose the related link.
2. Open the card for a bank account that you will export or import bank files for.
3. On the **Transfer** FastTab, fill in the fields as necessary. Hover over a field to read a short description.

NOTE

Different file export services and their formats require different setup values on the **Bank Account Card** page. You will be informed about wrong or missing setup values as you try to export the file. So read the short descriptions of the fields carefully or refer to the related procedure topics. For example, exporting a payment file for North American electronic funds transfer (EFT) requires that both the **Last Remittance Advice No.** field and the **Transit No.** field are filled in. For more information, see [Export Payments to a Bank File](#).

To set up vendor bank accounts for export of bank files

Fields on the **Transfer** FastTab on the **Vendor Bank Account Card** page are related to export of bank feeds and files. For more information, see [Set Up the Bank Data Conversion Service](#) and [Export Payments to a Bank File](#).

1. Choose the  icon, enter **Vendors**, and then choose the related link.
2. Open the card for a vendor whose bank account you will export payment bank files to.
3. Choose the **Bank Accounts** action.
4. On the **Vendor Bank Account Card** page, on the **Transfer** FastTab, fill in the fields as necessary. Hover over

a field to read a short description.

Use XML Schemas to Prepare Data Exchange Definitions

3/31/2019 • 5 minutes to read

To enable import/export of data in XML files through the data exchange framework in Business Central, you can use XML schemas to define which data elements you want to exchange with Business Central. You perform this work on the **XML Schema Viewer** page by loading the XML schema file, selecting the relevant data elements, and then initializing either a data exchange definition or an XMLport.

When you have defined which data elements to include based on the XML schema, you can use the **Generate XMLport** action to create the XMLport object.

Alternatively, you can use the **Generate Data Exchange Definition** action to initialize a data exchange definition based on the selected data elements, which you then complete in the Data Exchange Framework. This creates a record on the **Posting Exchange Definition** page where you continue by defining which elements in the file map to which fields in Business Central. For more information, see [Set Up Data Exchange Definitions](#).

This topic contains the following procedures:

- To load an XML schema file
- To select or clear nodes in an XML schema
- To generate a data exchange definition that is based on an XML schema
- To generate an XMLport for the file that is based on an XML schema
- To import an XMLport into the Object Designer

To load an XML schema file

1. Make sure that the relevant XML schema file is available. The file extension is .xsd.
2. In the **Search** box, enter **XML Schemas**, and then choose the related link.
3. On the **Home** tab, in the **New** group, choose **New**.
4. Fill the fields as described in the following table.

FIELD	DESCRIPTION
Code	Specify a code to identify the XML schema.
Description	Specify a description of the XML schema.

The **Target Namespace** field specifies any namespace in the XML schema file that has been loaded for the line.

5. On the **Home** tab, in the **Process** group, choose **Load Schema**, and then select the XML schema file.

When the file is loaded, the rest of the fields on the line are filled with information from the file, and the **Schema is Loaded** check box is selected.

NOTE

The tree of the loaded XML schema is collapsed by default. You expand each node by choosing the + button on the node. To expand all nodes, choose **Expand All** on the ribbon.

To select or clear nodes in an XML schema

1. In the **Search** box, enter **XML Schema Viewer**, and then choose the related link.
2. Fill the fields on the header as described in the following table.

FIELD	DESCRIPTION
XML Schema Code	Specify the XML schema file that you loaded in step 5 in the "To load an XML schema file" section.
New XMLport No.	Specify the number of the XMLport that is created from this XML schema when you choose the Generate XMLport action.

The lines are now filled with nodes representing all elements in the XML schema. Nodes for elements that are mandatory according to the XML schema are selected by default.

3. On the first line, in the **Node Name** column, expand the **Document** node, and then gradually expand underlying nodes that you want to review.

Alternatively, right-click on a node and then choose **Expand All**.

4. On the **Home** tab, in the **View** group, choose either of the following actions to change which nodes are displayed.

ACTION	DESCRIPTION
Show All	All nodes are shown.
Hide Non-Mandatory	Only nodes representing elements that are required according to the XML schema are shown. These nodes are typically indicated by a 1 in the MinOccurs field. Choose Show All to reverse the view.
Hide Non-Selected	Only nodes where the Selected check box is selected are shown. Choose Show All to reverse the view.

5. On the **Home** tab, in the **Manage** group, choose **Edit**.
6. In the **Selected** check box, specify for each node if you want the element to be supported in the data exchange definition for the related SEPA bank file.

NOTE

When you select a mandatory child node, all parent nodes above it are also selected.

7. Choose the **Select All Mandatory Elements** action to reselect all nodes that represent elements that are mandatory according to the XML schema.

8. Choose the **Deselect All** action to clear all selections.

The **Choice** field specifies that the node has two or more sibling nodes that function as options.

To generate a data exchange definition that is based on an XML schema

1. In the **Search** box, enter **XML Schemas**, and then choose the related link.
2. Select the relevant XML schema, and then on the **Home** tab, in the **Process** group, choose **Open XML Schema Viewer**.
3. Make sure the relevant nodes are selected. For more information, see the "To select or clear nodes in an XML schema" section.
4. On the **XML Schema Viewer** page, on the **Home** tab, in the **Process** group, choose **Generate Data Exchange Definition**.

A data exchange definition is created on the **Posting Exchange Definition** page, which you can complete by specifying which elements in the file map to which fields in Business Central. For more information, see [Set Up Data Exchange Definitions](#).

NOTE

You can also use the **Get File Structure** function from the **Posting Exchange Definition** page, which uses the functionality of the **XML Schema Viewer** page to prefill the **Column Definitions** TabTab.

To generate an XMLport that is based on an XML schema

1. In the **Search** box, enter **XML Schemas**, and then choose the related link.
2. Select the relevant XML schema, and then on the **Home** tab, in the **Process** group, choose **Open XML Schema Viewer**.
3. In the **New XMLport No.** field, specify the number that the new XMLport object will be given when it is generated.
4. Make sure the relevant nodes are selected. For more information, see the "To select or clear nodes in an XML schema" section.
5. On the **Home** tab, in the **Process** group, choose **Generate XMLport**, and then save the object as a .txt file in an appropriate location.
6. Import the new XMLport into the Business Central development environment and compile it.

[About the Data Exchange Framework](#)

Set Up Data Exchange Definitions

3/31/2019 • 12 minutes to read

You can set up Business Central to exchange data in specific tables with data on external files, for example to send and receive electronic documents, import and export bank data or other data, such as payroll, currency exchange rates, and item catalogues. For more information, see [Exchanging Data Electronically](#).

As preparation for creating a data exchange definition for a data file or stream, you can use the related XML schema to define which data elements to include on the **Column Definitions** FastTab. See step 6 in [To describe the formatting of lines and columns in the file](#). For more information, see the [Use XML Schemas to Prepare Data Exchange Definitions](#).

You normally set up data exchange definitions on the **Data Exchange Definition** page. However, when you set up a data exchange definition for the service of refreshing currency exchange rates, you start the process in the simplified **Exch. Rate Update Setup Card** page.

NOTE

If the file that is being converted is in XML format, the term “*column*” in this topic should be interpreted as “*XML element containing data*”.

This topic includes the following procedures:

- To create a data exchange definition
- To export a data exchange definition as an XML file for use by others
- To import an XML file for an existing data exchange definition

To create a data exchange definition

Creating a data exchange definition involves two tasks:

1. On the **Data Exchange Definition** page, describe the formatting of lines and columns in the file.
2. On the **Data Exchange Mapping** page, map columns in the data file to fields in Business Central.

This is described in the following procedures.

TIP

To see which codeunits Microsoft uses in existing definitions in the standard product, review the three **Codeunit** fields on the header of the **Field Mapping** page for each definition.

To describe the formatting of lines and columns in the file

1. In the **Search** box, enter **Data Exchange Definitions**, and then choose the related link.
2. Choose the **New** action.
3. On the **General** FastTab, describe the data exchange definition and the data file type by filling the fields as described in the following table.

FIELD	DEFINITION
Code	Enter a code to identify the data exchange definition.
Name	Enter a name for the data exchange definition.
File Type	<p>Specify what type of file that the data exchange definition is used for. You can select between four file types:</p> <ul style="list-style-type: none"> - XML: Layered strings of content and markup surrounded by tags indicating function. - Variable Text: Records have variable length and are separated by a character, such as comma or semi-colon. Also known as <i>delimited file</i>. - Fixed Text: Records have the same length, using pad characters, and each record is on a separate line. Also known as <i>fixed-width file</i>. - Json: Layered strings of content in JavaScript.
Type	Specify what type of business activity the data exchange definition is used for, such as Payment Export .
Data Handling Codeunit	Specify the codeunit that transfers data in and out of tables in Business Central.
Validation Codeunit	Specify the codeunit that is used to validate data against pre-defined business rules.
Reading/Writing Codeunit	Specify the codeunit that processes imported data prior to mapping and exported data after mapping.
Reading/Writing XMLport	Specify the XMLport through which an imported data file or service enters prior to mapping and through which exported data exits when it is written to a data file or service after mapping.
Ext. Data Handling Codeunit	Specify the codeunit that transfers external data in and out of the data exchange framework.
User Feedback Codeunit	Specify the codeunit that does various clean-up after mapping, such as marks the lines as exported and deletes temporary records.
File Encoding	Specify the encoding of the file. Note: This field is only relevant for import.
Column Separator	Specify how columns in the data file are separated, if the file is of type Variable Text .
Header Lines	<p>Specify how many header lines exist in the file.</p> <p>This makes sure that the header data is not imported. Note: This field is only relevant for import.</p>

FIELD	DEFINITION
Header Tag	<p>If a header line exists in several positions in the file, enter the text of the first column on the header line.</p> <p>This makes sure that the header data is not imported. Note: This field is only relevant for import.</p>
Footer Tag	<p>If a footer line exists in several positions in the file, enter the text of the first column on the footer line.</p> <p>This makes sure that the footer data is not imported. Note: This field is only relevant for import.</p>

- On the **Line Definitions** FastTab, describe the formatting of lines in the data file by filling the fields as described in the following table.

NOTE

For import of bank statements, you only create one line for the single format of the bank statement file that you want to import.

For export of payments, you can create a line for each payment type that you want to export. In that case, the **Column Definitions** FastTab shows different columns for each payment type.

FIELD	DESCRIPTION
Code	Enter a code to identify the line in the file.
Name	Enter a name that describes the line in the file.
Column Count	Specify how many columns the line in data file has. Note: This field is only relevant for import.
Data Line Tag	Specify the position in the related XML schema of the element that represents the main entry of the data file. Note: This field is only relevant for import.
Namespace	Specify the namespace that is expected in the file, to enable namespace validation. You can leave this field blank if you do not want to enable namespace validation.

- Repeat step 4 to create a line for every type of file data that you want to export.

Proceed to describe the formatting of columns in the data file by filling the fields on the **Column Definitions** FastTab as described in the table below. You can use the structure file, such as an .XSD file, for the data file to prefill the FastTab with the relevant elements. For more information, see [Use XML Schemas to Prepare Data Exchange Definitions](#).

- On the **Column Definitions** FastTab, choose **Get File Structure**.
- On the **Get File Structure** page, select the related structure file, and then choose the **OK** button. The lines on the **Column Definitions** FastTab are filled according to the structure of the data file.
- On the **Column Definitions** FastTab, edit or fill the fields as described in the following table.

FIELD	DESCRIPTION
Column No.	Specify the number that reflects the column's position on the line in the file. For XML files, specify the number that reflects the type of element in the file that contains the data.
Name	Specify the name of the column. For XML files, specify the markup that marks the data to be exchanged.
Data Type	Specify if the data to be exchanged is of type Text , Date , or Decimal .
Data Format	Specify the format of the data, if any. For example, MM-dd-yyyy if the data type is Date . Note: For export, specify the data format according to Business Central. For import, specify the data format according to the .NET Framework. For more information, see Standard Date and Time Format Strings .
Data Formatting Culture	Specify the culture of the data format, if any. For example, en-US if the data type is Decimal to make sure that comma is used as the .000 separator, according to the US format. For more information, see Standard Date and Time Format Strings . Note: This field is only relevant for import.
Length	Specify the length of the fixed-width line that holds the column if the data file is of type Fixed Text .
Description	Enter a description of the column, for information.
Path	Specify the position of the element in the related XML schema.
Negative-Sign Identifier	Enter the value that is used in the data file to identify negative amounts, in data files that cannot contain negative signs. This identifier is then used to reverse the identified amounts to negative signs during import. Note: This field is only relevant for import.
Constant	Specify any data that you want to export in this column, such as extra information about the payment type. Note: This field is only relevant for export.

- Repeat step 8 for every column or XML element in the data file that has data that you want to exchange with Business Central.

The next step in creating a data exchange definition is to decide which columns or XML elements in the data file map to which fields in Business Central.

NOTE

The specific mapping depends on the business purpose of the data file to be exchanged and on local variations. Even the SEPA bank standard has local variations. Business Central supports import of SEPA CAMT bank statement files out-of-the-box. This is represented by the **SEPA CAMT** data exchange definition record code on the **Data Exchange Definitions** page. For information about the specific field mapping of this SEPA CAMT support, see [Field Mapping When Importing SEPA CAMT Files](#).

To map columns in the data file to fields in Business Central

1. On the **Line Definitions** FastTab, select the line for which you want to map columns to fields, and then choose **Field Mapping**. The **Data Exchange Mapping** page opens.
2. On the **General** FastTab, specify the mapping setup by filling the fields as described in the following table.

FIELD	DESCRIPTION
Table ID	Specify the table that holds the fields to or from which data is exchanged according to the mapping.
Use as Intermediate Table	Specify if the table that you select in the Table ID field is an intermediate table where the imported data is stored before it is mapped to the target table. You typically use an intermediate table when the data exchange definition is used to import and convert electronic documents, such as vendor invoices into purchase invoices in Business Central. For more information, see Exchanging Data Electronically .
Name	Enter a name for the mapping setup.
Pre-Mapping Codeunit	Specify the codeunit that prepares the mapping between fields in Business Central and external data.
Mapping Codeunit	Specify the codeunit that is used to map the specified columns or XML data elements to fields in Business Central.
Post-Mapping Codeunit	Specify the codeunit that completes the mapping between fields in Business Central and external data. Note: When using the Bank Data Conversion Service feature, the codeunit converts exported data from Business Central to a generic format that is ready for export. For import, the codeunit converts external data to a format that is ready for import into Business Central.

3. On the **Field Mapping** FastTab, specify which columns map to which fields in Business Central by filling the fields as described in the following table.

FIELD	DESCRIPTION
-------	-------------

FIELD	DESCRIPTION
Column No.	<p>Specify which column in the data file that you want to define a map for.</p> <p>You can only select columns that are represented by lines on the Column Definitions FastTab on the Data Exchange Definition page.</p>
Field ID	<p>Specify which field the column in the Column No. field maps to.</p> <p>You can only select from fields that exist in the table that you specified in the Table field on the General FastTab.</p>
Optional	<p>Specify that the map will be skipped if the field is empty. Note: If you do not select this check box, an export error will occur if the field is empty. Note: This field is only relevant for export.</p>
Target Table ID	<p>Only visible when the Use as Intermediate Table check box is selected.</p> <p>Specify the table that the value in the Column Caption field is mapped to, when you are using an intermediate table for data import.</p>
Target Table Caption	<p>Only visible when the Use as Intermediate Table check box is selected.</p> <p>Specify the name of the table in the Target Table ID field, which is the table that the value in the Column Caption field is mapped to, when you are using an intermediate table for data import.</p>
Target Field ID	<p>Only visible when the Use as Intermediate Table check box is selected.</p> <p>Specify the field in the target table that the value in the Column Caption field is mapped to, when you are using an intermediate table for data import.</p>
Target Field Caption	<p>Only visible when the Use as Intermediate Table check box is selected.</p> <p>Specify the name of the field in the target table that the value in the Column Caption field is mapped to, when you are using an intermediate table for data import.</p>
Optional	<p>Only visible when the Use as Intermediate Table check box is selected.</p> <p>Specify if the map should be skipped if the field is empty. If you do not select this check box, then an export error will occur if the field is empty.</p>

The data exchange definition is now ready to be enabled for users. For more information, see [Set Up Electronic Document Sending and Receiving](#), [Set Up SEPA Credit Transfer](#), [Set Up SEPA Direct Debit](#), and [Make Payments with Bank Data Conversion Service or SEPA Credit Transfer](#).

When you have created the data exchange definition for a specific data file, you can export the data exchange definition as an XML file that can be used to quickly enable import of the data file in question. This is described in the following procedure.

To export a data exchange definition as an XML file for use by others

1. In the **Search** box, enter **Data Exchange Definitions**, and then choose the related link.
2. Select the data exchange definition that you want to export.
3. Choose the **Export Data Exchange Definition** action.
4. Save the XML file that represents the data exchange definition in an appropriate location.

If a data exchange definition has already been created, you just have to import the XML file into the Data Exchange Framework. This is described in the following procedure.

To import an existing data exchange definition

1. Save the XML file that represents the data exchange definition in an appropriate location.
2. In the **Search** box, enter **Data Exchange Definitions**, and then choose the related link.
3. Choose the **New** action. The **Data Exchange Definitio** page opens.
4. Choose the **Import Data Exchange Definition** action.
5. Choose the file that you saved in step 1.

Exchanging Data

3/31/2019 • 2 minutes to read

You can exchange data between Business Central and external files or streams in connection with common business tasks, such as sending and receiving electronic documents and importing and exporting bank files.

Before you can send and receive electronic documents or import and export bank files, you must set up the data exchange framework to process the involved data files or streams. In addition, you must set up related areas. These include master data for customers that you send electronic invoices to and the bank data conversion service in case you distribute bank file conversions to an external service provider. For more information, see [Setting Up Data Exchange](#).

The following table describes a sequence of tasks, with links to the topics that describe them.

TO	SEE
Convert sales document records in Business Central to a standardized format and send them as electronic documents that your customers can receive into their system.	Send Electronic Documents
Send PDF or image files to a provider of OCR services, and receive them back as electronic documents that can be converted to document records in Business Central.	Use OCR to Turn PDF and Image Files into Electronic Documents
Receive electronic documents, either from the OCR service or the document exchange service, in a standardized format that you convert to the relevant document records in Business Central.	Receive and Convert Electronic Documents
Prepare to import a bank statement file into the Payment Reconciliation Journal page as the first step in reconciling payments or into the Bank Acc. Reconciliation page as the first step in reconciling bank accounts.	Set Up the Investnet Yodlee Bank Feeds Service
Export payments from the Payment Journal page to a bank file that you upload to your electronic bank account for processing.	Export Payments to a Bank File
Make electronic payments according to the EU SEPA Credit Transfer standard.	Making Payments with Bank Data Conversion Service or SEPA Credit Transfer
Instruct your bank to transfer payment amounts from your customers' bank accounts to your company's account according to your setup of SEPA direct debit.	Create SEPA Direct Debit Collection Entries and Export to a Bank File
Use a service provider of currency exchange rates to update the Currencies page.	Update Currency Exchange Rates
View which file elements are mapped to fields in Business Central when importing SEPA CAMT statement files.	Field Mapping When Importing SEPA CAMT Files

Send Electronic Documents

3/31/2019 • 2 minutes to read

The generic version of Business Central supports sending electronic invoices and credit memos in the PEPPOL format, which is supported by the largest document exchange service providers. A document exchange service provider dispatches electronic documents between trading partners. To provide support for other electronic document formats, you use the data exchange framework.

In the generic version of Business Central, a document exchange service is preconfigured and ready to be set up for your company. For more information, see [Set Up a Document Exchange Service](#).

To send a sales invoice as an electronic PEPPOL document, you select the **Electronic Document** option in the **Post and Send** dialog box from where you can also set up the customer's default document sending profile. First, you must set up various master data, such as company information, customers, items, and units of measure. These are used to identify the business partners and items when converting data in fields in [Set Up Electronic Document Sending and Receiving](#).

To send an electronic sales invoice

1. Choose the  icon, enter **Sales Invoices**, and then choose the related link.
2. Create a new sales invoice.
3. When the sales invoice is ready to be invoiced, on the **Actions** tab, in the **Posting** group, choose **Post and Send**.

If the customer's default sending profile is **Electronic Document**, then it will be shown in the **Post and Send Confirmation** dialog box and you just have to choose the **Yes** button to post and send the invoice electronically in the selected format.

4. In the **Post and Send Confirmation** dialog box, choose the AssistEdit button to the right of the **Send Document to** field.
5. In the **Send Document to** dialog box, in the **Electronic Document** field, choose **Through Document Exchange Service**.
6. In the **Format** field, choose **PEPPOL**.
7. Choose the **OK** button. The **Post and Send Confirmation** dialog box appears. **Electronic Document (PEPPOL)** is added to the **Send Document to** field.
8. Choose the **Yes** button.

The sales invoice is posted and sent to the customer as an electronic document in the PEPPOL format.

NOTE

You can also send a posted sales invoice as an electronic document. The procedure is the same as described in this topic for non-posted sales documents. On the **Posted Sales Invoice** page, on the **Actions** tab, in the **General** group, choose **Activity Log** to view the status of the electronic document. For more information, see **Activity Log**.

Use OCR to Turn PDF and Image Files into Electronic Documents

3/31/2019 • 9 minutes to read

From PDF or image files that you receive from your trading partners, you can have an external OCR service (Optical Character Recognition) generate electronic documents that can be converted to document records in Business Central. For example, when you receive an invoice in PDF format from your vendor, you can send it to the OCR service from the **Incoming Documents** page. This is described in the first procedure.

As an alternative to sending the file from the **Incoming Documents** page, you can send the file to the OCR service by email. Then, when you receive the electronic document back, a related incoming document record is created automatically. This is described in the second procedure.

After some seconds, you receive the file back from the OCR service as an electronic invoice that can be converted to a purchase invoice for the vendor. This is described in the third procedure.

Because OCR is based on optical recognition, it is likely that the OCR service will interpret characters in your PDF or image files wrongly when it first processes a certain vendor's documents, for example. It may not interpret the company logo as the vendor's name or it may misinterpret the total amount on a receipt because of its layout. To avoid these errors going forward, you can correct the errors in a separate version of the **Incoming Document** page. Then you send the corrections back to the OCR service to train it to interpret the specific characters correctly next time it processes a PDF or image document for the same vendor. For more information, see [To train the OCR service to avoid errors](#).

The traffic of files to and from the OCR service is processed by a dedicated job queue entry, which are created automatically when you enable the related service connection. For more information, see [Set Up Incoming Documents](#).

To send a PDF or image file to the OCR service from the **Incoming Documents** page

1. Choose the  icon, enter **Incoming Documents**, and then choose the related link.
2. Create a new incoming document record and attach the file. For more information, see [Create Incoming Document Records](#).
3. On the **Incoming Documents** page, select one or more lines, and then choose the **Send to Job Queue** action.

The value in the **OCR Status** field changes to **Ready**. The attached PDF or image file is sent to the OCR service by the job queue according to the schedule, provided that no errors exist.

4. Alternatively, on the **Incoming Documents** page, select one or more lines, and then choose the **Send to OCR Service** action.

The value in the **OCR Status** field changes to **Sent**, provided that no errors exist.

To send a PDF or image file to the OCR service by email

From your email application, you can send an email to the OCR service provider with the PDF or image file attached. For information about the email address to send to, see the OCR service provider's web site.

Because no incoming document record exists for the file, a new record will be created automatically on the **Incoming Documents** page when you receive the resulting electronic document from the OCR service. For more information, see [Create Incoming Document Records](#).

NOTE

If you work on a tablet or phone, you can send the file to the OCR service as soon as you have taken a photo of the document, or you can create an incoming document directly. For more information, see [To create an incoming document record by taking a photo](#).

To receive the resulting electronic document from the OCR service.

The electronic document that is created by the OCR service from the PDF or image file is automatically received into the **Incoming Documents** page by the job queue entry that is set up when you enable the OCR service.

If you are not using a job queue, or you want to receive a finished OCR document sooner than per the job queue schedule, you can choose the **Receive from OCR Service** button. This will get any documents that are completed by the OCR service.

NOTE

If the OCR service is set up to require manual verification of processed documents, then the **OCR Status** field will contain **Awaiting Verification**. In that case, perform the following steps to log in to the OCR service website to manually verify an OCR document.

1. In the **OCR Status** field, choose the **Awaiting Verification** hyperlink.
2. On the OCR service website, log in using the credentials of your OCR service account. These are the credentials you also used when setting up the service. For more information, see [To set up an OCR service](#).

Information for the OCR document is displayed, showing both the source content of the PDF or image file and the resulting OCR field values.

3. Review the various field values and manually edit or enter values in fields that the OCR service has tagged as uncertain.
4. Choose the **OK** button. The OCR process is completed and the resulting electronic document is sent to the **Incoming Documents** page in Business Central, according to the job queue schedule.
5. Repeat step 4 for any other OCR document to be verified.

Now you can proceed to create document records for the received electronic documents in Business Central, manually or automatically. For more information, see the next procedure. You can also connect the new incoming document record to existing posted or non-posted document so that the source file is easy to access from Business Central. For more information, see [Process Incoming Documents](#).

To create a purchase invoice from an electronic document received from the OCR service

The following procedure describes how to create a purchase invoice record from a vendor invoice received as an electronic document from the OCR service. The procedure is the same when you create, for example, a general journal line from an expense receipt or a sales return order from a customer.

NOTE

The **Description** and **No.** fields on the created document lines will only be filled if you have first mapped text found on the OCR document to the two fields in Business Central. You can do this mapping as item cross-references, for document lines of type Item. For more information, see [Use Item Cross References](#). You can also use the Text-to-Account Mapping function. For more information, see [To map text on an incoming document to a specific vendor, G/L, or bank account](#).

1. Select the line for the incoming document, and then choose the **Create Document** action.

A purchase invoice will be created in Business Central based on the information in the electronic vendor document that you received from the OCR service. Information will be inserted in the new purchase invoice based on the mapping that you have defined as a cross-reference or as text-to-account mapping.

Any validation errors, typically related to wrong or missing master data in Business Central, will be shown on the **Errors and Warnings** FastTab. For more information, see [To handle errors when receiving electronic documents](#).

To map text on an incoming document to a specific vendor account

For incoming documents, you typically use the **Map Text to Account** action to define that a certain text on a vendor invoice received from the OCR service is mapped to a certain vendor account. Going forward, any part of the incoming document description that exists as a mapping text means that the **No.** field on resulting document or journal lines of type G/L Account are filled with the vendor in question.

In addition to mapping to a vendor account or G/L accounts, you can also map to a bank account. This is practical, for example, for electronic documents for expenses that are already paid where you want to create a general journal line that is ready to post to a bank account.

1. Select the relevant incoming document line, and then choose the **Map Text to Account** action. The **Text-to-Account Mapping** page opens.
2. In the **Mapping Text** field, enter any text that occurs on vendor invoices that you want to create purchase documents or journal lines for. You can enter up to 50 characters.
3. In the **Vendor No.** field, enter the vendor that the resulting purchase document or journal line will be created for.
4. In the **Debit Acc. No.** field, enter the debit-type G/L account that will be inserted on resulting purchase document or journal line of type G/L Account.
5. In the **Credit Acc. No.** field, enter the credit-type G/L account that will be inserted on resulting purchase document or journal line of type G/L Account.

NOTE

Do not use the **Bal. Source Type** and **Bal. Source No.** fields in connection with incoming documents. They are used for automatic payment reconciliation only. For more information, see [Map Text on Recurring Payments to Accounts for Automatic Reconciliation](#).

6. Repeat steps 2 through 5 for all text on incoming documents that you want to automatically create documents for.

To handle errors when receiving electronic documents

1. On the **Incoming Documents** page, select the line for an electronic document received from the OCR service with errors. This is indicated by the Error value in the **OCR Status** field.
2. Choose the **Edit** action to open the **Incoming Document** page.

3. On the **Errors and Warnings** FastTab, select the message, and then choose the **Open Related Record** action.
4. The page that contains the wrong or missing data, such as a vendor card with a missing field value, opens.
5. Correct the error or errors as described in each error message.
6. Proceed to process the incoming electronic document by choosing the **Create Manually** action again.
7. Repeat steps 5 and 6 for any remaining errors until the electronic document can be received successfully.

To train the OCR service to avoid errors

Because OCR is based on optical recognition, it is likely that the OCR service will interpret characters in your PDF or image files wrongly when it first processes documents from a certain vendor, for example. It may not interpret the company logo as the vendor's name or it may misinterpret the total amount on an expense receipt because of its layout. To avoid such errors going forward, you can correct data received by the OCR service and then send the feedback to the service.

The **OCR Data Correction** page, which you open from the **Incoming Document** page, shows the fields from the **Financial Information** FastTab in two columns, one with the OCR data editable and one with the OCR data read-only. When you choose the **Send OCR Feedback** button, the content of the **OCR Data Correction** page is sent to the OCR service. Next time the service processes PDF or image files that contain the data in question, your corrections will be incorporated to avoid the same errors.

1. Choose the  icon, enter **Incoming Documents**, and then choose the related link.
2. Open an incoming document record that contains data received from OCR service, which you want to correct.
3. On the **Incoming Document** page, choose the **Correct OCR Data** action.
4. On the **OCR Data Correction** page, overwrite the data in the editable column for each field that has an incorrect value.
5. To undo corrections that you have made since you opened the **OCR Data Correction** page, choose the **Reset OCR Data** action.
6. To send the corrections to the OCR service, choose the **Send OCR Feedback** action.
7. To save the corrections, close the **OCR Data Correction** page.

The fields on the **Financial Information** FastTab on the **Incoming Document** page are updated with any new values that you entered in step 4.

Receive and Convert Electronic Documents

3/31/2019 • 3 minutes to read

The generic version of Business Central supports receiving electronic invoices and credit memos in the PEPOL format, which is supported by the largest providers of document exchange services. To receive an invoice from a vendor as an electronic PEPOL document, you process the document in the Incoming Documents page to convert it to a purchase invoice or general journal line in Business Central.

In addition to receiving electronic documents directly from trading partners, you can receive electronic documents from an OCR service that has turned your PDF or image files into electronic documents.

Before you can receive electronic documents through the document exchange service, you must set up various master data, such as company information, vendors, items, and units of measure. These are used to identify the business partners and items when converting data in elements in the incoming document file to fields in Business Central. For more information, see [Set Up a Document Exchange Service](#).

Before you can receive electronic documents through the OCR service, you must set up and enable the preconfigured service connection. For more information, see [Set Up Incoming Documents](#).

The traffic of electronic documents in and out of Business Central is managed by the Job Queue feature. Before you can receive electronic documents, the relevant job queue must be started.

You can either start the conversion of electronic documents manually, as described in this procedure, or you can enable a workflow to convert electronic documents automatically when they are received. The generic version of Business Central includes a workflow template, *From Incoming Electronic through OCR to Open Purchase Invoice Workflow*, which is ready to be copied to a workflow and enabled. For more information, see [Workflow](#).

NOTE

When you convert electronic documents received from the OCR service to documents or journal lines in Business Central, multiple lines on the source document will be summed on one line. The single line will be of type G/L Account and the **Description** and (G/L account) **No.** fields will be empty. The value in the **Amount** field will equal the total amount excluding VAT of all lines in the source document.

To make sure that the **Description** and **No.** fields are filled, you can choose the **Map Text to Account** button on the **Incoming Documents** page to define that a certain invoice text is always mapped to a certain debit or credit account in the general ledger. Going forward, the **Description** field on document or journal lines created from an electronic document for that vendor or customer will be filled with the text in question and the (G/L account) **No.** field with the account in question.

Instead of mapping to a G/L account, you can also map to a bank account. This is practical, for example, for electronic documents for expenses that are already paid where you want to create a general journal line that is ready to post to a bank account.

The following procedure describes how to receive a vendor invoice and convert it to a purchase invoice in Business Central. The procedure is the same when you convert a vendor invoice to a general journal line.

To receive and convert an electronic invoice to a purchase invoice

1. Choose the  icon, enter **Incoming Documents**, and then choose the related link.
2. Select the line for the incoming document record that represents a new incoming electronic invoice, and then, on the **Home** tab, in the **Manage** group, choose **Edit**.

On the **Incoming Document Card** page, the related XML file is attached, and most of the fields are

prefilled with information from the electronic invoice. For more information, see [Create Incoming Document Records](#).

3. In the **Data Exchange Type** field, choose **PEPPOL - Invoice** or **OCR – Invoice** depending on the source of the electronic document.
4. To map text on the vendor invoice to a specific debit account, on the **Actions** tab, in the **General** group, choose **Map Text to Account**, and then fill the **Text-to-Account Mapping Worksheet** page.
5. On the **Actions** tab, in the **General** group, choose **Create Document**.

A purchase invoice will be created in Business Central based on the information in the electronic document.

Any validation errors, typically related to wrong or missing master data in Business Central will be shown on the **Error Messages** FastTab.

Set Up the Envestnet Yodlee Bank Feeds Service

3/31/2019 • 6 minutes to read

You can import electronic bank statements from your bank to quickly fill on the **Payment Reconciliation Journal** page so you can apply payments and reconcile the bank account. For more information, see [Applying Payments Automatically and Reconciling Bank Accounts](#).

NOTE

The Envestnet Yodlee Bank Feeds service is only supported in the online version of Business Central. To use this functionality on-premises, you must obtain a cobrand account from Envestnet Yodlee.

The Envestnet Yodlee Bank Feeds service is only supported in the US, Canada, and UK.

The Envestnet Yodlee Bank Feeds service is installed as an extension to Business Central online and is ready to be enabled in the supported countries. For more information, see [Customizing Business Central Using Extensions](#).

After you enable the bank feed service, you must link a bank account to the online bank account that the feed will come from. You link bank accounts to online bank accounts in the following different scenarios:

- A bank account does not exist in Business Central for your online bank account. Therefore, you create the bank account by linking from the online bank account.
- A bank account exists in Business Central, which you want to link to an online bank account.
- A linked bank account must be unlinked because you want to stop using the bank feed service for the account.
- Online bank accounts have changed and you want to update the information on bank accounts in Business Central.

When the bank feed service is enabled, you can set a bank account up to automatically import new bank statements into the **Payment Reconciliation Journal** page every two hour. Transactions for payments that have already been posted as applied and/or reconciled on the **Payment Reconciliation Journal** page will not be imported. For more information, see the "To enable automatic import of bank statements" section.

NOTE

If you use the Set Up Company assisted setup guide, some of the steps in the following procedures happen automatically when you get to the company bank account setup. For more information, see [Getting Started](#).

To enable the bank feed service

1. Choose the  icon, enter **Bank Accounts**, and then choose the related link.
2. Open the bank account that you will use for the bank feed service.
3. On the **Bank Account** page, in the **Bank Statement Import Format** field, select YODLEEBANKFEED.

The bank feed service will be enabled when you link a bank account to its related online bank account. See the next procedure.

NOTE

If you use the **Company Setup** assisted setup guide, then you enable the service by selecting the **Use a bank feed service** check box. For more information, see [Creating New Companies in Business Central](#).

To create a new linked bank account

1. Choose the  icon, enter **Bank Accounts**, and then choose the related link.
2. Select the relevant bank account, and then choose the **Create New Linked Bank Account**. The **Bank Account Linking** page opens after a few moments.

NOTE

This page shows the actual web page of the Envestnet Yodlee Bank Feeds service. Terminology and functionality on the page may not match instructions provided in this topic.

3. On the **Online Bank Account Linking** page, in the **Link Account** pane, use the Search function to find the bank where you have one or more online bank accounts.
4. Choose the bank name. The **Log In** pane opens.
5. Enter the username and password that you use to log on to the online bank, and then choose the **Next** button.
6. The bank feed service prepares to link the first online bank account at the specified bank to a new bank account in Business Central.

NOTE

If you have more than one online bank account at the bank, you must create additional bank accounts in Business Central for them. See steps 8 through 10.

After the process completes, the bank name will appear in the **My Accounts** pane on the **Linked** tab. The number in brackets indicates how many online bank accounts were linked.

7. Choose the **OK** button.

If you are only linking one online bank account, the **Bank Account Card** page opens and displays the name of the online bank account. In this case, the bank account linking task is completed. All that's left to do is to set up the bank account. For more information, see [Set Up Bank Accounts](#).

If you are linking more than one online bank accounts, the **Bank Account Linking** page opens and lists the online bank accounts that are not yet linked to bank accounts in Business Central. In that case, follow the next step.

8. On the **Bank Account Linking** page, select the line for an online bank account, and then choose the **Link to New Bank Account** action.

The **Bank Account Card** page for a new bank account opens and displays the name of the online bank account.

If a bank account already exists in Business Central that you want to link the additional online bank account to, follow the next step.

9. On the **Bank Account Linking** page, select the line for an online bank account, and then choose the

Link to Existing Bank Account action.

10. On the **Bank Account List** page, select the bank account that you want to link to, and then choose the **OK** button.

To link a bank account to an online bank account

1. Choose the  icon, enter **Bank Accounts**, and then choose the related link.
2. Select the line for a bank account that is not linked to an online bank account, and then choose the **Link to Online Bank Account** action. The **Online Bank Account Linking** page opens with the name of the bank prefilled in the **Link Account** pane.
3. Choose the bank name. The **Log In** pane opens.
4. Enter the username and password that you use to log on to the online bank, and then choose the **Next** button.

The bank feed service prepares to link your bank account in Business Central to the related online bank account.

When the process has completed successfully, the bank name will appear in the **My Accounts** pane on the **Linked** tab. If the bank has more than one bank account, only the bank account that you selected in step 2 is linked.

5. Choose the **OK** button.

On the **Bank Account List** page, the **Linked** check box is selected.

To unlink a bank account

1. Choose the  icon, enter **Bank Accounts**, and then choose the related link.
2. Select the line for a linked bank account that you want to unlink from its related online bank account, and then choose the **Unlink Online Bank Account** action.

NOTE

If you choose **Yes** on the confirmation dialog, the link to the online bank account is removed, and the log-in details are cleared. To link the bank account to the online bank account again, you must log on to the bank again. For more information, see the "To link a bank account to an online bank account" section.

To update bank account linking

1. Choose the  icon, enter **Bank Accounts**, and then choose the related link.
2. Select the relevant bank account, and then choose the **Update Bank Account Linking** action.

If issues exist for any of the linked bank accounts on the **Bank Account List** page, the **Bank Account Linking** page opens specifying which bank accounts have issues. Issues can best be resolved by unlinking the online bank account and then re-creating the link. For more information, see the "To link a bank account to an online bank account" section.

To enable automatic import of bank statements

1. Choose the  icon, enter **Bank Accounts**, and then choose the related link.
2. Select the line for a linked bank account, and then choose the **Automatic Bank Statement Import**

Setup action.

3. On the **Automatic Bank Statement Import Setup** page, in the **Number of Days Included** field, specify how far back in time to get new bank transactions for.

NOTE

It is recommended that you set this value to 7 days or more.

4. Select the **Enabled** check box.

Every hour, the **Payment Reconciliation Journal** page will display new payments that are made on the online bank account.

NOTE

Transactions for payments that have already been posted as applied and/or reconciled on the **Payment Reconciliation Journal** page will not be imported.

[Working with Business Central](#)

Export Payments to a Bank File

5 minutes to read

When you are ready to make payments to your vendors, or reimbursements to your employees, you can export a file with the payment information on the lines on the **Payment Journal** page. You can then upload the file to your bank to process the related money transfers.

In the generic version of Business Central, a global provider of services to convert bank data to any file format that your bank requires is set up and connected. In North American versions, the same service can be used to send payment files as electronic funds transfer (EFT), however with a slightly different process. See step 6 in [To export payments to a bank file](#).

NOTE

Before you can export payment files from the payment journal, you must specify the electronic format for the involved bank account, and you must enable the bank data conversion service. For more information, see [Set Up Bank Accounts](#) and [Set Up the Bank Data Conversion Service](#). In addition, you must select the **Allow Payment Export** check box on the **General Journal Batches** page. For more information, see [Working with General Journals](#).

You use the **Credit Transfer Registers** page to view the payment files that have been exported from the payment journal. From this page, you can also re-export payment files in case of technical errors or file changes. Note, however, that exported EFT files are not shown in this page and cannot be re-exported.

To export payments to a bank file

The following describes how to pay a vendor by check. The steps are similar to refund a customer by check.

1. Choose the  icon, enter **Payment Journals**, and then choose the related link.
2. Fill in the payment journal lines. For more information, see [Record Payments and Refunds](#).

NOTE

If you are using EFT, you must select either **Electronic Payment** or **Electronic Payment-IAT** in the **Bank Payment Type** field. Different file export services and their formats require different setup values in the **Bank Account Card** and **Vendor Bank Account Card** pages. You will be informed about wrong or missing setup values as you try to export the file.

3. When you have completed all payment journal lines, choose the **Export** action.
4. On the **Export Electronic Payments** page, fill in the fields as necessary.

Any error messages will be shown in the **Payment File Errors** FactBox where you can also choose an error message to see detailed information. You must resolve all errors before the payment file can be exported.

TIP

When you use the bank data conversion service, a common error message states that the bank account number does not have the length that your bank requires. To avoid or resolve the error, you must remove the value in the **IBAN** field on the **Bank Account Card** page and then, in the **Bank Account No.** field, enter a bank account number in the format that your bank requires.

5. On the **Save As** page, specify the location that the file is exported to, and then choose **Save**.

NOTE

If you are using EFT, save the resulting vendor remittance form as a Word document or select to have it emailed directly to the vendor. The payments are now added to the **Generate EFT File** page from where you can generate multiple payment orders together to save transmission cost. For more information, see the following steps.

6. On the **Payment Journal** page, choose the **Generate EFT File** action.

On the **Generate EFT File** page, all payments set up for EFT that you have exported from the payment journal for a specified bank account but not yet generated are listed on the **Lines** FastTab.

7. Choose the **Generate EFT File** action to export one file for all the EFT payments.

8. On the **Save As** page, specify the location that the file is exported to, and then choose **Save**.

The bank payment file is exported to the location that you specify, and you can proceed to upload it to your electronic bank account and make the actual payments. Then you can post the exported payment journal lines.

To plan when to post exported payments

If you do not want to post a payment journal line for an exported payment, for example because you are waiting for confirmation that the transaction has been processed by the bank, you can just delete the journal line. When you later create a payment journal line to pay the remaining amount on the invoice, the **Total Exported Amount** field shows how much of the payment amount has already been exported. Also, you can find detailed information about the exported total by choosing the **Credit Transfer Reg. Entries** button to see details about exported payment files.

If you follow a process where you do not post payments until you have confirmation that they have been processed in the bank, you can control this in two ways.

- In a payment journal with suggested payment lines, you can sort on either the **Exported to Payment File** column or the **Total Exported Amount** and then delete payment suggestions for open invoices for which payments have already been made and you do not want to make payments for.
- On the **Suggest Vendor Payments** page, where you specify which payments to insert in the payment journal, you can select the **Skip Exported Payments** check box if you do not want to insert journal lines for payments that have already been exported.

To see information about exported payments, choose the **Payment Export History** action.

To re-export payments to a bank file

You can re-export payment files from the **Credit Transfer Registers** page. Before you delete or post payment journal lines, you can also re-export the payment file from the **Payment Journal** page by simply exporting it again. If you have deleted or posted the payment journal lines after exporting them, you can re-export the same payment file from the **Credit Transfer Registers** page. Select the line for the batch of credit transfers that you want to re-export, and then use the **Reexport Payments to File** action.

NOTE

Exported EFT files are not shown on the **Credit Transfer Registers** page and cannot be re-exported.

1. Choose the  icon, enter **Credit Transfer Registers**, and then choose the related link.
2. Select a payment export that you want to re-export, and then choose the **Reexport Payment to File** action.

Making Payments with Bank Data Conversion Service or SEPA Credit Transfer

4/12/2019 • 9 minutes to read

On the **Payment Journal** page, you can process payments to your vendors by exporting a file together with the payment information from the journal lines. You can then upload the file to your electronic bank where the related money transfers are processed. Business Central supports the SEPA Credit Transfer format, but in your country/region, other formats for electronic payments may be available.

In the generic version of Business Central, a global provider of services to convert bank data to any file format that your bank requires is set up and connected. In North American versions, the same service can be used to send payment files as electronic funds transfer (EFT), however with a slightly different process. See step 6 in [To export payments to a bank file](#).

To enable SEPA credit transfers, you must first set up a bank account, a vendor, and the general journal batch that the payment journal is based on. You then prepare payments to vendors by automatically filling the **Payment Journal** page with due payments with specified posting dates.

NOTE

When you have verified that the payments are successfully processed by the bank, you can proceed to post the payment journal lines.

Setting Up the Bank Data Conversion Service.

Activate the Bank Data Conversion Service feature to have any bank statement file converted to a format that you can import or to have your exported payment files converted to the format that your bank requires. For more information, see [Set Up the Bank Data Conversion Service](#).

Setting Up SEPA Credit Transfer

From the **Payment Journal** page, you can export payments to a file for upload to your electronic bank for processing of the related money transfers. Business Central supports the SEPA Credit Transfer format, but in your country/region, other formats for electronic payments may be available.

To enable export of a bank file formats that are not supported out of the box in Business Central, you can set up a data exchange definition by using the data exchange framework. For more information, see [Set Up Data Exchange Definitions](#).

Before you can process payment electronically by exporting payment files in the SEPA Credit Transfer format, you must perform the following setup steps:

- Set up the bank account in question to handle the SEPA Credit Transfer format
- Set up vendor cards to process payments by exporting files in the SEPA Credit Transfer format
- Set up the related general journal batch to enable payment export from the **Payment Journal** page
- Connect the data exchange definition for one or more payment types with the relevant payment method or methods

To set up a bank account for SEPA Credit Transfer

1. In the **Search** box, enter **Bank Accounts**, and then choose the related link.

2. Open the card of the bank account from which you will export payment files in the SEPA Credit Transfer format.
3. On the **Transfer** FastTab, in the **Payment Export Format** field, choose **SEPADD**.
4. In the **SEPA CT Msg. ID No. Series** field, choose a number series from which numbers are assigned to SEPA credit transfer entries.
5. Make sure the **IBAN** field is filled.

NOTE

The **Currency Code** field must be set to **EUR**, because SEPA credit transfers can only be made in the EURO currency.

To set up a vendor card for SEPA Credit Transfer

1. In the **Search** box, enter **Vendors**, and then choose the related link.
2. Open the card of the vendor whom you will pay electronically by export payment files in the SEPA Credit Transfer format.
3. On the **Payment** FastTab, in the **Payment Method Code** field, choose **BANK**.
4. In the **Preferred Bank Account** field, choose the bank to which the money will be transferred when it is processed by your electronic bank.

The value in the **Preferred Bank Account** field is copied to the **Recipient Bank Account** field on the **Payment Journal** page.

To set the payment journal up to export payment files

1. In the **Search** box, enter **Payment Journals**, and then choose the related link.
2. Open the payment journal that you use to process payments by exporting files in the SEPA Credit Transfer format.
3. In the **Batch Name** field, choose the drop-down button.
4. On the **General Journal Batches** page, on the **Home** tab, in the **Manage** group, choose **Edit List**.
5. On the line for the payment journal that you will use to export payments, select the **Allow Payment Export** check box.

To connect the data exchange definition for one or more payment types with the relevant payment method or methods

1. In the **Search** box, enter **Payment Methods**, and then choose the related link.
2. On the **Payment Methods** page, select the payment method that is used to export payments from, and then choose the **Pmt. Export Line Definition** field.
3. On the **Pmt. Export Line Definitions** page, select the code that you specified in the **Code** field on the **Line Definitions** FastTab in step 4 in the "To describe the formatting of lines and columns in the file" section in the [Set Up Data Exchange Definitions](#) procedure.

The direct-debit mandate is automatically inserted in the **Direct Debit Mandate ID** field when you create a sales invoice for the customer that you selected in step 2. For more information, see [Create Recurring Sales and Purchase Lines](#).

Preparing the Payment Journal

Fill the payment journal with lines for due payments to vendors, with the option to insert posting dates based on the due date of the related purchase documents. For more information, see [Managing Payables](#).

Exporting Payments to a Bank File

When you are ready to make payments to your vendors, or reimbursements to your employees, you can export a file with the payment information on the lines on the **Payment Journal** page. You can then upload the file to your bank to process the related money transfers.

In the generic version of Business Central, the Bank Data Conversion service is set up and connected. In North American versions, the same service can be used to send payment files as electronic funds transfer (EFT), however with a slightly different process. See step 6 in [To export payments to a bank file](#).

NOTE

Before you can export payment files from the payment journal, you must specify the electronic format for the involved bank account, and you must enable the bank data conversion service. For more information, see [Set Up Bank Accounts](#) and [Set Up the Bank Data Conversion Service](#). In addition, you must select the **Allow Payment Export** check box on the **General Journal Batches** page. For more information, see [Working with General Journals](#).

You use the **Credit Transfer Registers** page to view the payment files that have been exported from the payment journal. From this page, you can also re-export payment files in case of technical errors or file changes. Note, however, that exported EFT files are not shown in this page and cannot be re-exported.

To export payments to a bank file

The following describes how to pay a vendor by check. The steps are similar to refund a customer by check.

1. Choose the  icon, enter **Payment Journals**, and then choose the related link.
2. Fill in the payment journal lines. For more information, see [Record Payments and Refunds](#).

NOTE

If you are using EFT, you must select either **Electronic Payment** or **Electronic Payment-IAT** in the **Bank Payment Type** field. Different file export services and their formats require different setup values in the **Bank Account Card** and **Vendor Bank Account Card** pages. You will be informed about wrong or missing setup values as you try to export the file.

3. When you have completed all payment journal lines, choose the **Export** action.
4. On the **Export Electronic Payments** page, fill in the fields as necessary.

Any error messages will be shown in the **Payment File Errors** FactBox where you can also choose an error message to see detailed information. You must resolve all errors before the payment file can be exported.

TIP

When you use the bank data conversion service, a common error message states that the bank account number does not have the length that your bank requires. To avoid or resolve the error, you must remove the value in the **IBAN** field on the **Bank Account Card** page and then, in the **Bank Account No.** field, enter a bank account number in the format that your bank requires.

5. On the **Save As** page, specify the location that the file is exported to, and then choose **Save**.

NOTE

If you are using EFT, save the resulting vendor remittance form as a Word document or select to have it emailed directly to the vendor. The payments are now added to the **Generate EFT File** page from where you can generate multiple payment orders together to save transmission cost. For more information, see the following steps.

6. On the **Payment Journal** page, choose the **Generate EFT File** action.

On the **Generate EFT File** page, all payments set up for EFT that you have exported from the payment journal for a specified bank account but not yet generated are listed on the **Lines** FastTab.

7. Choose the **Generate EFT File** action to export one file for all the EFT payments.

8. On the **Save As** page, specify the location that the file is exported to, and then choose **Save**.

The bank payment file is exported to the location that you specify, and you can proceed to upload it to your electronic bank account and make the actual payments. Then you can post the exported payment journal lines.

To plan when to post exported payments

If you do not want to post a payment journal line for an exported payment, for example because you are waiting for confirmation that the transaction has been processed by the bank, you can just delete the journal line. When you later create a payment journal line to pay the remaining amount on the invoice, the **Total Exported Amount** field shows how much of the payment amount has already been exported. Also, you can find detailed information about the exported total by choosing the **Credit Transfer Reg. Entries** button to see details about exported payment files.

If you follow a process where you do not post payments until you have confirmation that they have been processed in the bank, you can control this in two ways.

- In a payment journal with suggested payment lines, you can sort on either the **Exported to Payment File** column or the **Total Exported Amount** and then delete payment suggestions for open invoices for which payments have already been made and you do not want to make payments for.
- On the **Suggest Vendor Payments** page, where you specify which payments to insert in the payment journal, you can select the **Skip Exported Payments** check box if you do not want to insert journal lines for payments that have already been exported.

To see information about exported payments, choose the **Payment Export History** action.

To re-export payments to a bank file

You can re-export payment files from the **Credit Transfer Registers** page. Before you delete or post payment journal lines, you can also re-export the payment file from the **Payment Journal** page by simply exporting it again. If you have deleted or posted the payment journal lines after exporting them, you can re-export the same payment file from the **Credit Transfer Registers** page. Select the line for the batch of credit transfers that you want to re-export, and then use the **Reexport Payments to File** action.

NOTE

Exported EFT files are not shown on the **Credit Transfer Registers** page and cannot be re-exported.

1. Choose the  icon, enter **Credit Transfer Registers**, and then choose the related link.
2. Select a payment export that you want to re-export, and then choose the **Reexport Payment to File** action.

Posting the Payments

When the electronic payment is successfully processed by the bank, post the payments. For more information, see [Making Payments](#).

Collect Payments with SEPA Direct Debit

Collect Payments with SEPA Direct Debit

3/31/2019 • 9 minutes to read

With your customer's consent, you can collect payments directly from the customer's bank account according to the SEPA format.

First, set up the export format of the bank file that instructs your bank to perform a direct debit. Then, set up the customer's payment method. Last, set up the direct-debit mandate that reflects your agreement with the customer to collect their payments in a certain agreement period.

To instruct the bank to transfer the payment amount from the customer's bank account to your company's account, you create a direct-debit collection entry, which holds information about bank accounts, the affected sales invoices, and the direct-debit mandate. You then export an XML file that is based on the collection entry, which you send to your bank for processing. Any payments that could not be processed will be communicated to you by your bank, and you must then manually reject the direct debit-collection entries in question.

You can set up standard customer sales codes with the direct-debit payment method and mandate information. You can then use the **Create Standard Cust. Invoices** batch job to generate multiple sales invoices with the direct-debit information prefilled. This can be done manually or automatically, according to the payment due date.

When payments are successfully processed, as communicated by your bank, you can post the payment receipts either directly from the **Direct Debit Collect. Entries** page or by moving the payment lines to the journal where you post payment receipts, such as the **Cash Receipt Journal** page. Alternatively, depending on your cash management process, you can wait and just apply the payments as a part of bank reconciliation.

NOTE

To collect payments using SEPA Direct Debit, the currency on the sales invoice must be EURO.

Setting Up SEPA Direct Debit

From the **Direct Debit Collections** page, you can export instructions to your electronic bank to perform a direct debit collection from the customer's bank account to your bank account. Business Central supports the SEPA direct debit format, but in your country/region, other formats for electronic payments may be available.

To enable export of a bank file formats that are not supported out of the box in Business Central, you can set up a data exchange definition by using the data exchange framework. For more information, see [Set Up Data Exchange Definitions](#).

Before you can process customer payments electronically by exporting direct debit instructions in the SEPA Direct Debit format, you must perform the following setup steps:

- Set up the export format of the bank file that instructs your bank to perform a direct debit collection from the customer's bank account to your bank account.
- Set up the customer's payment method.
- Set up the direct-debit mandate that reflects your agreement with the customer to collect their payments in a certain agreement period.

To set up your bank account for SEPA direct debit

1. In the **Search** box, enter **Bank Accounts**, and then choose the related link.
2. Open the bank account that you want to use for direct debit.

- On the **Transfer** FastTab, in the **SEPA Direct Debit Export Format** field, choose the option for SEPA direct debit.

To set up the customer's payment method for SEPA direct debit

- In the **Search** box, enter **Payment Methods**, and then choose the related link.
- Choose the **New** action.
- Set up a payment method. Fill in the direct debit-specific fields as described in the following table.

FIELD	DESCRIPTION
Direct Debit	Specify if the payment method is for SEPA direct debit collection.
Direct Debit Pmt. Terms Code	Specify the payment terms, such as DON'T PAY, that are displayed on sales invoices that are paid with SEPA direct debit to indicate to the customer that the payment will be collected automatically. Alternatively, leave the field empty.

NOTE

Do not enter a value in the **Bal. Account No.** field.

- Choose the **OK** button to close the **Payment Methods** page.
- In the **Search** box, enter **Customers**, and then choose the related link.
- Open the customer card for the customer that you want to set up for SEPA direct debit collection.
- Choose the **Payment Method Code** field, and then select the payment method code that you specified in step 3.
- Repeat steps 6 and 7 for all customers that you want to set up for SEPA direct debit collection.

To set up the direct-debit mandate that represents the customer agreement

- In the **Search** box, enter **Customers**, and then choose the related link.
- Open the card for the customer that you want to set up for SEPA direct debits.
- Choose the **Bank Accounts** action.
- On the **Customer Bank Account List** page, select the customer bank account that will use direct debits, and then, on the **Home** tab, in the **Process** group, choose **Direct Debit Mandates**.
- On the **SEPA Direct Debit Mandates** page, fill in the fields as described in the following table.

FIELD	DESCRIPTION
Customer Bank Account Code	Specifies the bank account from which direct-debit payments are collected. This field is filled automatically.
Valid From	Specify the date when the direct-debit mandate starts.
Valid To	Specify the date when the direct-debit mandate ends.
Date of Signature	Specify the date when the customer signed the direct-debit mandate.

FIELD	DESCRIPTION
Sequence Type	Specify if the agreement covers multiple (Recurring) or a single (One Off) direct debit collection.
Expected Number of Debits	Specify how many direct debit collections you expect to make. This field is only relevant if you selected Recurring in the Sequence Type field.
Debit Counter	Specifies how many direct debit collections have been made using this direct-debit mandate. This field is automatically updated.
Blocked	Specify that direct debit collections cannot be made using this direct-debit mandate.

6. Repeat steps 1 through 5 for all customers that you want to set up for SEPA direct debits.

The direct-debit mandate is automatically inserted in the **Direct Debit Mandate ID** field when you create a sales invoice for the customer that you selected in step 2. For more information, see [Create Recurring Sales and Purchase Lines](#).

Creating SEPA Direct Debit Collection Entries and Export to a Bank File

To instruct the bank to transfer the payment amount from the customer's bank account to your company's account, you create a direct-debit collection, which holds information about the customer's bank account, the affected sales invoices, and the direct-debit mandate. From the resulting direct-debit collection entry, you then export an XML file that you send or upload to your electronic bank for processing. Any payments that could not be processed by the bank will be communicated to you by your bank, and you must then manually reject the direct debit-collection entries in question.

NOTE

To collect payments using SEPA Direct Debit, the currency on the sales invoice must be EURO.

To create a direct-debit collection

1. Choose the  icon, enter **Direct Debit Collections**, and then choose the related link.
2. On the **Direct Debit Collections** page, on the **Home** tab, in the **New** group, choose **Create Direct Debit Collection**.
3. On the **Create Direct Debit Collection** page, fill in the fields as described in the following table.

FIELD	DESCRIPTION
From Due Date	Specify the earliest payment due date on sales invoices that you want to create a direct-debit collection for.
To Due Date	Specify the latest payment due date on sales invoices that you want to create a direct-debit collection for.
Partner Type	Specify if the direct-debit collection is made for customers of type Company or Person .

FIELD	DESCRIPTION
Only Customers With Valid Mandate	Specify if a direct-debit collection is created for customers who have a valid direct-debit mandate. Note: A direct-debit collection is created even if the Direct Debit Mandate ID field is not filled on the sales invoice.
Only Invoices With Valid Mandate	Specify if a direct-debit collection is only created for sales invoices if a valid direct-debit mandate is selected in the Direct Debit Mandate ID field on the sales invoice.
Bank Account No.	Specify which of your company's bank accounts the collected payment will be transferred to from the customer's bank account.
Bank Account Name	Specifies the name of the bank account that you select in the Bank Account No. field. This field is filled automatically.

4. Choose the **OK** button.

A direct-debit collection is added to the **Direct Debit Collections** page, and one or more direct-debit collection entries are created.

To export a direct-debit collection entry to a bank file

1. On the **Direct Debit Collections** page, on the **Home** tab, in the **Process** group, choose **Direct Debit Collect. Entries**.
2. On the **Direct Debit Collect. Entries** page, select the entry that you want to export, and then, on the **Home** tab, in the **Process** group, choose **Create Direct Debit File**.
3. Save the export file to the location from where you send or upload it to your electronic bank.

On the **Direct Debit Collect. Entries** page, the **Direct Debit Collection Status** field is changed to File Created. On the **SEPA Direct Debit Mandates** page, the **Debit Counter** field is updated with one count.

If the exported file cannot be processed, for example because the customer is insolvent, you can reject the direct-debit collection entry. If the exported file is successfully processed by the bank, the due payments of the involved sales invoices are automatically collected from the involved customers. In that case you can close the collection.

To reject a direct-debit collection entry

- On the **Direct Debit Collect. Entries** page, select the entry that was not successfully processed, and then, on the **Home** tab, in the **Process** group, choose **Reject Entry**.

The value in the **Status** field on the **Direct Debit Collect. Entries** page is changed to **Rejected**.

To close a direct-debit collection

- On the **Direct Debit Collect. Entries** page, select the entry that was successfully processed, and then, on the **Home** tab, in the **Process** group, choose **Close Collection**.

The related direct-debit collection is closed.

You can now proceed to post receipts of payment for the involved sales invoices. You can do this as you typically post payment receipts, such as on the **Payment Registration** page, or you can post the related payment receipts directly from the **Direct Debit Collect. Entries** page. For more information, see [Post SEPA Direct Debit Payment Receipts](#).

Posting SEPA Direct Debit Payment Receipts

When a direct debit collection is successfully processed by your bank, you can proceed to post receipt of the payment for the involved sales invoices. For more information, see [Create SEPA Direct Debit Collection Entries and Export to a Bank File](#).

You can post the payment receipt directly from the **Direct Debit Collections** page or the **Direct Debit Collect. Entries** page. Alternatively, you can relay the work to another user by preparing the related journal lines.

To post a direct-debit payment receipt from the Direct Debit Collections page

1. Choose the  icon, enter **Direct Debit Collections**, and then choose the related link.
2. Select a line for a direct debit collection that has been exported to a bank file and successfully processed by the bank. For more information, see [Create SEPA Direct Debit Collection Entries and Export to a Bank File](#).
3. Choose the **Post Payment Receipts** action.
4. On the **Post Direct Debit Collection** page, fill in the fields as described in the following table.

FIELD	DESCRIPTION
Direct Debit Collection No.	Specify the direct debit collection that you want to post payment receipt for.
General Journal Template	Specify which general journal template to use for posting the payment receipt, such as the template for cash receipts.
General Journal Batch Name	Specify which general journal batch to use for posting the payment receipt.
Create Journal Only	Select this check box if you do not want to post the payment receipt when you choose the OK button. The payment receipt will be prepared in the specified journal and will not be posted until someone posts the journal lines in question.

5. Choose the **OK** button.

[Managing Receivables](#)

Update Currency Exchange Rates

6/6/2019 • 4 minutes to read

As companies operate in increasingly more countries/regions, it becomes more important that they be able to trade and report financials in more than one currency. You must set up a code for each currency you use if you buy or sell in currencies other than your local currency, have receivables or payables in other currencies, or record G/L transactions in different currencies.

Your general ledger is set up to use your local currency (LCY), but you can set it up to also use another currency with a current exchange rate assigned. By designating a second currency as a so-called additional reporting currency, Business Central will automatically record amounts in both LCY and this additional reporting currency on each G/L entry and other entries, such as VAT entries. For more information, see [Set Up an Additional Reporting Currency](#).

Adjusting Exchange Rates

Because exchange rates fluctuate constantly, additional currency equivalents in your system must be adjusted periodically. If these adjustments are not done, amounts that have been converted from foreign (or additional) currencies and posted to the general ledger in LCY may be misleading. In addition, daily entries posted before a daily exchange rate is entered into the program must be updated after the daily exchange rate information is entered.

The **Adjust Exchange Rates** batch job is used to manually adjust the exchange rates of posted customer, vendor and bank account entries. It can also update additional reporting currency amounts on G/L entries. You can also have the exchange rates adjusted automatically by using a service. For more information, see [To set up a currency exchange rate service](#).

Effect on Customers and Vendors

For customer and vendor accounts, the batch job adjusts the currency by using the exchange rate that is valid on the posting date that is specified in the batch job. The batch job calculates the differences for the individual currency balances and posts the amounts to the general ledger account that is specified in the **Unrealized Gains Acc.** field or the **Unrealized Losses Acc.** field on the **Currencies** page. Balancing entries are automatically posted to the receivables/payables account in the general ledger.

The batch job processes all open customer ledger entries and vendor ledger entries. If there is an exchange rate difference for an entry, the batch job creates a new detailed customer or vendor ledger entry which reflects the adjusted amount on the customer or vendor ledger entry.

Dimensions on Customer and Vendor Ledger Entries

The adjustment entries are assigned the dimensions from the customer/vendor ledger entries, and the adjustments are posted per combination of dimension values.

Effect on Bank Accounts

For bank accounts, the batch job adjusts the currency by using the exchange rate that is valid on the posting date specified in the batch job. The batch job calculates the differences for each bank account that has a currency code and posts the amounts to the general ledger account that is specified in the **Realized Gains Acc.** field or the **Realized Losses Acc.** field on the **Currencies** page. Balancing entries are automatically posted to the general ledger bank accounts that are specified in the bank account posting groups. The batch job calculates one entry per currency per posting group.

Dimensions on Bank Account Entries

The adjustment entries for the bank account's general ledger account and for the gain/loss account are assigned the

bank account's default dimensions.

Effect on G/L Accounts

If you post in an additional reporting currency, you can have the batch job create new general ledger entries for currency adjustments between LCY and the additional reporting currency. The batch job calculates the differences for each general ledger entry and adjusts the general ledger entry depending on the contents of the **Exchange Rate Adjustment** field for each general ledger account.

Dimensions on G/L Account Entries

The adjustment entries are assigned the default dimensions from the accounts they are posted to.

IMPORTANT

Before you can use the batch job, you must enter the adjustment exchange rates that are used to adjust the foreign currency balances. You do so on the **Currency Exchange Rates** page.

To set up a currency exchange rate service

You can use an external service to keep your currency exchange rates up to date, such as FloatRates.

1. Choose the  icon, enter **Currency Exchange Rate Services**, and then choose the related link.
2. Choose the **New** action.
3. On the **Currency Exchange Rate Service** page, fill in the fields as necessary. Hover over a field to read a short description.
4. Choose the **Enabled** check box to enable the service.

To update currency exchange rates through a service

1. Choose the  icon, enter **Currencies**, and then choose the related link.
2. Choose the **Update Exchange Rates** action.

The value in the **Exchange Rate** field on the **Currencies** page is updated with the latest currency exchange rate.

Field Mapping When Importing SEPA CAMT Files

3/31/2019 • 3 minutes to read

Business Central supports the regional SEPA standards (Single Euro Payments Area) for importing SEPA bank statements (CAMT format). For more information, see [Set Up the Bank Data Conversion Service](#).

The SEPA CAMT standard itself has local variations. Therefore, you may have to modify the generic data exchange definition (represented by the **SEPA CAMT** code on the **Posting Exchange Definitions** page) to adapt it to a local variation of the standard. The following tables show the element-to-field mapping for tables 81, 273, and 274 in the SEPA CAMT implementation in Business Central.

For information about creating or adjusting a data exchange definition, see [Set Up Data Exchange Definitions](#).

CAMT data mapping to fields in the General Journal table (81)

ELEMENT PATH	MESSAGE ELEMENT	DATA TYPE	DESCRIPTION	NEGATIVE-SIGN IDENTIFIER	FIELD NO.	FIELD NAME
Stmt/Ntry/Amount	Amount	Decimal	The amount of money in the cash entry		13	Amount
Stmt/Ntry/CdtDbtInd	CreditDebitIndicator	Text	Indicates whether the entry is a credit or a debit entry	DBIT	13	Amount
Stmt/Ntry/BookDt/Dt	Date	Date	The date when an entry is posted to an account on the account servicer's books		5	Posting Date
Stmt/Ntry/BookDt/DtTm	DateTime	DateTime	The date and time when an entry is posted to an account on the account servicer's books		5	Posting Date

ELEMENT PATH	MESSAGE ELEMENT	DATA TYPE	DESCRIPTION	NEGATIVE-SIGN IDENTIFIER	FIELD NO.	FIELD NAME
Stmt/Ntry/NtryDtls/TxDtls/RelatedPties/Dbtr/Nm	Name	Text	The name of the party that owes an amount of money to the (ultimate) creditor		15	Payer Information
Stmt/Ntry/NtryDtls/TxDtls/RmtInf/Ustrd	Unstructured	Text	Information supplied to enable the matching/reconciliation of an entry with the items that the payment is intended to settle, such as commercial invoices in an accounts-receivable system, in an unstructured form		6	Description
Stmt/Ntry/AdditionalNtryInf	AdditionalEntryInformation	Text	Additional information about the entry		16	Transaction Information

Elements in the **Ntry** node that are imported into Business Central but not mapped to any fields are stored in the **Posting Exch. Column Def** table. Users can view these elements from the **Payment Reconciliation Journal**, **Payment Application**, and **Bank Acc. Reconciliation** pages by choosing the **Bank Statement Line Details** action. For more information, see [Reconcile Payments Using Automatic Application](#).

Field Mapping When Exporting Payment Files Using Bank Data Conversion Service

3/31/2019 • 4 minutes to read

When you export payment files using the Bank Data Conversion Service feature, the data that you export is exposed to the provider of the bank data conversion service. The service provider is responsible for the privacy of this data. For more information about how the Bank Data Conversion Service feature works, see [About the Data Exchange Framework](#).

Caution

When you export payment files by using the Bank Data Conversion Service feature, some of your business data will be exposed to the provider of the service. The service provider, AMC Consult A/S, is responsible for the privacy of this data. For more information, see [AMC Privacy Policy](#).

The following table lists the fields in Business Central from which data can be exported to the service provider.

MAPPED FIELD	FIELD IN TABLE	TABLE	DESCRIPTION
Creditor No.	Creditor No.	Bank Account	The identifier assigned to your company by your bank to collect payments
Sender Bank Account No.	Bank Account No./IBAN	Bank Account	Your company's bank account number (IBAN or other) that is specified on the bank account card
Sender Bank Clearing Standard	Bank Clearing Standard	Bank Account	The national bank names register used for the sender bank account
Sender Bank Clearing Code	Bank Clearing Code	Bank Account	The identifier of the sender's bank in relation to the bank names register used
Sender Bank BIC	SWIFT Code	Bank Account	The SWIFT identifier of the sender bank account
Sender Bank Account Currency	Currency Code	Bank Account	The sender bank account Currency Code
Document No.	Document No.	General Journal Line	The document number of the payment line
Applies-to Ext. Doc. No.	Applies-to Ext. Doc. No.	General Journal Line	The external document number of the invoice or credit memo that the payment line is applied to
Recipient ID	Account No.	General Journal Line	The customer or vendor number that is specified on the payment line

MAPPED FIELD	FIELD IN TABLE	TABLE	DESCRIPTION
Payment Type	Bank Data Conversion Pmt. Type	Payment Method	The type of bank transfer, such as domestic or international
Payment Reference	Payment Reference	General Journal Line	The payment reference of the payment line
Recipient Address	Address	Customer/Vendor	The recipient address that is specified on the customer or vendor card
Recipient City	City	Customer/Vendor	The recipient city that is specified on the customer or vendor card
Recipient Name	Name	Customer/Vendor	The recipient name that is specified on the customer or vendor card
Recipient Country/Region Code	Country/Region Code	Customer/Vendor	The recipient country/region code that is specified on the customer or vendor card
Recipient Post Code	Post Code	Customer/Vendor	The recipient post code that is specified on the customer or vendor card
Recipient Bank Acc. No.	Bank Account No./IBAN	Customer Bank Account/Vendor Bank Account	The recipient bank account number (IBAN or other) that is specified on the customer or vendor bank account card
Recipient Bank Clearing Code	Bank Clearing Standard	Customer Bank Account/Vendor Bank Account	The national bank names register used for the recipient bank account
Recipient Bank Clearing Std.	Bank Clearing Code	Customer Bank Account/Vendor Bank Account	The identifier of the recipient bank account in relation to the bank names register that is used
Recipient Email Address	E-Mail	Customer/Vendor	The email address of the recipient
Message To Recipient 1	Message to Recipient	General Journal Line	The message to recipient that is specified on the payment line
Amount	Amount	General Journal Line	The amount on the payment line
Currency Code	Currency Code	General Journal Line	The currency code on the payment line

MAPPED FIELD	FIELD IN TABLE	TABLE	DESCRIPTION
Transfer Date	Posting Date	General Journal Line	The posting date of the payment line
Invoice Amount	Original Amount	Customer/Vendor Ledger Entry	The amount on the entry that the payment is applied to
Invoice Date	Document Date	Customer/Vendor Ledger Entry	The invoice date on the entry that the payment is applied to
Recipient Bank Address	Address	Customer Bank Account/Vendor Bank Account	The recipient bank account address that is specified on the customer or vendor bank account card
The recipient bank account address that is specified on the customer or vendor bank account card	City	Customer Bank Account/Vendor Bank Account	The recipient bank account city that is specified on the customer or vendor bank account card
Recipient Bank Name	Name	Customer Bank Account/Vendor Bank Account	The recipient bank account name that is specified on the customer or vendor bank account card
Recipient Bank Country/Region	Country/Region Code	Customer Bank Account/Vendor Bank Account	The recipient bank account country/region that is specified on the customer or vendor bank account card
Recipient Bank Post Code	Post Code	Customer Bank Account/Vendor Bank Account	The recipient bank account post code that is specified on the customer or vendor bank account card
Sender Bank Address	Address	Bank Account	The sender bank account address that is specified on the bank account card
Sender Bank City	City	Bank Account	The sender bank account city that is specified on the bank account card
Sender Bank Name	Name	Bank Account	The sender bank account name that is specified on the bank account card
Sender Bank Country/Region	Country/Region Code	Bank Account	The sender bank account country/region that is specified on the bank account card
Sender Bank Post Code	Post Code	Bank Account	The sender bank account post code that is specified on the bank account card

MAPPED FIELD	FIELD IN TABLE	TABLE	DESCRIPTION
General Journal Template	Journal Template Name	General Journal Line	The general journal template that is used for the payment line
General Journal Batch Name	Journal Batch Name	General Journal Line	The general journal batch name that is used for the payment line
Sender Bank Name - Data Conv.	Bank Name – Data Conv.	Bank Account	The sender bank account name that is requested by the bank data conversion service and specified on the bank account card

Administration

3/31/2019 • 2 minutes to read

Central administration tasks are usually performed by one role in the company. The scope of these tasks can depend on the company's size and the administrator's job responsibilities. These tasks can include managing database synchronization of job and email queues, setting up users, and customizing the user interface.

Entering the correct setup values from the start is important to the success of any new business software. Business Central includes a number of setup guides that help you set up core data. For more information, see [Setting Up Business Central](#).

Whether you use RapidStart Services to implement setup values or you manually enter them in the new company, you can support your setup decisions with some general recommendations for selected setup fields that are known to potentially cause the solution to be inefficient if defined incorrectly.

A super user or an administrator can set up the Data Exchange Framework to enable users to export and import data in bank and payroll files, for example for various cash management processes.

NOTE

You can set up a new company in Business Central with RapidStart Services, which is a tool designed to shorten deployment times, improve quality of implementation, introduce a repeatable approach to implementations, and enhance productivity by automating and simplifying recurring tasks. For more information, see [Setting Up a Company With RapidStart Services](#).

The following table describes a sequence of tasks, with links to the topics that describe them.

TO	SEE
Add users, manage permissions and access to data, assign roles.	Understanding Profiles and Role Centers
Assign permissions to users, modify permission sets, and group users per permissions.	Managing Users and Permissions
Classify data sensitivities for fields so that you can respond to requests from data subjects related to their personal data.	Classifying Data Sensitivity
Respond to requests from data subjects related to their personal data.	Responding to Requests About Personal Data
Set up a new business unit using templates	Creating New Companies
Track all direct modifications that users make to data in the database to identify the origin of errors and data changes.	Logging Changes
Enter single or recurring requests to run reports or codeunits.	Using Job Queues to Schedule Tasks

TO	SEE
Manage, delete, or compress documents	Deleting Documents
Expose pages, codeunits, and queries as web services.	Publishing a Web Service
As a part of creating Connect apps between Business Central and 3rd-party solutions through REST APIs, define templates that are used to populate empty properties on an entity when you create a POST action through an API.	Configuring API Templates

Understanding Users, Profiles, and Role Centers

3/31/2019 • 4 minutes to read

In Business Central, users are added by an administrator who also gives users access to the areas of Business Central that they need in their work.

Access to functionality is managed through *user groups* and *profiles*. As an administrator, you can add and remove users as part of your Business Central subscription, and you can assign users permissions through user groups.

Adding Users

To add users in Business Central online, your company's Office 365 administrator must first create the users in the Office 365 Admin Center. For more information, see [Add Users to Office 365 for business](#).

Then, the administrator can assign permissions to each user and groups of users. For more information, see [Managing Users and Permissions](#).

The most powerful permissions that a user can have is the SUPER permission set. Each company must have at least one user with this permission set, but it is a best practice to give each user permissions that match their work needs in Business Central and not more than that. This helps ensure that users only have access to data that is relevant to their work, for example.

TIP

It's a best practice to make sure that the Office 365 administrator also has the SUPER permission set in Business Central because that makes many administrative tasks easier, including setting up integration with other apps.

Users of on-premises deployments

For on-premises deployments of Business Central, the administrator can choose between different credential authorization mechanisms for users. Then, when you create a user, you provide different information depending on the credential type that you are using in the specific Business Central Server instance. For more information, see the [Authentication and Credential Types](#) in the Administration section of the developer and ITPro content for Business Central.

Profiles

The people in your company who have access to Business Central are all assigned a *profile* that gives them access to a *Role Center*.

Profiles are collections of Business Central users who share the same Role Center. A Role Center is the entry point and home page for Business Central that gives you quick access to your most important tasks and displays various insights and key performance indicators (KPIs) about your work.

NOTE

In the current version of Business Central online, you cannot add, edit, or delete profiles.

Create a profile

1. Choose the  icon, enter **Profile List**, and then choose the related link.
2. On the **Profile List** page, choose the **New** action to open the **New Profile Card** page.

3. In the **Profile ID** field, enter a name that describes the intended role of the users.
4. In the **Description** field, enter a description of the Profile ID, for example, **Order Processor**.
5. Set the **Role Center ID** field to the Role Center that you want to assign to the profile.

The procedure for modifying an existing profile is the same, except you select an existing profile on the **Profile List** page instead of choosing the **New** action.

Copy a profile

Copying a profile can save you time if you want to use similar settings on a profile and you only want to change a few settings.

1. Open the profile that you want to copy, and then choose the **Copy Profile** action.
2. In **New Profile ID** field, enter a name for the profile that you want to copy.
3. Set the **New Profile Scope** field to one of the following:
 - **System** to make the new profile available to all tenant databases that use the application.
 - **Tenant** to make the new profile available to just the current tenant database.
4. Choose the **OK** button when done.

Export and import profiles

You can export and import profiles as XML files to and from the a Business Central database. Exporting and importing a profile can save you time when configuring the user interface because you reuse an existing profile configuration instead of having to configure a profile from scratch. If you have a profile that is configured in a Business Central database and you would like to reuse all or some of the same profile configurations in another database, you can export the profile to an XML file. Then, you can import the profile XML file into the other database.

- To export a profile, you can either choose the **Export Profiles** action from the **Profile List** or **Profile Card** page or you can search for and open the **Export Profiles** page. Save the XML file to a location on your computer or network.
- To import a profile, you can either choose the **Import Profile** action from the **Profile List** page, or you can search for and open the **Import Profiles** page.

NOTE

You cannot import a profile that already exists in the database, even though the XML file is named differently or has different content. You must delete the existing profile before you can import the new profile.

Configuration and Personalization

Users personalize the user interface of their personal version by customizing the user interface under their own user logon. This personalization can be deleted by the administrator. For more information, see [Personalizing Your Workspace](#).

[Managing Personalization as an Administrator](#)

[Personalizing Your Workspace](#)

Managing Users and Permissions

3/31/2019 • 11 minutes to read

To add users in Business Central, your company's Office 365 administrator must first create the users in the Office 365 Admin Center. For more information, see [Add Users to Office 365 for business](#).

Once users are created in Office 365, they can be imported into the **Users** page in Business Central. Users are assigned permission sets depending on the plan assigned to the user in Office 365. For detailed information about licensing, see [Microsoft Dynamics 365 Business Central Licensing Guide](#).

You can then proceed to assign permission sets to the users to define which database objects, and thereby which UI elements, they have access to, and in which companies. You can add users to user groups. This makes it easier to assign the same permission sets to multiple users.

A permission set is a collection of permissions for specific objects in the database. All users must be assigned one or more permission sets before they can access Business Central.

From the **User Card** page, you can open the **Effective Permissions** page to see which permissions the user has and through which permission sets they are granted. Here you can also change permission details for permission sets of type **User-Defined**. For more information, see [To get an overview of a user's permissions](#).

Administrators can use the **User Setup** page to define periods of time during which specified users are able to post, and also specify if the system logs the amount of time users are logged on.

Another system that defines what users can access is the Experience setting. For more information, see [Changing Which Features are Displayed](#).

To add a user in Business Central

1. Choose the  icon, enter **Users**, and then choose the related link.
2. Choose the **Get Users from Office 365** action.

Any new user that has been created for your Office 365 subscription will be added on the **Users** page.

To group users in user groups

You can set up users groups to help you manage permission sets for groups of users in your company.

1. Choose the  icon, enter **User Groups**, and then choose the related link.
2. Alternatively, on the **Users** page, choose the **User Groups** action.
3. On the **User Group** page, choose the **User Group Members** action.
4. On the **User Group Members** page, choose the **Add Users** action.

When users or user groups are created, you must assign permission sets to each to define which object a user can access. First, you must organize the relevant permissions in permission sets. For more information, see [To get an overview of a user's permissions](#).

To copy a user group and all its permission sets

To quickly define a new user group, you can copy all permission sets from an existing user group to your new user group.

The user group members are not copied to the new user group. You must add them manually afterwards.

1. Choose the  icon, enter **User Groups**, and then choose the related link.
2. Select the user group that you want to copy, and then choose the **Copy User Group** action.
3. In the **New User Group Code** field, enter a name for the group, and then choose the **OK** button.

The new user group is added to the **User Groups** page. Proceed to add users. For more information, see [To group users in user groups](#).

To set up user time constraints

Administrators can define periods of time during which specified users are able to post, and also specify if the system logs the amount of time users are logged on. Administrators can also assign responsibility centers to users. For more information, see [Work with Responsibility Centers](#).

1. Choose the  icon, enter **User Setup**, and then choose the related link.
2. On the **User Setup** page opens, choose the **New** action.
3. In the **User ID** field, enter the ID of a user, or choose the field to see all current Windows users in the system.
4. Fill in the fields as necessary.

To create or modify a permission set

Permission sets function as containers of permissions, so that you can easily manage multiple permissions in one record. When you have created a permission set, you must add the actual permissions. For more information, see [To create or edit permissions manually](#).

NOTE

A Business Central solution typically contains a number of predefined permission sets that are added by Microsoft or by your software provider. These permission sets are of type **System** or **Extension**. You cannot create or edit these types of permission sets or the permissions within them. However, you can copy them to define your own permission sets and permissions.

Permission sets that users create, from new or as copies, are of type **User-Defined** and can be edited.

1. Choose the  icon, enter **Permission Sets**, and then choose the related link.
2. To create a new permission set, choose the **New** action.
3. On the new line, fill in the fields as necessary. Hover over a field to read a short description.

To copy a permission set

When you create new permission sets, you can use a copy function to quickly carry all the permissions of another permission set to a new permission set.

NOTE

If a System permission set that you have copied is changed, you will be notified (depending on your selection), so that you can consider if the changes are relevant to copy or write into your user-defined permission set.

1. On the **Permission Sets** page, select the line for a permission set that you want to copy, and then choose the **Copy Permission Set** action.
2. On the **Copy Permission Set** page, specify the name of the new permission set, and then choose the **OK** button.
3. Select the **Notify on Changed Permission Set** check box if you want to maintain a link between the

original and the copied permission sets. The link is then used to notify you if the name or content of the original permission set changes in a future version that the solution is upgraded to later.

The new permission set, containing all the permissions of the copied permission set, is added as a new line on the **Permission Sets** page. Note that the lines are sorted alphabetically within each type.

To create or modify permissions manually

This procedure explains how to add or edit permissions manually. You can also have a permission sets generated automatically from your actions in the UI. For more information, see [To create or modify permission sets by recording your actions](#).

1. On the **Permission Sets** page, select the line for a permission set, and then choose the **Permissions** action.
2. On the **Permissions** page, create a new line or edit the fields on an existing line.

In each of the five access type fields, **Read Permission**, **Insert Permission**, **Modify Permission**, **Delete Permission**, and **Execute Permission**, you can select one of the following three permission options:

OPTION	DESCRIPTION	RANKING
Yes	The user can perform the action on the object in question.	Highest
Indirect	The user can perform the action on the object in question but only through another related object that the user has full access to.	Second highest
Blank	The user cannot perform the action on the object in question.	Lowest

Example - Indirect Permission

You can assign an indirect permission to use an object only through another object. For example, a user can have permission to run codeunit 80, Sales-Post. The Sales-Post codeunit performs many tasks, including modifying table 37, Sales Line. When the user posts a sales document, the Sales-Post codeunit, Business Central checks if the user has permission to modify theSales Line table. If not, the codeunit cannot complete its tasks, and the user receives an error message. If so, the codeunit runs successfully.

However, the user does not need to have full access to the Sales Line table to run the codeunit. If the user has indirect permission for the Sales Line table, then the Sales-Post codeunit runs successfully. When a user has indirect permission, that user can only modify the Sales Line table by running the Sales-Post codeunit or another object that has permission to modify the Sales Line table. The user can only modify the Sales Line table when doing so from supported application areas. The user cannot run the feature inadvertently or maliciously by other methods.

To limit a user's access to specific records in a table

For record-level security in Business Central, you use security filters to limit a user's access to data in a table. You create security filters on table data. A security filter describes a set of records in a table that a user has permission to access. You can specify, for example, that a user can only read the records that contain information about a particular customer. This means that the user cannot access the records that contain information about other customers. For more information, see [Using Security Filters](#) in Developer and IT-Pro help.

To create or modify permission sets by recording your actions

1. Choose the  icon, enter **Permission Sets**, and then choose the related link.
2. Alternatively, on the **Users** page, choose the **Permission Sets** action.
3. On the **Permission Sets** page, choose the **New** Action.
4. On a new line, fill in the fields as necessary.
5. Choose the **Permissions** action.
6. On the **Permissions** page, choose the **Record Permissions** action, and then choose the **Start** action.

This starts a recording process that captures all your action in the user interface.
7. Go to the various pages and activities in Business Central that you want users with this permission set to access. You must carry out the tasks that you want to record permissions for.
8. When you want to finish the recording, return to the **Permissions** page, and then choose the **Stop** action.
9. Choose the **Yes** button to add the recorded permissions to the new permission set.
10. For each object in the recorded list, specify if users are able to insert, modify, or delete records in the recorded tables.

NOTE

When you edit a permission and thereby the related permission set, the changes will also apply to other users that have the permission set assigned.

To assign permission sets to users or user groups

You can assign permissions to users in two ways:

- Define permission sets on a user's user card.
- Select the check box for a user, on a column, for a related permission set, on a row, on the **Permission Set by User** page. With this method, you can also assign permissions sets to user groups.

To assign a permission set on a user card

1. Choose the  icon, enter **Users**, and then choose the related link.
2. Select the user that you want to assign permission to. Any permission sets that are already assigned to the user are displayed in the **Permission Sets** FactBox.
3. Choose the **Edit** action to open the **User Card** page.
4. On the **User Permission Sets** FastTab, on a new line, fill in the fields as necessary. For more information, see [To create or edit a permission set](#).

To assign a permission set on the Permission Set by User page

The following procedure explains how to assign permission sets to a user on the **Permission Set by User** page. The steps are similar on the **Permission Set by User Group** page.

1. Choose the  icon, enter **Users**, and then choose the related link.
2. On the **Users** page, select the relevant user, and then choose the **Permission Set by User** action.
3. On the **Permission Set by User** page, select the **[user name]** check box on a line for the relevant permission set to assign the set to the user.
4. Select the **All Users** check box to assign the permission set to all users.

To get an overview of a user's permissions

1. Choose the , enter **Users**, and then choose the related link.
2. Open the card of the relevant user.
3. Choose the **Effective Permissions** action.

The **Permissions** part lists all the database objects that the user has access to. You cannot edit this section.

The **By Permission Set** part shows the assigned permission sets through which the permissions are granted to the user, the source and type of the permission set, and to which extend the different access types are permitted.

For each row that you select in the **Permissions** section, the **By Permission Set** section shows which permission set or sets that the permission is granted through. In this section, you can edit the value in each of the five access type fields, **Read Permission**, **Insert Permission**, **Modify Permission**, **Delete Permission**, **Execute Permission**.

NOTE

Only permission sets of type **User-Defined** can be edited.

Rows of source Entitlement originate from the subscription plan. The permission values of the entitlement overrule values in other permission sets if they have a higher ranking. A value in a non-entitlement permission set that has a higher ranking than the related value in the entitlement will be surrounded by brackets to indicate that it is not effective as it is overruled by the entitlement. For an explanation of ranking, see [To create or edit permissions manually](#).

4. To edit a permission set, in the **By Permission Set** part, on the line for a relevant permission set of type **User-Defined**, choose one of the five access type fields and select a different value.
5. To edit individual permissions within the permission set, choose the value in the **Permission Set** field to open the **Permissions** page. Follow the steps described in [To create or edit permissions](#).

NOTE

When you edit a permission set, the changes will also apply to other users that have the permission set assigned.

Classifying Data Sensitivity

3/31/2019 • 2 minutes to read

To classify the fields that hold sensitive or personal data, a Microsoft partner can set the `DataClassification` property on fields. This requires access to the database tables, either through the development environment or by running a Windows PowerShell script. For more information, see [Classifying Data](#).

As a customer, you can add a second level of classification by specifying sensitivity levels for the data you store in standard and custom fields. Classifying data sensitivity helps ensure that you know where you keep personal data in your system, and makes it easier to respond to requests from data subjects. For example, if a contact or customer asks you to export their personal data. For more information, see [Responding to Requests About Personal Data](#).

IMPORTANT

Microsoft is providing this Data Sensitivity Classification feature as a matter of convenience only. It's your responsibility to classify the data appropriately and comply with any laws and regulations that are applicable to you. Microsoft disclaims all responsibility towards any claims related to your classification of the data.

The following table describes data sensitivity levels you can assign.

SENSITIVITY	DESCRIPTION
Sensitive	Information about a data subject's racial or ethnic origin, political opinions, religious beliefs, involvement with trade unions, physical or mental health, sexuality, or details about criminal offenses.
Personal	Information that can be used to identify a data subject, either directly or in combination with other data or information.
Confidential	Business data that you use for accounting or other business purposes, and do not want to expose to other entities. For example, this might include ledger entries.
Normal	General data that does not belong to any other categories.

How Do I Classify My Data?

Classifying the sensitivity of a large number of fields one-by-one would take a long time. To help speed up the process, we provide tools that you can use to bulk classify the sensitivity of fields, and then fine-tune classifications for specific fields. You can find tools on the Data Classification worksheet, which is available on the Administration of users, user groups, and permissions Role Center. You must be a system administrator to use the worksheet.

IMPORTANT

When you open the Data Classification worksheet for the first time, it will be empty. You must run the Data Classification guide to generate the list of fields. To start the guide, choose the **Set Up Data Classifications** action.

For example, the Data Classification worksheet lets you do things like:

- Use the Data Classification guide to export your fields to an Excel worksheet where you can bulk classify them. Using the Excel worksheet is particularly useful if you are collaborating with a Microsoft partner. After you update the worksheet, you can use the guide to import and apply the classifications. You can also use the guide to classify fields manually.
- Choose a field and then filter the list to find similar fields that are likely to belong to the same classification as the field you based the search on.
- Investigate a field by viewing its contents.

TIP

We have defined sample sensitivity classifications for the tables and fields in the Cronus demonstration company. You can use those classifications as inspiration when you classify your own tables and fields.

See Also

[Classifying Data](#)

Responding to Requests About Personal Data

3/31/2019 • 6 minutes to read

Data subjects can request several types of actions regarding their personal data. For example, under the General Data Protection Regulation (GDPR), EU residents have the right to request the export, deletion and modification of their personal data. This is known as a *Data Subject Request*. If you have classified the sensitivity of your data, and are sure they are correct, an administrator can respond to requests by using the options under **Data Privacy** on the **Manage Users, User Groups, and Permissions** Role Center or, if you are using the Windows client, in the **IT Manager** Role Center. For more information about classifying data and classifying data sensitivity in Dynamics 365 Business Central, see [Classifying Data](#) and [Classifying Data Sensitivity](#).

Types of Requests

The following table provides examples of the types of requests you can respond to.

NOTE

While we provide capabilities for responding to these types of request, and thereby accessing, personal data, it is your responsibility to ensure that personal and sensitive data are located and classified appropriately.

REQUEST TYPE	DESCRIPTION AND SUGGESTED RESPONSE
Portability requests	<p>A data subject can make a data portability request, meaning, in part, that you must export the data subject's personal data from your systems and provide it in a structured, commonly used format. To respond to these requests you can use the Data Privacy Utility to export personal data to an Excel file or a RapidStart configuration package. Using Excel, you can edit the personal data and save it in a commonly used, machine-readable format, such as .csv or .xml. For RapidStart configuration packages, you can configure master data tables and their related tables that contain personal data.</p> <p>Note: When you export data you specify a minimum sensitivity level. The export will include the minimum and all sensitivity levels above it. For example, if you choose to export data that is classified as Personal, the export will also include data that is classified as Sensitive.</p> <p>When exporting data related to a data subject, the Data Privacy Utility looks for direct relationships between the data subject and data related to the data subject. Indirect relationships between data related to the data subject and other data are not exported automatically by the Data Privacy Utility. For example, the Contact table has directly related Contact Profile Answers data, and the Contact Profile Answers table is further related to Profile Questions data. If you want to export Profile Questions as well, you must add this table manually as a row with the appropriate filters in the configuration package that the Data Privacy Utility creates.</p>

REQUEST TYPE	DESCRIPTION AND SUGGESTED RESPONSE
Requests for deletion	<p>A data subject can request that you delete their personal data. There are several ways to delete personal data using the customization capabilities, but the decision and implementation is your responsibility. In some cases, you may choose to directly edit your data, for example deleting a contact and then running the Delete Canceled Interaction batch job to delete interactions for the contact.</p> <p>Note: If you have specified a date in the Allow Document Deletion Before field on the Sales & Receivables Setup or Purchases & Payables Setup pages, you might need to change the date so that you can delete posted sales and purchase documents that you have printed and that have posting dates on or before that date.</p>
Requests for correction	<p>A data subject can request that you correct inaccurate personal data. There are several ways to do so. In some cases, you can export lists to Excel to quickly bulk-edit multiple records, and then import the updated data. For more information, see Exporting your Business Data to Excel. You can also manually edit fields that contain personal data, such as editing information about a customer in the Customer card. However, transaction records such as general, customer, and tax ledger entries are essential to the integrity of the enterprise resource planning system. If you store personal data in business transaction records, consider using the customization capabilities to modify such personal data.</p>

Restrict Data Processing for a Data Subject

A data subject can request that you temporarily stop processing their personal data. To honor such requests, you can mark their record as blocked due to privacy to stop processing their data. When a record is marked as blocked, you cannot create new transactions that use that record. For example, you cannot create a new invoice for a customer when either the customer or the salesperson is blocked. To mark a data subject as blocked, open the card for the data subject, for example the Customer, Vendor, or Contact cards, and choose the **Privacy Blocked** check box. You may need to choose **Show More** to display the field.

Handling Data Subject Requests While in Trial

Certain types of personal data is part of your Office 365 account and requires administrative access to export, if you receive a data subject request from a user regarding this type of personal data under the General Data Protection Regulation (GDPR). The process for handling data subject requests is different depending on the type of Business Central tenant.

If you have a paid subscription for Business Central, you must contact your organization's tenant administrator to make a data subject request. The administrator has the administrative rights and tools to fulfil your request.

If you signed up for Business Central from the [Trials](#) page, and you have not moved out of this trial experience through a paid subscription by your organization's tenant administrator, then you can fulfil your own data subject request in the [Work and School Privacy page in the Azure Portal](#). Here, you can export and download your personal data.

On the Work and School Privacy page, you can also close your account. However, we recommend that you make sure that you have exported and deleted all data first, since deleting your account means that you lose access to Business Central.

You can still mark people as blocked due to privacy and export, edit, or delete transactions as explained elsewhere in this article.

Exporting Data from Tables not Classified by Data Subject

If you have a situation where you have to export data that is not classified in a way so that it gets automatically exported, such as data from the Profile Answers table, you must do the following:

- Consider if you really want or have to export this supplemental data that is unrelated to the contact, meaning that it has no direct relationship to it
- Add this table and relationship manually to the Rapid Start package and export it directly from the Rapid Start package – that’s why we generate a Rapid Start package for you, so that you can tweak it in situations such as this.

Handling Data About Minors

If a contact person's age is below the age of legal consent according to the laws in your region, you can indicate that by choosing the **Minor** check box on the **Contact** card. When you do, the **Privacy Blocked** check box is automatically selected. When you receive consent from the minor's parent or legal guardian, you can choose the **Parental Consent Received** check box to unblock the contact. Though you can process personal data for minors, you cannot use the profiling functionality in Dynamics 365 for Sales.

NOTE

The Change Log can record details such as when, and by whom, the **Parental Consent Received** check box was chosen. An administrator can set that up by using the **Change Log Setup** guide, and also choosing the **Log Modification for Parental Consent Received** check box on the **Contact** card. For more information, see [Logging Changes](#).

Creating New Companies in Business Central

3/31/2019 • 2 minutes to read

In Business Central, the containers for business data that belongs to a business unit or legal entity is referred to as a *company*. When you sign up for Business Central, you are given a demonstration company and an empty company, *My Company*. Switching between the companies is easy - just got to **My Settings** and move to the other company. But you can also create new companies in Business Central, depending on your business needs. When you create a new company, an assisted setup guide helps you get the basics in place. Then, you can import relevant data from your legacy system or another company in Business Central.

Create New Company

If you decide to add a company to your Business Central, you can use the **Create New Company** assisted setup guide to get you started. The setup wizard is available from the **Companies** page and from the lookup in the **Company** field in **My Settings**.

The setup wizard offers three templates:

- **Evaluation - Sample Data**
This creates a company that is similar to the demonstration company with sample data and setup data.
- **Production - Setup Data Only**
This creates a company that is similar to **My Company** with setup data but without sample data.
- **Advanced Evaluation - Complete Sample Data** This creates a company with setup data and complete sample data for all features, including Manufacturing and Service Management.
- **Create New - No Data**
This creates a blank company without setup data.

If you want to get started easily with a new company, choose **Production - Setup Data Only** and then import your own business data, such as customers, items, and vendors. Choose the **New** template if you want to set everything up from scratch. In that case, you can use the **Company Setup** assisted setup guide to help you get started with essential setup data.

NOTE

When you create a new company, it takes a few minutes before you can access it in Business Central. The setup status on the **Companies** page shows when the new company is ready for you. Then, you can switch to the new company by using **My Settings**.

During your 30 day trial, you can create any number of new companies, but they will only be available during your trial. For more information, contact your Business Central partner.

Company Setup

When you sign in to a new company, the **Company Setup** wizard runs automatically and helps you get started. You will be asked for information about your business, such as the address, bank details, and inventory costing method. We ask for this information because it is used as a basis for many areas in Business Central that you will then not have to set up manually later.

For example, your company address is included in invoices and other documents, your bank information is used in payments, and the costing method is used to calculate prices as well as inventory valuation.

Once you have the basics in place, you can set up remaining core areas. Then, you are ready to add business data, such as customers and vendors. For more information, see [Setting Up Business Central](#).

Auditing Changes in Business Central

3/31/2019 • 2 minutes to read

You can enable the change log in Business Central so you have a history of activities. The log is based on changes that are made to data in the tables that you track. On the **Change Log Entries** page, entries are chronologically ordered and show changes that are made to the fields on the specified tables. The change log collects all changes that are made to the table.

IMPORTANT

A user's changes are not visible in the **Change Log Entries** until the user's session is restarted, which happens in the following cases:

- The session expired and was refreshed.
- The user selected another company or Role Center.
- The user signed out and back in.

Working with the Change Log

A common problem in many financial systems is to locate the origin of errors and changes in data. It could be anything from an incorrect customer telephone number to an incorrect posting to the general ledger. The change log lets you track all direct modifications a user makes to data in the database. You must specify each table and field that you want the system to log, and then you must activate the change log.

You activate and deactivate the change log on the **Change Log Setup** page. When a user activates or deactivates the change log, this activity is logged, so you can always see which user deactivated or reactivated the change log.

On the **Change Log Setup** page, if you choose the **Tables** action, you can specify which tables you want to track changes for, and which changes to track. Business Central also tracks a number of system tables.

After you have set up the change log, activated it, and made a change to data, you can view and filter the changes on the **Change Log Entries** page. If you want to delete entries, you can do that on the **Delete Change Log Entries** page, where you can set filters based on dates and time.

[Managing Users and Permissions](#)

[Working with Business Central](#)

Use Job Queues to Schedule Tasks

3/31/2019 • 7 minutes to read

Job queues in Business Central enables users to schedule and run specific reports and codeunits. You can set jobs to run one time, or on a recurring basis. For example, you might want to run the **Salesperson - Sales Statistics** report weekly, to track sales by salesperson each week, or you might want to run the **Process Service E-mail Queue** codeunit daily, to make sure pending email messages to customers regarding their service orders are sent out in a timely manner.

The **Job Queue Entries** page lists all existing jobs. If you add a new job queue entry that you want to schedule, you must specify information about the type of object you want to run, such as a report or codeunit, and the name and object ID of the object that you want to run. You can also add parameters to specify the behavior of the job queue entry. For example, you can add a parameter to only send posted sales orders. You must have permission to run the particular report or codeunit, or an error will be returned when the job queue is run.

A job queue can have many entries, which are the jobs that the queue manages and runs. Information in the entry specifies what codeunit or report is run, when and how often the entry is run, in what category the job runs, and how it runs.

To set up background posting with job queues

Job queues are an effective tool to schedule the running of business processes in the background, such as when multiple users are trying to post sales orders, but only one order can be processed at a time. Alternatively, you may want to schedule postings for hours when it is convenient for your organization. For example, it may make sense in your business to run certain routines when most of the data entry for the day has concluded.

You can achieve this by setting the job queue up to run various batch-posting reports, such as the **Batch Post Sales Orders**, **Batch Post Sales Invoices**, **Batch Post Sales Return Orders**, and **Batch Post Sales Credit Memos** reports. For more information, see [To create a job queue entry for background sales order posting](#).

Business Central supports background posting for all sales, purchasing, and service documents.

The following procedure explains how to set up background posting of sales orders. The steps are similar for purchasing and service.

1. Choose the  icon, enter **Sales & Receivables Setup**, and then choose the related link.
2. On the **Sales & Receivables Setup** page, choose the **Post with Job Queue** check box.
3. To filter to job queue entries for sales order posting, choose the **Job Queue Category Code** field, and then select the **SalesPost** category.

A job queue object, codeunit 88 **Sales Post via Job Queue**, is created. Proceed to enable it on the **Job Queue Entries** page.

4. Choose the  icon, enter **Job Queue Entries**, and then choose the related link.
5. On the **Job Queue Entries** page, choose the **New** action.
6. In the **Object Type to Run** field, select **Codeunit**.
7. In the **Object ID to Run** field, select 88, **Sales Post via Job Queue**.

No other fields are relevant for this scenario.

8. Choose the **Set Status to Ready** action.
9. To verify that the job queue is working as expected, post a sales order. For more information, see [Sell Products](#).
10. Review on the **Job Queue Log Entries** page if the sales order was posted successfully. For more information, see [To view status or errors in the job queue](#).

If you also want sales documents to be printed when they are posted, select the **Post & Print with Job Queue** check box on the **Sales & Receivables Setup** page.

IMPORTANT

If you set up a job that will post and print documents, and the printer displays a dialog box, such as a request for credentials or a warning about low printer ink, your document is posted but not printed. The corresponding job queue entry eventually times out and the **Status** field is set to **Error**. Accordingly, we recommend that you do not use a printer setup that requires interaction with the display of printer dialog boxes in conjunction with background posting.

To create a job queue entry for batch posting of sales orders

The following procedure shows how to set the **Batch Post Sales Orders** report up to automatically post released sales orders at 4 PM on week days.

1. Choose the  icon, enter **Job Queue Entries**, and then choose the related link.
2. Choose the **New** action.
3. In the **Object Type to Run** field, select **Report**.
4. In the **Object ID to Run** field, select 296, **Batch Post Sales Orders**.
5. Select the **Report Request Page** check box.
6. In the **Batch Post Sales Orders** request page, define what is included during automatic posting of sales orders, and then choose the **OK** button.
7. Select all check boxes from **Run on Mondays** through **Run on Fridays**.
8. In the **Starting Time** field, enter 4 PM.
9. Choose the **Set Status to Ready** action.

Sales orders that are ready to post will now be posted every week day at 4 PM.

NOTE

If the job queue cannot post the sales order, the status is changed to **Error** and the sales order is added to the list of sales orders that the user must handle manually. For more information, see [To view status or errors in the job queue](#).

After job queues are set up and running, the status can change as follows within each recurring period:

- **On Hold**
- **Ready**
- **In Process**
- **Error**
- **Finished**

After a job has finished successfully, it is removed from the list of job queue entries unless it is a recurring job. If it is a recurring job, the **Earliest Start Time** field is adjusted to show the next time that the job is expected to run.

To view status or errors in the job queue

Data that is generated when a job queue is run is stored in the database, so that you can troubleshoot job queue errors.

To view status for any job

1. Choose the  icon, enter **Job Queue Entries**, and then choose the related link.
2. On the **Job Queue Entries** page, select a job queue entry, and then choose the **Log Entries** action.

To view status from a sales or purchase document

1. From the document that you have tried to post with the job queue, choose the **Job Queue Status** field, which will contain **Error**.
2. Review the error message and fix the problem.

The My Job Queue Part

The **My Job Queue** part on your Role Center shows the job queues entries that you have started, but which are not yet finished. By default, the part is not visible, so you have to add it to your Role Center. For more information, see [Changing Basic Settings](#).

The part shows which documents with your ID in the **Assigned User ID** field are being processed or are queued, including those related to background posting. The part can tell you at a glance whether there has been an error in the posting of a document or if there are errors in a job queue entry. The part also lets you cancel a document posting if it is not running.

To view an error from the My Job Queue part

1. On an entry with the status **Error**, choose the **Show Error** action.
2. Review the error message and fix the problem.

Security

Job queue entries run based on permissions. Those permissions must allow the execution of the report or codeunit.

When a job queue is activated manually, it is run with the credentials of the user. When a job queue is activated as a scheduled task, it is run with the credentials of the server instance. When a job is run, it is run with the credentials of the job queue that activates it. However, the user who created that job queue entry must also have permissions. When a job is "run in user session" (such as during background posting), it is run with the credentials of the user who created that job.

IMPORTANT

If you use the SUPER permissions set that comes with Business Central, you and your users have permissions to run all objects. In this case, access for each user is only limited by permissions for data.

Using Job Queues Effectively

The job queue entry record has many fields whose purpose is to carry parameters into a codeunit that you have specified to be run with a job queue. This also means that codeunits that are to be run via the job queue must be specified with the Job Queue Entry record as a parameter in the **OnRun** trigger. This helps provide an extra level of security, as this prevents users from running random codeunits via the job queue. If the user must pass parameters to a report, the only way to do this is by wrapping the report execution into a codeunit, which then parses the input parameters and enters them into the report before executing it.

Manage Documents

3/31/2019 • 2 minutes to read

A central role, such as the application administrator, must regularly deal with accumulating historic documents by deleting or compressing them.

Delete Documents

In certain situations, you may need to delete invoiced purchase orders that have not been deleted. Business Central checks that you have fully invoiced the deleted purchase orders. You cannot delete orders that you have not fully invoiced and received.

Return orders are usually deleted after they are invoiced. When you post an invoice, it is transferred to the **Posted Purchase Credit Memo** page. If you selected the **Return Shipment on Credit Memo** check box on the **Purchases & Payable Setup** page, then the invoice is transferred to the **Posted Return Shipment** page. You can delete the documents using the **Delete Invd Purch. Ret. Orders** batch job. Before deleting, the batch job checks if the purchase return orders are fully shipped and invoiced.

Blanket purchase orders are not deleted after you have processed and invoiced all the related purchase orders. You can delete blanket orders with the **Delete Invoiced Blanket Purchase Orders** batch job.

Invoiced service orders are usually deleted automatically after having been fully invoiced. When an invoice is posted, a corresponding entry is created on the **Posted Service Invoices** page. The posted document can be viewed on the **Posted Service Invoice** page.

Service orders are not deleted automatically, however, if the total quantity on the order has been posted not from the service order itself, but from the **Service Invoice** page. Then you may need to delete invoiced orders that were not deleted. You can do this by running the **Delete Invoiced Service Orders** batch job.

Publish a Web Service

3/31/2019 • 2 minutes to read

Web services are a lightweight way to make application functionality available to a variety of external systems and users. Business Central includes an number of objects that are exposed as web services by default due to integration with other Microsoft services, but you can also add other web services.

You can set up a web service in the Windows client or in the Web client. You must then publish the web service so that it is available to service requests over the network. Users can discover web services by pointing a browser at the server location and requesting a list of available services. When you publish a web service, it is immediately available over the network for authenticated users. All authorized users can access metadata for web services, but only users who have sufficient permissions can access actual data.

Creating and Publishing a Web Service

The following steps explain how to create and publish a web service.

To create and publish a web service

1. Choose the  icon, enter **Web Services**, and then choose the related link.
2. On the **Web Services** page, choose **New**. Hover over a field to read a short description.

NOTE

Codeunit and **Page** are valid types for SOAP web services. **Page** and **Query** are valid types for OData web services. Also, if the database contains multiple companies, you can choose an object ID that is specific to one of the companies. Finally, the service name is visible to consumers of your web service and is the basis for identifying and distinguishing web services, so you should make the name meaningful.

3. Select the check box in the **Published** column.

When you publish the web service, in the **OData URL** and **SOAP URL** fields, you can see the URLs that are generated for the web service. You can test the web service immediately by choosing the links in the **OData URL** and **SOAP URL** fields. Optionally, you can copy the value of the field and save it for later use.

IMPORTANT

For codeunits that are published as a SOAP web service, the methods exposed in the codeunit must be marked as `[External]` in the code.

After you publish a web service, it is available to external parties. You can verify the availability of that web service by using a browser, or you can choose the link in the **OData URL** and **SOAP URL** fields on the **Web Services** page. The following procedure illustrates how you can verify the availability of the web service for later use.

To verify the availability of a web service

1. In your browser, enter the relevant URL. The following table illustrates the types of URLs that you can enter for different web service types.

TYPE	SYNTAX	EXAMPLE
SOAP	<code>https://api.businesscentral.dynamics.com/versio n/tenant/WS/CompanyName/entity/</code>	<code>https://api.businesscentral.dynamics.com/v1.0/a10b3ee d9a2-42fe-926f- 946e23bb8ddd/WS/CRONUS%20USA%2C%20Inc./Page/InvoiceDc</code>
OData V4	<code>https://api.businesscentral.dynamics.com/versio n/tenant/ODataV4/Company('CompanyName')entity</code>	<code>https://api.businesscentral.dynamics.com/v1.0/a10b3ee 946e23bb8ddd/ODataV4/Company('CRONUS%20USA%2C%20Inc.')entity</code> The company name is case-sensitive.

2. Review the information that is displayed in the browser. Verify that you can see the name of the web service that you have created.

When you access a web service, and you want to write data back to Business Central, you must specify the company name. You can specify the company as part of the URI as shown in the examples, or you can specify the company as part of the query parameters. For example, the following URIs point to the same OData web service and are both valid URIs.

```
https://api.businesscentral.dynamics.com/v1.0/OData/Company('CRONUS International Ltd.)/Customer
```

```
https://api.businesscentral.dynamics.com/v1.0/OData/Customer?company='CRONUS International Ltd.'
```

Configuring API Templates

3/31/2019 • 2 minutes to read

The API library for Business Central provides a simplified representation of the underlying entities. All the properties in the application are not exposed through the associated API. The **API Setup** page allows you to define templates that are used to populate empty properties on an entity when you create a POST action through the API.

For example, if a configuration template is defined for the item entity, when a new item record is created through the items API, any properties for the new item that are not defined in the API call will be populated from the selected template. If, for example, no value is defined for the **Gen. Prod. Posting Group** field through the API, but a value is defined in the selected template, then the posting group value defined in the template will be applied to the new item.

Setting up the Entity Template

To use templates with the API library, you must first set up and define properties for the templates. You can set up these templates on the **Configuration Templates** page. For more information, see [Prepare to Migrate Customer Data](#).

Assign the template to an API

To assign a template to an API, you must go through the following steps.

1. Choose the  icon, enter **API Setup**, and choose the related link.
2. Choose **New**, and then choose the **Order** value for the record.
If there is more than one template selected for an API (Page ID), the templates are applied in the order defined in the **Order** column.
When each template is applied, field values defined in the template are only applied to fields that have not already had a value defined, either explicitly in the API, or in a previously applied template in the order.
3. Select a **Page ID** value.
This is the page for the API to which the template will be applied. The **Page ID** lookup provides a list of all APIs available in the library.
4. Select a value in the **Template Code** field.
The template code is the code for the template that was defined on the **Configuration Templates** page. The template values defined are applied to the API.
5. In the **Conditions** field, specify which template should be applied.
The defined template is applied to a new record created through the API if, and only if, the conditions defined in the **Conditions** field are met by the values already defined for the new instance of the entity.

[Administration](#)

Need More Time to Decide Whether to Subscribe?

3/31/2019 • 2 minutes to read

It's important to make the right decision when choosing a business application, and we know that it can take time to explore all of the corners in Business Central. If you need more time to finish your evaluation you can extend the trial period yourself for another 30 days. When the expiration date for your trial period is approaching we will display a notification to alert you when you sign in. The notification contains a link to the **Extend Trial Period** guide that you can use to extend your trial period. The extra 30 days start the moment you choose **Extend Trial** in the guide.

Extending the trial period yourself is a one time-thing though. You cannot extend it twice, at least not yourself. If you have already extended the period, your Microsoft partner can extend it for you again. That's also a one-time thing. If you are not already working with a partner, the following link will help you find one: [Contact a partner](#).

What happens if my trial period is expired?

If your first 30-day trial period is expired, you can extend it yourself and things will be business as usual. Just sign in to the demonstration company and start the **Extend Trial Period** guide from the notification. If you have created your own company, sign out and then sign in again with the credentials for that company. If your extended trial period is expired, you can [subscribe](#) to Business Central within 90 days and continue working in the company you created. After 90 days we will delete your company and data.

To extend your trial period

1. Sign in to Business Central.
2. In the notification at the top of the workspace, choose **Extend Trial**.

[Access to a Preview](#)

Inspecting Pages in Business Central

5/2/2019 • 2 minutes to read

The page inspection feature enables you to get details about a page, providing insight into the page design, the different elements that comprise the page, and the source behind the data it displays. Page inspection is especially designed for administrators, power users, support personnel, and developers. It is ideal for learning the data model behind a page and troubleshooting. For example, if you are experiencing a problem with a page, you could use page inspection to get information to pass on to your system administrator or support personnel.

Working with Page Inspection

You start page inspection from the **Help & Support** page. Choose the question mark in the top right corner, choose **Help & Support**, and then choose **Inspect pages and data**. Or, you can just use the keyboard shortcut **Ctrl+Alt+F1**.

The **Page inspection** pane opens on the side. The following figure illustrates the **Page Inspection** pane on the **Sales Order** page.

The screenshot displays the Dynamics 365 Business Central interface. The main window shows the 'Sales Order' page for 'S-ORD101004 · Alpine Ski House'. The 'Page Inspection' pane is open on the right side, showing details for the selected 'Sales Line (37)'. The pane includes a 'Table Fields' section with the following fields:

Field Name	Field Type	Field Value
Document Type (1, Option, PK)	Order	
Sell-to Customer No. (2, Code)	40000	
Document No. (3, Code, PK)	S-ORD101004	
Line No. (4, Integer, PK)	10000	
Type (5, Option)	Item	
No. (6, Code)	2000-S	
Location Code (7, Code)	(Blank)	
Posting Group (8, Code)	RESALE	
Shipment Date (10, Date)	05/13/19	

The main window also shows a table of sales lines:

TYPE	NO.	DESCRIPTION	LOCATION CODE	QUANTITY	RESE	QUA
Item	2000-S	SYDNEY Swivel Chair, green		3		
Comment						
Comment						
Item	1900-S	PARIS Guest Chair, black				

Below the table, there is a summary section:

Subtotal Excl. Tax (US...)	570.30	Total Excl. Tax (USD)	570.30
Inv. Discount Amoun...	0.00	Total Tax (USD)	39.92
Invoice Discount %	0	Total Incl. Tax (USD)	610.22

When the **Page Inspection** pane first opens, it shows information that pertains to the main page object.

Use the keyboard or pointing device to move focus to different elements on the page. When you select a FactBox or a part on the main page, the bounding area is highlighted by a border, and the **Page Inspection** pane shows information about the selected element. For example, the previous figure shows information about the list part in the **Sales Order** page. As you navigate to other pages in the application, the **Page Inspection** pane will automatically update with page information as you move along.

For more information about what is shown in page inspection, see [Inspecting and Troubleshooting Pages](#) in the

Business Central Developer and IT Pro help.

If you do not see the details that you expect to see in the **Page Inspection** pane, you probably do not have the required permissions, as described in the next section.

Controlling Access to Page Inspection Details

As an administrator, you can control access to the full details that are shown in the **Page Inspection** pane by configuring the permissions that users have. To grant a user permission to the full details, give users **Execute** permission on the **System** object **5330**. You can grant this permission by using a permission set (such as **D365 Troubleshoot**) or a user group (such as **D365 Troubleshoot**). For more information about permissions, see [Managing Users and Permissions](#).

Users who are not granted permissions on **System object 5330** can still access the **Page Inspection** pane, but they will only see the **Page** and **Table** fields, which display basic details that they can pass on to their support team.

[Working with Business Central](#)

This is early-release functionality that we're still working on. The functionality, and the content on this page, are subject to change. To learn what's coming, see the [Microsoft Dynamics 365 Business Central Release Plan](#).

Creating a Sandbox Environment

A sandbox environment (Preview) is a non-production instance of Business Central. Isolated from production, a sandbox environment is the place to safely explore, learn, demo, develop, and test the service without the risk of affecting the data and settings of your production environment.

To create a sandbox environment

You must have a subscription to Business Central to be able to create a sandbox environment. There can only be one sandbox environment per subscription.

1. Sign in to your production instance of the Business Central service.
2. Choose the  icon, enter **Sandbox Environment**, and then choose the related link.
3. Select **Create**.
Another tab in your browser will open for finishing the setup of your sandbox environment.

NOTE

If you have pop-up blocker enabled in your browser, change it to allow URLs from the *.businesscentral.dynamics.com address.

4. When the sandbox environment is ready, you will be redirected to sandbox environment's Welcome wizard.
5. Choose **Learn more** to read about scenarios that you can try in a sandbox environment. Or, choose **Close** to continue to the Role Center of your Business Central sandbox instance.
6. At the top of the Role Center, a notification appears to inform you that this is a sandbox environment. You can also see the type of the environment in the title bar of the client.

In the sandbox environment, a new tenant has been created. This tenant is loaded with default demonstration data for the CRONUS company. No data is copied or otherwise transferred from the production environment during the sandbox creation.

7. At any time, you can return to the **Sandbox Environment** page, and reset the sandbox environment.

NOTE

Resetting the sandbox environment will remove it completely, and then create it again with the default demonstration data.

8. To switch between your production and sandbox environments, you can use the Business Central app launcher.
9. It is possible for an administrator or another user to limit or even block access for some users to the sandbox environment. This can be done by using the standard security features of the product, such as the User card, User Groups, and Permission Sets.

Advanced functionality in the sandbox environment

Designer

In a sandbox environment, you will find the **Designer** enabled, which you can activate by selecting the design icon  on a page.

Enable the advanced user experience

It is possible to enable and try the advanced (full) functionality of Business Central in a sandbox tenant by setting the **Experience** field on the **Company Information** page.

After you've enabled the advanced functionality in a sandbox tenant, you get access to all the standard Profiles and Role Centers. You can also create an evaluation company that is fully set up, including demonstration data and access to the advanced areas of the product.

Integrating with Dynamics 365 for Sales

6/13/2019 • 3 minutes to read

The sales person role is often considered as one the most outward-facing jobs in a business. However, it can be helpful for sales people to be able to look inward in the business and see what is happening on the back end. By integrating Business Central and Dynamics 365 for Sales, you can give your sales people that insight by enabling them to view information in Business Central while they are working in Dynamics 365 for Sales. For example, when preparing a sales quote it could be useful to know whether you have enough inventory to fulfill the order. For more information, see [Using Dynamics 365 for Sales from Business Central](#).

NOTE

These steps describe the process of integrating online versions of Dynamics 365 for Sales and Business Central. For information about on-prem configuration, see [Preparing Dynamics 365 for Sales for Integration on-premises](#).

Overview of the Integration Process

The following steps provide an overview of the steps to integrate Dynamics 365 for Sales with Business Central.

NOTE

These tasks require the **System Administrator** security role in Dynamics 365 for Sales and Business Central.

1. In the Office 365 admin center, set up a user account for connecting to and synchronizing data with Dynamics 365 for Sales. For more information, see [Setting Up User Accounts for Integrating with Dynamics 365 for Sales](#).
2. Assign licenses for Dynamics 365 for Sales to the Business Central users who will use the integrated apps.
3. Set up a connection to Dynamics 365 for Sales. For more information, see [Set Up a Connection to Dynamics 365 for Sales](#).
4. Optional: Couple Business Central and Dynamics 365 for Sales records. For more information, see [Couple and Synchronize Records Manually](#).
5. Synchronize data between the apps. For more information, see [Synchronizing Business Central and Dynamics 365 for Sales](#).

About the Business Central Integration Solution

The solution lets people view information in Business Central while they are working in Dynamics 365 for Sales. For example, it can provide insights into customer statistics, allows users to couple and view records in Business Central from Dynamics 365 for Sales, and allows people to see whether products are available in Business Central.

By default, the Set Up Dynamics 365 for Sales Connection assisted setup guide will import the Business Central integration solution. To do that, the setup guide uses an administrator user account. This account must also be a valid user in Dynamics 365 for Sales with the following security roles:

- System Administrator
- Solution Customizer

For more information, see [Setting Up User Accounts for Integrating with Dynamics 365 for Sales](#), [Create users in Microsoft Dynamics 365 \(online\) and assign security roles](#), and [Managing Users and Permissions](#).

This account is used only one time during the setup. After the solution is imported into Business Central the account is no longer needed. Integration will continue to use the user account that was created specifically for the integration.

In addition to customizing Dynamics 365 for Sales, the Business Central integration solution also creates the following roles in Dynamics 365 for Sales for the integration:

- **Integration Administrator** - Allows users to manage the connection between Business Central and Dynamics 365 for Sales. Typically assigned only to the user account for synchronization.
- **Integration User** - Allows users to access synchronized data. Typically assigned to the user account for synchronization and any other user who needs to view or access the synchronized data.
- **Product Availability User** - Allows users to query product availability in Business Central from Dynamics 365 for Sales.

At the end of the setup guide, Business Central prompts you to couple sales people to users in Dynamics 365 for Sales. Records in Dynamics 365 for Sales usually have an owner (user) assigned to them, and if coupling between the user in Dynamics 365 for Sales and the sales person in Business Central does not exist, synchronization will fail. You can also do this later by using the **Couple Salespersons** action on the **Microsoft Dynamics 365 Connection Setup** page.

[Preparing Dynamics 365 for Sales for Integration on-premises](#)

Setting Up User Accounts for Integrating with Dynamics 365 for Sales

6/6/2019 • 2 minutes to read

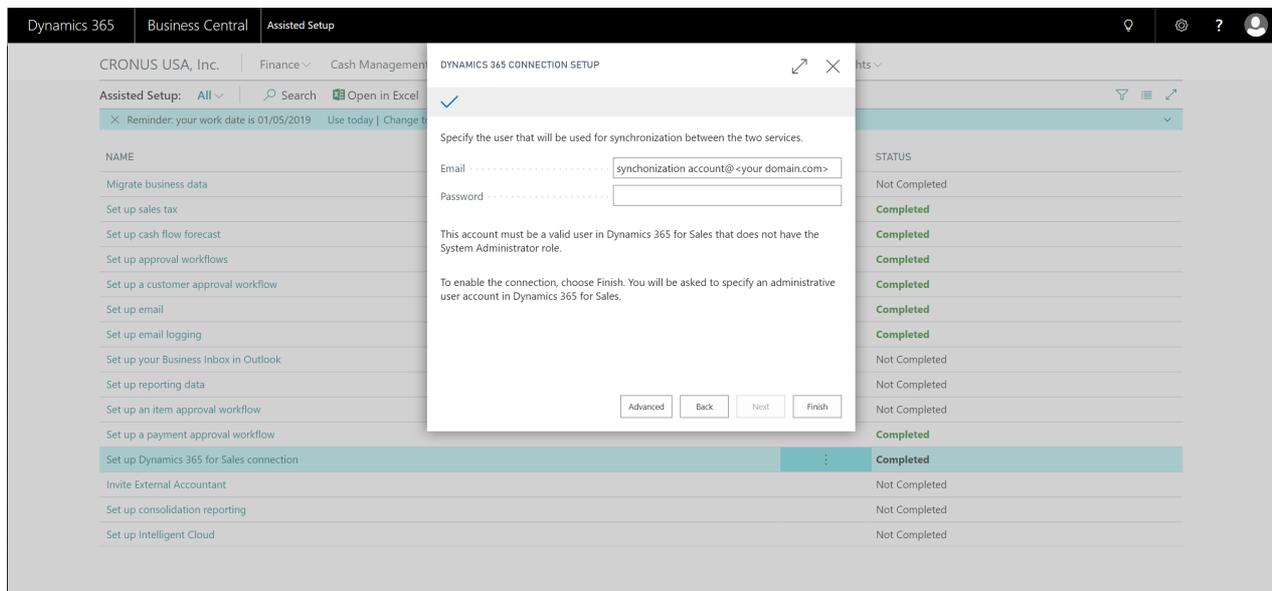

This article provides an overview of how to set up the user accounts that are required to integrate Dynamics 365 for Sales with Business Central.

Setting Up the Administrator User Account in Sales

You must add your administrator user account for Business Central as a user in Dynamics 365 for Sales, and then promote the user to administrator in Dynamics 365 for Sales. The administrator user account must also have the System Customizer role and at least one other non-administrative user role, such as Sales Manager, in Dynamics 365 for Sales.

Setting Up the User Account for the Integration

You must create a dedicated user account in your Office 365 subscription that both Business Central and Dynamics 365 for Sales can use to synchronize data. This user account must be able to sign in to Dynamics 365 for Sales, which means this user must have a license for Dynamics 365 for Sales and at least one security role assigned to it in Dynamics 365 for Sales as described [here](#). For more information about how to create users in Dynamics 365 for Sales, see [Manage security, users, and teams](#). After the connection is set up, Business Central will assign the user account the security roles that it needs in Business Central and this account can be set to [non-interactive access mode](#) in Dynamics 365 for Sales.

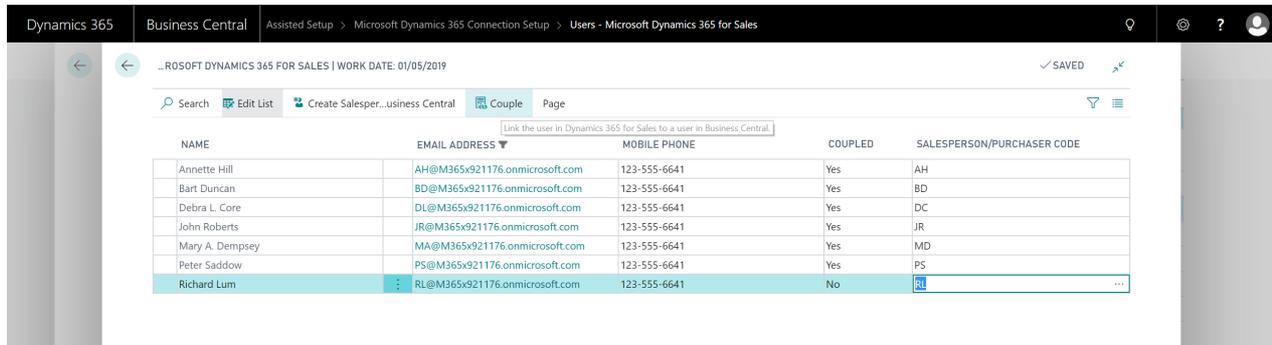

IMPORTANT

Do not use the administrator account for Dynamics 365 for Sales for synchronization. Doing so will break the synchronization. Also, to avoid constant synchronization, changes to data that are made by the integration user account are not synchronized. After the connection is made, we recommend setting the access mode for the user account for integration to non-interactive mode in Dynamics 365 for Sales. For more information, see [Create a non-interactive user account](#).

Setting Up Accounts for Sales People

You must create user accounts in Dynamics 365 for Sales for the salespeople from Business Central. To make that easier, the Microsoft 365 admin center offers an Excel template that you can use. On the **Active users** page, choose **More**, and then **Import multiple users**. Choose **Download a CSV file with headers only**, and then enter the information for the salespersons. To see an example, choose **Download a CSV file with headers and sample user information**. After you enter the information about the users, the next step in the import process is to assign the users licenses to the Dynamics 365 Customer Engagement Plan.

After you import the users, and assign them licenses for Dynamics 365 Customer Engagement, you must assign the users to the **Salesperson** role in Dynamics 365 for Sales.

The screenshot shows the Dynamics 365 interface for Business Central. The breadcrumb trail is: Dynamics 365 > Business Central > Assisted Setup > Microsoft Dynamics 365 Connection Setup > Users - Microsoft Dynamics 365 for Sales. The page title is "...ROSOFT DYNAMICS 365 FOR SALES | WORK DATE: 01/05/2019". The page contains a table with the following data:

NAME	EMAIL ADDRESS	MOBILE PHONE	COUPLED	SALESPERSON/PURCHASER CODE
Annette Hill	AH@M365x921176.onmicrosoft.com	123-555-6641	Yes	AH
Bart Duncan	BD@M365x921176.onmicrosoft.com	123-555-6641	Yes	BD
Debra L. Core	DL@M365x921176.onmicrosoft.com	123-555-6641	Yes	DC
John Roberts	JR@M365x921176.onmicrosoft.com	123-555-6641	Yes	JR
Mary A. Dempsey	MA@M365x921176.onmicrosoft.com	123-555-6641	Yes	MD
Peter Sadow	PS@M365x921176.onmicrosoft.com	123-555-6641	Yes	PS
Richard Lum	RL@M365x921176.onmicrosoft.com	123-555-6641	No	RL

[Integrating with Dynamics 365 for Sales](#)

Set Up a Connection to Dynamics 365 for Sales

6/13/2019 • 11 minutes to read

To integrate with Dynamics 365 for Sales, you must set up a connection between Business Central and Dynamics 365 for Sales.

Before You Start

Before you start to connect the apps, there are a few pieces of information that will be useful to have ready:

- A URL for your Dynamics 365 for Sales app. A fast way to get the URL is to open Dynamics 365 for Sales and copy the URL, and then paste it in the **Dynamics 365 for Sales URL** field in Business Central. Business Central will correct the formatting for you.
- A user name and password of a user account that is used only for the integration.
- The user name and password of the account that has administrator permissions.

NOTE

These steps describe the procedure for the online version of Business Central.

Set Up, Test, and Enable a Connection to Dynamics 365 for Sales

For all authentication types other than Office 365 authentication, you set up your connection to Dynamics 365 for Sales on the **Microsoft Dynamics 365 for Sales Connection Setup** page. For Office 365 authentication, you can also use the **Set Up Dynamics 365 for Sales Connection** assisted setup guide, which will help you provide the required information.

To use an assisted setup guide

The **Set Up Dynamics 365 for Sales Connection** assisted setup guide can help you set up the connection and specify whether to enable advanced features, such as coupling between records.

1. Choose **Setup and Extensions**, and then choose **Assisted Setup**.
2. Choose **Set Up Dynamics 365 for Sales Connection** to start the assisted setup guide.
3. Fill in the fields as necessary.
4. Optionally, there are advanced settings that can enhance security and enable Dynamics 365 for Sales additional capabilities, such as sales order processing and viewing inventory levels. The following table describes the advanced settings.

FIELD	DESCRIPTION
Import Dynamics 365 for Sales Solution	Enable this to install and configure the integration solution in Dynamics 365 for Sales. For more information, see About the Business Central Integration Solution .

FIELD	DESCRIPTION
Publish Item Availability Web Service	Enable people who are using Dynamics 365 for Sales to view the availability of items (products) in inventory in Business Central. This requires that the Business Central user account with a web services access key. Assigning the key is a two-step process. On the user account in Business Central you must choose the Change Web Service Key action. In the Set Up Dynamics 365 for Sales Connection assisted setup guide, you must specify the Dynamics 365 Business Central OData web service URL, and provide Business Central user credentials for accessing the service. For more information, see OData Web Services .
Dynamics 365 Business Central OData Web Service URL	If you enable the Item Availability Web Service, the URL for the OData Web service is provided for you.
Dynamics 365 Business Central OData Web Service Username	The name of the Business Central user account that the Dynamics 365 for Sales uses to retrieve information about item availability in Business Central through OData Web Service.
Dynamics 365 Business Central OData Web Service Accesskey	The access key for the user account that the Dynamics 365 for Sales uses to get information about item availability from Business Central through OData Web Service. The key is assigned to the user chosen in the Dynamics 365 Business Central OData Web Service Username field. To get the key, choose the Look up value button next to the user name, choose the user, choose Manage , and then Edit . On the user card, choose Actions, Authentication , and then choose Change Web Service Key .
Enable Sales Order Integration	When people create sales orders in Dynamics 365 for Sales, copy the orders to Business Central. This requires that you provide credentials for an administrator user account in Dynamics 365 for Sales. For more information, see Handling Sales Order Data .
Enable Dynamics 365 for Sales Connection	Enable the connection to Dynamics 365 for Sales.
Dynamics 365 SDK Version	This is relevant only if you are integrating with an on-premises version of Dynamics 365 for Sales. This is the Dynamics 365 software development kit (also referred to as Xrm) you use to connect Business Central to Dynamics 365 for Sales. The version must be compatible with the SDK version that is used by Dynamics 365 for Sales, and equal to or newer than the version used by Dynamics 365 for Sales.

NOTE

Set Up Dynamics 365 for Sales Connection assisted setup guide automatically assigns **Integration Administrator** and **Integration User** security roles to the user account used for integration.

To create or maintain the connection manually

The following procedure describes how to fill in the fields on the **Microsoft Dynamics 365 for Sales Connection Setup** page manually. This is also the page where you manage settings for the integration.

1. Choose the  icon, enter **Microsoft Dynamics 365 Connection Setup**, and then choose the related link.

2. Enter the following information for the connection from Business Central to Dynamics 365 for Sales.

FIELD	DESCRIPTION
Dynamics 365 for Sales URL	The URL for your instance of Dynamics 365 for Sales. To get the URL, open Dynamics 365 for Sales, copy the URL from the address bar in your browser, and then paste the URL in the field. Business Central will make sure that the format is correct.
User Name and Password	The credentials of the user account that is dedicated for the integration. For more information, see Setting Up User Accounts for Integrating with Dynamics 365 for Sales .
Enabled	Start using the integration. If you do not enable the connection now, the connection settings will be saved but users will not be able to access Dynamics 365 for Sales data from Business Central. You can return to this page and enable the connection later.
Dynamics 365 SDK Version	If you are integrating with an on-premises version of Dynamics 365 for Sales, this is the Dynamics 365 software development kit (also referred to as Xrm) you use to connect Business Central to Dynamics 365 for Sales. The version that you select must be compatible with the SDK version that is used by Dynamics 365 for Sales. This version equal to or newer than the version used by Dynamics 365 for Sales.

NOTE

If you are connecting an on-premises version of Business Central to Dynamics 365 for Sales and you want to configure a connection to a Dynamics 365 for Sales instance with a specific authentication type, fill in the fields on the **Authentication Type Details** FastTab. For more information, see [Use connection strings in XRM tooling to connect to Dynamics 365](#). This step is not required when connecting an online version of Business Central.

3. Enter the following information for the connection from Dynamics 365 for Sales to Business Central.

FIELD	DESCRIPTION
Dynamics 365 Business Central Web Client URL	<p>The URL of your Business Central instance. This enables users in Dynamics 365 for Sales to open corresponding records in Business Central from records in Dynamics 365 for Sales, such as an account or product. The Business Central records open in Business Central. Set this field to the URL of the Business Central instance to use.</p> <p>To reset the field to the default URL for the Business Central, choose Reset Web Client URL action.</p> <p>This field is relevant only if the Business Central Integration Solution is installed in Dynamics 365 for Sales.</p>
Item Availability Web Service Enabled	Enable people who are using Dynamics 365 for Sales to view the availability of items (products) in inventory in Business Central. If you enable this, you must also provide a user name and an access key for the Dynamics 365 for Sales to use to query OData Web Service for availability of items (products). For more information, see OData Web Services .

FIELD	DESCRIPTION
Dynamics 365 Business Central OData Web Service URL	If you enable the Item Availability Web Service, the URL for the OData Web service is provided for you.
Dynamics 365 Business Central OData Web Service Username	The name of the user account that the Dynamics 365 for Sales uses to get information about item availability from Business Central through OData Web service.
Dynamics 365 Business Central OData Web Service Accesskey	The access key for the user account that the Dynamics 365 for Sales uses to get information about item availability from Business Central through OData Web service. The key is assigned to the user chosen in the Dynamics 365 Business Central OData Web Service Username field. To get the key, choose the Look up value button next to the user name, choose the user, choose Manage , and then Edit . On the user card, choose Actions, Authentication , and then choose Change Web Service Key .

4. Enter the following settings for Dynamics 365 for Sales.

FIELD	DESCRIPTION
Sales Order Integration is Enabled	Enable users to submit sales orders and activated quotes in Dynamics 365 for Sales and then view and process them in Business Central.
Automatically Create Sales Orders	Create a sales order in Business Central when a user creates and submits one in Dynamics 365 for Sales.
Automatically Process Sales Quotes	Process a sales quote in Business Central when a user creates and activates one in Dynamics 365 for Sales.

5. Enter the following advanced settings.

FIELD	DESCRIPTION
Business Central Users Must Map to Dynamics 365 for Sales Users	<p>Specify whether Business Central user accounts must have a matching user accounts in Dynamics 365 for Sales. The Office 365 Authentication Email of the Business Central user must be the same as the Primary Email of the Dynamics 365 for Sales user.</p> <p>If you set the value to Yes, Business Central users who do not have a matching Dynamics 365 for Sales user account will not have Business Central integration capabilities in the user interface. Access to Dynamics 365 for Sales data directly from Business Central is done on behalf of the Dynamics 365 for Sales user account.</p> <p>If you set the value to No, all Business Central users will have Dynamics 365 for Sales integration capabilities in the user interface. Access to Dynamics 365 for Sales data is done on behalf of the Dynamics 365 for Sales connection (integration) user.</p>
Current Business Central User is Mapped to a Dynamics 365 for Sales User	Indicates whether your user account is mapped to an account in Dynamics 365 for Sales

- To test the connection settings, choose **Test Connection**.

NOTE

If data encryption is not enabled in Business Central, you will be asked whether you want to enable it. To enable data encryption, choose **Yes** and provide the required information. Otherwise, choose **No**. You can enable data encryption later. For more information, see [Encrypting Data in Dynamics 365 Business Central](#) in Developer and IT-Pro help.

- If Dynamics 365 for Sales synchronization is not already set up, you will be asked whether you want to use the default synchronization setup. Depending on whether you want to keep records aligned in Dynamics 365 for Sales and Business Central, choose **Yes** or **No**.

NOTE

Connecting to Dynamics 365 for Sales using the **Microsoft Dynamics 365 for Sales Connection Setup** page may require that you assign the Integration Administrator and Integration User security roles to the account used for integration. For more information, see [Assign a security role to a user](#).

NOTE

Connecting to Dynamics 365 for Sales using **Microsoft Dynamics 365 for Sales Connection Setup** page may require you to assign **Integration Administrator** and **Integration User** security roles to user account used for integration.

To disconnect from Dynamics 365 for Sales

- Choose the  icon, enter **Microsoft Dynamics 365 for Sales Connection Setup**, and then choose the related link.
- On the **Microsoft Dynamics 365 for Sales Connection Setup** page, clear the **Enabled** check box.

[View the Status of a Synchronization](#)

Synchronizing Data in Business Central and Dynamics 365 for Sales

6/13/2019 • 7 minutes to read

When you integrate Dynamics 365 for Sales with Business Central, you can decide whether to synchronize data in selected fields of Business Central records (such as customers, contacts, and sales people) with equivalent records in Business Central (such as accounts, contacts, and users). Depending on the type of record, you can synchronize data from Dynamics 365 for Sales to Business Central, or vice versa. For more information, see [Integrating with Dynamics 365 for Sales](#).

Synchronization uses the following elements:

- Integration table mappings
- Integration field mappings
- Synchronization rules
- Coupled records

When synchronization is set up you can couple Business Central records to Dynamics 365 for Sales records to synchronize their data. You can start a synchronization manually, or based on a schedule. The following table provides an overview of the ways you can synchronize records.

TYPE	METHOD	SEE
Manual synchronization	<p>Synchronize on a record-by-record basis.</p> <p>You can synchronize individual records in Business Central, such as a customer, with a corresponding Dynamics 365 for Sales record, such as an account. This is typically how users will work with Dynamics 365 for Sales data in Business Central.</p>	Couple and Synchronize Records Manually
	<p>Synchronize on a table mapping basis.</p> <p>You can synchronize all records in a Business Central table with an entity Dynamics 365 for Sales entity.</p>	Synchronize Individual Table Mappings
	<p>Synchronize all modified records for all table mappings.</p> <p>You can synchronize all of the records that have been modified in Business Central tables since the last synchronization.</p>	Synchronizing All Modified Records

TYPE	METHOD	SEE
	<p>Full synchronization of all data for all table mappings.</p> <p>You can synchronize all of the data in Business Central tables and Dynamics 365 for Sales entities that are mapped, and create new records in the destination solution for uncoupled records in the source solution.</p> <p>Full synchronization synchronizes all data and ignores coupling. Typically, you do a full synchronization when you set up the integration and only one of solutions contains data. A full synchronization can also be useful in a demonstration environment.</p>	Run a Full Synchronization
Scheduled synchronization	<p>Synchronize all changes to data for all table mappings.</p> <p>You can synchronize Business Central with Dynamics 365 for Sales on scheduled intervals by setting up jobs in the job queue.</p>	Schedule a Synchronization

Standard Sales Entity Mapping for Synchronization

Entities in Dynamics 365 for Sales, such as accounts, are integrated with equivalent types of entities in Business Central, such as customers. To work with Dynamics 365 for Sales data you set up links, called couplings, between entities in Business Central and Dynamics 365 for Sales.

The following table lists the standard mapping between entities in Business Central and Dynamics 365 for Sales that Business Central provides.

BUSINESS CENTRAL	DYNAMICS 365 FOR SALES	SYNCHRONIZATION DIRECTION	DEFAULT FILTER
Salesperson/Purchaser	User	Dynamics 365 for Sales -> Business Central	Sales contact filter: Status is No , User Licensed is Yes , Integration user mode is No
Customer	Account	Business Central -> Dynamics 365 for Sales and Dynamics 365 for Sales -> Business Central	Sales account filter: Relationship Type is Customer and Status is Active .
Contact	Contact	Business Central -> Dynamics 365 for Sales and Dynamics 365 for Sales -> Business Central	Business Central contact filter: Type is Person and the contact is assigned to a company. Sales contact filter: The contact is assigned to a company and the parent customer type is Account
Currency	Transaction Currency	Business Central -> Dynamics 365 for Sales	

BUSINESS CENTRAL	DYNAMICS 365 FOR SALES	SYNCHRONIZATION DIRECTION	DEFAULT FILTER
Unit of Measure	Unit Group	Business Central -> Dynamics 365 for Sales	
Item	Product	Business Central -> Dynamics 365 for Sales and Dynamics 365 for Sales -> Business Central	Sales contact filter: Product Type is Sales Inventory
Resource	Product	Business Central -> Dynamics 365 for Sales and Dynamics 365 for Sales -> Business Central	Sales contact filter: Product Type is Services
Customer Price Group	Price List	Business Central -> Dynamics 365 for Sales	
Sales Price	Product Price List	Business Central -> Dynamics 365 for Sales	Business Central contact filter: Sales Code is not blank, Sales Type is Customer Price Group
Opportunity	Opportunity	Business Central -> Dynamics 365 for Sales and Dynamics 365 for Sales -> Business Central	
Sales Invoice Header	Invoice	Business Central -> Dynamics 365 for Sales	
Sales Invoice Line	Invoice Product	Business Central -> Dynamics 365 for Sales	
Sales Order Header	Sales Order	Business Central -> Dynamics 365 for Sales	Business Central Sales Header filter: Document Type is Order, Status is Released
Sales Order Notes	Sales Order Notes	Business Central -> Dynamics 365 for Sales and Dynamics 365 for Sales -> Business Central	

Tip for Admins: Viewing Entity Mappings

You can view the mapping between the entities in Dynamics 365 for Sales and the tables in Business Central on the **Integration Table Mappings** page, where you can also apply filters. You define the mapping between the fields in Business Central tables and the fields in Dynamics 365 for Sales entities on the **Integration Field Mapping** page, where you can add additional mapping logic. For example, this can be useful if you need to troubleshoot synchronization.

Tip for Developers: Mapping Fields in Business Central to the Option Sets in Sales

If you are a developer and you want to add options to the option sets in Dynamics 365 for Sales, you need to know this. There are three tables in Business Central that are mapped to the option fields of the **Account** entity in Dynamics 365 for Sales. Records in the tables that are not linked to options in Dynamics 365 for Sales will not be synchronized. This means that the **Option** field will be blank in Dynamics 365 for Sales.

The following table shows mappings from Business Central tables for the **Option** field in the **Account** entity in Dynamics 365 for Sales.

TABLE	OPTION FIELD IN THE ACCOUNT ENTITY
Payment Terms	Payment Terms
Shipment Method	Address 1: Freight Terms
Shipping Agent	Address 1: Shipping Method

Synchronization Rules

The following table describes rules that control the synchronization between the apps.

NOTE

Changes to data in Dynamics 365 for Sales that were made by the Dynamics 365 for Sales connection user account are not synchronized. Therefore, we recommended that you do not change data while using that account. For more information, see [Setting Up User Accounts for Integrating with Dynamics 365 for Sales](#).

TABLE	RULE
Customers	<p>Before a customer can be synchronized to an account, the salesperson that is assigned to the customer must be coupled to a user in Dynamics 365 for Sales. Therefore, when you run the CUSTOMERS - Dynamics 365 for Sales synchronization job and you set it up to create new records, make sure that you synchronize salespeople with Dynamics 365 for Sales users before you synchronize customers with accounts in Dynamics 365 for Sales.</p> <p>The CUSTOMERS - Dynamics 365 for Sales synchronization job only synchronizes Sales accounts that have the relationship type Customer.</p>
Contacts	<p>Only contacts in Dynamics 365 for Sales that are associated with an account will be created in Business Central. The Salesperson Code value defines the owner of the coupled entity in Dynamics 365 for Sales.</p>
Currencies	<p>Currencies are coupled to transaction currencies in Dynamics 365 for Sales based on ISO codes. Only currencies that have a standard ISO code will be coupled and synchronized with transaction currencies.</p>
Units of Measure	<p>Units of measure are synchronized with unit groups in Dynamics 365 for Sales. There can only be one unit of measure defined in the unit group.</p>
Items	<p>When synchronizing items with Dynamics 365 for Sales products, Business Central automatically creates a price list in Dynamics 365 for Sales. To avoid synchronization errors, you should not modify this price list manually.</p>

TABLE	RULE
Salespersons	Salespersons are coupled to system users in Dynamics 365 for Sales. The user must be enabled and licensed and must not be the Integration user. Note, that this is the first table that must be synchronized because it is used in customers, contacts, opportunities, and sales invoices.
Resources	Resources are synchronized with Dynamics 365 for Sales products that have product type Service.
Customer Price Groups	Customer price groups are synchronized with Sales price lists.
Sales Prices	Sales prices that have sales type Customer Price Group and have a sales code defined are synchronized with Dynamics 365 for Sales price list lines
Opportunities	Opportunities are synchronized with Dynamics 365 for Sales opportunities. The Salesperson Code value defines the owner of the coupled entity in Dynamics 365 for Sales.
Posted Sales Invoices	Posted sales invoices are synchronized with sales invoices. Before an invoice can be synchronized, it is better to synchronize all other entities that can participate in the invoice, from salespersons to price lists. The Salesperson Code value in the invoice header defines the owner of the coupled entity in Sales.
Sales Orders	Released sales order (headers) are synchronized with sales order. Before an order can be synchronized, it is better to synchronize all other entities that can participate in the order, from salespersons to price lists. The Salesperson Code value in the order header defines the owner of the coupled entity in Sales.

Modify Table Mappings for Synchronization

5/13/2019 • 3 minutes to read

An integration table mapping links a table in Business Central to an integration table for the Dynamics 365 for Sales entity. For each entity in Dynamics 365 for Sales that you want to synchronize with corresponding data in Business Central, there must be a corresponding integration table mapping. An integration table mapping includes several settings that enable you to control how records in a Business Central table and a Dynamics 365 for Sales entity are synchronized by the corresponding integration synchronization jobs.

Filtering Records

If you do not want to synchronize all records for a specific entity in Dynamics 365 for Sales or table in Business Central, you can set up filters to limit the records that are synchronized. You set up filters on the **Integration Table Mappings** page.

To filter records for synchronization

1. Choose the  icon, enter **Integration Table Mappings**, and then choose the related link.
2. To filter the Business Central records, set the **Table Filter** field.
3. To filter the Dynamics 365 for Sales records, set the **Integration Table Filter** field.

Creating New Records

By default, only records in Business Central and Dynamics 365 for Sales that are coupled will be synchronized by the integration synchronization jobs. You can set up table mappings so that new records will be created in the destination (for example, Business Central) for each record in the source (for example, Dynamics 365 for Sales) that is not already coupled.

For example, the SALESPEOPLE - Dynamics 365 for Sales synchronization job uses the table mapping SALESPEOPLE. The synchronization job copies data from user records in Dynamics 365 for Sales to salesperson records in Business Central. If you set up the table mapping to create new records, for every user in Dynamics 365 for Sales that is not already coupled to a salesperson in Business Central, a new salesperson record is created in Business Central.

To create new records during synchronization

1. Choose the  icon, enter **Integration Table Mappings**, and then choose the related link.
2. In the table mapping entry in the list, clear the **Synch. Only Coupled Records** field.

Using Configuration Templates on Table Mappings

You can assign configuration templates to table mappings to use for new records that are created in Business Central or Dynamics 365 for Sales. For each table mapping, you can specify a configuration template to use for new Business Central records and another template to use new Dynamics 365 for Sales records.

If you install the default synchronization setup, most of the time, two configuration templates will be automatically created and used on the table mapping for Business Central customers and Dynamics 365 for Sales accounts:

CRMCUST and **CRMACCOUNT**.

- **CRMCUST** is used to create and synchronize new customers in Business Central based on an account in Dynamics 365 for Sales.

This template is created by copying an existing configuration template for customers in the application. The **CRMCUST** is created only if there is an existing configuration template and the **Currency Code** field in the template is blank. If a field in the configuration template contains a value, the value will be used instead of the value in the mapped field for the Dynamics 365 for Sales account. For example, if the **Country/Region** field in an account in Dynamics 365 for Sales contains *U.S.* and the **Country/Region** field in the configuration template is *GB*, then *GB* is used as the **Country/Region** for the customer in Business Central.

- **CRMACCOUNT** creates and synchronizes new accounts in Dynamics 365 for Sales based on an account in Business Central.

To specify configuration templates on a table mapping

1. Choose the  icon, enter **Integration Table Mappings**, and then choose the related link.
2. In the table mapping entry in the list, in the **Table Config Template Code** field, choose to the configuration template to use for new records in Business Central.
3. Set the **Int. Tbl. Config Template Code** field to the configuration template to use for new records in Dynamics 365 for Sales.

Manually Synchronize Table Mappings

6/13/2019 • 5 minutes to read

An integration table mapping associates a Business Central table (record type), such as customer, with a Dynamics 365 for Sales entity, such as an account. Synchronizing an integration table mapping enables you to synchronize data in all records of the Business Central table and Dynamics 365 for Sales entity that are coupled. Additionally, depending on the configuration of the table mapping, synchronization can create and couple new records in the destination solution for uncoupled records in the source.

Manually synchronizing integration table mappings can be useful during the initial set up of an integration, and when diagnosing synchronization errors.

This article describes three methods for manually synchronizing integration table mappings. Each method provides a different level of synchronization.

Run a Full Synchronization

A full synchronization runs all the default integration synchronization jobs for synchronizing Business Central records and Dynamics 365 for Sales entities, as defined on the **Integration Table Mappings** page.

A full synchronization performs the following operations For Business Central or Dynamics 365 for Sales records that are:

- Not coupled, a new matching record will be created and coupled in the opposing solution. Whether and where a record gets created depends on the synchronization direction. For example, when synchronizing data from Business Central customers to Dynamics 365 for Sales accounts, if there is a customer that is not coupled to an account, then a new account will be automatically added in Dynamics 365 for Sales and coupled to the customer in Business Central. The opposite holds true when the synchronization direction is from Dynamics 365 for Sales to Business Central. For each account that is not already coupled to a customer, a new matching customer will be created in Business Central and coupled to the account in Dynamics 365 for Sales.

NOTE

To achieve this, the full synchronization operation temporarily clears the **Synch. Only Coupled Records** option on the integration table mapping that is used by the synchronization job. At the end of the full synchronization process, you will be prompted whether you want to keep this option cleared for all jobs.

- Coupled, the synchronization direction (for example, from Business Central to Dynamics 365 for Sales or from Dynamics 365 for Sales to Business Central) is predetermined by the integration table mappings. For more information, see [Standard Sales Entity Mapping for Synchronization](#).

The jobs are run in the following order to avoid coupling dependencies between entities.

1. CURRENCY - Dynamics 365 for Sales synchronization job
2. SALEPEOPLE - Dynamics 365 for Sales synchronization job
3. UNITOFMEASURE - Dynamics 365 for Sales synchronization job
4. CUSTOMER - Dynamics 365 for Sales synchronization job
5. CONTACTS - Dynamics 365 for Sales synchronization job
6. RESOURCE-PRODUCT - Dynamics 365 for Sales synchronization job

7. ITEM-PRODUCT - Dynamics 365 for Sales synchronization job

IMPORTANT

You typically only use the full synchronization when you initially set up integration between Business Central and Dynamics 365 for Sales and only one of solutions contains data, which you want to copy to the other solution. A full synchronization can be useful in a demonstration environment. Because the full synchronization automatically creates and couples records between the solutions, it makes it faster to start working with synchronizing data between records. On the other hand, you should only run a full synchronization if you want a record in Business Central for each record in Dynamics 365 for Sales for the given table mappings. Otherwise, you can have unwanted or duplicate records in either Business Central or Dynamics 365 for Sales.

See the process for a full synchronization

To run a full synchronization

1. Choose the  icon, enter **Microsoft Dynamics 365 for Sales Connection Setup**, and then choose the related link.
2. Choose the **Run Full Synchronization** action, and then choose the **Yes** button.
3. When the full synchronization is completed, you can specify whether to allow scheduled synchronization jobs to create new records.

If you want all synchronization jobs to create new records in the destination for uncoupled records in the source, choose **Yes**. This sets the **Synch. Only Coupled Records** field on the table mappings that are used by the synchronization jobs.

If you want synchronization jobs to run as they did before the full synchronization with regard to creating new records, choose **No**. This sets the **Synch. Only Coupled Records** field to the setting it had before the full synchronization.

You can view the results of the full synchronization on the **Integration Synchronization Jobs** page. For more information, see [View the Status of a Synchronization](#).

Synchronizing All Modified Records

You can use the **Microsoft Dynamics 365 for Sales Connection Setup** page to synchronize changes to data in all integration table mappings. This is similar to a full synchronization. It will synchronize data in all coupled records in the Business Central tables and Dynamics 365 for Sales entities that are defined in the table mappings. By default, only records that have been modified since the last time they were synchronized will be synchronized. The table mappings are synchronized in the following order to avoid coupling dependencies between the entities:

1. CURRENCY - Dynamics 365 for Sales synchronization job
2. SALEPEOPLE - Dynamics 365 for Sales synchronization job
3. UNITOFMEASURE - Dynamics 365 for Sales synchronization job
4. CUSTOMER - Dynamics 365 for Sales synchronization job
5. CONTACTS - Dynamics 365 for Sales synchronization job
6. RESOURCE-PRODUCT - Dynamics 365 for Sales synchronization job
7. ITEM-PRODUCT - Dynamics 365 for Sales synchronization job

You can view the results of the synchronization on the **Integration Synchronization Jobs** page. For more information, see [View the Status of a Synchronization](#).

TIP

By modifying the integration table mapping in advance, you can configure the synchronization with filters to control which records are synchronized, or configure it to create new records in the destination solution for uncoupled records in the source. For more information, see [Modify Table Mappings for Synchronization](#).

To synchronize records for all tables

1. Choose the  icon, enter **Microsoft Dynamics 365 for Sales Connection Setup**, and then choose the related link.
2. Choose the **Synchronize Modified Records** action, and then choose **Yes**.

Synchronize Individual Table Mappings

You can use the **Integration Table Mappings** page to run a synchronization job specific table mappings. This will synchronize data in all coupled records in the Business Central table and Dynamics 365 for Sales entity that are defined by the table mapping. By default, only records that have been modified since the last time they were synchronized will be synchronized.

By modifying the integration table mapping in advance, you can configure the synchronization job to create new records in the destination solution for uncoupled records in the source.

To synchronize records of an integration table mapping

1. Choose the  icon, enter **Integration Table Mappings**, and then choose the related link.
2. Choose the **Synchronize Modified Records** action, and then choose **Yes**.

Scheduling a Synchronization between Business Central and Dynamics 365 for Sales

3/31/2019 • 5 minutes to read

You can synchronize Business Central with Dynamics 365 for Sales on scheduled intervals by setting up jobs in the job queue. The synchronization jobs synchronize data in Business Central records and Dynamics 365 for Sales records that have been previously coupled together. Or for records that are not already coupled, depending on the synchronization direction and rules, the synchronization jobs can create and couple new records in the destination system. There are several synchronization jobs that are available out-of-the-box. You can view them on the **Job Queue Entries** page. For more information, see [Use Job Queues to Schedule Tasks](#).

Synchronization Process

Each synchronization job queue entry uses a specific integration table mapping that specifies which Business Central table and Dynamics 365 for Sales entity to synchronize. The table mappings also include some settings that control which records in the Business Central table and Dynamics 365 for Sales entity to synchronize.

To synchronize data, Dynamics 365 for Sales entity records must be coupled to Business Central records. For example, a Business Central customer must be coupled to a Dynamics 365 for Sales account. You can set up couplings manually, before running the synchronization jobs, or let the synchronization jobs set up couplings automatically. The following list describes how data is synchronized between Dynamics 365 for Sales and Business Central when you are using the synchronization job queue entries. For more information, see [Couple and Synchronize Records Manually](#).

- By default, only records in Business Central that are coupled to records in Dynamics 365 for Sales are synchronized. You can change the table mapping between a Dynamics 365 for Sales entity and a Business Central table so that the integration synchronization jobs will create new records in the destination database for each record in the source database that is not coupled. The new records are also coupled to the corresponding records in the source. For example, when you synchronize customers with Dynamics 365 for Sales accounts, a new account record is created for each customer in Business Central. The new accounts are automatically coupled to customers in Business Central. Because the synchronization in this case is bidirectional, a new customer is created and coupled for each Dynamics 365 for Sales account that is not already coupled.

NOTE

There are rules and filters that determine what data is synchronized. For more information, see [Synchronization Rules](#).

- When new records are created in Business Central, the records use either the template that is defined for the integration table mapping or the default template that is available for the record type. Fields are populated with data from Business Central or Dynamics 365 for Sales depending on the synchronization direction. For more information, see [How to: Modify Table Mappings for Synchronization](#).
- With subsequent synchronizations, only records that have been modified or added after the last successful synchronization job for the entity will be updated.

New records in Dynamics 365 for Sales are added in Business Central. If data in fields in Dynamics 365 for Sales records has changed, the data is copied to the corresponding field in Business Central.

- With bidirectional synchronization, the job synchronizes from Business Central to Dynamics 365 for Sales, and then from Dynamics 365 for Sales to Business Central.

Default Synchronization Job Queue Entries

The following table describes the default synchronization jobs.

JOB QUEUE ENTRY	DESCRIPTION	DIRECTION	INTEGRATION TABLE MAPPING
CONTACT - Dynamics 365 for Sales synchronization job	Synchronizes Dynamics 365 for Sales contacts with Business Central contacts.	Bidirectional	CONTACT
CURRENCY - Dynamics 365 for Sales synchronization job	Synchronizes Dynamics 365 for Sales transaction currencies with Business Central currencies.	From Business Central to Dynamics 365 for Sales	CURRENCY
CUSTOMER - Dynamics 365 for Sales synchronization job	Synchronizes Dynamics 365 for Sales accounts with Business Central customers.	Bidirectional	CUSTOMER
CUSTPRCGRP-PRICE - Dynamics 365 for Sales synchronization job	Synchronizes Dynamics 365 for Sales sales price lists with Business Central customer price groups.		CUSTOMER PRICE GROUPS-SALES PRICE LISTS
ITEM - PRODUCT - Dynamics 365 for Sales synchronization job	Synchronizes Dynamics 365 for Sales products with Business Central items.	From Business Central to Dynamics 365 for Sales	ITEM-PRODUCT
POSTEDSALESINV-INV - Dynamics 365 for Sales synchronization job	Synchronizes Dynamics 365 for Sales invoices with Business Central posted sales invoices.	From Dynamics 365 for Sales to Business Central	INVOICES-POSTED SALES INVOICES
RESOURCE-PRODUCT - Dynamics 365 for Sales synchronization job	Synchronizes Dynamics 365 for Sales products with Business Central resources.	From Business Central to Dynamics 365 for Sales	RESOURCE-PRODUCT
SALESPEOPLE - Dynamics 365 for Sales synchronization job	Synchronizes Business Central salespeople with Dynamics 365 for Sales users.	From Dynamics 365 for Sales to Business Central	SALESPEOPLE
SALESPRC-PRODUCTPRICE - Dynamics 365 for Sales synchronization job	Synchronizes Dynamics 365 for Sales product prices with Business Central sales prices.		PRODUCT PRICE-SALES PRICE
UNITOFMEASURE - Dynamics 365 for Sales synchronization job	Synchronizes Dynamics 365 for Sales unit groups with Business Central units of measure.	From Business Central to Dynamics 365 for Sales	UNIT OF MEASURE

JOB QUEUE ENTRY	DESCRIPTION	DIRECTION	INTEGRATION TABLE MAPPING
Customer Statistics - Dynamics 365 for Sales synchronization	<p>Updates Dynamics 365 for Sales accounts with the latest Business Central customer data. In Dynamics 365 for Sales, this information appears in Business Central Account Statistics quick view form of accounts that are coupled to Business Central customers.</p> <p>This data can also be updated manually from each customer record. For more information, see How to: Couple and Synchronize Records Manually.</p> <p>Note: This job queue entry is relevant only if the Business Central integration solution is installed in Dynamics 365 for Sales. For more information, see About the Business Central Integration Solution.</p>	Not applicable.	Not applicable.

To view the synchronization job log

1. Choose the  icon, enter **Integration Synchronization Log**, and then choose the related link.
2. If one or more error occurred for a synchronization job, the number of errors appears in the **Failed** column. To view the errors for the job, choose the number.

TIP

You can view all synchronization job errors by opening the synchronization job error log directly.

To view the synchronization job log from the table mappings

1. Choose the  icon, enter **Integration Table Mappings**, and then choose the related link.
2. In the **Integration Table Mappings** page, select an entry, and then choose **Integration Synch. Job Log**.

To view the synchronization error log

- Choose the  icon, enter **Integration Synchronization Errors**, and then choose the related link.

Troubleshooting Synchronization Errors

6/13/2019 • 2 minutes to read

There are lots of moving parts involved in integrating Business Central with Dynamics 365 for Sales, and sometimes things go wrong. This topic points out some of the typical errors that occur and gives some pointers for how to fix them.

Errors often occur either because of something that a user has done to coupled records or something is wrong with how the integration is set up. For errors related to coupled records, users can resolve those themselves. These errors are caused by actions such as deleting a record in one, but not both, business apps and then synchronizing. For more information, see [View the Status of a Synchronization](#).

Errors that are related to how the integration is set up typically require an administrator's attention. You can view these errors on the **Integration Synchronization Errors** page. Examples of some typical issues include:

- The permissions and roles assigned to users are not correct.
- The administrator account was specified as the integration user.
- The integration user's password is set to require a change when the user signs in.
- The exchange rates for currencies are not specified in one or the other app.

You must manually resolve the errors, but there are a few ways in which the page helps you. For example:

- The **Source** and **Destination** fields may contain links to the record where the error was found. Click the link to open the record and investigate the error.
- The **Delete Entries Older than 7 Days** and the **Delete All Entries** actions will clean up the list. Typically, you use these actions after you have resolved the cause of an error that affects many records. Use caution, however. These actions might delete errors that are still relevant.

Customizing Business Central

3/31/2019 • 2 minutes to read

There are different ways to customize the application to give you and your colleagues access to the features, functionality, and data that you need most, in a manner that best suits your daily work. Those who see the changes will depend on what you do, as described in this table.

NOTE

In addition to what administrators can customize, users can personalize their pages by adding, moving, or removing fields, freeze panes, parts, and more. For more information, see [Personalizing Your Workspace](#).

WHAT YOU CAN DO	DESCRIPTION	WHO SEES THE CHANGES	MORE INFORMATION
Install an extension	Extensions are like small applications that add functionality, change behavior, provide access to new online services, and more. For example, Microsoft provides an extension that provides integration with PayPal Payments Standard.	All users in all companies.	Customizing Using Extensions
Change which UI elements are visible.	The Experience setting determines how much of the functionality is displayed in the user interface. Choose between Essential and Premium.	All users in a specific company.	Changing Which Features are Displayed
Manage users' personalizations.	Control and manage users' personalization by disabling the ability to personalize pages and clearing any page personalizations.	All users in a specific company.	Managing Personalization as an Administrator
Enable colors on Role Centers to signal importance.	Set up Cues that appear on users' Role Centers to include an indicator that changes color based on the values in the Cues.	All users in a specific company.	Setting Up a Colored Indicator on Cues

NOTE

All feature descriptions in user documentation for Business Central assume the **Premium** experience, meaning the descriptions cover the full scope of UI elements. Therefore, users with the **Essential** experience may in some topics read about functionality and UI elements that are not visible in their user interface.

Customizing Business Central Using Extensions

6/13/2019 • 3 minutes to read

You can change Business Central by installing extensions that add functionality, changes behavior, or gives you access to new online services, for example. When you first launch Business Central, some extensions are already installed for you. Over time, more extensions will be made available to you, and you can then choose if you want to use the extension or not.

For example, Microsoft provides an extension that provides integration with PayPal Payments Standard. This extension is installed by default. But if another extension is made available that offers integration with another payment service, you can install the new extension and then choose which of the two services to use.

You manage the extensions on the **Extension Management** page. You can access this page from Home. Alternatively, choose the **Search for Page or Report** icon  in the top right corner, enter **Extension**, and then choose the related link.

NOTE

If you think you should have access to an extension but you cannot find its functionality, check the **Extension Management** page - if the extension is not listed there, you can install it as described in the following section.

Installing an Extension

You can get new extensions from the marketplace at AppSource.microsoft.com. Here, you can see all available extensions for Business Central, and you can get apps, extensions, and content packs for other Microsoft products. Set the relevant filters, take a look at the information for each extension, and get an extension for your Business Central.

NOTE

Sign in to AppSource.microsoft.com using the email account that you use for Business Central. Use the same email account for other services and products for a smooth experience.

You can also get to the marketplace from inside Business Central. On the **Extension Management** page, you can see the extensions that are currently installed, and you can open the **Extension Marketplace** page that shows the Business Central extensions that are currently available in AppSource. If you choose the *More apps* link, you are taken to AppSource.microsoft.com.

If you choose an extension, you can read about what the extension does, and you can access Help for the extension to learn more. When you choose to get an extension, you must agree to the terms of use. If you get the extension from the AppSource website, you will be signed in to Business Central to complete the installation.

When you install an extension, you might have to set it up, such as specifying an account for use with the **PayPal Payments Standard for Business Central** extension. Other extensions simply add fields to an existing page, or they add a new page, for example.

If you uninstall an extension, and you then change your mind, you can install it again. When you uninstall an extension that you have been using, the data is preserved so that if you install the extension again, your data is still available.

Some extensions are provided by Microsoft, and other extensions are provided by [other companies](#). All extensions

are tested before they are made available to you, but we recommend that you access the links that are provided with each extension to learn more about the extension before you choose to install it.

Microsoft provides the following extensions:

- [Accountant Portal for Business Central](#)
- [Ceridian Payroll](#)
- [Dynamics GP Data Migration](#)
- [Envestnet Yodlee Bank Feeds](#)
- [Essential Business Insights](#)
- [Image Analyzer](#)
- [Intelligent Cloud](#)
- [Intelligent Cloud Base](#)
- [Late Payment Predictions](#)
- [Microsoft Pay](#)
- [PayPal Payments Standard](#)
- [QuickBooks Data Migration](#)
- [QuickBooks Online Data Migration](#)
- [Quickbooks Payroll File Import](#)
- [Sales and Inventory Forecast](#)
- [WorldPay Payments Standard](#)
- [DK - C5 Data Migration](#)
- [DK - Payments and Reconciliations](#)
- [DK - Tax File Formats](#)
- [UK - GetAddress.io UK Postcodes](#)
- [US/CA/UK/AU/NZ/ZA - Send Remittance Advice](#)
- [Business Central Extensions by Other Providers](#)

NOTE

New extensions are not available in AppSource immediately after we announce an update. You can keep an eye out for the extensions at AppSource.microsoft.com.

The Accountant Portal for Business Central Extension

3/31/2019 • 2 minutes to read

This application has been deprecated. We recommend that you do not install this extension but sign up for Dynamics 365 — Accountant Hub at [Business Central for Accountants on Microsoft.com](#) instead.

For more information, see [Welcome to Dynamics 365 — Accountant Hub](#).

See Also

[Accountant Experiences in Business Central Finance](#)

The Ceridian Payroll Extension

3/31/2019 • 2 minutes to read

To account for salary payments and related transactions, you must import and post financial transactions made by your payroll provider to the general ledger.

To do this, you first import a file that you receive from the payroll provider into the **General Journal** page. Then you map the external accounts in the payroll file to the relevant G/L accounts. Lastly, you post the payroll transactions according to the account mapping. For more information, see [Import Payroll Transactions](#).

The Ceridian Payroll extension allows you to import payroll transactions from the Ceridian HR/Payroll (US) and Ceridian PowerPay (Canada) services.

[Working with Business Central](#)

The Dynamics GP Data Migration Extension

3/31/2019 • 3 minutes to read

This extension makes it easy to migrate customers, vendors, inventory items, general ledger accounts, open payables and open receivables transactions from Dynamics GP to Business Central. If your business uses Dynamics GP today, you can export the relevant records and then open an assisted setup guide to add the data to Business Central. The migration extension works for all supported versions of Microsoft Dynamics GP. For more information, see [Importing Business Data from Other Finance Systems](#).

Exporting Data from Dynamics GP

You must have exported some or all of your existing customers, vendors, inventory items, and general ledger accounts using data export functionality within Dynamics GP. When selecting the data to export the following types can be selected:

- Account
- Customer
- Item
- Vendor

When the export file is created you will have a zip file that contains several txt files that will be determined by what you selected during the export data process. There will also be additional txt files that are generated that contain supporting information needed for setup within your new Business Central company.

The Dynamics GP Data Migration extension automatically maps the exported data so that your data is quickly available to you in your new Business Central company.

What's New in the October 2018 Release

In this version, we have expanded the amount of data we bring into Business Central from Dynamics GP.

In the migration wizard, you can now choose how you want to migrate the Dynamics GP chart of accounts. You can migrate the existing chart of accounts, or you can create a new chart of accounts based on the existing chart of accounts.

If you choose to use the existing chart of accounts, the accounts will be set up as the main account segment from Dynamics GP and the additional segments will be setup as dimensions within Business Central.

If you choose to create a new chart of accounts, you will get an additional account information page in the wizard so that you can download the workbook, make the relevant changes, and then import the workbook again to change your accounts.

You will have to download the Excel workbook and map a new account number to each account number in the Excel spreadsheet. Each account will be required to have its own number, or the migration will error. When you have completed the mapping, you can continue through the migration wizard by importing the Excel workbook that you just updated. The wizard will validate that each row has a unique account number and that no rows have an empty new account number in them.

With the change to the mapping of the chart of account options, you will also note a change to the type of data that comes across into the general journal for the account numbers.

- If you choose to use the existing account numbers, we will bring over the beginning balance of the main

segment (new account number) as a summation of the main account number at the time of the migration.

- If you choose to create new account numbers, we will bring summary information for the equivalent of two fiscal years based on the fiscal periods you have set up in Dynamics GP.

In earlier versions of Business Central, the wizard migrated a summary transaction for the customer/vendor balance in Dynamics GP. Now we bring in the detailed open transactions for customers and vendors at the time of the migration. What does this mean? If your customer has 3 outstanding transactions registered in the Receivables module, the wizard brings those transactions into Business Central with the outstanding amount as the document amount. This is the same for the Payables module for vendors.

Inventory items are imported with the cost valuation method that was selected when the company setup wizard was run. Service items are automatically assigned the FIFO valuation method. Currently we bring in the Quantity on Hand for the items at the time of migration. This quantity is brought into the blank location.

The last option you see in the Data Migration wizard for Dynamics GP is the ability to specify your posting option. This setting specifies if you want to automatically post all transactions in the general journals as soon as the migration moves the data into Business Central, or if you want to post manually so that all transactions will sit in batches inside the General Journal page so you can verify the information before you post. This option is visible on the Chart of Accounts options page.

The Envestnet Yodlee Bank Feeds Extension

3/31/2019 • 2 minutes to read

To quickly reconcile payments made to your bank accounts, the Envestnet Yodlee Bank Feeds service allows you to link your system bank account to your online bank account. This means that the latest bank statement is automatically or manually fed into your reconciliation journal, ensuring that you are always processing the latest payments with minimal risk of errors.

NOTE

This functionality is only supported in the online version of Business Central. To use this functionality on-premise, you must obtain a cobrand account from Envestnet Yodlee.

The Envestnet Yodlee Bank Feeds service provides the following benefits:

- Removes the need for manual entry.
- Improves efficiency and accuracy when doing payment reconciliation.
- Supports a large number of banks.
- Allows up-to-date information about bank transactions from within Business Central.
- Supports manual as well as automatic bank feeds.
- Enables outsourcing of payment reconciliation to an accountant by providing access to bank statements.

For more information, see [Set Up the Envestnet Yodlee Bank Feeds Service](#).

The Essential Business Insights Extension

3/31/2019 • 2 minutes to read

The Essential Business Insights extension finds interesting business facts in your company data and displays them as newspaper-like headlines in Role Centers. Depending on what the extension finds in the data, the insights are from the last week, month, or three months from the current date. The insights update every 10 minutes.

If you want to take a closer look at an insight, you can choose it to go to its source. For example, if you want details about the largest sales invoice that was posted last week, you can choose the insight to display the invoice.

The following table describes the insights that this extension provides for each Role Center.

ROLE CENTER	QUESTIONS THE INSIGHTS ANSWER
Default	Displays a greeting, and link to product information.
Business Manager	<ul style="list-style-type: none">• What was the most popular item last week, month, or last three months, and how many did we sell?• What was the largest sale order last week, month, or last three months?• Who, or what, was the busiest resource, and what were the bookings?• Have sales gone up in the last week, month, or three months, compared to the same period last year?• What was the biggest sales invoice we posted last week, month, or last three months, and to which customer did we send the bill?
Accountant	<ul style="list-style-type: none">• What was the largest sales order and posted invoice last week, month, or last three months?• Have sales gone up in the last week, month, or three months, compared to the same period last year?
Order Processor	What was the largest sale order and posted invoice last week, month, or last three months?
Relationship Manager	What was the largest invoiced amount, and to which customer did we send the bill?
Team Member	Displays a greeting, and link to product information.
Project Manager	Displays a greeting, and link to product information.
Administrator	Displays a greeting, and link to product information.

[Customizing Business Central Using Extensions](#)

The Image Analyzer Extension

3/31/2019 • 4 minutes to read

The Image Analyzer extension uses powerful image analytics provided by the Computer Vision API for Microsoft Cognitive Services to detect attributes in the images that you import for items and contact persons, so you can easily review and assign them. For items, attributes could be whether the item is a table or a car, and whether it is red or blue. For contact persons, attributes can be gender or age.

Image Analyzer suggests attributes based on tags that the Computer Vision API finds, and a confidence level. By default, it suggests attributes only if it is at least 80% sure that the attribute is correct. You can set another confidence level, if needed. To learn more about how the tags and confidence level are determined, see [Computer Vision API](#).

Image Analyzer is free in Business Central, but there is a limit to the number of items that you can analyze during a certain period of time. By default, you can analyze 100 images per month.

After you enable the extension, Image Analyzer runs each time you import an image to an item or contact person. You will see the attributes, confidence level, and details right away, and can decide what to do with each attribute. If you imported images before you enabled the Image Analyzer extension, you must go to the item or contact cards and choose the **Analyze Picture** action.

Privacy Notice

This extension uses the Computer Vision API from Microsoft Cognitive Services, which may have varying levels of compliance commitments than Business Central. When you enable the Image Analyzer extension, Customer Data such as a contact image or an item image will be sent to the Computer Vision API. By installing this extension you agree for this limited set of data to be sent to the Computer Vision API. Note that you may disable, as well as uninstall, the Image Analyzer extension at any time to discontinue use of this functionality. For more information, see [Microsoft Trust Center](#).

Requirements

There are a few requirements for the images:

- Image formats: JPEG, PNG, GIF, BMP
- Maximum file size: Less than 4 MB
- Image dimensions: Greater than 50 x 50 pixels

To enable Image Analyzer

The Image Analyzer extension is built-in to Business Central. You just need to turn it on.

NOTE

To enable the Image Analyzer extension, you must be an administrator. Make sure that you are assigned the **SUPER** user permission set.

1. To enable the Image Analyzer extension, do one of the following:

- Open an item or contact card. In the notification bar, choose **Analyze Images**, and then follow the steps in the assisted setup guide.

- Choose the  icon, enter **Service Connections**, and then choose **Image Analysis Setup**. Choose the **Enable Image Analyzer** check box, and then complete the steps in the assisted setup guide.

TIP

The **Image Analysis Setup** page is also where you can change the degree of confidence for attribute suggestions. For example, if you want to require a greater degree of confidence, you can enter a higher percentage.

To analyze an image of an item

The following steps describe how to analyze an image that was imported before you enabled the Image Analyzer extension.

1. Choose the  icon, enter **Items**, and then choose the related link.
2. Choose the item, and then choose the **Analyze Picture** action.
3. The **Image Analyzer Attributes** page displays the detected attributes, the confidence level, and other details about the attribute. Use the **Action to perform** options to specify what to do with the attribute.

TIP

You can add the name of the attribute to the item description by choosing **Add to item description**. For example, this can be useful for quickly adding detail.

To analyze a picture of a contact person

The following steps describe how to analyze an image that was imported before you enabled the Image Analyzer extension.

1. Choose the  icon, enter **Contacts**, and then choose the related link.
2. Choose the contact person, and then choose the **Analyze Picture** action.
3. On the **Profile Questionnaire** FastTab, review the suggestions, and make corrections if needed.

Blacklisting suggested attributes

If the analysis suggests an attribute that you do not want to see you can blacklist the attribute. Use caution, however. Blacklisted attributes are not suggested for other items or contact persons either. If you regret blacklisting an attribute, you can choose **Blacklisted Attributes**, and then delete the attribute from the list.

To use your own account for the Computer Vision API

You can also use your own account for the Computer Vision API, for example, if you want to analyze more images than we allow.

1. Choose the  icon, enter **Image Analyzer Setup**, and then choose the related link.
2. Enter the **API URI** and **API Key** that you received for Computer Vision API.

NOTE

You must add **/analyze** at the end of the API URI, if it isn't already there. For example:

```
https://cronus.api.cognitive.microsoft.com/vision/v1.0/analyze .
```

To see how many analyses you have left in the current period

You can view the number of analyses you've done, and how many you can still do, in the current period.

1. Choose the  icon, enter **Image Analyzer Setup**, and then choose the related link.
2. The **Limit type**, **Limit value**, and **Analyzes performed** provide the usage information.

To stop using the Image Analyzer extension

1. Choose the  icon, enter **Service Connections**, and then choose **Image Analyzer Setup**.
2. Clear the **Enable Image Analyzer** check box.

[Getting Started](#)

Intelligent Cloud Extensions

6/13/2019 • 2 minutes to read

This extension will connect your data from Business Central on-premises with Business Central online for intelligent insights.

If you are using one of the supported on-premises products, you can configure your intelligent cloud environment based on a product-specific extension. Once your intelligent cloud environment is configured, you will be able to replicate data from your on-premises solution to your Business Central cloud tenant. This will enable you to take full advantage of what the cloud has to offer your business such as, enhanced insights into your business, artificial intelligence, multiple device access, and anytime, anywhere access.

Business Central on-premises

If you are using an on-premises deployment of Business Central, get the **Intelligent Cloud Base** extension and the **Business Central Intelligent Cloud** extension, and then run the **Intelligent Cloud Setup** assisted setup guide.

Dynamics GP

If you are using Dynamics GP, get the **Intelligent Cloud Base Extension** extension, the **Dynamics GP Data Migration** extension, and the **Dynamics GP Intelligent Cloud** extension, and then run the **Intelligent Cloud Setup** assisted setup guide.

Dynamics NAV

If you are using Dynamics NAV, get the **Intelligent Cloud Base Extension** extension and the **Dynamics NAV Intelligent Cloud** extension, and then run the **Intelligent Cloud Setup** assisted setup guide.

The Late Payment Prediction Extension

3/31/2019 • 5 minutes to read

Effectively managing receivables is important to the overall financial health of a business. The Late Payment Prediction extension can help you reduce outstanding receivables and fine-tune your collections strategy by predicting whether sales invoices will be paid on time. For example, if a payment is predicted to be late, you might decide to adjust the terms of payment or the payment method for the customer.

What are Predictions Based On?

The Late Payment Prediction extension uses a predictive model that we developed in Azure Machine Learning Studio and trained using data that is representative of a range of small to medium sized businesses. Though we have already trained and evaluated it, our predictive model will continue to learn from your data. The more you use the model and the more data you feed it, the more accurate predictions will become. By default, the extension evaluates the model and updates the predictions on a weekly basis. However, you can update the predictions whenever you want by choosing the **Update Prediction** action on the **Customer Ledger Entries** page.

NOTE

We use a bit of your compute time each week when we evaluate the model and update your predictions. In addition to manually updating your predictions, other actions that consume compute time are when you train the model (which you might do if you've recently added data) and when you evaluate the model (which looks at the quality of the model).

Getting Started

The extension is free in Business Central, and we provide a subscription to Azure Machine Learning. The subscription offers 30 minutes of compute time per month. If you need more than that you can create your own predictive model and use it instead. For more information, see the section titled *Building Your Own Predictive Model* later in this topic.

When you open a posted sales document, a notification will display at the top of the page. To use the Late Payment Prediction Extension you can opt in by choosing **Enable** in the notification. Alternatively, you can set up the extension manually. For example, if you regret dismissing the notification.

To enable the extension manually, follow these steps:

1. Choose the  icon, enter **Service Connections**, and then choose the related link.
2. Choose the **Late Payment Prediction Setup** option, and then fill in the fields as necessary.

Viewing All Payment Predictions

If you enable the extension a **Payments Predicted to be Late** tile is available in the **Business Manager** Role Center. The tile displays the number of payments that are predicted to be late, and let's you open the **Customer Ledger Entries** page where you can dig deeper into the posted invoices. There are three columns to pay attention to:

- **Late Payment** - Indicates whether the payment for the invoice is predicted to be late.
- **Prediction Confidence** - Indicates how reliable you should consider the prediction to be. **High** means that the prediction is at least 90% sure, **Medium** is between 80 and 90%, and **Low** is below 80%.
- **Prediction Confidence %** - Shows the actual percentage behind the confidence rating. By default, this column

is not displayed, but you can add it if you want. For more information, see [Personalizing Your Workspace](#).

TIP

The Customer Ledger Entries page also shows a FactBox on the right. While you are reviewing predictions, the information in the **Customer Details** section can be helpful. When you choose the invoice in the list, the section shows information about the customer. It also lets you take immediate action. For example, if a customer frequently misplaces their wallet, you can open the Customer card from the FactBox and block the customer for future sales.

Viewing a Payment Prediction for a Specific Sales Document

You can also predict late payments up-front. On the **Sales Quotes**, **Sales Orders**, and **Sales Invoices** pages, you can use the **Predict Payment** action to generate a prediction for the sales document you're viewing.

Building Your Own Predictive Model

Interested in building your own predictive model? You can use Azure Machine Learning Studio to build your own predictive model and use it in Business Central. To use your own model, you must subscribe to Azure Machine Learning. For more information, see [Azure Machine Learning Studio Documentation](#).

We do, however, offer an easier way for you to create and use your own predictive model. You can share data from your invoices with our [Prediction Experiment for Dynamics 365 Business Central](#) in Azure Machine Learning, and let our experiment create and train a predictive model based on your data. To share your data, on the **Late Payment Prediction Setup** page, choose the **Create My Model** action. Afterward, predictions will be based on your model and your data, not ours.

NOTE

The quality of the model is important. When our predictive experiment uses your data to train a model it determines a quality value for the model as a percentage. The model quality indicates how accurate the model's predictions are likely to be. Several factors can impact the quality of a model. For example, these factors might be that there was not enough data, or the data did not contain enough variation. You can view the quality of the model you are currently using on the **Late Payment Prediction Setup** page. You can also specify a minimum threshold for the model quality. Models with a quality value below the threshold will not produce predictions.

To use your model instead of ours

If you create your own model in Azure Machine Learning Studio, without using the tools in Business Central, you must provide your credentials so that Business Central can access the model. There are a couple of steps to do that:

1. Choose the  icon, enter **Late Payment Prediction Setup**, and then choose the related link.
2. Choose the **Use My Azure Subscription** check box.
3. In the **Selected Model** field, choose **My Model**.
4. On the **My Model Credentials** FastTab, enter the API URL and API key for your model.

The Microsoft Pay Extension

3/31/2019 • 2 minutes to read

Customers continuously require higher customer service, both in terms of the quality of product but also in terms of delivery and payment services. The Microsoft Pay service helps you increase your customer service.

The Microsoft Pay extension adds a Microsoft Pay link to your sales documents so customers can easily pay using Microsoft Pay. Then you can send the documents by email to provide higher customer service and shorten the time it takes for customers' payments to arrive on your bank account.

The Microsoft Pay extension provides the following benefits:

- Customer payments appear faster on your bank account.
- Customers have more ways to pay invoices.
- Microsoft Pay offers a trustworthy payment service, which customers prefer to entering credit card information on unknown web sites.
- Microsoft Pay offers multiple ways of handling payments, including credit card processing, such as PayPal and Stripe.
- The Microsoft Pay link can be embedded automatically on every invoice document or by the user.
- Because this functionality is built as an extension, it gives you full control to enable it when and if your business processes require it.

Enabling payment service extensions is free in Business Central, however, you will need to contact the payment service to get an account. For more information, see [Enable Customer Payment Through Payment Services](#).

The PayPal Payments Standard Extension

3/31/2019 • 2 minutes to read

Customers continuously require higher customer service, both in terms of product quality but also in terms of delivery and payment options. The PayPal Payments Standard service helps you increase your customer service.

As an alternative to collecting payments through bank transfer or credit cards, you can offer your customers to pay you through their PayPal account. When you send a sales invoice or sales order by email, there is a PayPal link in the email body and in the attached PDF document. When the customer chooses the link, the service page for their PayPal account appears showing the payment details for the sale. The customer can then pay the invoice as any other PayPal payment.

The PayPal Payments Standard service provides the following benefits:

- Customer payments arrive faster in your bank account.
- Customers have more ways to pay invoices.
- PayPal offers a trustworthy payment service, which customers prefer to entering credit card information on web sites.
- PayPal offers multiple ways of handling payments, including credit card processing, PayPal accounts, and other sources.
- The PayPal link can be added automatically to sales documents or manually by the user.
- The PayPal Payments Standard service does not involve monthly fees or setup fees.
- Because it is an extension, you can easily enable the PayPal Payment Standard service when and if your business requires it.

For more information, see [Enable Customer Payment Through PayPal](#).

[Setting Up Sales](#)

[Working with Business Central](#)

The QuickBooks Data Migration Extension

3/31/2019 • 3 minutes to read

This extension makes it easy to migrate customers, vendors, items, and accounts from QuickBooks to Business Central. If your business uses QuickBooks today, you can export the relevant information and then open an assisted setup guide to upload the data to Business Central.

For more information, see [Importing Business Data from Other Finance Systems](#).

Data from QuickBooks Desktop

You can import the following data from QuickBooks Online to Business Central:

- Customers
- Vendors
- Items
- Chart of Accounts
- Beginning Balance transactions in General Ledger
- On-hand Quantities for Inventory Items
- Open documents for customers and vendors, such as invoices, credit memos and payments

We migrate only full amounts on sales and purchase documents. We do not update partially paid amounts. For example, if a customer has paid 300 of a total of 500 dollars on a sales invoice, we migrate the full 500. If you have received partial payments, you must update these manually, either before or after you migrate data. We recommend that you apply outstanding transactions before you migrate, just to make things easier afterward.

NOTE

We do not migrate purchase orders or sales orders.

Before You Start

An important part of the migration process is to specify the accounts to migrate transactions to. It's a good idea to plan this mapping before you migrate data. For example, the accounts where you post transactions for:

- The sale of items or services to customers
- The purchase of items or services from vendors
- Adjustments in the general ledger

Business Central requires that general ledger accounts have account numbers assigned to them. Make sure that account numbers are assigned to your accounts in QuickBooks. If transactions in QuickBooks have tax amounts, you must set up a tax account for your tax jurisdictions in Business Central before you can post transactions.

In order to get your data out of the QuickBooks desktop application you will need to download the Microsoft Data Exporter Tool. The instructions for the tool are in the Data Migration Wizard in Business Central. The tool will connect to your QuickBooks application and export the applicable data to a .zip file.

NOTE

Currently the data exporter tool only works with QuickBooks 2017 and 2018.

Finding the QuickBooks Data Migration Extension

The QuickBooks Data Migration extension is installed and ready to go as an integrated part of the Data Migration assisted setup guide. If you are ready to get started now, and have exported your data from QuickBooks, choose the  icon, enter **Assisted Setup**, and then choose the related link. Choose **Migrate business data**, and then follow the steps in the guide.

What do I do after I migrate Data?

After you migrate data, transactions have the status Unposted, so you can review them and make adjustments. To review the transactions, go to the page where you would normally find them. For example, to review unposted sales invoices, go to the Sales Invoices page. To review payment journals, go to the Payment Journals page. There are a few things in particular that you should do: If the transactions in QuickBooks had markup or discount amounts, you must manually add the amounts to the related transactions in Business Central before you post them. If you are using value added tax (VAT), you may need to add a business posting group and a product posting group to the posting setup so that you can post VAT amounts. Verify the beginning balances for accounts in the general ledger. QuickBooks does not store the current balance for all accounts, so you might need to correct beginning balances.

[Customizing Business Central Using Extensions](#)

The QuickBooks Online Data Migration Extension

3/31/2019 • 2 minutes to read

This extension is included in the **Data Migration** assisted setup guide to help you migrate important business data from QuickBooks Online to Business Central. For example, this is useful when your business is growing, and you've decided to upgrade your business management app by starting to use Business Central.

What data can I import from QuickBooks Online?

You can import the following data from QuickBooks Online to Business Central:

- Customers
- Vendors
- Items
- Chart of accounts
- Beginning balance transaction in the general ledger
- On-hand quantities for inventory items
- Open documents for customers and vendors, such as invoices, credit memos, and payments

We migrate only full amounts on sales and purchase documents. We do not update partially paid amounts. For example, if a customer has paid 300 of a total of 500 dollars on a sales invoice, we migrate the full 500. If you have received partial payments, you must update these manually, either before or after you migrate data. We recommend that you apply outstanding transactions before you migrate, just to make things easier afterward.

NOTE

We do not migrate purchase orders or sales orders.

Before you start

An important part of the migration process is to specify the accounts to migrate transactions to. It's a good idea to plan this mapping before you migrate data. For example, the accounts where you post transactions for:

- The sale of items or services to customers.
- The purchase of items or services from vendors.
- Adjustments in the general ledger.

Business Central requires that general ledger accounts have account numbers assigned to them. Make sure that account numbers are assigned to your accounts in QuickBooks Online.

If transactions in QuickBooks Online have tax amounts, you must set up a tax account for your tax jurisdictions in Business Central before you can post transactions.

How do I start using the extension?

Getting started is easy. All you need to do is run the **Data Migration** assisted setup guide. Here's how:

1. Choose the  icon, enter **Assisted Setup**, and then choose **Migrate business data**.
2. Follow the instructions on each step in the assisted setup guide.

What do I do after I migrate data?

After you migrate data, transactions have the status **Unposted**, so you can review them and make adjustments. To review the transactions, go to the page where you would normally find them. For example, to review unposted sales invoices, go to the **Sales Invoices** page. To review payment journals, go to the **Payment Journals** page.

There are a few things in particular that you should do:

- If the transactions in QuickBooks Online had markup or discount amounts, you must manually add the amounts to the related transactions in Business Central before you post them.
- If you are using value added tax (VAT), you may need to add a business posting group and a product posting group to the posting setup so that you can post VAT amounts.
- Verify the beginning balances for accounts in the general ledger. QuickBooks Online does not store the current balance for all accounts, so you might need to correct beginning balances.

The QuickBooks Payroll File Import Extension

3/31/2019 • 2 minutes to read

Use the QuickBooks Payroll File Import extension to import payroll transactions from QuickBooks to general ledger accounts in Business Central. For example, this is useful when you are transitioning from QuickBooks to Business Central, or if you outsource your payroll but also want to keep track of it in Business Central.

Steps to Import Payroll Data

The first step is for you, or maybe your accountant, to use the export features in QuickBooks to export the payroll data to an .IIF file. The second step is to open the **General Journals** page in Business Central and use the **Import Payroll Transactions** action to import the file. During the import process you map the general ledger accounts from QuickBooks to corresponding accounts in Business Central. The final step is to post the payroll transactions in Business Central according to the account mapping.

For more information, see [Import Payroll Transactions](#).

[Working with Business Central](#)

The Sales and Inventory Forecast Extension

3/31/2019 • 2 minutes to read

Inventory management is a trade-off between customer service and managing your cost. On one hand, a low inventory requires less working capital, but, on the other hand, stock-outs potentially lead to missed sales. The Sales and Inventory Forecast extension predicts potential sales using historical data and gives a clear overview of expected stock-outs. Based on the forecast, the extension helps create replenishment requests to your vendors and saves you time.

Setting up Forecasting

In Business Central, the connection to [Cortana Intelligence](#) is already set up for you. But you can configure the forecast to use a different type of period to report by, such as changing from forecasting by month to forecasting by quarter. You can also choose the number of periods to calculate the forecast by, depending on how granular you want the forecast to be. We suggest that you forecast by month and with a 12 month horizon for the forecast.

Using the Forecasts

The extension uses Cortana Intelligence to predict future sales based on your sales history to help you avoid inventory shortage. For example, when you choose an item on the **Items** page, the chart in the **Item Forecast** pane shows the estimated sales of this item in the coming period. This way you can see if you are likely to run out of stock of the item soon.

You can also use the extension to suggest when to stock up on inventory. For example, if you create a purchase order for Fabrikam because you want to buy their new desk chair, the Sales and Inventory Forecast extension will suggest that you also restock on the LONDON swivel chair that you usually buy from this vendor. This is because the extension forecasts that you will run out of stock of the LONDON swivel chair in the coming two months, so you might want to order more chairs already now.

The WorldPay Payments Standard Extension

3/31/2019 • 2 minutes to read

The WorldPay Payments Standard extension lets you offer customers a convenient alternative to making payments through bank transfers or credit cards. Not only that, payments made through payment services will typically land in your bank account more quickly. If you enable the extension, and send a sales invoice or sales order by email, the document includes a link to the payment service in the email body and in the attached PDF document. A customer can choose the link, and then use the payment service to make the payment.

Enabling payment service extensions is free in Business Central, however, you will need to contact the payment service to get an account. For more information, see [Enable Customer Payment Through Payment Services](#).

The C5 Data Migration Extension

3/31/2019 • 5 minutes to read

This extension makes it easy to migrate customers, vendors, items, and your general ledger accounts from Microsoft Dynamics C5 2012 to Business Central. You can also migrate historical entries for general ledger accounts.

NOTE

The company in Business Central must not contain any data. Additionally, after you start a migration, do not create customers, vendors, items, or accounts until the migration finishes.

What Data is Migrated?

The following data is migrated for each entity:

Customers

- Contacts
- Location
- Country
- Customer dimensions (department, center, purpose)
- Shipment method
- Sales Person
- Payment terms
- Payment method
- Customer price group
- Customer invoice discount

If you migrate accounts, the following data is also migrated:

- Customer posting setup
- General journal batch
- Open transactions (customer ledger entries)

Vendors

- Contacts
- Location
- Country
- Vendor dimensions (department, center, purpose)
- Invoice discount
- Shipment method
- Purchaser
- Payment terms
- Payment method
- Vendor invoice discount

If you migrate accounts, the following data is also migrated:

- Vendor posting setup
- General journal batch
- Open transactions (vendor ledger entries)

Items

- Location
- Country
- Item dimensions (department, center, purpose)
- Sales line discounts
- Customer discount groups
- Item discount groups
- Sales price
- Tariff number
- Units of measure
- Item tracking code
- Customer price group
- Assembly BOMs

If you migrate accounts, the following data is also migrated:

- Inventory posting setup
- General posting setup
- Item journal batch
- Open transactions (item ledger entries)

NOTE

If there are open transactions that use foreign currencies, the exchange rates for those currencies are also migrated. Other exchange rates are not migrated.

Chart of Accounts

- Standard dimensions: Department, Cost Center, Purpose
- Historical G/L transactions

NOTE

Historical G/L transactions are treated a little differently. When you migrate data you set a **Current Period** parameter. This parameter specifies how to process G/L transactions. Transactions after this date are migrated individually. Transactions before this date are aggregated per account and migrated as a single amount. For example, let's say there are transactions in 2015, 2016, 2017, 2018, and you specify January 01, 2017 in the Current Period field. For each account, amounts for transactions on or before December 31, 2106, will be aggregated in a single general journal line for each G/L account. All transactions after this date will be migrated individually.

File Size Requirements

The largest file size you can upload to Business Central is 150 MB. If the file you export from C5 is larger than that, consider migrating data in multiple files. For example, export one or two types of entities from C5, such as customers and vendors, to a file, and then export items to another file, and so on. You can import files individually in Business Central.

To migrate data

There are just a few steps to export data from C5, and import it in Business Central:

1. In C5, use the **Export Database** feature to export the data. Then send the export folder to a compressed (zipped) folder.
2. In Business Central, choose the  icon, enter **Data Migration**, and then choose **Data Migration**.
3. Complete the steps in the assisted setup guide. Make sure to choose **Import from Microsoft Dynamics C5 2012** as the data source.

Viewing the Status of the Migration

Use the **Data Migration Overview** page to monitor the success of the migration. The page shows information such as the number of entities that the migration will include, the status of the migration, and the number of items that have been migrated and whether they were successful. It also shows the number of errors, lets you investigate what went wrong and, when possible, makes it easy to go to the entity to fix the issues. For more information, see the next section in this topic.

NOTE

While you are waiting for the results of the migration, you must refresh the page to display the results.

How to Avoid Double-Posting

To help avoid double-posting to the general ledger, the following balance accounts are used for open transactions:

- For vendors, we use the A/P account from the vendor posting group.
- For customers, we use the A/R account from the customer posting group.
- For items, we create a general posting setup where the adjustment account is the account specified as the inventory account on the inventory posting setup.

Correcting Errors

If something goes wrong and an error occurs, the **Status** field will show **Completed with Errors**, and the **Error Count** field will show how many. To view a list of the errors, you can open the **Data Migration Errors** page by choosing:

- The number in the **Error Count** field for the entity.
- The entity, and then the **Show Errors** action.

On the **Data Migration Errors** page, to fix an error you can choose an error message, and then choose **Edit Record** to view the migrated data for the entity. If you have several errors to fix, you can choose **Bulk-Fix Errors** to edit the entities in a list. You still need to open individual records if the error was caused by a related entry though. For example, a vendor will not be migrated if an email address one of their contacts has an invalid format.

After you fix one or more errors, you can choose **Migrate** to migrate only the entities you fixed, without having to completely restart the migration.

TIP

If you have fixed more than one error, you can use the **Select More** feature to select multiple lines to migrate. Alternatively, if there are errors that are not important to fix, you can choose them and then choose **Skip Selections**.

NOTE

If you have items that are included in a BOM, you might need to migrate more than once if the original item is not created before the variants that reference it. If an item variant is created first, the reference to the original item can cause an error message.

Verifying Data After Migrating

One way to verify that your data migrated correctly is to look at the following pages in C5 and Business Central.

MICROSOFT DYNAMICS C5 2012	BUSINESS CENTRAL	BATCH JOB TO USE
Customer Entries	General Journals	CUSTMIGR
Vendor Entries	General Journals	VENDMIGR
Item Entries	Item Journals	ITEMMIGR
G/L Entries	General Journals	GLACMIGR

Stopping Data Migration

You can stop migrating data by choosing **Stop All Migrations**. If you do, all pending migrations are also stopped.

The Payments and Reconciliations (DK) Extension

3/31/2019 • 3 minutes to read

Make fast, error-free payments by exporting files that are formatted specifically for exchanges with your vendor or bank. These files speed up the payment and reconciliation processes, and eliminate errors that can happen when you manually enter the information on a bank website.

This extension supports file formats for several Danish banks. When you export payment information to a file, the extension packages the data into the format that your bank requires. For example, the formats include Bankdata-V3, BEC, SDC, and FIK, which many different banks use, and some that are more specialized for certain banks, for example, Danske Bank and Nordea. The extension also includes some formats for importing and reconciling bank statements.

NOTE

To use the extension, you must know the format that your bank or vendor requires. Some banks or vendors provide this information on their websites; however, you might need to contact their customer service to get the information.

Supported Bank Formats

This extension can apply the following file formats for payment files:

- BANKDATA-V3
- BEC-INDLAND
- BEC-CSV
- DANSKEBANK-CMKV
- DANSKEBANK-CMKXKSX
- DANSKEBANK
- FIK71
- NORDEA-ERHVERV-CSV
- NORDEA
- NORDEA-UNITEL-V3
- SDC
- SDC-CSV

To set up the extension

There are a few steps to get started.

- Allow payment data exports. To help protect your data, this is not readily available.
- Set up purchase and payables so that you do not require external document numbers on invoices. If needed, you can use the reference number to refer to a specific invoice.
- Specify the payment method for each vendor. Payment methods define how you pay invoices from the vendor. For example, Bank, Cash, Check, or Account.
- Specify the type of format to use for each of your bank accounts. For example, NORDEA, DANSKEBANK, SDC, and so on.

Additionally, you must assign vendors to a domestic **Gen. Bus. Posting Group** and a **Vendor Posting Group**. The

Country/Region setting for the vendor must be Denmark (DK). For more information, see [Setting Up Posting Groups](#).

To allow Business Central to export payment data

1. Choose the  icon, enter **Payment Journal**, and then choose the related link.
2. On the **Edit Payment Journal** page, choose the **Bank** batch.
3. Choose the **Allow Payment Export** check box.

To specify a payment method for a vendor

The following table shows the combinations of FIK and GIRO payment methods that Business Central supports.

	TYPE 01	TYPE 04	TYPE 71	TYPE 73
Giro Account No. or FIK Creditor No.?	Giro Account No.	Giro Account No.	FIK Creditor No.	FIK Creditor No.
Allows Message to Recipient?	Yes	No	No	Yes
Contains Payment Reference number?	No	Yes, 16 digits.	Yes, 15 digits.	No

1. Choose the  icon, enter **Vendors**, and then choose the related link.
2. Open the card, expand the **Payments** tab, in the **Payment Method** field choose the payment method.
3. Depending on your selection, you must complete other fields. See the table above for a description of the combinations.

To specify the format to use for a bank account

1. Choose the  icon, enter **Bank Accounts**, and then choose the related link.
2. Open the card for the bank account.
3. In the **Payment Export Format** field, choose the format for your export file.

Choosing the FIK or Giro payment information for vendor invoices

1. Choose the  icon, enter **Purchase Invoices**, and then choose the related link.
2. Choose the vendor. Remember, this must be a Danish vendor with an address in Denmark.
3. Create an invoice. The **Payment Method** and **Vendor Number** fields are filled in based on settings on the Vendor card. You can change them if you want.
4. In the **Payment Reference** field, enter the 15-digit number from the vendor invoice.

TIP

You only have to add the last 11 digits of the number. Business Central will add four zeros to the beginning of the number.

5. Post the invoice.

To use the extension to export payment data

1. Choose the  icon, enter **Payment Journals**, and then choose the related link.
2. Choose the **Suggest Vendor Payment Journals** action.

TIP

If you want to export only specific payments, use the options for filtering the data.

3. If needed, you can add filters to export only specific payments.
4. In the **Bank Payment Type** field, choose **Electronic Payment**.
5. Choose the **Export** action.

The Tax File Formats (DK) Extension

3/31/2019 • 2 minutes to read

If you engage in trade with companies, or internal branches or subsidiaries, in other EU countries you must report information about the activities to SKAT and to Statistics Denmark. If you use the VAT and Intrastat reporting features in Business Central, this extension can ensure that the file you export is compatible with requirements from these organizations. The extension adds the MS-ECSL Report Export File and Intrastat Export Lines submission codeunits to your VAT Report configuration, so you can export data in the new format right away.

The extension is free, you just need to install it.

The GetAddress.io UK Postcodes Extension

3/31/2019 • 2 minutes to read

The GetAddress.io UK Postcodes extension can save time and prevent mistakes when you enter addresses for entities like customers, vendors, bank accounts, and employees. For example, when you're creating a customer, you just choose a postcode and Business Central shows a list of addresses. Pick the address you want, and presto, the address fields are filled out.

##To use the GetAddress.io UK Postcodes extension when you enter an address

1. Under **Address**, choose **Look up address from postcode**.

NOTE

The **Look up address from postcode** option is available only if the **Country/Region Code** field is either empty, or contains **GB**.

2. On the **Postcode Search** page, in the **Postcode** field, enter or choose the postcode.
3. On the **Address Selection** page, choose the address.

TIP

If you know the street number, you can filter the addresses by entering some or all of the number in the **Delivery Point** field.

Send Remittance Advice

6/6/2019 • 2 minutes to read

Where remittance advice is used to notify vendors of payments being made, you can now email remittance advice in bulk from the payment journal as well as resend after payments are made from vendor ledger entries by using document sending profiles.

NOTE

This functionality is only supported in Business Central online and on-premises in following countries: United Kingdom, United States, Canada, Australia, New Zealand, and South Africa.

You can send remittance advice in two different ways:

- In the **Payment Journal** page, choose **Navigate, Payments, Send Remittance Advice** to email remittance advice for one or multiple payment journal lines
- In the **Vendor Ledger Entries** page, choose Action, Functions, Send Remittance Advice to email remittance advice after posting of vendor payments, for one of multiple vendor ledger entries

Business Central Extensions by Other Providers

3/31/2019 • 2 minutes to read

At AppSource.microsoft.com, you can get extensions for Business Central. Some extensions are provided by Microsoft, and other extensions are provided by other companies. We refer to the websites that these companies provide for more information about the extensions that are not published by Microsoft. You can find this information at AppSource.microsoft.com.

The list of the extensions by other companies grows each month. So keep an eye out for AppSource.microsoft.com and get apps to help you in your work in Business Central.

Changing Which Features are Displayed

3/31/2019 • 3 minutes to read

Business Central is designed to help you run your business, regardless which line of business you are in. At the core of Business Central, you find financial reporting and sales and purchasing processes. You add experiences to that according to your business needs by adding extensions from AppSource or by changing the Experience setting for your company. For more information, see [Customizing Business Central Using Extensions](#), or [Choosing a User Experience to Show or Hide Features](#).

Choosing a User Experience to Show or Hide Features

The user experience determines how much of the core functionality is available when you and your colleagues use Business Central. You can choose the user experience for your company on the **Company Information** page, in the **Experience** field.

NOTE

This setting applies to all users in your company. Users can customize their own experience even further by changing page layouts and content. For more information, see [Personalizing Your Workspace and Pages](#).

The following table lists the experiences that are currently available.

EXPERIENCE	IMPACT ON USER INTERFACE
Essential	Shows all actions and fields for all common business functionality.
Premium	Shows all actions and fields for all business functionality, including Manufacturing and Service Management.

NOTE

The experiences that you can select from in Business Central depend on your solution license, called a plan. For information about the **Essential** and **Premium** plans, see [Business Central](#) on the Microsoft Dynamics 365 marketing site. See also the [Business Central Licensing Guide](#) (requires access to CustomerSource or PartnerSource).

IMPORTANT

All regular users in a solution must be assigned the same plan, Essential or Premium, before that experience can be selected for the company. Accordingly, one user cannot access Premium features if one or more other users can only access Essential features. This is not the case for non-regular users of type Team Member, Internal Admin, External Accountant, and Delegated Admin, who can each be assigned a different plan than other users in the solution.

Enabling Premium Features after Upgrading a Plan

Users are assigned to plans in Office 365 Admin Center in connection with the general work to create the Business Central users. For more information, see [Add Users to Office 365 for business](#).

You can then define which specific functions and pages within the experience those users are allowed to access

by assigning permission sets. For more information, see [Managing Users and Permissions](#).

To update plan changes in users groups

When you have made a change to users plans in Office 365 Admin Center, such as assigned more users to the Premium plan, you must reflect the change in Business Central.

1. Sign in as an administrator.
2. Choose the  icon, enter **Users**, and then choose the related link.
3. On the **Users** page, choose the **Refresh all User Groups** action.

All new information about the users' plans and their assigned user groups are now updated according to the plan changes.

To select the Premium experience

You can now proceed to select the new experience.

1. Choose the  icon, enter **Company Information**, and then choose the related link.
2. On the **Company Information** page, on the **User Experience** FastTab, select Premium in the **Experience** field.

Help Assumes Premium Experience

All feature descriptions in user documentation for Business Central assume the **Premium** experience, meaning the descriptions cover the full scope of UI elements. A text note is inserted in high-level help topics for the Manufacturing and Service Managements feature areas stating that they require the **Premium** experience.

Managing Personalization as an Administrator

3/31/2019 • 3 minutes to read

Users can personalize their workspace to suit their own preferences. As an administrator, you control and manage personalization by:

- Enabling or disabling the personalization feature for the entire the application (on-premises installation only).
- Enabling or disabling the personalization feature for users of a specific profile.
- Clearing any page personalizations that users have made.

To enable or disable personalization (On-Premises Only)

By default, personalization is not enabled in the client. You enable or disable personalization by modifying the configuration file (navsettings.json) of the Business Central Web Server instance that serves the clients.

1. To enable personalization, add the following line in the navsettings.json file:

```
"PersonalizationEnabled": "true"
```

To disable personalization, remove this line or change it to:

```
"PersonalizationEnabled": "false"
```

For more information about how to modify the navsettings.json file, see [Modify the navsettings.json file directly](#).

2. Generate and download the application symbols.

This step is optional, and not required to enable personalization. However, it ensures that new pages that are created by developers can be personalized.

- a. First, you generate the symbols by running finsql.exe with `generatesymbolreference` command. The finsql.exe file is located in the installation folder for the Business Central Server and Dynamics NAV Development Environment (CSIDE). To generate the symbols, open a command prompt, change to the directory where the file is store, and the run the following command:

```
finsql.exe Command=generatesymbolreference, Database="<Database Name>", ServerName=<SQL Server Name\<Server Instance>
```

For example:

```
...  
finsql.exe Command=generatesymbolreference, Database="Demo Database BC", ServerName=MySQLServer\BCDEMO  
...
```

For more information, see [Running C/SIDE and AL Side-by-Side](#).

- b. Configure Microsoft Dynamics NAV Server instance to **Enable loading application symbol references at server startup** (EnableSymbolLoadingAtServerStartup). For more information, see [Configuring Business Central Server](#).

To disable personalization for a profile

You can prevent all users that belong to a specific profile from being able to personalize their pages.

1. Choose the  icon, enter **Profiles**, and then choose the related link.
2. Select the profile in the list that you want to modify.
3. Select the **Disable personalization** check box, and then choose the **OK** button.

To clear user personalizations

Clearing page personalization changes the page back to its original layout before any personalization was made. There are two ways to clear the personalizations that users have made to pages: using the **Delete User Personalization** page and using the **User Personalization Card** page.

To clear user personalizations by using the Delete User Personalization page

The **Delete User Personalization** page enables you to clear personalizations on a per-page basis for each user individually.

1. Choose the  icon, enter **Delete User Personalization**, and then choose the related link.

The page lists all the pages that have been personalized and the user it belongs to.

NOTE

A check mark in the **Legacy Personalization** columns indicates that the personalization was done in an older version of Business Central, which handled personalization different than it does now. Users who try to personalize these pages are locked from doing so unless they choose to unlock the page. For more information, see [Why a page is locked from personalizing](#).

2. Select the entry that you want to delete, and then choose the **Delete** action.

The user will see the changes the next time they sign-in.

To clear user personalizations by using the User Personalization Card page

The **User Personalization Card** page enables you to clear the personalization on all pages for specific user. This requires write permission to Table 2000000072 **Profile**.

1. Choose the  icon, enter **User Personalization**, and then choose the related link.

The **User Personalization** page lists all users who potentially have personalized pages. If you cannot find a user in the list, this means that they do not have any personalized pages.

2. Select the user from the list, and then choose the **Edit** action.
3. On the **Actions** tab, choose **Clear Personalized Pages**.

The user will see the changes the next time they sign-in.

Set Up a Colored Indicator on Cues for the Company or Individual Users

3/31/2019 • 3 minutes to read

As an administrator, you can set up Cues that appear on the users' Role Centers to include an indicator that changes color based on the data values in the Cues.

The indicator appears as a colored bar along the top border of the Cue tile. It provides a visual signal of the status of the Cue's activity, which can indicate favorable or unfavorable conditions to prompt the user to take action. For example, if a Cue displays ongoing sales invoices, you can set up the indicator to appear green (favorable) when total number of ongoing sales invoices is below 10, and appears red (unfavorable) when the total is greater than 20.

From the **Cue Setup** page, you set up indicators for all the Cues that are available in the company database. You can set up the indicators to apply to all users in the company or an individual user only. The indicator settings on the **Cue Setup** page act as the default indicator settings. If the **Cue Setup End User** page is made available to users, then they can personalize the indicators settings that you define on the **Cue Setup** page.

To set up the indicator, you specify up to two threshold values that define three ranges of data values (low, middle, and high) to which you can apply a different color (or style).

To set up colored indicators on Cues

1. Choose the  icon, enter **Cue Setup**, and then choose the related link.

The **Cue Setup** page appears. The page lists the indicators that are currently setup up on Cues. Indicators that apply to all users in the company have a blank **User Name** field. Indicators that apply to a specific user include the user's name in the **User Name** field.

NOTE

If you set up a company-wide indicator and a user modifies the indicator later on, then a separate entry for the indicator appears in list for that user.

2. Choose **Edit List** action.
3. To set up an indicator for a Cue that is not listed on the page, choose the **New** action, and then fill in the fields as described in the following. If you want to modify an existing indicator, go to the next step.

FIELD	DESCRIPTION
User Name	If you want to set up the indicator for all users, leave this field blank. If you want to set up the indicator for a specific user, then set this field to the user name.

FIELD	DESCRIPTION
Table No	<p>Specifies the ID of the table object that contains the Cue. Use the drop down list to find the table. The drop down list includes all Cue tables in the company database.</p> <p>The Table Name field will be automatically filled in based on your selection.</p>
Field No	<p>Specifies the ID of the Cue that you want to set up an indicator on. Use the drop down list to find the Cue that you want. Note: The Cue ID corresponds to the field number that is assigned to the Cue in the table.</p> <p>The Field Name field is automatically filled in based on your selection</p>

4. To set up the indicator for a Cue, set the fields as described in the following table.

FIELD	DESCRIPTION
LowStyle	Specifies the color of the indicator when the Cue's value is below the value of the Threshold 1 field.
LowThreshold	Specifies the value at or above which the indicator changes to the color specified by the Middle Range Style field.
MiddleStyle	Specifies the color of the indicator when Cue's value is greater than or equal to the value of the Threshold 1 field but less than or equal to the value of the Threshold 2 field.
HighThreshold	Specifies the value above which the indicator changes to the color specified by the High Range Style field.
HighStyle	Specifies the color to use when the Cue's value is above the value of the Threshold 2 field.

The following table lists the colors that correspond to the options of the **LowStyle**, **MiddleStyle**, and **HighStyle** fields.

OPTION	COLOR
None	No color (same color as the Cue tile)
Favorable	Green
Unfavorable	Red
Ambiguous	Yellow
Subordinate	Gray

Managing Receivables

3/31/2019 • 3 minutes to read

A regular step in any financial rhythm is to reconcile bank accounts, which requires that you apply incoming payments to customer or vendor ledger entries to close sales invoices and purchase credit memos as paid.

While most customers in B2B environments pay some time after delivery, leaving the posted sales invoices open for the Accounts Receivable department to close (apply) when payment is received, some sales invoices can be paid immediately, for example with PayPal. Such invoices are immediately applied as paid when they are posted and, therefore, do not appear as payments to be processed in AR. For more information, see, for example, [Invoice Sales](#).

In Business Central, one of the fastest ways to register payments from the **Payment Reconciliation Journal** page by importing a bank statement file or feed. The payments are applied to open customer or vendor ledger entries based on data matches between payment text and entry information. You can review and change the matches before you post the journal, and close bank account ledger entries for ledger entries when you post the journal. The bank account is reconciled when all payments are applied.

Other pages exist where you can either apply payments or reconcile bank accounts:

- The **Bank Account Reconciliations** page, where you reconcile bank accounts by matching imported bank statement lines with your system bank account ledger entries. Here, you can also reconcile check payments. For more information, see [Reconcile Bank Accounts Separately](#). Here, you cannot apply payments.
- The **Payment Registration** page, where you can manually apply payments received as cash, check, or bank transaction against a generated list of unpaid sales documents. Note that this functionality is available only for sales documents. Here, you cannot apply outgoing payments, and you cannot reconcile bank accounts.
- The **Cash Receipt Journal** page, where you manually post receipts to the relevant general ledger, customer, or other account by entering a payment line. You can either apply the receipt or refund to one or more open entries before you post the cash receipt journal, or from the customer ledger entries. Here, you cannot reconcile bank accounts.

Other aspects of managing receivables include to collect outstanding balances, including finance charges and reminders, and to set bank accounts up to allow customers' payments to be withdrawn from their account automatically.

The following table describes a sequence of tasks, with links to the topics that describe them.

TO	SEE
Apply payments to open customer or vendor ledger entries based on an imported bank statement file or feed, and reconcile the bank account when all payments are applied.	Applying Payments Automatically and Reconciling Bank Accounts
Apply payments to open customer ledger entries based on a list of unpaid sales documents on the Payment Registration page.	Reconcile Customer Payments from a List of Unpaid Sales Documents
Post cash receipts or refunds for customers in the cash receipt journal and apply to customer ledger entries, either from the journal or from posted ledger entries.	Reconcile Customer Payments with the Cash Receipt Journal or from Customer Ledger Entries

TO	SEE
Remind customers of overdue amounts, calculate interest and finance charges, and manage accounts receivable.	Collect Outstanding Balances
With your customer's consent, collect payments directly from the customer's bank account according, in the Euro currency only.	Collect Payments with SEPA Direct Debit
Block a customer from being entered on documents or from posting, for example because of insolvency.	Block Customers
Ensure that you know the cost of shipped items by assigning added item costs, such as freight, physical handling, insurance, and transportation that you incur after selling.	Use Item Charges to Account for Additional Trade Costs
Set up a tolerance by which the system closes an invoice even though the payment, including any discount, does not fully cover the amount on the invoice.	Work with Payment Tolerances and Payment Discount Tolerances
Predict when payments will be made late for sales documents.	The Late Payment Prediction Extension

Applying Payments Automatically and Reconciling Bank Accounts

3/31/2019 • 2 minutes to read

You must regularly reconcile your bank, receivables, and payables accounts by applying payments recorded in the bank to their related unpaid invoices and credit memos or other open entries in Business Central.

You can perform this task on the **Payment Reconciliation Journal** page by importing a bank statement file or feed to quickly register the payments. Payments are applied to open customer or vendor ledger entries based on matches between payment text and entry information. You can review and change automatic applications before you post the journal. You can choose to close any open bank account ledger entries related to the applied ledger entries when you post the journal. The bank account is automatically reconciled when all payments are applied.

You can also reconcile bank accounts without simultaneously applying payments. You perform this work on the **Bank Acc. Reconciliation** page. For more information, see [Reconcile Bank Account Separately](#).

To import bank statements as a bank feed, you must first set up and enable the Envestnet Yodlee Bank Feed service, and then link your bank accounts to the related online bank accounts. For more information, see [Set Up the Envestnet Yodlee Bank Feeds Service](#).

Alternatively, you can use the bank data conversion service to convert a bank statement file, from any format, to a data stream that you can import into Business Central. For more information, see [Set Up the Bank Data Conversion Service](#).

The following table describes a sequence of tasks, with links to the topics that describe them.

TO	SEE
Apply payments to open customer or vendor ledger entries by importing a bank statement, and reconcile the bank account when all payments are applied.	Reconcile Payments Using Automatic Application
Manually apply payments by viewing detailed information about matched data and suggestions for candidate open entries to apply payments to.	Review or Apply Payments After Automatic Application
Resolve payments that cannot be applied automatically to their related open ledger entries. For example because the amounts differ, or because a related ledger entry does not exist.	Reconcile Payments that Cannot be Applied Automatically
Link text on payments to specific customer, vendor, or general ledger accounts to always post recurring cash receipts or expenses to those accounts when no documents exist to apply to.	Map Text on Recurring Payments to Accounts for Automatic Reconciliation

Reconcile Payments Using Automatic Application

3/31/2019 • 6 minutes to read

The **Payment Reconciliation Journal** page specifies payments, either incoming or outgoing, that have been recorded as transactions on your online bank account and that you can apply to their related open customer, vendor, and bank account ledger entries. The lines in the journal are filled by importing a bank statement as a bank feed or file.

NOTE

The page offers automatic matching functionality that applies payments to their related open entries based on a matching of text on a bank statement line (journal line) with text on one or more open entries. Note that you can overwrite the suggested automatic applications, and you can choose to not use automatic application at all. For more information, see step 7.

A payment reconciliation journal is related to one bank account in Business Central that reflects the online bank account where the payment transactions are recorded. Any open bank account ledger entries related to the applied customer or vendor ledger entries will be closed when you choose the **Post Payments and Reconcile Bank Account** action. This means that the bank account is automatically reconciled for payments that you post with the journal.

If you want to import bank statements as bank feeds, you must first enable the Envestnet Yodlee Bank Feeds service and then link the bank account to its related online bank account. The payment reconciliation journal will then automatically detect bank feeds when you choose the **Import Bank Transactions** action. In addition, you can set a bank account up to automatically import new bank statement feeds every hour. Transactions for payments that have already been posted as applied and/or reconciled will not be imported. For more information, see [Set Up the Envestnet Yodlee Bank Feeds Service](#).

With the **Map Text to Account** action, you can set up mappings between text on payments and specific debit, credit, and balancing accounts so that such payments are posted to the specified accounts when you post the payment reconciliation journal. See step 8. For more information, see [Map Text on Recurring Payments to Accounts for Automatic Reconciliation](#).

Similar functionality exists to reconcile excess amounts on payment reconciliation journal lines on an ad-hoc basis. For more information, see [Reconcile Payments That Cannot be Applied](#).

You use the **Apply Automatically** function, either automatically when you import a bank file or feed with payment transactions or when you activate it, to apply payments to their related open entries based on a matching of text on a bank statement line (journal line) with text on one or more open entries.

On journal lines where a payment has been applied automatically to one or more open entries, the **Match Confidence** field has a value between Low and High to indicate the quality of the data matching that the suggested payment application is based on. In addition, the **Account Type** and **Account No.** fields are filled with information about the customer or vendor that the payment is applied to. If you have set up a text-to-account mapping, the automatic application can result in a match confidence value of **High - Text-to-Account Mapping**.

For each journal line on the **Payment Reconciliation Journal** page, you can open the **Payment Application** page to see all candidate open entries for the payment and view detailed information for each entry about the data matching that a payment application is based on. Here, you can manually apply payments or reapply payments that were applied automatically to a wrong entry. For more information, see [Review or Apply Payments After Automatic Application](#).

NOTE

You can start the bank transactions import at the same time as you open the **Payment Reconciliation** Journal page for an existing payment reconciliation journal on the **Payment Reconciliation Journals** page. The following procedure describes how to import bank transactions into the **Payment Reconciliation Journal** page after you have created a new journal.

To reconcile payments using automatic application

1. Choose the  icon, enter **Payment Reconciliation Journals**, and then choose the related link.
2. To work in a new payment reconciliation journal, choose the **New Journal** action.
3. On the **Payment Bank Account List** page, select the bank account that you want to reconcile payments for, and then choose the **OK** button. The **Payment Reconciliation Journal** page opens prepared for the selected bank account.
4. Choose the **Import Bank Transactions** action. If the bank account for the selected journal is not set up for import of bank transactions, then a dialog box will open to help you fill in the relevant fields.
5. On the **Select a file to import** page, select the file that contains the bank transactions for payments that you want to reconcile, and then choose the **Open** button.
6. If the Bank Statement service is enabled, on the **Bank Statement Filter** page that opens automatically, specify the date interval for the bank statements to be imported.

The **Payment Reconciliation Journal** page is filled with lines for payments representing bank transactions in the imported bank statement.

On lines for payments that have been automatically applied to their related open entries, the **Match Confidence** field has a value between **Low** and **High** to indicate the quality of the data matching that the suggested payment application is based on. In addition, the **Account Type** and **Account No.** fields are filled with information about the customer or vendor that the payment is applied to.

7. Select a journal line, and then, choose the **Apply Manually** action to review, reapply, or apply the payment manually on the **Payment Application** page. For more information, see [Review or Apply Payments After Automatic Application](#).

When you have finished your manual application, the **Match Confidence** field on the journal line that you have processed manually contains **Accepted**.

8. Select an unapplied journal line for a recurring cash receipt or expense, such as a car gasoline purchase, and then choose the **Map Text to Account** action. For more information, see [Map Text on Recurring Payments to Accounts for Automatic Reconciliation](#)
9. When you have finished your mapping of payment text to accounts, choose the **Apply Manually** action.
10. When you are content that all payments on the journal lines are correctly applied or set to direct posting, choose the **Post** action, and then choose one of the options:
 - **Post Payments and Reconcile Bank Accounts** - To post the payments as applied and also close the related bank account ledger entries as reconciled.
 - **Post Payments Only** - To only post the payments as applied, but leave the related bank account ledger entries open. Required that you reconcile the bank account separately, for example: For more information, see [Reconcile Bank Accounts Separately](#).
 - **Test Report** - To review the result of posting before you post. The **Bank Account Statement** report opens and shows the same fields as at the bottom of the **Payment Reconciliation Journal** page.

When you post the payment reconciliation journal, the applied open entries memos are closed, and the related customer, vendor, or general ledger accounts are updated. For payments on journal lines based on text-to-account mapping, the specified customer, vendor, and general ledger accounts are updated. For all journal lines, bank account ledger entries are created. If you choose the **Post Payments and Reconcile Bank Account** action, any open bank account ledger entries related to the applied customer or vendor ledger entries will be closed. This means that the bank account is automatically reconciled for payments that you post with the journal.

You can compare the value in the **Balance on Bank Account After Posting** field together with the value in the **Statement Ending Balance** field to track when the bank account is reconciled based on payments that you post.

NOTE

If you do not want to reconcile the bank account from the **Payment Reconciliation Journal** page, then you must use the **Bank Acc. Reconciliation** page. For more information, see [Reconcile Bank Accounts Separately](#).

Review or Apply Payments Manually After Automatic Application

3/31/2019 • 3 minutes to read

For each journal line representing a payment on the **Payment Reconciliation Journal** page, you can open the **Payment Application** page to see all candidate open entries for the payment and view detailed information for each entry about the data matching that a payment application is based on. Here, you can manually apply payments or reapply payments that were applied automatically to a wrong entry. For more information about automatic application, see [Reconcile Payments Using Automatic Application](#).

IMPORTANT

When the bank account that you are reconciling payments for is set up for the local currency, then the **Payment Application** page will show all open entries in the local currency, including open entries for documents that were originally invoiced in foreign currencies. Payments applied to entries with converted currencies may therefore be posted with different amounts than on the original document because of the potentially different exchange rates used by the bank and Business Central respectively.

Therefore, we recommend that you look for foreign currency codes in the **Currency Code** field on the **Payment Application** page to check if applications are based on converted currencies. To review the original document amount in the foreign currency and to see the exchange rate used, choose the **Applies-to Entry No.** field, and then, on the shortcut menu, choose the drilldown button to open the **Customer Ledger Entries** or **Vendor Ledger Entries** page.

Any gains-and-loss adjustment required due to currency conversions is not handled automatically by Business Central.

NOTE

You cannot apply entries with a different sign than the sign on the payment. For example, to close both a negative-sign credit memo and its related positive-sign invoice, you must first apply the credit memo to the invoice, and then apply the payment to the invoice with the reduced remaining amount.

WARNING

If you use payment discounts, and if the payment date is before the payment due date, then the **Remaining Amt. Incl. Discount** field on the **Payment Application** page will be used for matching. Otherwise, the value in the **Remaining Amount** field will be used. If the payment was made with a discounted amount after the payment due date, or the full amount was paid but a discount was granted, then the amount will not be matched.

NOTE

You can only apply a payment to one account. If you want to split the application on multiple open entries, for example to apply a lump-sum payment, then the open entries must be for the same account. For more information, see steps 7 and 8 in the procedure in this topic.

To review or apply payments after automatic application

1. Choose the  icon, enter **Payment Reconciliation Journals**, and then choose the related link.
2. Open the payment reconciliation journal for a bank account that you want to reconcile payments for. For more information, see [Reconcile Payments Using Automatic Application](#).
3. On the **Payment Reconciliation Journal** page, select a payment that you want to review or manually apply to one or more open entries, and then choose the **Apply Manually** action.
4. Select the **Applied** check box on the line for the open entry that you want to apply the payment to.
5. The payment amount, which is also shown in the **Transaction Amount** field on the **Payment Application** page, is inserted in the **Applied Amount** field, but you can modify the field, for example if you want to apply the amount to several open entries.
6. To apply a part of the paid amount to another open entry for the account, for example to apply a lump-sum payment, select the **Applied** check box for the line. The applied amount is automatically deducted from the transactions amount to reflect the distribution on the two open entries.
7. To apply a part of a payment to one or more open entries that does not exist in the database, create a new line under the line for the same account. In the **Applied Amount** field, enter the amount to apply on the new line, and then adjust the **Applied Amount** field on the existing line.
8. Repeat steps 5, 6, or 7 for other open entries that you want to apply a full or partial payment amount to.
9. When you have reviewed a payment application or manually applied to one or more open entries, choose the **Accept Application** action.

The **Payment Application** page closes, and on the **Payment Reconciliation Journal** page, the value in the **Match Confidence** field is changed to **Accepted** to indicate to you that you have reviewed or manually applied the payment.

Reconcile Payments that Cannot be Applied Automatically

3/31/2019 • 2 minutes to read

You may sometimes have to handle payments to your bank account that cannot be applied to a related open customer, vendor or bank account ledger entry. Reasons may be that no document exists in Business Central that the payment can be applied to, or the related document in Business Central has a different amount than the transaction amount, for example, because of currency exchange. On the **Payment Reconciliation Journal** page, all transaction amounts for payments that are not yet applied appear in the **Difference** field, including amounts that cannot be applied because of reasons such as the above.

Payments that cannot be applied can appear on payment reconciliation journal lines in the following different ways:

- The value in the **Difference** field is equal to the value in the **Transaction Amount** field, which indicates that no part of the payment can be applied to a related open customer, vendor, or bank account ledger entry.
- The value in the **Difference** field is lower than the value in the **Transaction Amount** field, which indicates that a part of the payment can be applied to a related open customer, vendor, or bank account ledger entry. The remaining part of the payment cannot be applied and must be reconciled manually or by posting it directly to an account.

To reconcile such payments, you can choose the **Transfer Difference to Account** button and then specify to which account the amount in the **Difference** field will be posted when you post the payment reconciliation journal.

TIP

Similar functionality exists to set up automatic reconciliation of recurring payments that cannot be applied to related open customer, vendor, or bank account ledger entries. For more information, see [Map Text on Recurring Payments to Accounts for Automatic Reconciliation](#).

To reconcile payments that cannot be applied automatically

1. Choose the  icon, enter **Payment Reconciliation Journals**, and then choose the related link.
2. Open a payment reconciliation journal. For more information, see [Reconcile Payments Using Automatic Application](#).
3. Choose the **Transfer Difference to Account**. The **Transfer Difference to Account** page opens.
4. In the **Account Type** field, specify if the type of account that the payment amount will be posted to.
5. In the **Account No.** field, specify the account that the payment amount will be posted to.
6. In the **Description** field, specify text that describes this direct payment posting. By default, the text in the **Transaction Text** field on the payment reconciliation journal line is inserted.
7. Choose the **OK** button.

If the value in the **Difference** field was equal to the value in the **Transaction Amount** field when you post the payment reconciliation journal, the whole payment on the journal line will be posted directly to the specified balancing account.

If the value in the **Difference** field was lower than the value in the **Transaction Amount** field, then an additional journal line will be created with the same text and date and with the difference inserted in the **Transaction Amount** field. On the original journal line, the difference will be deducted from the value in the **Transaction Amount** field, and the payment will remain applied to its related customer, vendor, or bank account ledger entry.

When you post the payment reconciliation journal, one part of the payment will be posted as an applied payment. The other part of the payment will be posted directly to the specified account.

Map Text on Recurring Payments to Accounts for Automatic Reconciliation

3/31/2019 • 3 minutes to read

On the **Text-to-Account Mapping** page, which you open from the **Payment Reconciliation Journal** page, you can set up mappings between text on payments and specific debit, credit, and balancing accounts so that such payments are posted to the specified accounts when you post the payment reconciliation journal.

Similar functionality exists to reconcile excess amounts on payment reconciliation journal lines on an ad-hoc basis. For more information, see [Reconcile Payments that Cannot be Applied Automatically](#).

Payments posted based on text-to-account mapping are not applied to open entries, but are merely posted to the specified accounts in addition to creating bank account ledger entries. Accordingly, text-to-account mapping is suited for recurring cash receipts or expenses, such as frequent purchases of car fuel or bank fees and interest, that regularly occur on the bank statement and do not need a related business document. For more information, see the "Example - Text-to-Account Mapping for Fuel Expense" section in this topic.

NOTE

Payments on reconciliation journal lines are only set to posting according to text-to-account mapping if the automatic application function can only provide a match confidence of **Low** or **Medium**. If the automatic application function provides a match confidence of High, then the payment is automatically applied to one or more open entries, and the payment is not posted to the accounts specified on the **Text-to-Account Mapping** page. In other words, a match confidence of **High** overrules a text-to-account mapping.

On a payment reconciliation journal line where the payment has been set to posting according to text-to-account mapping, the **Match Confidence** field contains **High - Text-to-Account Mapping**, and the **Account Type** and **Account No.** fields contain the mapped accounts.

To map text on recurring payments to accounts for automatic reconciliation

1. Choose the  icon, enter **Payment Reconciliation Journals**, and then choose the related link.
2. Open a payment reconciliation journal. For more information, see [Reconcile Payments Using Automatic Application](#).
3. Choose the **Map Text to Account** action. The **Text-to-Account Mapping** page opens.
4. In the **Mapping Text** field, enter any text that occurs on payments that you want to post to specified accounts without applying to an open entry. You can enter up to 50 characters.

NOTE

If no other payments exist with the mapping text in question, then the text-to-account mapping will occur even when only a part of the text on the payment exists as a mapping text.

5. In the **Vendor No.** field, enter the vendor that the payments will be posted to.
6. In the **Bal. Source Type** field, specify if the payment will be posted to a general ledger account or to a

customer or vendor account.

7. In the **Bal. Source No.** field, specify the account that the payment will be posted to, depending on your selection in the **Bal. Source Type** field.

NOTE

Do not use the **Debit Acc. No.** and **Credit Acc. No.** fields in connection with payment reconciliation. They are used for incoming documents only. For more information, see [Use OCR to Turn PDF and Image Files into Electronic Documents](#).

8. Repeat steps 3 through 7 for all text on payments that you want to map to accounts for direct posting without application.

Next time you import a bank statement file or choose the **Apply Automatically** action on the **Payment Reconciliation Journal** page, journal lines for the payments that contain the specified mapping text will contain the mapped accounts in the **Account Type** and **Account No.** fields. The **Match Confidence** field will contain **High - Text-to-Account Mapping**. This is on the condition that the automatic application function can only provide a match confidence of **Low** or **Medium**.

Example: Text-to-Account Mapping for Fuel Expense

To always post fuel expenses incurred at Shell gas stations to the general ledger account for gasoline (account 8510), fill a line on the **Text-to-Account Mapping** page as follows.

MAPPING TEXT	DEBIT ACC. NO.	CREDIT ACC. NO.	BAL. SOURCE TYPE	BAL. SOURCE NO.
Shell	BLANK	8510	G/L Account	BLANK

Reconcile Customer Payments from a List of Unpaid Sales Documents

3/31/2019 • 12 minutes to read

When your customers have made payments to your electronic bank account, you must apply each amount paid to the related sales document and then post the payment to update the customer, general ledger, and bank ledger entries. Depending on your business needs, you can get paid and register that payment in different ways: manually, automatically, and through payment services.

NOTE

You can perform the same tasks, including vendor payments, on the **Payment Reconciliation Journal** page using functions for bank statement import, automatic application, and bank account reconciliation. For more information, see [Reconcile Payments Using Automatic Application](#).

The **Register Customer Payments** page is designed to support you in tasks involved in balancing internal accounts by using actual cash figures to make sure that payments are collected efficiently from customers. This payment processing tool enables you to quickly verify and post individual or lump-sum payments, process discounted payments, and find specific unpaid documents for which payment is made.

Payments for different customers that have different payment dates must be posted as individual payments. Payments for the same customer that have the same payment date can be posted as a lump-sum payment. This is useful, for example, when a customer has made a single payment that covers multiple sales invoices.

To set up the payment registration journal

Because you can post different payment types to different balancing accounts, you must select a balancing account on the **Payment Registration Setup** page before you start processing customer payments. If you always post to the same balancing account, you can set that account as the default and avoid this step every time that you open the **Register Customer Payments** page.

1. Choose the  icon, enter **Payment Registration Setup**, and then choose the related link.

Alternatively, on the **Register Customer Payments** page, choose the **Setup** action.

2. Fill in the fields on the **Payment Registration Setup** page. Choose a field to read a short description of the field or link to related information.

To register customer payments individually

1. Choose the  icon, enter **Register Customer Payments**, and then choose the related link.

The **Register Customer Payments** page shows all posted documents for which a payment can be registered. The page can also be opened from the **Customers** and **Customer Card** pages where it is automatically filtered for the specified customer.

2. Select the **Payment Made** check box on the line that represents the posted document for which a payment has been made.

If the **Auto Fill Date Received** check box is selected on the **Payment Registration Setup** page, then the work date is entered in the **Date Received** field.

3. In the **Date Received** field, enter the date when the payment was made. This date may be different from the work date.

4. In the **Amount Received** field, enter the amount that has been paid.

For full payments, this is the same as the amount in the **Remaining Amount** field on the line. For partial payments, this is lower than the amount in the **Remaining Amount** field on the line.

5. Repeat steps 2-4 for other lines that represent posted documents for which payments are made.

6. Choose the **Post Payments** action.

The payment information is posted for documents represented by lines where the **Payment Made** check box is selected.

Payments entries are posted to general ledger, bank, and customer accounts. Each payment is applied to the related posted sales document.

To reconcile lump-sum payments

1. Choose the  icon, enter **Payment Registration**, and then choose the related link.

2. Select the **Payment Made** check box on the lines that represent posted documents for the same customer for which a lump-sum payment has been made.

NOTE

The customer in the **Name** field must be the same on all lines that will be posted as a lump-sum payment.

If the **Auto Fill Date Received** check box is selected on the **Payment Registration Setup** page, then the work date is filled in the **Date Received** field.

3. In the **Date Received** field, enter the date when the payment was made. This date may be different from the work date.

NOTE

This date must be the same on all lines that will be posted as a lump-sum payment.

4. In the **Amount Received** field, enter amounts on multiple lines that sum up to the lump payment amount.

TIP

Try to post as many full payments as possible with the lump-sum amount. Enter amounts that are the same as the amount in the **Remaining Amount** field on as many lines as possible.

5. Repeat steps 2-4 for other lines that represent posted documents for the same customer for which a lump-sum payment has been made.

6. Choose the **Post As Lump Payment** action. The entered payment information is posted for documents represented by lines where the **Payment Made** check box is selected.

Payment entries are posted to general ledger, bank, and customer accounts. Each payment is applied to the related posted sales document.

If a payment in the bank is not represented by line on the **Payment Registration** page, it may be because the

related document has not yet been posted. In that case, you can use a search function to quickly find the document and post it to process the payment. For more information, see [To find a specific sales document that is not fully invoiced](#).

If a payment in the bank is not represented by any document in Business Central, then you can open a prefilled general journal from the **Payment Registration** page to post the payment directly to the balancing account without applying the payment to a document. Alternatively, you may want to record the payment in the journal until the origin of the payment has been resolved. For more information, see [To record or post a payment without a related document](#).

To process customer payments with discounts manually

If you have agreed on a payment discount with your customer, then the payment amounts can be lower than the invoice amounts if payment occurs before the agreed discount date.

The following procedures explain four different ways to post discounted payments on the **Payment Registration** page.

- The payment amount is equal to the remaining discounted amount, and the payment date is before the discount date. You post the payment as is.
- The payment amount is equal to the remaining discounted amount, but the payment date is after the discount date. You post the payment as partial. The document remains open to collect/pay the remaining amount. Alternatively, you set the discount date later to allow the payment in full.
- The payment amount is lower than the remaining discounted amount. You post the payment as partial. The document remains open to collect/pay the remaining amount.
- The payment amount is more than the remaining discounted amount. You post the payments as is. Only the remaining amount is posted. The additional amount is credited to the customer.

To process a payment amount that is equal to the discounted amount and where the payment date is before the discount date

1. Choose the  icon, enter **Payment Registration**, and then choose the related link.
2. Enter the payment amount in the **Amount Received** field. The amount is equal to the amount in the **Rem. Amt. after Discount** field.

The **Payment Made** check box is automatically selected, and the **Date Received** field is filled with the work date.

3. In the **Date Received** field, enter the payment date. The date is before the date in the **Pmt. Discount Date** field.
4. Verify that the **Remaining Amount** field contains zero (0).
5. Choose the **Post Payments** action to post the full payment to general ledger, bank, and customer accounts.

To process a payment amount that is equal to the discounted amount but where the payment date is after the discount date

1. Choose the  icon, enter **Payment Registration**, and then choose the related link.
2. Enter the payment amount in the **Amount Received** field. The amount is equal to the amount in the **Rem. Amt. after Discount** field.

The **Payment Made** check box is automatically selected, and the **Date Received** field is filled with the work date.

3. In the **Date Received** field, enter a payment date that is after the date in the **Pmt. Discount Date** field. Date fields change to red font, and an error message is shown at the bottom of the page.

TIP

If you want to make an exception and grant the discount even though the payment is late, follow these steps:

4. Choose the **Details** action.
5. On the **Payment Registration Details** page, in the **Pmt. Discount Date** field on the **Payment Discount** FastTab, enter a date that is after the date in the **Date Received** field on the **Payment Registration** page.
The error message and the red font disappear, and you can proceed to process the discounted payment.
6. Verify that the **Remaining Amount** field contains the amount that remains to pay the full invoice amount.
7. Choose the **Post Payments** action to post the partial payment to general ledger, bank, and customer accounts.

The related document remains open.

To process a payment that is lower than the remaining discounted amount

1. Choose the  icon, enter **Payment Registration**, and then choose the related link.
2. Enter the payment amount in the **Amount Received** field. The amount is lower than the amount in the **Rem. Amt. after Discount** field.
The **Payment Made** check box is automatically selected, and the **Date Received** field is filled with the work date.
3. In the **Date Received** field, enter the payment date. The date is before the date in the **Pmt. Discount Date** field.
4. Verify that the **Remaining Amount** field contains the amount that remains to pay the discounted amount.
5. Choose the **Post Payments** action to post the partial payment to general ledger, bank, and customer accounts.

The related document remains open.

To process a payment that is more than the remaining discounted amount

1. Choose the  icon, enter **Payment Registration**, and then choose the related link.
2. Enter the payment amount in the **Amount Received** field. The amount is more than the amount in the **Rem. Amt. after Discount** field.
The **Payment Made** check box is automatically selected, and the **Date Received** field is filled with the work date.
3. In the **Date Received** field, enter the payment date. The date is before the date in the **Pmt. Discount Date** field.
4. Verify that the **Remaining Amount** field contains zero (0).
5. Choose the **Post Payments** action to post the full payment to general ledger, bank, and customer accounts.

The related document is closed, and the customer is credited the excess payment amount.

To find a specific sales document that is not fully invoiced

The **Payment Registration** page supports you in tasks needed to balance internal accounts with actual cash figures to ensure effective collection from customers. It shows outstanding incoming payments as lines that

represent sales documents where an amount is due for payment.

Typically, when a payment has been made, recorded in the bank or otherwise, the related sales or purchase document is represented as a line on the **Payment Registration** page because the document in question is waiting for the payment to be posted against the outstanding amount. However, sometimes a payment that has been made is not represented by a line on the **Payment Registration** page, typically because the document in question has not been fully invoice posted.

On the **Document Search** page, you can search among documents that are not fully invoiced. You can search based on one or more of the following criteria:

- Document number
- Amount or amount range

The following procedure explains how to find a specific document by using both search criteria.

1. Choose the  icon, enter **Payment Registration**, and then choose the related link.
2. With the pointer on any line, Choose the **Search Documents** action.
3. On the **Document Search** page, enter a search value in the **Document No.** field.

NOTE

The value that you enter in this field is enclosed in hidden wildcard characters. This means that the function searches for all document numbers that contain the entered value.

4. In the **Amount** field, enter the specific amount that exists on the document that you want to find.
5. In the **Amount Tolerance %** field, enter a percentage value to define the range of amounts that you want to search to find the open document.

If you enter 10, then the function will search for amounts in a range between ten percent lower and ten percent higher than the value in the **Amount** field.

6. Choose the **Search** action.

The Search function searches among documents that are not fully invoiced based on the specified criteria.

If one or more documents match the criteria, then the **Document Search Result** page opens to display lines that represent those documents. Each line contains a document number, description, and amount so that you can easily find a specific document, for example based on information on your bank statement.

If a payment in the bank is not represented by any document in Business Central, then you can open a prefilled general journal from the **Payment Registration** page to post the payment directly to the balancing account without applying the payment to a document. Alternatively, you may want to record the payment in the journal until the origin of the payment has been resolved.

To record or post a payment without a related document

If a payment in the bank is not represented by any document in Business Central, then you can open a prefilled general journal line from the **Payment Registration** page to post the payment directly to the balancing account without applying the payment to a document. Alternatively, you may want to record the payment in the journal until the origin of the payment has been clarified.

1. Choose the  icon, enter **Payment Registration**, and then choose the related link.

Proceed to record an undocumented payment.

2. Choose the **General Journal** action.

The **General Journal** page opens with one line prefilled with the balancing account of the journal batch that is set up on the **Payment Registration Setup** page.

3. Fill in the remaining fields on the general journal line, such as the amount and the customer number or other information from the bank statement. For more information, see [Post Transactions Directly to the General Ledger](#).

You can either post the journal line to update the total on the balancing account. Alternatively, you can leave the journal line unposted, and perhaps append it with a note that the payment needs more analysis.

If you leave the journal line unposted, it will add to the value in the **Unposted Balance** field at the bottom of the **Payment Registration** page.

Reconcile Customer Payments with the Cash Receipt Journal or from Customer Ledger Entries

3/31/2019 • 9 minutes to read

When you receive a cash receipt from a customer, or you make a cash refund, you must decide whether to apply the payment or refund to close one or more open debit or credit entries. You can specify the amount you want to apply. For example, you can apply partial payments to customer ledger entries. Closing customer ledger entries makes sure that information such as customer statistics, account statements, and finance charges are correct.

TIP

On the **Customer Ledger Entries** page, red font means that the related payment is past its due date. If overdue payments are becoming a problem, we can help you reduce their frequency. You can enable the **Late Payment Predictions** extension, which uses a predictive model that we built in Azure Machine Learning to predict the timing of payments. These predictions help you reduce outstanding receivables and fine-tune your collections strategy. For example, if a payment is predicted to be late, you can adjust the terms of payment or the payment method for the customer. For more information, see [Late Payment Predictions](#).

You can apply customer ledger entries in several ways:

- By entering information on dedicated pages:
 - The **Payment Reconciliation Journal** page. For more information, see [Applying Payments Automatically and Reconciling Bank Accounts](#).
 - The **Payment Registration** page. For more information, see [Reconcile Customer Payments from a List of Unpaid Sales Documents](#).
 - The **Cash Receipt Journal**. This is described below.
- By filling in the **Applies-to Doc. No.** field on sales credit memo documents. This is described below.
- By using the **Set Applies-to ID** action on a customer ledger entry. This is described below.

NOTE

If the **Application Method** field on the customer card contains **Apply to Oldest**, payments are applied to the oldest open credit entry, unless you manually specify an entry. If the application method is **Manual**, you always apply entries manually.

To fill and post a cash receipt journal

A cash receipt journal is a type of general journal, so you can use it to post transactions to general ledger, bank, customer, vendor, and fixed assets accounts. You can apply the payment to one or more debit entries when you post the payment, or you can apply from the posted entries later.

1. Choose the  icon, enter **Cash Receipt Journal**, and then choose the related link.
2. Choose the **Edit Journal** action.
3. Select the relevant batch in the **Batch Name** field.
4. Fill in the **Posting Date** field.
5. In the **Document Type** field, select **Payment**.

The **Document No.** field is filled by the number series assigned to the batch.

6. Use the **External Document No.** field to store an identifier, such as the customer's check number.
7. In the **Account Type** field, select **Customer**.
8. In the **Account No.** field, select the relevant G/L account.
9. If you want to post the application at the same time as you post the journal, do one of the following.
10. In the **Balancing Account Type** field, select **G/L Account** for cash payments, and **Bank Account** for other payments.
11. In the **Balancing Account No.** field, select the cash account for cash payments, or the relevant bank account for other payments.
12. Post the journal.

To apply a payment to a single customer ledger entry

1. Choose the  icon, enter **Cash Receipt Journal** and choose the related link.
2. Choose the **Edit Journal** action.
3. On the first journal line, enter the relevant information about the entry to be applied.
4. In the **Document Type** field, enter **Payment**.
5. In the **Account Type** field, enter **Customer**.
6. In the **Bal. Account Type** field, enter **Bank Account**.
7. In the **Applies-to Doc. No.** field, choose the field to open the **Apply Customer Entries** page.
8. On the **Apply Customer Entries** page, select the entry to apply the payment to.
9. In the **Amount to Apply** field, enter the amount you want to apply to the entry. If you do not enter an amount, the maximum amount is applied.

At the bottom of the **Apply Customer Entries** page, you can see the specific amount in the **Applied Amount** field and also whether the application balances.

10. Choose the **OK** button. The **Cash Receipt Journal** page now shows the entry you have selected entered in the **Applies-to Doc. Type** and **Applies-to Doc. No.** fields.
11. Post the cash receipt journal.

To apply a payment to multiple customer ledger entries

1. Choose the  icon, enter **Cash Receipt Journal**, and then choose the related link.
2. Choose the **Edit Journal** action.
3. On the first journal line, enter the relevant information about the entry to be applied.
4. In the **Document Type** field, enter **Payment**.
5. In the **Account Type** field, enter **Customer**.
6. In the **Bal. Account Type** field, enter **Bank Account**.
7. In the **Amount** field, enter the full payment as a negative amount.

8. To apply the payment to multiple customer ledger entries when posting, choose the **Apply Entries** action.
9. Select the lines with the entries that you want the applying entry to be applied to, and then choose the **Set Applies-to ID** action.
10. On each line, in the **Amount to Apply** field, enter the amount you want to apply to the individual entry. If you do not enter an amount, the maximum amount is applied.

At the bottom of the **Apply Customer Entries** page, you can see the specific amount in the **Applied Amount** field and also whether the application balances.

11. Choose the **OK** button.
12. Post the cash receipt journal.

To apply a credit memo to a single customer ledger entry

1. Choose the  icon, enter **Sales Credit Memos**, and then choose the related link.
2. Open the relevant sales credit memo.
3. To apply the credit memo to a single customer ledger entry when posting, in the **Applies-to Doc. No.** field, select the entry to which you want to apply the payment.
4. On the line in the **Amount to Apply** field, enter the amount you want to apply to the entry.

If you do not enter an amount, the program automatically applies the maximum amount. At the bottom of the **Apply Customer Entries** page, you can see the specific amount in the **Applied Amount** field and also whether the application balances.

5. Choose the **OK** button. The **Sales Credit Memo** page now shows the entry you have selected entered in the **Applies-to Doc. Type** and **Applies-to Doc. No.** fields. And the amount of the credit memo to be posted, adjusted for any possible payment discounts.
6. Post the credit memo.

To apply a credit memo to multiple customer ledger entries

1. Choose the  icon, enter **Sales Credit Memos**, and then choose the related link.
2. Open the relevant sales credit memo.
3. To apply the credit memo to multiple customer ledger entries when posting, choose the **Apply Entries** action.
4. Select the lines with the entries that you want the applying entry to be applied to, and then choose the **Set Applies-to ID** action.
5. On each line, in the **Amount to Apply** field, enter the amount you want to apply to the individual entry. If you do not enter an amount, the maximum amount is applied.

At the bottom of the **Apply Customer Entries** page, you can see the specific amount in the **Applied Amount** field and also whether the application balances.

6. Choose the **OK** button. The **Sales Credit Memo** page now shows the amount of the credit memo to be posted, adjusted for any possible payment discounts.
7. Post the credit memo.

To apply posted customer ledger entries

1. Choose the  icon, enter **Customers**, and then choose the related link.
2. Open the customer card for the customer with entries that you want to apply.
3. Choose the **Ledger Entries** action, and then select the line with the entry that will be the applying entry.
4. Choose the **Apply Entries** action. The **Apply Customer Entries** page opens showing the open entries for the customer.
5. Select the lines with the entries that you want the applying entry to be applied to, and then choose the **Set Applies-to ID** action.
6. For each line in the **Amount to Apply** field, enter the amount you want to apply to the individual entry. If you do not enter an amount, the maximum amount is applied.

At the bottom of the **Apply Customer Entries** page, you can see the specific amount in the **Applied Amount** field.

7. Choose the **Post Application** action. The **Post Application** page appears with the document number of the applying entry and the posting date of the entry with the most recent posting date.
8. Choose the **OK** button to post the application.

If the posted application has resulted in closed customer ledger entries, the **Open** field is cleared for these ledger entries.

9. To see the ledger entries, choose the  icon, enter **Customers**, and then choose the related link. Browse to the card for the relevant customer to see the ledger entries.

On the ledger entry list, on the line that contains the ledger entry that was fully applied to, you can see that the **Open** check box is not selected.

NOTE

After you select an entry on the **Apply Customer Entries** page, or several entries by setting the **Applies-to ID**, the **Applied Amount** field on the journal line will contain the sum of the remaining amounts for the posted entries you have selected, unless the field contains something already. If you select **Apply to Oldest** in the **Application Method** field on the customer card, the application occurs automatically.

To apply customer ledger entries in different currencies to one another

If you sell to a customer in one currency and receive payment in another currency, you can still apply the invoice to the payment.

If you apply an entry (Entry 1) in one currency to an entry (Entry 2) in a different currency, the posting date on Entry 1 is used to find the relevant exchange rate to convert amounts on Entry 2. The relevant exchange rate is found on the **Currency Exchange Rates** page.

Applying customer ledger entries in different currencies must be enabled. For more information, see [Enable Application of Ledger Entries in Different Currencies](#).

1. Choose the  icon, enter **Cash Receipts Journal**, and then choose the related link.
2. Open the journal you want, and fill in the first empty journal line using a currency code.
3. Choose the **Apply Entries** action.
4. Select the line with the entry you want to apply to the entry in the cash receipt journal, choose the **Set Applies-to ID** action, and then select the entry you want to apply to.
5. Choose the **OK** button to return to the cash receipt journal.

6. Post the sales journal.

IMPORTANT

When you apply entries in different currencies, the entries are converted to USD. Although the exchange rates for the two currencies are fixed, for example between USD and EUR, there may be a small residual amount when they are converted to USD. These small residual amounts are posted as gains and losses to the account specified in the **Realized Gains Account** or **Realized Losses Account** fields on the **Currencies** page. The **Amount (USD)** field is also adjusted on the vendor ledger entries.

To correct an application of customer entries

When you correct an application, correcting entries that are identical to the original entry but with opposite sign in the amount field are created and posted for all entries, including all general ledger posting derived from the application, such as payment discount and currency gains/losses. The entries that were closed by the application are reopened.

1. Choose the  icon, enter **Customers**, and then choose the related link.
2. Open the relevant customer card.
3. Choose the **Ledger Entries** action.
4. Select the relevant ledger entry, and then choose the **Unapply Entries** action.
5. Alternatively, choose the **Detailed Ledger Entry** action.
6. Select the application entry, and then choose the **Unapply Entries** action.
7. Fill in the fields in the header, and then choose the **Unapply** action.

IMPORTANT

If an entry has been applied by more than one application entry, you must unapply the latest application entry first.

Collect Outstanding Balances

3/31/2019 • 15 minutes to read

Managing receivables includes checking whether amounts due are paid on time. If customers have overdue payments, you can begin by sending the Customer Statement report as a reminder. Alternatively, you can issue reminders.

You can use reminders to remind customers about overdue amounts. You can also use reminders to calculate finance charges, such as interest or fees and include them on the reminder. Use finance charge memos if you want to debit customers for interest or fees without reminding them of overdue amounts.

Reminders

Before you can create reminders, you must set up reminder terms and assign them to your customers. Each reminder term has predefined reminder levels. Each reminder level includes rules about when the reminder will be issued, for example, how many days after the invoice due date or the date of the previous reminder. The contents of the **Finance Charge Terms** page determines whether interest is calculated on the reminder.

You can periodically run the **Create Reminders** batch job to create reminders for all customers with overdue balances, or you can manually create a reminder for a specific customer and have the lines calculated and filled in automatically.

After you create the reminders, you can modify them. The text that appears at the beginning and end of a reminder is determined by the reminder level terms, and can be seen in the **Description** column. If a calculated amount has been inserted automatically in the beginning or ending text, the text will not be adjusted if you delete lines. Then you must use the **Update Reminder Text** function.

A customer ledger entry with the **On Hold** field filled in will not prompt the creation of a reminder. However, if a reminder is created on the basis of another entry, an overdue entry marked on hold will also be included on the reminder. Interest is not calculated on lines with these entries.

After you have created reminders and made any needed modifications, you can either print test reports or issue the reminders, typically as email.

Finance Charges

When a customer does not pay by the due date, you can have finance charges calculated automatically and add them to the overdue amounts on the customer's account. You can inform customers of the added charges by sending finance charge memos.

NOTE

You use finance charge memos to calculate interest and finance charges and to inform your customers about interest and finance charges without reminding them of overdue payments. Alternatively, you can calculate interest on overdue payments when you create reminders.

You can manually create a finance charge memo for an individual customer, and fill in the lines automatically. Alternatively, you can use the **Create Finance Charge Memos** function job to create finance charge memos for all or selected customers with overdue balances.

After you create the finance charge memos, you can modify them. The text that appears at the beginning and end of

the finance charge memo is determined by the finance charge terms, and can be seen in the **Description** column on the lines. If a calculated amount has been inserted automatically in the beginning or ending text, the text will not be adjusted if you delete lines. Then you must use the **Update Finance Charge Text** function.

After you have created finance charge memos and made any needed modifications, you can either print test reports or issue the finance charge memos, typically as email.

Multiple Interest rates

When you set up finance charge terms and reminder terms, for delayed payment penalty, you can specify multiple interest rates so that the penalty fee is calculated from different interest rates in different periods. If multiple interest rates are not set up, then the interest rate and period that is defined in the **Finance Charge Terms** and **Reminder Terms** pages for the whole period of calculation will be used. For more information, see [Set Up Multiple Interest Rates](#).

To send the Customer Statement report

1. Choose the  icon, enter **Customer Statement**, and then choose the related link.
2. Fill in the fields as necessary. Hover over a field to read a short description.
3. Under **Output Options**, select how to send the report to the customer.

NOTE

If you are using multiple currencies, the Customer Statement report is always printed in the customer's currency. The last date in a statement period is also used as the statement date and the aging date, if aging is included.

To set up reminder terms

If customers have overdue payments, you must decide when and how to send them a reminder. In addition, you may want to debit their accounts for interest or fees. You can set up any number of reminder terms. For each reminder terms code, you can define an unlimited number of reminder levels.

1. Choose the  icon, enter **Reminder Terms**, and then choose the related link.
2. Fill in the fields as necessary.
3. To use more than one combination of reminder terms, set up a code for each one.

To set up reminder levels

The first time a reminder is created for a customer, the setting from level 1 is used. When the reminder is issued, the level number is registered on the reminder entries that are created and linked to the individual customer ledger entries. If it is necessary to remind the customer again, all reminder entries linked to open customer ledger entries are checked to locate the highest level number. The conditions from the next level number will then be used for the new reminder.

If you create more reminders than you have defined levels for, the conditions for the highest level will be used. You can create as many reminders as are allowed by the **Max. No of Reminders** field in the reminder terms.

1. Choose the  icon, enter **Reminder Terms**, and then choose the related link.
2. On the **Reminder Terms** page, select the line with the terms you want to set up levels for, and then choose **Levels** action.
3. Fill in the fields as necessary.

For each reminder level, you can specify individual conditions, which can include additional fees in both LCY

and in foreign currency. You can define many additional fees in foreign currencies for each code on the **Reminder Levels** page.

4. Choose the **Currencies** action.
5. On the **Currencies for Reminder Levels** page, define for each reminder level code and corresponding reminder level number a currency code and an additional fee.

NOTE

When you create reminders in a foreign currency, the foreign currency conditions that you set up here will be used to create reminders. If there are no foreign currency reminder conditions set up, the LCY reminder conditions that are set up on the **Reminder Levels** page will be used and then converted to the relevant currency.

For each reminder level, you can specify text that will be printed before (**Beginning Text**) or after (**Ending Text**) on the entries on the reminder.

6. Choose the **Beginning Text** or **Ending Text** actions respectively, and fill on the **Reminder Text** page.
7. To automatically insert related values in the resulting reminder text, enter the following placeholders in the **Text** field .

PLACEHOLDER	VALUE
%1	Content of the Document Date field on the reminder header
%2	Content of the Due Date field on the reminder header
%3	Content of the Interest Rate field on the related finance charge terms
%4	Content of the Remaining Amount field on the reminder header
%5	Content of the Interest Amount field on the reminder header
%6	Content of the Additional Fee field on the reminder header
%7	The total amount of the reminder
%8	Content of the Reminder Level field on the reminder header
%9	Content of the Currency Code field on the reminder header
%10	Content of the Posting Date field on the reminder header
%11	The company name
%12	Content of the Add. Fee per Line field on the reminder header

For example, if you write **You owe %9 %7 due on %2.**, then the resulting reminder will contain the following text:
You owe USD 1.200,50 due on 02-02-2014..

NOTE

The due date is calculated according to the date formula that you enter. For more information, see [Using Date Formulas](#).

After you have set up the reminder terms, with additional levels and text, enter one of the codes on each of the customer cards. For more information, see [Register New Customers](#).

To create a reminder automatically

A reminder is similar to an invoice. When you create a reminder, a reminder header as well as one or more reminder lines must be filled in. You can use a function to create reminders for all customers automatically.

1. Choose the  icon, enter **Reminders**, and then choose the related link.
2. On the **Reminder** page, choose the **Create Reminders** action.
3. On the **Create Reminders** page, fill in the fields to define how and to whom the reminders are created.
4. Choose the **OK** button.

To create a reminder manually

On the **Reminder** page, you can fill in the **General** FastTab manually and then have the lines filled in automatically.

1. Choose the  icon, enter **Reminders**, and then choose the related link.
2. Choose the **New** action.
3. On the **General** FastTab, fill in the fields as necessary.
4. Choose the **Suggest Reminder Lines** action.
5. In the **Suggest Reminder Lines** batch job, fill in the fields to define how and to whom the reminders are created.
6. Select the **Include Entries On Hold** check box if you want the reminders to contain overdue open entries that are on hold.

IMPORTANT

Open entries that are on hold will be inserted, irrespective of the setting in the Only Entries with Overdue Amounts check box.

7. Choose the **OK** button.

To replace reminder texts

There are several ways you can determine the text that appears on the printed reminder. In some cases, you may want to replace the beginning and ending texts that have been defined for the current level with those from a different level.

1. Choose the  icon, enter **Reminders**, and then choose the related link.
2. Open the relevant reminder, and then choose the **Update Reminder Text** action.
3. On the **Update Reminder Text** page, enter the required level in the **Reminder Level** field.
4. Choose the **OK** button to update the beginning and ending texts.

To issue a reminder

After you have created reminders and made any needed modifications, you can either print test reports or issue the reminders.

When you issue a reminder, the data is transferred to a separate page for issued reminders. At the same time, reminder entries are posted. If interest or an additional fee has been calculated, entries are posted to the customer ledger and the general ledger.

When a reminder is issued, the entries are posted according to your specifications on the **Reminder Terms** page. This specification determines whether interest and/or additional fees are posted to the customer's account and the general ledger. Setup on the **Customer Posting Groups** page determines which accounts are posted to.

For each customer ledger entry on the finance charge memo, an entry is created on the **Reminder/Fin. Charge Entries** page.

If the **Post Interest** or the **Post Additional Fee** check boxes are selected on the **Reminder Terms** page, then the following entries are also created:

- One entry on the **Cust. Ledger Entries** page
- One receivables entry in the relevant G/L account
- One interest and/or one additional fee entry in the relevant G/L account

In addition, issuing the reminder may result in VAT entries.

1. Choose the  icon, enter **Reminders**, and then choose the related link.
2. Select the relevant reminder, and then choose the **Issue** action.
3. On the **Issue Reminders** page, fill in the fields as necessary.
4. Choose the **OK** button

The reminder is either printed for sent to an specified email as a PDF attachment.

To set up finance charge terms

You must set up a code representing each finance charge calculation. Then you can enter this code in the **Fin. Charge Terms Code** field on customer or vendor cards.

Finance charges can be calculated using either the average daily balance method or the balance due method.

- Balance due method

The finance charge is simply a percentage of the overdue amount:

$$\text{Balance Due method - Finance Charge} = \text{Overdue Amount} \times (\text{Interest Rate} / 100)$$

- Average daily balance method

The number of days the payment is overdue is taken into account:

$$\text{Average Daily Balance method - Finance Charge} = \text{Overdue Amount} \times (\text{Days Overdue} / \text{Interest Period}) \times (\text{Interest Rate}/100)$$

In addition, each code in the Finance Charge Terms table is linked to a subtable, the Finance Charge Text table. For each set of finance charge terms, you can define a beginning and/or an ending text to be included on the finance charge memo.

1. Choose the  icon, enter **Finance Charge Terms**, and then choose the related link.
2. Fill in the fields as necessary.
3. To use more than one combination of finance charge terms, set up a code for each one.

For each finance charge term, you can specify individual conditions, which can include additional fees in both

LCY and in foreign currency. You can define many additional fees in foreign currencies for each code on the **Finance Charge Terms** page.

4. Choose the **Currencies** action.
5. On the **Currencies for Fin. Chrg. Terms** page, define for each term a currency code and an additional fee.

NOTE

When you create finance charges in a foreign currency, the foreign currency conditions that you set up here will be used to create finance charge memos. If there are no foreign currency finance charge conditions set up, then the LCY finance charge conditions that are set up on the **Finance Charge Terms** page will be used and then converted to the relevant currency.

For each finance charge term, you can specify text that will be printed before (**Beginning Text**) or after (**Ending Text**) on the entries on the finance charge memo.

6. Choose the **Beginning Text** or **Ending Text** actions respectively, and fill on the **Finance Charge Text** page.
7. To automatically insert related values in the resulting finance charge text, enter the following placeholders in the **Text** field.

PLACEHOLDER	VALUE
%1	Content of the Document Date field on the finance charge memo header
%2	Content of the Due Date field on the finance charge memo header
%3	Content of the Interest Rate field on the related finance charge terms
%4	Content of the Remaining Amount field on the finance charge memo header
%5	Content of the Interest Amount field on the finance charge memo header
%6	Content of the Additional Fee field on the finance charge memo header
%7	The total amount of the reminder
%8	Content of the Currency Code field on the finance charge memo header
%9	Content of the Posting Date field on the finance charge memo header

To create a finance charge memo manually

A finance charge memo is similar to an invoice. You can fill in a header manually and have the lines filled in for you, or you can create finance charge memos for all customers automatically.

1. Choose the  icon, enter **Finance Charge Memos**, and then choose the related link.
2. Choose the **New** action, and then fill in the fields as necessary.
3. Choose **Suggest Fin. Charge Memo Lines** action.
4. On the **Suggest Finance Charge Memo Lines** page, set a filter on the **Cust. Ledger Entry** FastTab if you want to create finance charge memos only for specific entries.
5. Choose the **OK** button to start the batch job.

To update finance charge memo texts

In some cases, you may want to modify the beginning and ending text that you have set up for the finance charge terms. If you do this at a time when you have created, but not yet issued, finance charge memos, you can update the memos with the modified text.

1. Choose the  icon, enter **Finance Charge Memo**, and then choose the related link.
2. open the finance charge memo that you want to change text for, and then choose the **Update Finance Charge Text** action.
3. On the **Update Finance Charge Text** page, you can set a filter if you want to update several memos.
4. Choose the **OK** button to update the beginning and ending texts.

To issue finance charge memos

After you have created finance charge memos and made any needed modifications, you can either print test reports or issue the finance charge memos.

When a reminder is issued, the entries are posted according to your specifications on the **Finance Charge Terms** page. This specification determines whether interest and/or additional fees are posted to the customer's account and the general ledger. Setup on the **Customer Posting Groups** page determines which accounts are posted to.

For each customer ledger entry on the finance charge memo, an entry is created on the **Reminder/Fin. Charge Entries** page.

If the **Post Interest** or the **Post Additional Fee** check boxes are selected on the **Finance Charge Terms** page, then the following entries are also created:

- One entry on the **Cust. Ledger Entries** page
- One receivables entry in the relevant G/L account
- One interest and/or one additional fee entry in the relevant G/L account

In addition, issuing the finance charge memo may result in VAT entries.

1. Choose the  icon, enter **Finance Charge Memos**, and then choose the related link.
2. Select the relevant memo, and then choose the **Issue** action.
3. On the **Issue Finance Charge Memos** page, fill in the fields as necessary.
4. Choose the **OK** button

The finance charge memo is either printed for sent to an specified email as a PDF attachment.

To view reminder and finance charge entries

When you issue a reminder, a reminder entry is created on the **Reminder/Fin. Charge Entries** page for each reminder line that contains a customer ledger entry. You can then get an overview of the created reminder entries for a specific customer.

1. Choose the  icon, enter **Customers**, and then choose the related link.
2. Open the relevant customer card, and then choose the **Ledger Entries** action.

3. On the **Customer Ledger Entries** page, select the line with the ledger entry you want to see the reminder entries for, and then choose the **Reminder/Fin. Charge Entries** action.

Collect Payments with SEPA Direct Debit

3/31/2019 • 9 minutes to read

With your customer's consent, you can collect payments directly from the customer's bank account according to the SEPA format.

First, set up the export format of the bank file that instructs your bank to perform a direct debit. Then, set up the customer's payment method. Last, set up the direct-debit mandate that reflects your agreement with the customer to collect their payments in a certain agreement period.

To instruct the bank to transfer the payment amount from the customer's bank account to your company's account, you create a direct-debit collection entry, which holds information about bank accounts, the affected sales invoices, and the direct-debit mandate. You then export an XML file that is based on the collection entry, which you send to your bank for processing. Any payments that could not be processed will be communicated to you by your bank, and you must then manually reject the direct debit-collection entries in question.

You can set up standard customer sales codes with the direct-debit payment method and mandate information. You can then use the **Create Standard Cust. Invoices** batch job to generate multiple sales invoices with the direct-debit information prefilled. This can be done manually or automatically, according to the payment due date.

When payments are successfully processed, as communicated by your bank, you can post the payment receipts either directly from the **Direct Debit Collect. Entries** page or by moving the payment lines to the journal where you post payment receipts, such as the **Cash Receipt Journal** page. Alternatively, depending on your cash management process, you can wait and just apply the payments as a part of bank reconciliation.

NOTE

To collect payments using SEPA Direct Debit, the currency on the sales invoice must be EURO.

Setting Up SEPA Direct Debit

From the **Direct Debit Collections** page, you can export instructions to your electronic bank to perform a direct debit collection from the customer's bank account to your bank account. Business Central supports the SEPA direct debit format, but in your country/region, other formats for electronic payments may be available.

To enable export of a bank file formats that are not supported out of the box in Business Central, you can set up a data exchange definition by using the data exchange framework. For more information, see [Set Up Data Exchange Definitions](#).

Before you can process customer payments electronically by exporting direct debit instructions in the SEPA Direct Debit format, you must perform the following setup steps:

- Set up the export format of the bank file that instructs your bank to perform a direct debit collection from the customer's bank account to your bank account.
- Set up the customer's payment method.
- Set up the direct-debit mandate that reflects your agreement with the customer to collect their payments in a certain agreement period.

To set up your bank account for SEPA direct debit

1. In the **Search** box, enter **Bank Accounts**, and then choose the related link.
2. Open the bank account that you want to use for direct debit.

- On the **Transfer** FastTab, in the **SEPA Direct Debit Export Format** field, choose the option for SEPA direct debit.

To set up the customer’s payment method for SEPA direct debit

- In the **Search** box, enter **Payment Methods**, and then choose the related link.
- Choose the **New** action.
- Set up a payment method. Fill in the direct debit-specific fields as described in the following table.

FIELD	DESCRIPTION
Direct Debit	Specify if the payment method is for SEPA direct debit collection.
Direct Debit Pmt. Terms Code	Specify the payment terms, such as DON'T PAY, that are displayed on sales invoices that are paid with SEPA direct debit to indicate to the customer that the payment will be collected automatically. Alternatively, leave the field empty.

NOTE

Do not enter a value in the **Bal. Account No.** field.

- Choose the **OK** button to close the **Payment Methods** page.
- In the **Search** box, enter **Customers**, and then choose the related link.
- Open the customer card for the customer that you want to set up for SEPA direct debit collection.
- Choose the **Payment Method Code** field, and then select the payment method code that you specified in step 3.
- Repeat steps 6 and 7 for all customers that you want to set up for SEPA direct debit collection.

To set up the direct-debit mandate that represents the customer agreement

- In the **Search** box, enter **Customers**, and then choose the related link.
- Open the card for the customer that you want to set up for SEPA direct debits.
- Choose the **Bank Accounts** action.
- On the **Customer Bank Account List** page, select the customer bank account that will use direct debits, and then, on the **Home** tab, in the **Process** group, choose **Direct Debit Mandates**.
- On the **SEPA Direct Debit Mandates** page, fill in the fields as described in the following table.

FIELD	DESCRIPTION
Customer Bank Account Code	Specifies the bank account from which direct-debit payments are collected. This field is filled automatically.
Valid From	Specify the date when the direct-debit mandate starts.
Valid To	Specify the date when the direct-debit mandate ends.
Date of Signature	Specify the date when the customer signed the direct-debit mandate.

FIELD	DESCRIPTION
Sequence Type	Specify if the agreement covers multiple (Recurring) or a single (One Off) direct debit collection.
Expected Number of Debits	Specify how many direct debit collections you expect to make. This field is only relevant if you selected Recurring in the Sequence Type field.
Debit Counter	Specifies how many direct debit collections have been made using this direct-debit mandate. This field is automatically updated.
Blocked	Specify that direct debit collections cannot be made using this direct-debit mandate.

6. Repeat steps 1 through 5 for all customers that you want to set up for SEPA direct debits.

The direct-debit mandate is automatically inserted in the **Direct Debit Mandate ID** field when you create a sales invoice for the customer that you selected in step 2. For more information, see [Create Recurring Sales and Purchase Lines](#).

Creating SEPA Direct Debit Collection Entries and Export to a Bank File

To instruct the bank to transfer the payment amount from the customer's bank account to your company's account, you create a direct-debit collection, which holds information about the customer's bank account, the affected sales invoices, and the direct-debit mandate. From the resulting direct-debit collection entry, you then export an XML file that you send or upload to your electronic bank for processing. Any payments that could not be processed by the bank will be communicated to you by your bank, and you must then manually reject the direct debit-collection entries in question.

NOTE

To collect payments using SEPA Direct Debit, the currency on the sales invoice must be EURO.

To create a direct-debit collection

1. Choose the  icon, enter **Direct Debit Collections**, and then choose the related link.
2. On the **Direct Debit Collections** page, on the **Home** tab, in the **New** group, choose **Create Direct Debit Collection**.
3. On the **Create Direct Debit Collection** page, fill in the fields as described in the following table.

FIELD	DESCRIPTION
From Due Date	Specify the earliest payment due date on sales invoices that you want to create a direct-debit collection for.
To Due Date	Specify the latest payment due date on sales invoices that you want to create a direct-debit collection for.
Partner Type	Specify if the direct-debit collection is made for customers of type Company or Person .

FIELD	DESCRIPTION
Only Customers With Valid Mandate	Specify if a direct-debit collection is created for customers who have a valid direct-debit mandate. Note: A direct-debit collection is created even if the Direct Debit Mandate ID field is not filled on the sales invoice.
Only Invoices With Valid Mandate	Specify if a direct-debit collection is only created for sales invoices if a valid direct-debit mandate is selected in the Direct Debit Mandate ID field on the sales invoice.
Bank Account No.	Specify which of your company's bank accounts the collected payment will be transferred to from the customer's bank account.
Bank Account Name	Specifies the name of the bank account that you select in the Bank Account No. field. This field is filled automatically.

4. Choose the **OK** button.

A direct-debit collection is added to the **Direct Debit Collections** page, and one or more direct-debit collection entries are created.

To export a direct-debit collection entry to a bank file

1. On the **Direct Debit Collections** page, on the **Home** tab, in the **Process** group, choose **Direct Debit Collect. Entries**.
2. On the **Direct Debit Collect. Entries** page, select the entry that you want to export, and then, on the **Home** tab, in the **Process** group, choose **Create Direct Debit File**.
3. Save the export file to the location from where you send or upload it to your electronic bank.

On the **Direct Debit Collect. Entries** page, the **Direct Debit Collection Status** field is changed to File Created. On the **SEPA Direct Debit Mandates** page, the **Debit Counter** field is updated with one count.

If the exported file cannot be processed, for example because the customer is insolvent, you can reject the direct-debit collection entry. If the exported file is successfully processed by the bank, the due payments of the involved sales invoices are automatically collected from the involved customers. In that case you can close the collection.

To reject a direct-debit collection entry

- On the **Direct Debit Collect. Entries** page, select the entry that was not successfully processed, and then, on the **Home** tab, in the **Process** group, choose **Reject Entry**.

The value in the **Status** field on the **Direct Debit Collect. Entries** page is changed to **Rejected**.

To close a direct-debit collection

- On the **Direct Debit Collect. Entries** page, select the entry that was successfully processed, and then, on the **Home** tab, in the **Process** group, choose **Close Collection**.

The related direct-debit collection is closed.

You can now proceed to post receipts of payment for the involved sales invoices. You can do this as you typically post payment receipts, such as on the **Payment Registration** page, or you can post the related payment receipts directly from the **Direct Debit Collect. Entries** page. For more information, see [Post SEPA Direct Debit Payment Receipts](#).

Posting SEPA Direct Debit Payment Receipts

When a direct debit collection is successfully processed by your bank, you can proceed to post receipt of the payment for the involved sales invoices. For more information, see [Create SEPA Direct Debit Collection Entries and Export to a Bank File](#).

You can post the payment receipt directly from the **Direct Debit Collections** page or the **Direct Debit Collect. Entries** page. Alternatively, you can relay the work to another user by preparing the related journal lines.

To post a direct-debit payment receipt from the Direct Debit Collections page

1. Choose the  icon, enter **Direct Debit Collections**, and then choose the related link.
2. Select a line for a direct debit collection that has been exported to a bank file and successfully processed by the bank. For more information, see [Create SEPA Direct Debit Collection Entries and Export to a Bank File](#).
3. Choose the **Post Payment Receipts** action.
4. On the **Post Direct Debit Collection** page, fill in the fields as described in the following table.

FIELD	DESCRIPTION
Direct Debit Collection No.	Specify the direct debit collection that you want to post payment receipt for.
General Journal Template	Specify which general journal template to use for posting the payment receipt, such as the template for cash receipts.
General Journal Batch Name	Specify which general journal batch to use for posting the payment receipt.
Create Journal Only	Select this check box if you do not want to post the payment receipt when you choose the OK button. The payment receipt will be prepared in the specified journal and will not be posted until someone posts the journal lines in question.

5. Choose the **OK** button.

Block Customers

3/31/2019 • 2 minutes to read

You can block a customer, for example because of insolvency, so that the customer cannot be added to sales documents or so that no transactions can be posted for the customer.

In addition to blocking a customer, you can set receivable transactions for the customer to be on hold in connection with reminders. For more information, see [Collect Outstanding Balances](#).

The following table describes the different blocking options.

OPTION	DESCRIPTION
Blank	Transactions are allowed for this customer.
Ship	New orders and new shipments cannot be created for this customer. Existing shipments not yet invoiced can be invoiced.
Invoice	New orders, new shipments, and new invoices cannot be created for this customer. Existing shipments not yet invoiced cannot be invoiced.
All	No transaction is allowed for this customer, including payments.

To block a customer

1. Choose the  icon, enter **Customers**, and then choose the related link.
2. Select a customer, and then choose the **Edit** action.
3. Fill in the **Blocked** field with one of the options described above.

Use Item Charges to Account for Additional Trade Costs

3/31/2019 • 4 minutes to read

To ensure correct valuation, your inventory items must carry any added costs, such as freight, physical handling, insurance, and transportation that you incur when purchasing or selling the items. For purchases, the landed cost of a purchased item consists of the vendor's purchase price and all additional direct item charges that can be assigned to individual receipts or return shipments. For sales, knowing the cost of shipping sold items can be as vital to your company as knowing the landed cost of purchased items.

In addition to recording the added cost in you inventory value, you can use the Item Charges feature for the following:

- Identify the landed cost of an item for making more accurate decisions on how to optimize the distribution network.
- Break down the unit cost or unit price of an item for analysis purposes.
- include purchase allowances into the unit cost and sales allowances into the unit price.

Before you can assign item charges, you must set up item charge numbers for the different types of item charges, including to which G/L accounts costs related to sales, purchases, and inventory adjustments are posted to. An item charge number contains a combination of general product posting group, tax group code, VAT product posting group, and item charge. When you enter the item charge number on a purchase or sales document, the relevant G/L account is retrieved based on the setup of the item charge number and the information on the document.

For both purchase and sales documents, you can assign an item charge in two ways:

- On the document where the items that the item charge relates to are listed. This you typically do for documents that are not yet fully posted.
- On a separate invoice by linking the item charge to a posted receipt or shipment where the items that the item charge relate to are listed.

NOTE

You can assign item charges to orders, invoices, and credit memos, for both sales and purchases. The following procedures describe how to work with item charges for a purchase invoice. The steps are similar for all other purchase and sales documents.

To set up item charge numbers

You use item charge numbers to distinguish between the different kinds of item charges that are used in your company.

1. Choose the  icon, enter **Item Charges**, and then choose the related link.
2. On the **Item Charges** page, choose the **New** action to create a new line.
3. Fill in the fields as necessary. Hover over a field to read a short description.

To assign an item charge directly to the purchase invoice for the item

If you know the item charge at the time when you post a purchase invoice for the item, follow this procedure.

1. Choose the  icon, enter **Purchase Invoices**, and then choose the related link.
2. Create a new purchase invoice. For more information, see [Record Purchases](#).
3. Make sure the purchase invoice has one or more lines of type Item.
4. On a new line, in the **Type** field, select **Charge (Item)**.
5. In the **Quantity** field, enter the units of the item charge that you have been invoiced for.
6. In the **Direct Unit Cost** field, enter the amount of the item charge.
7. Fill in the remaining fields as necessary. Hover over a field to read a short description.

In the following steps, you will perform the actual assignment. Until the item charge is fully assigned, the value in the **Qty. to Assign** field is in red font.

8. On the **Lines** tab, choose the **Item Charge Assignment** action.

The **Item Charge Assignment** page opens showing one line for each line of type Item on the purchase invoice. To assign the item charge to one or more invoice lines, you can use a function that assigns and distributes it for you or you can manually fill in the **Qty. to Assign** field. The following steps describe how to use the Suggest Item Charge Assignment function.

9. On the **Item Charge Assignment** page, choose the **Suggest Item Charge Assignment** action.
10. If there are more than one invoice lines of type Item, choose one of the four distribution options.

It the item charge is fully assigned, the value in the **Qty. to Assign** field on the purchase invoice is zero.

The item charge is now assigned to the purchase invoice. When you post the receipt of the purchase invoice, the items' inventory values are updated with the cost of the item charge.

To assign an item charge from a separate invoice to the purchase invoice for the item

If you received an invoice for the item charge after you posted the original purchase receipt, follow this procedure.

1. Repeat steps 1 through 8 in [To assign an item charge directly to the purchase invoice for the item](#).
2. On the **Item Charge Assignment** page, choose the **Get Receipt Lines** action.
3. On the **Purch. Receipt Lines** page, select the posted purchase receipt for the item that you want to assign the item charge to, and then choose the **OK** button.
4. Choose the **Suggest Item Charge Assignment** action.

The item charge on the separate purchase invoice is now assigned to the item on the posted purchase receipt, thereby updating the item's inventory value with the cost of the item charge.

Work with Payment Tolerances and Payment Discount Tolerances

6/13/2019 • 13 minutes to read

You can set up a payment tolerance to close an invoice when the payment does not fully cover the amount on the invoice. You can set up a payment discount tolerance to grant a payment discount after the payment discount date has passed.

You can use payment tolerances so that every outstanding amount has a set maximum allowed payment tolerance. If the payment tolerance is met, then the payment amount is analyzed. If the payment amount is an underpayment, then the outstanding amount is fully closed by the underpayment. A detailed ledger entry is posted to the payment entry so that no remaining amount is left on the applied invoice entry. If the payment amount is an overpayment, then a new detailed ledger entry is posted to the payment entry so that no remaining amount is left on the payment entry.

You can use payment discount tolerances so that if you accept a payment discount after the payment discount date, then it is always posted to either the payment discount account or a payment tolerance account.

Applying Payment Tolerance to Multiple Documents

A single document has the same payment tolerance whether it is applied on its own or with other documents. Acceptance of a late payment discount when you are applying payment tolerance to multiple documents automatically occurs for each document where the following rule is true:

payment discount date < payment date on the selected entry <= payment tolerance date

This rule also applies to determine whether to display warnings when you apply payment tolerance to multiple documents. The payment discount tolerance warning is displayed for each entry that meets the date criteria. For more information, see [Example 2 - Tolerance Calculations for Multiple Documents](#).

You can choose to display a warning that is based on different tolerance situations.

- The first warning is for the payment discount tolerance. You are informed that you can accept a late payment discount. You can then choose whether to accept tolerance on the discount date.
- The second warning is for the payment tolerance. You are informed that all entries can be closed because the difference is in the sum of the maximum payment tolerance for the applied entries. You can then choose whether to accept tolerance on the payment amount.

For more information, see [To enable or disable payment tolerance warning](#).

To set up tolerances

Tolerance on days and amounts allows you to close an invoice even though the payment does not fully cover the amount on the invoice, whether this is because the due date for the payment discount has been exceeded, goods have been deducted or because of a minor error. This also applies to refunds and credit memos.

To set up tolerance you have to set up various tolerance accounts, specify both payment discount tolerance and payment tolerance posting methods and then run the **Change Payment Tolerance** batch job.

1. Choose the  icon, enter **General Posting Setup**, and then choose the related link.
2. On the **General Posting Setup** page, set up a debit and a credit sales payment tolerance account and a debit and a credit purchase payment tolerance account.

3. Choose the  icon, enter **Customer Posting Groups**, and then choose the related link.
4. On the **Customer Posting Groups** page, set up a debit and a credit payment tolerance account. For more information, see [Setting Up Posting Groups](#).
5. Choose the  icon, enter **Vendor Posting Setup**, and then choose the related link.
6. On the **Vendor Posting Groups** page, set up a debit and a credit payment tolerance account.
7. Choose the  icon, enter **General Ledger Setup**, and then choose the related link.
8. Open the **General Ledger Setup** page.
9. On the **Application** FastTab, fill in the **Pmt. Disc. Tolerance Posting**, **Payment Discount Grace Period** and **Payment Tolerance Posting** fields.
10. Choose the **Change Payment Tolerance** action.
11. On the **Change Payment Tolerance** page, fill in the **Payment Tolerance %** and **Max Payment Tolerance Amount** fields, and then choose the **OK** button.

IMPORTANT

You have now set up tolerance for local currency only. If you want Business Central to handle tolerance on payments, credit memos, and refunds in a foreign currency, you must run the **Change Payment Tolerance** batch job with a value in the **Currency Code** field.

NOTE

If you want to get a payment tolerance warning every time that you post an application in the tolerance, you must activate the payment tolerance warning. For more information, see [To enable or disable payment tolerance warning](#) section.

To deactivate tolerance for a customer or vendor, you must block tolerances on the relevant customer or vendor card. For more information, see [To block payment tolerance for customers](#).

When you set up tolerance, Business Central also checks if there are any open entries and calculates the tolerance for these entries.

To enable or disable payment tolerance warnings

The payment tolerance warning appears when you post an application that has a balance in the allowed tolerance. You can then choose how you want to post and document the balance.

1. Choose the  icon, enter **General Ledger Setup**, and then choose the related link.
2. On the **General Ledger Setup** page, on the **Application** FastTab, select the **Payment Tolerance Warning** check box to activate the warning. To deactivate the warning, clear the check box.

NOTE

The default option for the **Payment Tolerance Warning** page is **Leave the Balance as Remaining Amount**. The default option for the **Pmt. Disc. Tolerance Warning** page the is **Do Not Accept the Late Payment Discount**.

To block payment tolerance for customers

The default setting for payment tolerance is allowed. To disallow a certain customer or vendor payment tolerance you need to block tolerance on the respective customer or vendor card. The following describes how to do it for a customer. The steps are similar for a vendor.

1. Choose the  icon, enter **Customer** or **Vendor**, and then choose the related link.
2. On the **Payments** FastTab, select the **Block Payment Tolerance** check box.

NOTE

If the customer or vendor has open entries, you must first remove payment tolerance from entries that are currently open.

Example 1 - Tolerance Calculations for a Single Document

The following are some example scenarios showing the expected tolerance calculations and postings occurring in different situations.

The **G/L Setup** page contains the following setup:

- Payment Discount Grace Period: 5D
- Max Payment Tolerance: 5

Scenarios with alternative A or B represent the following:

- **A** In this case, the payment discount tolerance warning has been turned off OR the user has the warning on and has selected to allow the late payment discount (Post the Balance as Payment Tolerance).
- **B** In this case, the user has the warning on and has selected not to allow the late payment discount (Leave the Balance as Remaining Amount).

Payment Range Diagrams

In relation to the scenario above, the diagrams of payment ranges are as follows:

(1) Payment Date <=01/15/03 (Scenarios 1-3)

Remaining Amount per

Normal Application Rules

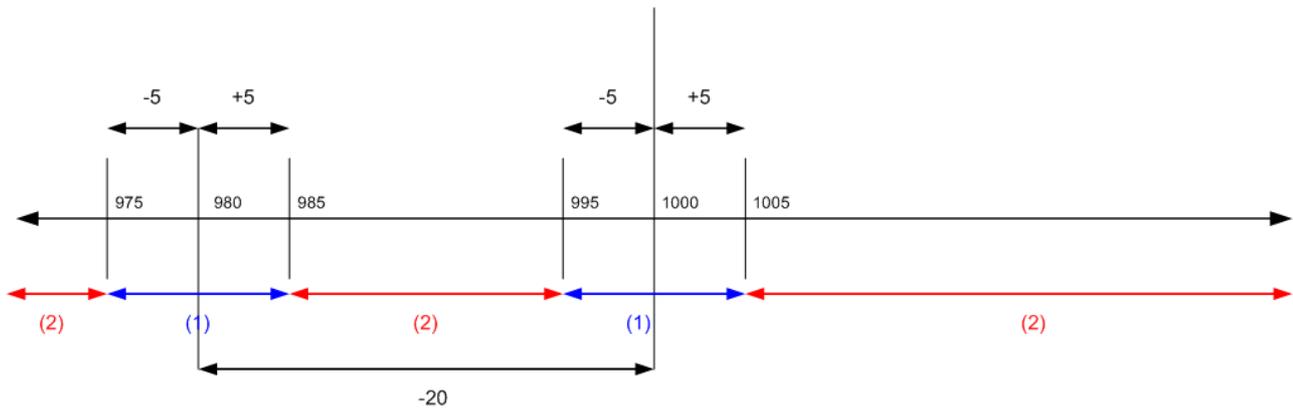

(1) If payment falls in these ranges, all application entries can be closed with or without tolerance.

(2) If payment falls in these ranges, all application entries cannot be closed even with tolerance.

(2) Payment Date is between 01/16/03 and 01/20/03 (Scenarios 4-9)

Remaining Amount per

Normal Application Rules

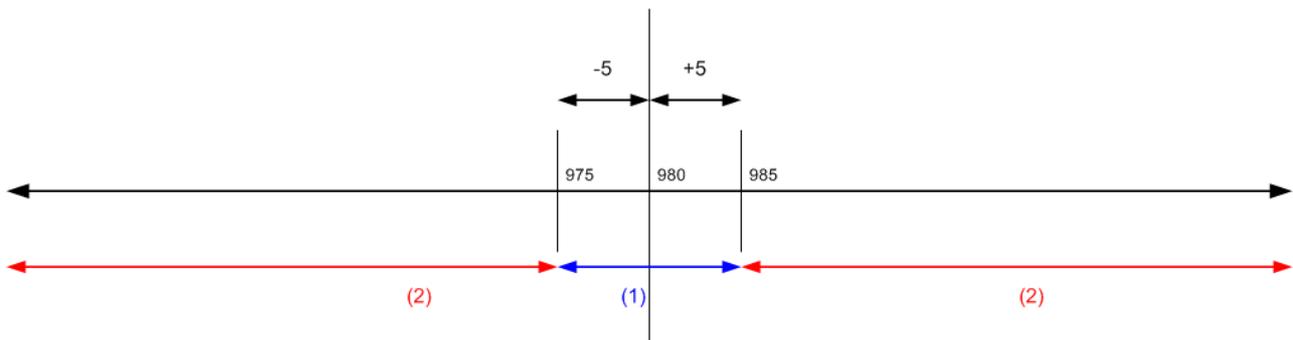

(1) If payment falls in these ranges, all application entries can be closed with or without tolerance.

(2) If payment falls in these ranges, all application entries cannot be closed even with tolerance.

(3) Payment Date is after 01/20/03 (Scenarios 10-15)

Remaining Amount per

Normal Application Rules

(1) If payment falls in these ranges, all application entries can be closed with or without tolerance.

(2) If payment falls in these ranges, all application entries cannot be closed even with tolerance.

Example 2 - Tolerance Calculations for Multiple Documents

The following are some example scenarios showing the expected tolerance calculations and postings occurring in different situations. The examples are limited to being only those scenarios that result in all entries in the application being closed.

The **G/L Setup** page contains the following setup:

- Payment Discount Grace Period 5D
- Max Payment Tolerance 5

Scenarios with alternative A, B, C, or D represent the following:

- **A** In this case the payment discount tolerance warning has been turned off, OR the user has the warning on and has selected to allow the late payment discount (Post as Tolerance) in any invoice.
- **B** In this case, the user has the warning on and has selected not to allow the late payment discount on any invoice.
- **C** - In this case, the user has the warning on and has selected to allow the late payment discount on the first invoice but not the second.
- **D** - In this case, the user has the warning on and has selected not to allow the late payment discount on the first invoice but allowed it on the second.

Payment Range Diagrams

In relation to the scenario above, the diagrams of payment ranges are as follows:

(1) Payment Date <=01/15/03 (Scenarios 1-3)

Remaining Amount per

Normal Application Rules

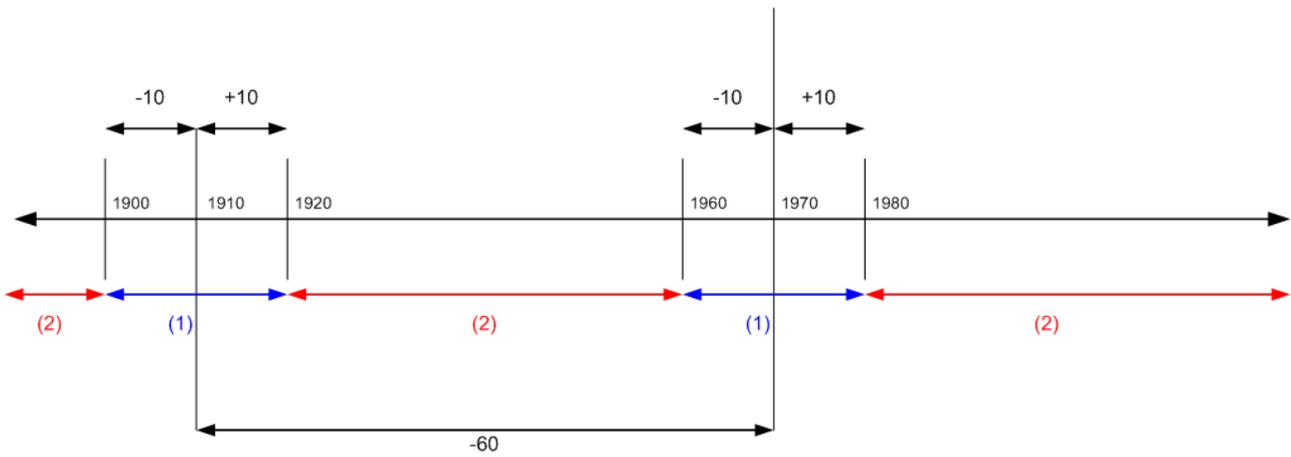

(1) If payment falls in these ranges, all application entries can be closed with or without tolerance.

(2) If payment falls in these ranges, all application entries cannot be closed even with tolerance.

(2) Payment Date is between 01/16/03 and 01/17/03 (Scenarios 4-9)

Remaining Amount per

Normal Application Rules

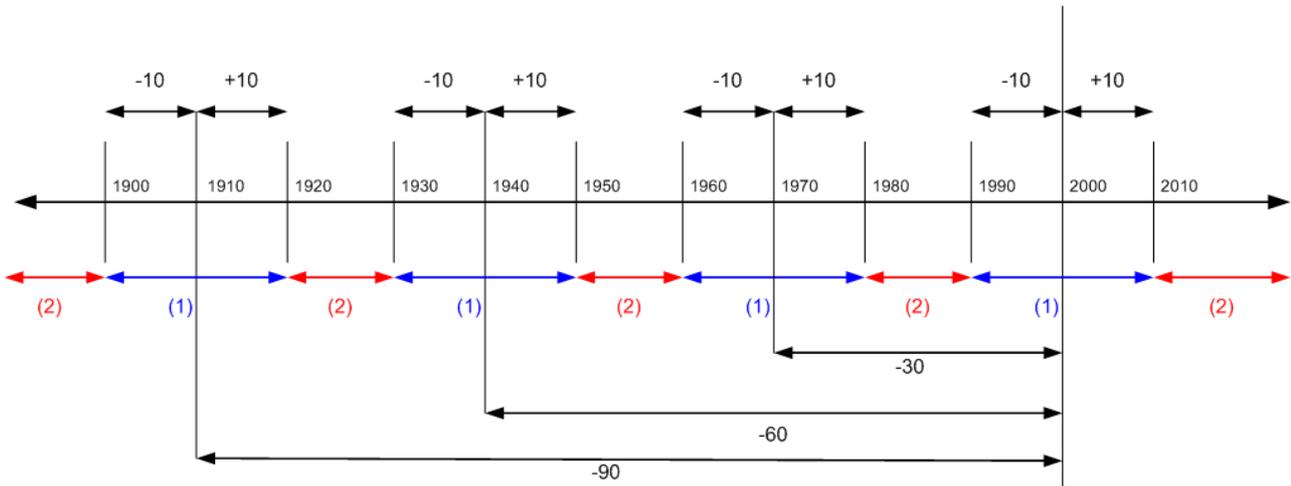

(1) If payment falls in these ranges, all application entries can be closed with or without tolerance.

(2) If payment falls in these ranges, all application entries cannot be closed even with tolerance.

(3) Payment Date is between 01/18/03 and 01/20/03 (Scenarios 10-21)

Remaining Amount per

Normal Application Rules

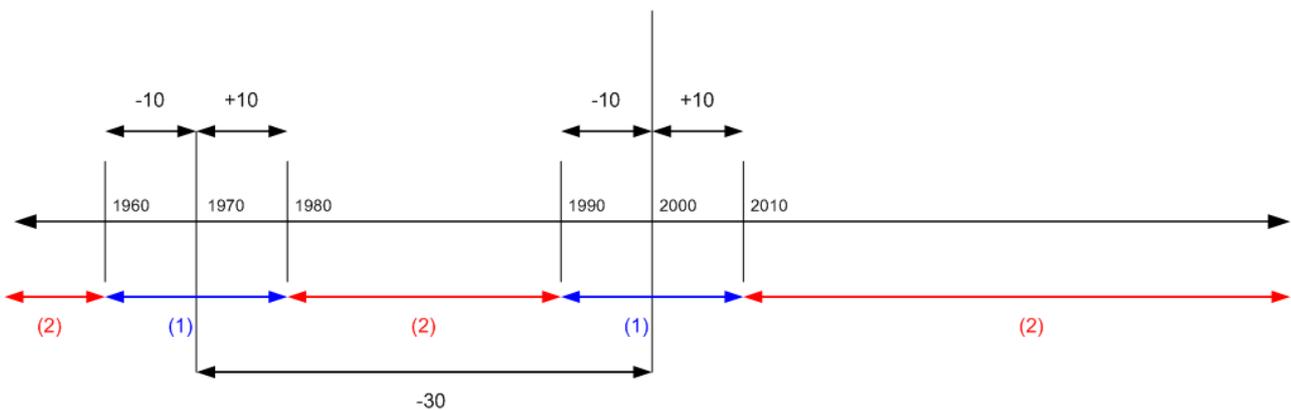

(1) If payment falls in these ranges, all application entries can be closed with or without tolerance.

(2) If payment falls in these ranges, all application entries cannot be closed even with tolerance.

(4) Payment Date is between 01/21/03 and 01/22/03 (Scenarios 22-27)

Remaining Amount per

Normal Application Rules

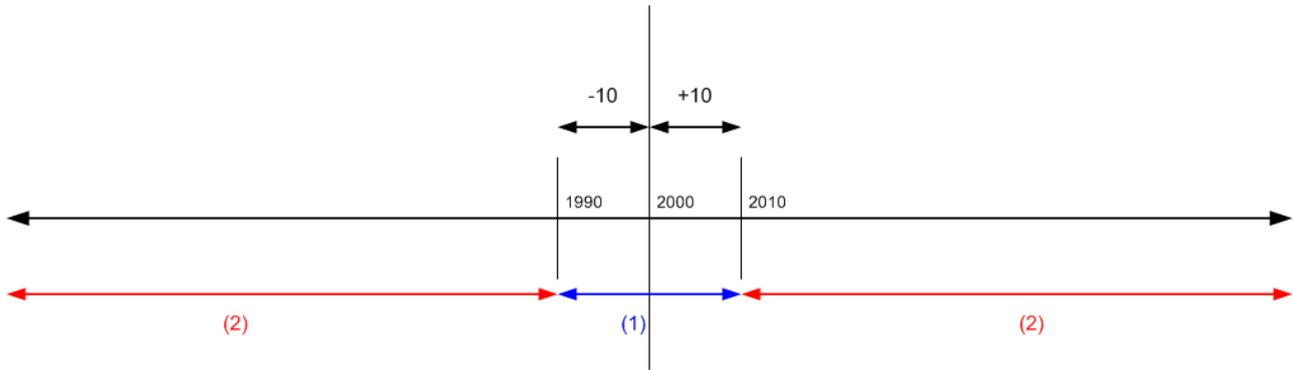

(1) If payment falls in these ranges, all application entries can be closed with or without tolerance.

(2) If payment falls in these ranges, all application entries cannot be closed even with tolerance.

(5) Payment Date is after 01/22/03 (Scenarios 28-30)

Remaining Amount per

Normal Application Rules

(1) If payment falls in these ranges, all application entries can be closed with or without tolerance.

(2) If payment falls in these ranges, all application entries cannot be closed even with tolerance.

The Late Payment Prediction Extension

3/31/2019 • 5 minutes to read

Effectively managing receivables is important to the overall financial health of a business. The Late Payment Prediction extension can help you reduce outstanding receivables and fine-tune your collections strategy by predicting whether sales invoices will be paid on time. For example, if a payment is predicted to be late, you might decide to adjust the terms of payment or the payment method for the customer.

What are Predictions Based On?

The Late Payment Prediction extension uses a predictive model that we developed in Azure Machine Learning Studio and trained using data that is representative of a range of small to medium sized businesses. Though we have already trained and evaluated it, our predictive model will continue to learn from your data. The more you use the model and the more data you feed it, the more accurate predictions will become. By default, the extension evaluates the model and updates the predictions on a weekly basis. However, you can update the predictions whenever you want by choosing the **Update Prediction** action on the **Customer Ledger Entries** page.

NOTE

We use a bit of your compute time each week when we evaluate the model and update your predictions. In addition to manually updating your predictions, other actions that consume compute time are when you train the model (which you might do if you've recently added data) and when you evaluate the model (which looks at the quality of the model).

Getting Started

The extension is free in Business Central, and we provide a subscription to Azure Machine Learning. The subscription offers 30 minutes of compute time per month. If you need more than that you can create your own predictive model and use it instead. For more information, see the section titled *Building Your Own Predictive Model* later in this topic.

When you open a posted sales document, a notification will display at the top of the page. To use the Late Payment Prediction Extension you can opt in by choosing **Enable** in the notification. Alternatively, you can set up the extension manually. For example, if you regret dismissing the notification.

To enable the extension manually, follow these steps:

1. Choose the  icon, enter **Service Connections**, and then choose the related link.
2. Choose the **Late Payment Prediction Setup** option, and then fill in the fields as necessary.

Viewing All Payment Predictions

If you enable the extension a **Payments Predicted to be Late** tile is available in the **Business Manager** Role Center. The tile displays the number of payments that are predicted to be late, and let's you open the **Customer Ledger Entries** page where you can dig deeper into the posted invoices. There are three columns to pay attention to:

- **Late Payment** - Indicates whether the payment for the invoice is predicted to be late.
- **Prediction Confidence** - Indicates how reliable you should consider the prediction to be. **High** means that the prediction is at least 90% sure, **Medium** is between 80 and 90%, and **Low** is below 80%.
- **Prediction Confidence %** - Shows the actual percentage behind the confidence rating. By default, this column

is not displayed, but you can add it if you want. For more information, see [Personalizing Your Workspace](#).

TIP

The Customer Ledger Entries page also shows a FactBox on the right. While you are reviewing predictions, the information in the **Customer Details** section can be helpful. When you choose the invoice in the list, the section shows information about the customer. It also lets you take immediate action. For example, if a customer frequently misplaces their wallet, you can open the Customer card from the FactBox and block the customer for future sales.

Viewing a Payment Prediction for a Specific Sales Document

You can also predict late payments up-front. On the **Sales Quotes**, **Sales Orders**, and **Sales Invoices** pages, you can use the **Predict Payment** action to generate a prediction for the sales document you're viewing.

Building Your Own Predictive Model

Interested in building your own predictive model? You can use Azure Machine Learning Studio to build your own predictive model and use it in Business Central. To use your own model, you must subscribe to Azure Machine Learning. For more information, see [Azure Machine Learning Studio Documentation](#).

We do, however, offer an easier way for you to create and use your own predictive model. You can share data from your invoices with our [Prediction Experiment for Dynamics 365 Business Central](#) in Azure Machine Learning, and let our experiment create and train a predictive model based on your data. To share your data, on the **Late Payment Prediction Setup** page, choose the **Create My Model** action. Afterward, predictions will be based on your model and your data, not ours.

NOTE

The quality of the model is important. When our predictive experiment uses your data to train a model it determines a quality value for the model as a percentage. The model quality indicates how accurate the model's predictions are likely to be. Several factors can impact the quality of a model. For example, these factors might be that there was not enough data, or the data did not contain enough variation. You can view the quality of the model you are currently using on the **Late Payment Prediction Setup** page. You can also specify a minimum threshold for the model quality. Models with a quality value below the threshold will not produce predictions.

To use your model instead of ours

If you create your own model in Azure Machine Learning Studio, without using the tools in Business Central, you must provide your credentials so that Business Central can access the model. There are a couple of steps to do that:

1. Choose the  icon, enter **Late Payment Prediction Setup**, and then choose the related link.
2. Choose the **Use My Azure Subscription** check box.
3. In the **Selected Model** field, choose **My Model**.
4. On the **My Model Credentials** FastTab, enter the API URL and API key for your model.

Managing Payables

3/31/2019 • 2 minutes to read

A big part of managing accounts payable is paying your vendors, or reimbursing your employees for expenses. You can use functions to add payments lines for purchase invoices that are due on the **Payment Journal** page. To send transactions to your bank, you can export multiple payment journal lines to a file, and then upload the file to your bank. You can also make payments by check, including transmitting checks as electronic payments.

Another typical task is to apply outgoing payments to their related vendor or employee ledger entries in order to close purchase invoices, purchase credit memos, or employee accounts as paid. You can do this on the **Payment Reconciliation Journal** page by importing a bank statement file to register the payments. The payments are applied to open vendor, customer, or employee ledger entries by matching payment text and entry information. There are various ways to review and change the matches before you post the journal. You can choose to close any open bank account ledger entries related to the applied ledger entries when you post the journal. The bank account is automatically reconciled when all payments are applied.

Alternatively, you can apply outgoing payments manually on the **Payment Journal** page or from the related vendor or employee ledger entries.

The following table describes a sequence of tasks within accounts payable, with links to the topics that describe them.

TO	SEE
Generate due vendor payments or employee reimbursements, prepare check payments, and export payments to a bank file when posting.	Making Payments
Apply vendor payments automatically to unpaid purchase invoices by importing a bank statement file.	Applying Payments Automatically and Reconciling Bank Accounts
Apply vendor payments to unpaid purchase invoices manually.	Reconcile Vendor Payments with the Payment Journal or from Vendor Ledger Entries
Ensure correct inventory valuation by assigning added item costs, such as freight, physical handling, insurance, and transportation that you incur when purchasing.	Use Item Charges to Account for Additional Trade Costs
Reimburse employees for personal expenses during business activities by making payment to their bank account.	Record and Reimburse Employees' Expenses

Making Payments

4/12/2019 • 2 minutes to read

When you make payments to vendors or customers, or reimburse your employees, you post the related payment lines on the **Payment Journal** page. The payment journal is a general journal that is optimized for making payments and includes a number of powerful functions such as the **Suggest Vendor Payments** function that finds vendor payments that are due, and the **Vendor - Summary Aging** report that shows an overview of due vendor payments.

You can start the process of making the payment from the lists, cards, and ledger entries for vendors, customers, and employees. Each of these pages has a button that starts the payment flow and helps you fill in the payment journal.

From the payment journal, you can print computer checks or record when checks are written. If you select **Computer Check** in the **Bank Payment Type** field, then any lines representing checks must be printed before the payment journal can be posted.

When the payments are posted, you can export them to a bank file for upload to your bank for processing.

After the payments are made at your bank, you must apply them to their related open vendor or employee ledger entries. You can do this manually or by importing a bank statement file and applying the payments automatically. For more information, see [Applying Payments Automatically and Reconciling Bank Accounts](#).

The following table describes a sequence of tasks, with links to the topics that describe them.

TO	SEE
Understand basic functions of the Payment Journal page, which is based on the general journal, to prepare to post payments to vendors or employees.	Working with General Journals
Post payments to vendors or employees and refunds to customers, and optionally apply the payments to the related unpaid invoices/credit memos to close them as paid.	Record Payments and Refunds
Use a function on the Payment Journal page to suggest vendor payments according to selected criteria, such as due date, discount eligibility, and your liquidity.	Suggest Vendor Payments
Issue checks for vendor payments or customer refunds, either as print-outs or as computer checks. Void checks before or after posting.	Make Check Payments
Make electronic payments according to the EU SEPA Credit Transfer standard.	Making Payments with Bank Data Conversion Service or SEPA Credit Transfer
Pay a vendor by cash or check, and post the payment when you post the invoice.	Settle Purchase Invoices Promptly
Make sure that your bank only clears validated checks and amounts by sending them a file that contains vendor, check, and payment information.	Export a Positive Pay file

Working with General Journals

3/31/2019 • 12 minutes to read

Most financial transactions are posted to the general ledger through dedicated business documents, such as purchase invoices and sales orders. But you can also process business activities such as purchasing, paying, or refunding employee expenses by posting journal lines in the various journals in Business Central.

Most journals are based on the *General Journal*, and you can process all transactions on the **General Journal** page. For more information, see [Post Transactions Directly to the General Ledger](#).

For example, you can use post employees' expenditure of own money on business-related expenses, for later reimbursement. For more information, see [Record and Reimburse Employees' Expenses](#).

But in many cases, you will want to use the journals that are optimized for specific types of transactions, such as the **Payment Journal** for registering payments. For more information, see [Record Payments and Refunds in the Payment Journal](#).

You use general journals to post financial transactions directly to general ledger accounts and other accounts, such as bank, customer, vendor, and employee accounts. Posting with a general journal always creates entries on general ledger accounts. This is true even when, for example, you post a journal line to a customer account, because an entry is posted to a general ledger receivables account through a posting group.

The information that you enter in a journal is temporary and can be changed while it is in the journal. When you post the journal, the information is transferred to entries on individual accounts, where it cannot be changed. You can, however, unapply posted entries, and you can post reversing or correcting entries. For more information, see [Reverse Postings](#).

NOTE

The general journal only shows a limited number of fields on the journal line by default. If you want to see additional fields, such as the **Account Type** field, choose the **Show More Columns** action. To hide the additional fields again, choose the **Show Fewer Columns** action.

Using Journal Templates and Batches

There are several general journal templates. Each journal template is represented by a dedicated page with particular functions and the fields that are required to support those functions, such as the **Payment Reconciliation Journal** page to process bank payments and the **Payment Journal** page to pay your vendors or reimburse your employees. For more information, see [Make Payments](#) and [Reconcile Customer Payments with the Cash Receipt Journal or from Customer Ledger Entries](#).

For each journal template, you can set up your own personal journal as a journal batch. For example, you can define your own journal batch for the payment journal that has your personal layout and settings. The following tip is an example of how to personalize a journal.

TIP

If you select the **Suggest Balancing Amount** check box on the line for your batch on the **General Journal Batches** page, then the **Amount** field on, for example, general journal lines for the same document number is automatically prefilled with the value that is required to balance the document. For more information, see [Letting Business Central Suggest Values](#).

Understanding Main Accounts and Balancing Accounts

If you have set up default balancing accounts for the journal batches on the **General Journals** page, the balancing account will be filled in automatically when you fill in the **Account No.** field. Otherwise, fill in both the **Account No.** field and the **Bal. Account No.** field manually. A positive amount in the **Amount** field is debited to the main account and credited to the balancing account. A negative amount is credited to the main account and debited to the balancing account.

NOTE

VAT is calculated separately for the main account and the balancing account, so they can use different VAT percentage rates.

Working with Recurring Journals

A recurring journal is a general journal with specific fields for managing transactions that you post frequently with few or no changes, such as rent, subscriptions, electricity, and heat. Using these fields for recurring transactions, you can post both fixed and variable amounts. You can also specify automatic reversal entries for the day after the posting date. You can also use allocation keys to divide the recurring entries among various accounts. For more information, see [Allocating Recurring Journal Amounts to Several Accounts](#).

With a recurring journal, entries that will be posted regularly need to be typed in only once. That is, the accounts, dimensions and dimension values and so on that you enter will remain in the journal after posting. If any adjustments are necessary, you can make them with each posting.

Recurring Method field

This field determines how the amount on the journal line is treated after posting. For example, if you will use the same amount every time you post the line, you can let the amount remain. If you will use the same accounts and text on the line but the amount will vary every time you post, you can choose to delete the amount after posting.

TO	SEE
Fixed	The amount on the journal line will remain after posting.
Variable	The amount on the journal line will be deleted after posting.
Balance	The posted amount on the account on the line will be allocated among the accounts specified for the line in the Gen. Jnl. Allocation table. The balance on the account will thus be set to zero. Remember to fill in the Allocation % field on the Allocations page. For more information, see Allocating Recurring Journal Amounts to Several Accounts .

TO	SEE
Reversing Fixed	The amount on the journal line will remain after posting, and a balancing entry will be posted on the next day.
Reversing Variable	The amount on the journal line will be deleted after posting, and a balancing entry will be posted on the next day.
Reversing Balance	The posted amount on the account on the line will be allocated among the accounts specified for the line on the Allocations page. The balance on the account will be set to zero, and a balancing entry is posted on the next day.

NOTE

The VAT fields can be filled in on either the recurring journal line or on the allocation journal line but not on both. That is, they can be filled in on the **Allocations** page only if the corresponding lines in the recurring journal are not filled in.

Recurring Frequency field

This field determines how often the entry on the journal line will be posted. It is a date formula field, and it must be filled in for recurring journal lines. For more information, see [Using Date Formulas](#).

Examples

If the journal line must be posted every month, enter "1M". After every posting, the date in the **Posting Date** field will be updated to the same date in the next month.

If you want to post an entry on the last day of every month, you can do one of the following:

- Post the first entry on the last day of a month by entering 1D+1M-1D (1 day + 1 month - 1 day). With this formula, the posting date is calculated correctly regardless of how many days there are in the month.
- Post the first entry on any arbitrary day of a month by entering 1M+CM. With this formula, the posting date will be after one full month + the remaining days of the current month.

Expiration Date field

This field determines the date on which the line will be posted for the last time. The line will not be posted after this date.

The advantage of using the field is that the line will not be deleted from the journal immediately and you can always replace the present expiration date with a later one so that you can use the line further into the future.

If the field is blank, the line will be posted every time you post until it is deleted from the journal.

Allocating Recurring Journal Amounts to Several Accounts

On the **Recurring General Journal** page, you can choose the **Allocations** action to see or manage how amounts on the recurring journal line are allocated to several accounts and dimensions. Note that an allocation functions as balancing account line to the recurring journal line.

Just as in a recurring journal, you need to enter an allocation only once. The allocation will remain in the allocation journal after posting, so you do not need to enter amounts and allocations every time you post the recurring journal line.

If the recurring method in the recurring journal is set to **Balance** or **Reversing Balance**, then any dimension value codes in the recurring journal are disregarded when the account is set to zero. So if you allocate a recurring line to various dimension values on the **Allocations** page, then only one reversing entry will be created. Therefore, if you allocate a recurring journal line that contains a dimension value code, then you must not enter the same code on the **Allocations** page. If you do, the dimension values will be incorrect.

Example: Allocating Rent Payments to Different Departments

You pay rent every month, so you have entered the rent amount on the cash account on a recurring journal line. On the **Allocations** page, you can divide the expense among several departments (Department dimension) according to the number of square feet that each one occupies. The calculation is based on the allocation percentage on each line. You can enter various accounts on different allocation lines (if rent will also be divided among several accounts), or you can enter the same account but with various dimension value codes for the Department dimension on each line.

Working with Standard Journals

When you have created journal lines which you know you are likely to create again later, you can save them as a standard journal before you post the journal. This functionality applies to item journals and general journals.

NOTE

The following procedure refers to the item journal, but the information also applies to the general journal.

To save a standard journal

1. Choose the  icon, enter **Item Journals**, and then choose the related link.
2. Enter one or more journal lines.
3. Select the journal lines that you want to reuse.
4. Choose the **Save as Standard Journal** action.
5. In the **Save as Standard Item Journal** request page, define a new or existing standard item journal that the lines should be saved in.

If you have already created one or more standard item journals and you want to replace one of these with the new set of item journal lines, in the Code field, select the code you want.

6. Choose the **OK** button to verify that you want to overwrite the existing standard item journal and replace all its content.
7. Select the **Save Unit Amount** field if you want to save the values in the **Unit Amount** field of the standard item journal.
8. Select the **Save Quantity** field if you want the program to save the values in the **Quantity** field.
9. Choose the **OK** button to save the standard item journal.

When you have finished saving the standard item journal, the Item Journal page is displayed so you can proceed to post it, knowing that it can easily be recreated next time you need to post the same or similar lines.

To reuse a standard journal

1. Choose the  icon, enter **Item Journals**, and then choose the related link.

2. Choose the **Get Standard Journals** action.

The Standard Item Journals page opens showing codes and descriptions for all existing standard item journals.

3. To review a standard item journal before you select it for reuse, choose the **Show Journal** action.

Any changes you make in a standard item journal are implemented right away. They will be there next time you open or reuse the standard item journal in question. You should therefore be sure that the change is important enough to apply generally. Otherwise, make the specific change in the item journal after the standard item journal lines have been inserted. See step 4 below.

4. On the **Standard Item Journals** page, select the standard item journal you want to reuse, and then choose the **OK** button.

Now the item journal is filled with the lines you saved as the standard item journal. If journal lines already existed in the item journal, the inserted lines will be placed under the existing journal lines.

If you did not check the **Save Unit Amount** field when you used the **Save as Standard Item Journal** function job, then the **Unit Amount** field on lines that are inserted from the standard journal is automatically filled with the item's current value, copied from the **Unit Cost** field on the item card.

NOTE

If you selected the **Save Unit Amount** or **Save Quantity** fields, you should now make sure the inserted values are correct for this particular inventory adjustment before you post the item journal.

If the inserted item journal lines contain saved unit amounts that you do not want to post, you can quickly adjust it to the current value of the item as follows.

5. Select the item journal lines you want to adjust, and then choose the **Recalculate Unit Amount** action. This will update the Unit Amount field with the current unit cost of the item.
6. Choose the **post** action.

To renumber document numbers in journals

To make sure that you do not receive posting errors because of the document number order, you can use the **Renumber Document Numbers** function before you post a journal.

In all journals that are based on the general journal, the **Document No.** field is editable so that you can specify different document numbers for different journal lines or the same document number for related journal lines.

If the **No. Series** field on the journal batch is filled, then the posting function in general journals requires that the document number on individual or grouped journal lines be in sequential order. To make sure that you do not receive posting errors because of the document number order, you can use the **Renumber Document Numbers** function before you post the journal. If related journal lines were grouped by document number before you used the function, they will remain grouped but may be assigned a different document number.

This function also works on filtered views.

Any renumbering of document numbers will respect related applications, such as a payment application that has been made from the document on the journal line to a vendor account. Accordingly, the **Applies-to ID** and **Applies-to Doc. No.** fields on the affected ledger entries may be updated.

The following procedure is based on the **General Journal** page, but applies to all other journals that are based on the general journal, such as the **Payment Journal** page.

1. Choose the  icon, enter **General Journals**, and then choose the related link.
2. When you are ready to post the journal, choose the **Renumber Document Numbers** action.

Values in the **Document No.** field are changed, where required, so that the document number on individual or grouped journal lines are in sequential order. After documents are renumbered, you can proceed to post the journal.

Record Payments and Refunds in the Payment Journal

3/31/2019 • 2 minutes to read

On the **Payment Journal** page, you record payments that you make to vendors and refunds that you make to customers. When you post a payment journal line, the paid amount is recorded on the specified system bank account. You must then take steps to perform the actual money transfer from the related bank account.

The payment journal is a general journal that is optimized for making payments. You can quickly add lines manually, you can let Business Central suggest vendor payments, and you can apply the payment to posted documents. Even though you are making payments, you enter a positive amount in the **Document Amount** field. Depending on the document type for the journal line, this amount is then converted to a negative amount in the underlying transactions. This way, it's faster for you to add journal lines manually. If you prefer to enter negative amounts, you can personalize the payment journal to show the **Amount** field instead.

- Applying payments to invoices or credit memos

If you fill in the **Applies-to Doc. No.** field with the invoice or credit memo that must be paid or refunded, then the document in question is set to paid when you post the journal. This is referred to as "applied". As an alternative to applying during payment posting, you can use the **Apply Vendor Entries** and **Apply Customer Entries** page after you have made the payment posting. For more information, see, for example, [Reconcile Vendor Payments with the Payment Journal or from Vendor Ledger Entries](#).

- Get suggested payments to vendors or employees

The **Suggest Vendor Payments** and **Suggest Employee Payments** functions can help you fill payment journal lines automatically according to vendor prioritization and due dates. For more information, see [Suggest Vendor Payments](#). With this function, the **Applies-to Doc. No.** field is always filled in.

- Print checks and submit payments electronically to your bank

In addition to recording that the payment is made, you can also use the **Payment Journal** page to output the payment for further processing by your bank. For more information, see [Make Check Payments](#) and [Make Electronic Payments](#).

To make payments in the payment journal

1. Choose the  icon, enter **Payment Journals**, and then choose the related link.
2. Open the journal batch that is dedicated to payments.
3. If you know who to pay or refund, fill in the fields manually. Hover over a field to read a short description.
4. To also apply the payment to the related invoice or credit memo, choose the **Applies-to Doc No.** field, on the **Apply Vendor Entries** page, select the relevant invoice or credit memo, and then choose the **OK** button.

Many fields, such as the **Document Amount** and **Due Date** fields, are now filled in with information from the selected document.

5. Alternatively, use the **Suggest Vendor Payments** function. All the applies-to information and amounts are then also entered on the journal lines. For more information, see [Suggest Vendor Payments](#).

Messages will guide you to fill in the required fields correctly.

6. When all payment journal lines are completed, choose the **Post** action.

Suggest Vendor Payments

3/31/2019 • 2 minutes to read

On the **Payment Journal** page, you can use the **Suggest Vendor Payments** batch job to suggest payment lines. Lines for payments that are due soon or payments where a payment discount is available are suggested based on your settings.

To benefit fully from payment suggestions, you must first prioritize your vendors. For more information, see [Prioritize Vendors](#).

NOTE

Vendor ledger entries that are **On Hold** are not included in the batch job.

IMPORTANT

If you want to take advantage of payment discounts, and have entered an available amount, the amount will be used for:

- * Prioritized overdue vendor entries first in order of priority.
- * Overdue vendor entries that are not prioritized.
- * Open vendor entries that qualify for payment discounts, arranged by vendor number.

To use the Suggest Vendor Payments function

1. Choose the  icon, enter **Payment Journals**, and then choose the related link.
2. Open the relevant journal, and then choose the **Suggest Vendor Payments** action.
3. Fill in the fields as necessary. Hover over a field to read a short description.
4. Choose the **OK** button.

To insert the due date as posting date on payment journal lines

When you use the **Suggest Vendor Payments** batch job to create payment lines for your vendors, you can fill two special fields to make sure that the generated lines use the due date to calculate the posting date. These fields are **Calculate Posting Date from Applies-to-Doc Due Date** and **Applies-to-Doc Due Date Offset**.

IMPORTANT

You cannot use the **Calculate Posting Date from Applies-to-Doc Due Date** field together with the **Find Payment Discounts** field or the **Summarize per Vendor** field. If the posting date is based on the due date, some payment discounts may not calculate correctly because the posting date is after the payment discount date.

Also, if the calculated posting date is in the past, then the posting date is moved up to the work date, and a warning is displayed.

Alternatively, you can manually create payment lines using the due date to calculate the posting date. After you apply vendor ledger entries, you can use the **Calculate Posting Date** action to update the posting date on the journal line with the due date of the related purchase invoice. For more information, see [Apply Purchase Transactions Manually](#).

NOTE

If the purchase invoice is overdue, the posting date is set to the work date, and the font on the line becomes red.

Make Check Payments

3/31/2019 • 3 minutes to read

You can issue electronic and manual checks in Business Central. Both methods use the payment journal to issue checks to vendors. You can also void checks and view check ledger entries.

The following procedure shows how to pay a vendor with a computer checks by applying the payment to the relevant vendor invoice, printing the check, and then posting the payment as paid. This results in positive vendor ledger entries, applied to negative bank ledger entries, and physical checks for processing in the bank.

You can pay with two types of checks. For both types, the **Bal. Account Type** or the **Account Type** field must contain **Bank Account**.

- **Computer Check:** Select this option if you want to print a check for the amount on the payment journal line. You must print the checks before you can post the journal lines. You can only select **Computer Check** if
- **Manual Check:** Select this option if you have created a check manually and want to create a corresponding check ledger entry for this amount. By using this option, you cannot print the check.

NOTE

To make sure that your bank only clears validated checks and amounts, you can send them a file that contains vendor, check, and payment information. For more information, see [Export a Positive Pay file](#).

Your printer must be correctly set up with the check forms, and you must define which check layout to use. For more information, see [Define Check Layouts](#)

You can print up to 10 invoices on a page for a check stub. If a check applies to more than 10 invoices, when you print the stub we void the check on the first page and print the word VOID on the check. We then print the remainder of the invoices and the total check amount on the second page.

To pay a vendor invoice with a computer check

The following describes how to pay a vendor by check. The steps are similar to refund a customer by check.

1. Choose the  icon, enter **Payment Journals**, and then choose the related link.
2. Fill in the payment journal lines. For more information, see [Record Payments and Refunds](#).
3. In the **Payment Method Code** field, select **Check**.
4. In the **Bank Payment Type** field, select **Computer Check**.
5. Choose the **Print Check** action.
6. On the **Check** page, fill in the fields as necessary. Hover over a field to read a short description.
7. Choose the **Send to** button, select the **PDF Document** option, and then choose the **OK** button.

The physical checks can now be brought to the bank for processing. Proceed to post the payment as applied to the vendor and thereby paid in the system.

8. Choose the **Post** action.

Fully applied vendor ledger entries and bank ledger entries are created.

NOTE

If you want to print and pay checks in more than one currency from different bank accounts, you must run the **Print Check** batch job separately for each currency and specify the appropriate bank account.

To cancel printed checks that are not posted

You can cancel non-posted checks after they have been printed by using the **Void Check** action on the **Payment Journal** page.

1. On the **Payment Journal** page, choose the **Void Check**, and then choose which checks to cancel.

To void checks

When check payment have been posted, you can only cancel (void) checks from the resulting bank ledger entries.

1. Choose the  icon, enter **Bank Accounts**, and then choose the related link.
2. Select the relevant bank account, choose the **Edit** action, and then choose the **Check Ledger Entries** action.
3. On the **Check Ledger Entries** page, choose the **Void Check** action.
4. Select the **Void Check Only** check box.
5. Choose the **OK** button.

To view a summary of posted checks

If you want to review posted checks, for example to verify multiple checks paid to one vendor, you can use the **Bank Account - Check Details** report.

1. Choose the  icon, enter **Bank Account - Check Details**, and then choose the related link.
2. Set filters as relevant, and then choose the **Preview** button.

Making Payments with Bank Data Conversion Service or SEPA Credit Transfer

4/12/2019 • 9 minutes to read

On the **Payment Journal** page, you can process payments to your vendors by exporting a file together with the payment information from the journal lines. You can then upload the file to your electronic bank where the related money transfers are processed. Business Central supports the SEPA Credit Transfer format, but in your country/region, other formats for electronic payments may be available.

In the generic version of Business Central, a global provider of services to convert bank data to any file format that your bank requires is set up and connected. In North American versions, the same service can be used to send payment files as electronic funds transfer (EFT), however with a slightly different process. See step 6 in [To export payments to a bank file](#).

To enable SEPA credit transfers, you must first set up a bank account, a vendor, and the general journal batch that the payment journal is based on. You then prepare payments to vendors by automatically filling the **Payment Journal** page with due payments with specified posting dates.

NOTE

When you have verified that the payments are successfully processed by the bank, you can proceed to post the payment journal lines.

Setting Up the Bank Data Conversion Service.

Activate the Bank Data Conversion Service feature to have any bank statement file converted to a format that you can import or to have your exported payment files converted to the format that your bank requires. For more information, see [Set Up the Bank Data Conversion Service](#).

Setting Up SEPA Credit Transfer

From the **Payment Journal** page, you can export payments to a file for upload to your electronic bank for processing of the related money transfers. Business Central supports the SEPA Credit Transfer format, but in your country/region, other formats for electronic payments may be available.

To enable export of a bank file formats that are not supported out of the box in Business Central, you can set up a data exchange definition by using the data exchange framework. For more information, see [Set Up Data Exchange Definitions](#).

Before you can process payment electronically by exporting payment files in the SEPA Credit Transfer format, you must perform the following setup steps:

- Set up the bank account in question to handle the SEPA Credit Transfer format
- Set up vendor cards to process payments by exporting files in the SEPA Credit Transfer format
- Set up the related general journal batch to enable payment export from the **Payment Journal** page
- Connect the data exchange definition for one or more payment types with the relevant payment method or methods

To set up a bank account for SEPA Credit Transfer

1. In the **Search** box, enter **Bank Accounts**, and then choose the related link.

2. Open the card of the bank account from which you will export payment files in the SEPA Credit Transfer format.
3. On the **Transfer** FastTab, in the **Payment Export Format** field, choose **SEPADD**.
4. In the **SEPA CT Msg. ID No. Series** field, choose a number series from which numbers are assigned to SEPA credit transfer entries.
5. Make sure the **IBAN** field is filled.

NOTE

The **Currency Code** field must be set to **EUR**, because SEPA credit transfers can only be made in the EURO currency.

To set up a vendor card for SEPA Credit Transfer

1. In the **Search** box, enter **Vendors**, and then choose the related link.
2. Open the card of the vendor whom you will pay electronically by export payment files in the SEPA Credit Transfer format.
3. On the **Payment** FastTab, in the **Payment Method Code** field, choose **BANK**.
4. In the **Preferred Bank Account** field, choose the bank to which the money will be transferred when it is processed by your electronic bank.

The value in the **Preferred Bank Account** field is copied to the **Recipient Bank Account** field on the **Payment Journal** page.

To set the payment journal up to export payment files

1. In the **Search** box, enter **Payment Journals**, and then choose the related link.
2. Open the payment journal that you use to process payments by exporting files in the SEPA Credit Transfer format.
3. In the **Batch Name** field, choose the drop-down button.
4. On the **General Journal Batches** page, on the **Home** tab, in the **Manage** group, choose **Edit List**.
5. On the line for the payment journal that you will use to export payments, select the **Allow Payment Export** check box.

To connect the data exchange definition for one or more payment types with the relevant payment method or methods

1. In the **Search** box, enter **Payment Methods**, and then choose the related link.
2. On the **Payment Methods** page, select the payment method that is used to export payments from, and then choose the **Pmt. Export Line Definition** field.
3. On the **Pmt. Export Line Definitions** page, select the code that you specified in the **Code** field on the **Line Definitions** FastTab in step 4 in the "To describe the formatting of lines and columns in the file" section in the [Set Up Data Exchange Definitions](#) procedure.

The direct-debit mandate is automatically inserted in the **Direct Debit Mandate ID** field when you create a sales invoice for the customer that you selected in step 2. For more information, see [Create Recurring Sales and Purchase Lines](#).

Preparing the Payment Journal

Fill the payment journal with lines for due payments to vendors, with the option to insert posting dates based on the due date of the related purchase documents. For more information, see [Managing Payables](#).

Exporting Payments to a Bank File

When you are ready to make payments to your vendors, or reimbursements to your employees, you can export a file with the payment information on the lines on the **Payment Journal** page. You can then upload the file to your bank to process the related money transfers.

In the generic version of Business Central, the Bank Data Conversion service is set up and connected. In North American versions, the same service can be used to send payment files as electronic funds transfer (EFT), however with a slightly different process. See step 6 in [To export payments to a bank file](#).

NOTE

Before you can export payment files from the payment journal, you must specify the electronic format for the involved bank account, and you must enable the bank data conversion service. For more information, see [Set Up Bank Accounts](#) and [Set Up the Bank Data Conversion Service](#). In addition, you must select the **Allow Payment Export** check box on the **General Journal Batches** page. For more information, see [Working with General Journals](#).

You use the **Credit Transfer Registers** page to view the payment files that have been exported from the payment journal. From this page, you can also re-export payment files in case of technical errors or file changes. Note, however, that exported EFT files are not shown in this page and cannot be re-exported.

To export payments to a bank file

The following describes how to pay a vendor by check. The steps are similar to refund a customer by check.

1. Choose the  icon, enter **Payment Journals**, and then choose the related link.
2. Fill in the payment journal lines. For more information, see [Record Payments and Refunds](#).

NOTE

If you are using EFT, you must select either **Electronic Payment** or **Electronic Payment-IAT** in the **Bank Payment Type** field. Different file export services and their formats require different setup values in the **Bank Account Card** and **Vendor Bank Account Card** pages. You will be informed about wrong or missing setup values as you try to export the file.

3. When you have completed all payment journal lines, choose the **Export** action.
4. On the **Export Electronic Payments** page, fill in the fields as necessary.

Any error messages will be shown in the **Payment File Errors** FactBox where you can also choose an error message to see detailed information. You must resolve all errors before the payment file can be exported.

TIP

When you use the bank data conversion service, a common error message states that the bank account number does not have the length that your bank requires. To avoid or resolve the error, you must remove the value in the **IBAN** field on the **Bank Account Card** page and then, in the **Bank Account No.** field, enter a bank account number in the format that your bank requires.

5. On the **Save As** page, specify the location that the file is exported to, and then choose **Save**.

NOTE

If you are using EFT, save the resulting vendor remittance form as a Word document or select to have it emailed directly to the vendor. The payments are now added to the **Generate EFT File** page from where you can generate multiple payment orders together to save transmission cost. For more information, see the following steps.

6. On the **Payment Journal** page, choose the **Generate EFT File** action.

On the **Generate EFT File** page, all payments set up for EFT that you have exported from the payment journal for a specified bank account but not yet generated are listed on the **Lines** FastTab.

7. Choose the **Generate EFT File** action to export one file for all the EFT payments.

8. On the **Save As** page, specify the location that the file is exported to, and then choose **Save**.

The bank payment file is exported to the location that you specify, and you can proceed to upload it to your electronic bank account and make the actual payments. Then you can post the exported payment journal lines.

To plan when to post exported payments

If you do not want to post a payment journal line for an exported payment, for example because you are waiting for confirmation that the transaction has been processed by the bank, you can just delete the journal line. When you later create a payment journal line to pay the remaining amount on the invoice, the **Total Exported Amount** field shows how much of the payment amount has already been exported. Also, you can find detailed information about the exported total by choosing the **Credit Transfer Reg. Entries** button to see details about exported payment files.

If you follow a process where you do not post payments until you have confirmation that they have been processed in the bank, you can control this in two ways.

- In a payment journal with suggested payment lines, you can sort on either the **Exported to Payment File** column or the **Total Exported Amount** and then delete payment suggestions for open invoices for which payments have already been made and you do not want to make payments for.
- On the **Suggest Vendor Payments** page, where you specify which payments to insert in the payment journal, you can select the **Skip Exported Payments** check box if you do not want to insert journal lines for payments that have already been exported.

To see information about exported payments, choose the **Payment Export History** action.

To re-export payments to a bank file

You can re-export payment files from the **Credit Transfer Registers** page. Before you delete or post payment journal lines, you can also re-export the payment file from the **Payment Journal** page by simply exporting it again. If you have deleted or posted the payment journal lines after exporting them, you can re-export the same payment file from the **Credit Transfer Registers** page. Select the line for the batch of credit transfers that you want to re-export, and then use the **Reexport Payments to File** action.

NOTE

Exported EFT files are not shown on the **Credit Transfer Registers** page and cannot be re-exported.

1. Choose the  icon, enter **Credit Transfer Registers**, and then choose the related link.
2. Select a payment export that you want to re-export, and then choose the **Reexport Payment to File** action.

Posting the Payments

When the electronic payment is successfully processed by the bank, post the payments. For more information, see [Making Payments](#).

Collect Payments with SEPA Direct Debit

Settle Purchase Invoices Promptly

3/31/2019 • 2 minutes to read

If you need to pay the vendor by cash or check, you can post the payment when you post the invoice.

To settle purchase invoices promptly

1. Choose the  icon, enter **Purchase Invoices**, and then choose the related link.
2. On the **Home** tab, choose **New**.
3. To pay either in cash or by bank transfer, enter the number of the general ledger cash account or the bank account in the **Bal. Account No.** field.

IMPORTANT

The **Bal. Account Type** and **Bal. Account No.** fields are not included in the standard layout of the invoice header. In order to post the payment of an invoice, you must first insert them with the design facilities.

NOTE

If you frequently pay purchase invoices in cash, it is a good idea to set up a specific payment method with a balancing account and enter this method in the **Payment Method** field on the vendor card. The balancing account number is inserted automatically on the invoice header every time you create a new invoice.

Export a Positive Pay File

3/31/2019 • 2 minutes to read

To make sure that your bank only clears validated checks and amounts, you can export a Positive Pay file that contains vendor information, check number, and payment amount, which you send to the bank for reference when you process payments.

Business Central is preconfigured to support Positive Pay files for Bank of America and City Bank.

To set up a bank account for Positive Pay

1. Choose the  icon, enter **Bank Accounts**, and then choose the related link.
2. Open the card for the bank that you want to use Positive Pay for.
3. In the **Positive Pay Export Code** field, enter POSPAYBANK.
4. Close the page.

To export a Positive Pay file

1. Choose the  icon, enter **Bank Accounts**, and then choose the related link.
2. Select the bank account that you want to export a Positive Pay file for.
3. Choose **Positive Pay Export** action.

The **Positive Pay Export** page opens displaying payments that have been made for the bank account since the last upload date, as shown in the **Last Upload Date** and **Last Upload Time** fields.

4. In the **Cutoff Upload Date** field, specify a date before which payments are not included in the exported file.
5. Choose the **Export** action.
6. On the **Export File** page, choose the **Save** button, and then save the file to a convenient location.
7. Upload the file to your electronic bank site.
8. Write down or copy the confirmation number that is displayed when the file upload is successful.

To view exported Positive Pay records

1. Choose the  icon, enter **Bank Accounts**, and then choose the related link.
2. Select the bank account that you want to view Positive Pay export records for.
3. Choose the **Positive Pay Entries** action.

On the **Positive Pay Entries** page, you can see all the Positive Pay export records for the bank account.

4. In the **Confirmation Number** field, enter, for each export record, the confirmation number that you receive when the file upload to the bank is successful.
5. To view the related payment lines, choose the **Positive Pay Entry Details** action.

To reexport Positive Pay files

1. Choose the  icon, enter **Bank Accounts**, and then choose the related link.

2. Select the bank account that you want to reexport Positive Pay files for.
3. Choose the **Positive Pay Entries** action.
4. Select the line for the Positive Pay export file that you want to reexport.
5. On the **Positive Pay Entries** page, choose the **Reexport Positive Pay to File** action.

Applying Payments Automatically and Reconciling Bank Accounts

3/31/2019 • 2 minutes to read

You must regularly reconcile your bank, receivables, and payables accounts by applying payments recorded in the bank to their related unpaid invoices and credit memos or other open entries in Business Central.

You can perform this task on the **Payment Reconciliation Journal** page by importing a bank statement file or feed to quickly register the payments. Payments are applied to open customer or vendor ledger entries based on matches between payment text and entry information. You can review and change automatic applications before you post the journal. You can choose to close any open bank account ledger entries related to the applied ledger entries when you post the journal. The bank account is automatically reconciled when all payments are applied.

You can also reconcile bank accounts without simultaneously applying payments. You perform this work on the **Bank Acc. Reconciliation** page. For more information, see [Reconcile Bank Account Separately](#).

To import bank statements as a bank feed, you must first set up and enable the Envestnet Yodlee Bank Feed service, and then link your bank accounts to the related online bank accounts. For more information, see [Set Up the Envestnet Yodlee Bank Feeds Service](#).

Alternatively, you can use the bank data conversion service to convert a bank statement file, from any format, to a data stream that you can import into Business Central. For more information, see [Set Up the Bank Data Conversion Service](#).

The following table describes a sequence of tasks, with links to the topics that describe them.

TO	SEE
Apply payments to open customer or vendor ledger entries by importing a bank statement, and reconcile the bank account when all payments are applied.	Reconcile Payments Using Automatic Application
Manually apply payments by viewing detailed information about matched data and suggestions for candidate open entries to apply payments to.	Review or Apply Payments After Automatic Application
Resolve payments that cannot be applied automatically to their related open ledger entries. For example because the amounts differ, or because a related ledger entry does not exist.	Reconcile Payments that Cannot be Applied Automatically
Link text on payments to specific customer, vendor, or general ledger accounts to always post recurring cash receipts or expenses to those accounts when no documents exist to apply to.	Map Text on Recurring Payments to Accounts for Automatic Reconciliation

Reconcile Payments Using Automatic Application

3/31/2019 • 6 minutes to read

The **Payment Reconciliation Journal** page specifies payments, either incoming or outgoing, that have been recorded as transactions on your online bank account and that you can apply to their related open customer, vendor, and bank account ledger entries. The lines in the journal are filled by importing a bank statement as a bank feed or file.

NOTE

The page offers automatic matching functionality that applies payments to their related open entries based on a matching of text on a bank statement line (journal line) with text on one or more open entries. Note that you can overwrite the suggested automatic applications, and you can choose to not use automatic application at all. For more information, see step 7.

A payment reconciliation journal is related to one bank account in Business Central that reflects the online bank account where the payment transactions are recorded. Any open bank account ledger entries related to the applied customer or vendor ledger entries will be closed when you choose the **Post Payments and Reconcile Bank Account** action. This means that the bank account is automatically reconciled for payments that you post with the journal.

If you want to import bank statements as bank feeds, you must first enable the Envestnet Yodlee Bank Feeds service and then link the bank account to its related online bank account. The payment reconciliation journal will then automatically detect bank feeds when you choose the **Import Bank Transactions** action. In addition, you can set a bank account up to automatically import new bank statement feeds every hour. Transactions for payments that have already been posted as applied and/or reconciled will not be imported. For more information, see [Set Up the Envestnet Yodlee Bank Feeds Service](#).

With the **Map Text to Account** action, you can set up mappings between text on payments and specific debit, credit, and balancing accounts so that such payments are posted to the specified accounts when you post the payment reconciliation journal. See step 8. For more information, see [Map Text on Recurring Payments to Accounts for Automatic Reconciliation](#).

Similar functionality exists to reconcile excess amounts on payment reconciliation journal lines on an ad-hoc basis. For more information, see [Reconcile Payments That Cannot be Applied](#).

You use the **Apply Automatically** function, either automatically when you import a bank file or feed with payment transactions or when you activate it, to apply payments to their related open entries based on a matching of text on a bank statement line (journal line) with text on one or more open entries.

On journal lines where a payment has been applied automatically to one or more open entries, the **Match Confidence** field has a value between Low and High to indicate the quality of the data matching that the suggested payment application is based on. In addition, the **Account Type** and **Account No.** fields are filled with information about the customer or vendor that the payment is applied to. If you have set up a text-to-account mapping, the automatic application can result in a match confidence value of **High - Text-to-Account Mapping**.

For each journal line on the **Payment Reconciliation Journal** page, you can open the **Payment Application** page to see all candidate open entries for the payment and view detailed information for each entry about the data matching that a payment application is based on. Here, you can manually apply payments or reapply payments that were applied automatically to a wrong entry. For more information, see [Review or](#)

NOTE

You can start the bank transactions import at the same time as you open the **Payment Reconciliation** Journal page for an existing payment reconciliation journal on the **Payment Reconciliation Journals** page. The following procedure describes how to import bank transactions into the **Payment Reconciliation Journal** page after you have created a new journal.

To reconcile payments using automatic application

1. Choose the  icon, enter **Payment Reconciliation Journals**, and then choose the related link.
2. To work in a new payment reconciliation journal, choose the **New Journal** action.
3. On the **Payment Bank Account List** page, select the bank account that you want to reconcile payments for, and then choose the **OK** button. The **Payment Reconciliation Journal** page opens prepared for the selected bank account.
4. Choose the **Import Bank Transactions** action. If the bank account for the selected journal is not set up for import of bank transactions, then a dialog box will open to help you fill in the relevant fields.
5. On the **Select a file to import** page, select the file that contains the bank transactions for payments that you want to reconcile, and then choose the **Open** button.
6. If the Bank Statement service is enabled, on the **Bank Statement Filter** page that opens automatically, specify the date interval for the bank statements to be imported.

The **Payment Reconciliation Journal** page is filled with lines for payments representing bank transactions in the imported bank statement.

On lines for payments that have been automatically applied to their related open entries, the **Match Confidence** field has a value between **Low** and **High** to indicate the quality of the data matching that the suggested payment application is based on. In addition, the **Account Type** and **Account No.** fields are filled with information about the customer or vendor that the payment is applied to.

7. Select a journal line, and then, choose the **Apply Manually** action to review, reapply, or apply the payment manually on the **Payment Application** page. For more information, see [Review or Apply Payments After Automatic Application](#).
- When you have finished your manual application, the **Match Confidence** field on the journal line that you have processed manually contains **Accepted**.
8. Select an unapplied journal line for a recurring cash receipt or expense, such as a car gasoline purchase, and then choose the **Map Text to Account** action. For more information, see [Map Text on Recurring Payments to Accounts for Automatic Reconciliation](#)
 9. When you have finished your mapping of payment text to accounts, choose the **Apply Manually** action.
 10. When you are content that all payments on the journal lines are correctly applied or set to direct posting, choose the **Post** action, and then choose one of the options:
 - **Post Payments and Reconcile Bank Accounts** - To post the payments as applied and also close the related bank account ledger entries as reconciled.
 - **Post Payments Only** - To only post the payments as applied, but leave the related bank account ledger entries open. Required that you reconcile the bank account separately, for example: For more

information, see [Reconcile Bank Accounts Separately](#).

- **Test Report** - To review the result of posting before you post. The **Bank Account Statement** report opens and shows the same fields as at the bottom of the **Payment Reconciliation Journal** page.

When you post the payment reconciliation journal, the applied open entries memos are closed, and the related customer, vendor, or general ledger accounts are updated. For payments on journal lines based on text-to-account mapping, the specified customer, vendor, and general ledger accounts are updated. For all journal lines, bank account ledger entries are created. If you choose the **Post Payments and Reconcile Bank Account** action, any open bank account ledger entries related to the applied customer or vendor ledger entries will be closed. This means that the bank account is automatically reconciled for payments that you post with the journal.

You can compare the value in the **Balance on Bank Account After Posting** field together with the value in the **Statement Ending Balance** field to track when the bank account is reconciled based on payments that you post.

NOTE

If you do not want to reconcile the bank account from the **Payment Reconciliation Journal** page, then you must use the **Bank Acc. Reconciliation** page. For more information, see [Reconcile Bank Accounts Separately](#).

Review or Apply Payments Manually After Automatic Application

3/31/2019 • 3 minutes to read

For each journal line representing a payment on the **Payment Reconciliation Journal** page, you can open the **Payment Application** page to see all candidate open entries for the payment and view detailed information for each entry about the data matching that a payment application is based on. Here, you can manually apply payments or reapply payments that were applied automatically to a wrong entry. For more information about automatic application, see [Reconcile Payments Using Automatic Application](#).

IMPORTANT

When the bank account that you are reconciling payments for is set up for the local currency, then the **Payment Application** page will show all open entries in the local currency, including open entries for documents that were originally invoiced in foreign currencies. Payments applied to entries with converted currencies may therefore be posted with different amounts than on the original document because of the potentially different exchange rates used by the bank and Business Central respectively.

Therefore, we recommend that you look for foreign currency codes in the **Currency Code** field on the **Payment Application** page to check if applications are based on converted currencies. To review the original document amount in the foreign currency and to see the exchange rate used, choose the **Applies-to Entry No.** field, and then, on the shortcut menu, choose the drilldown button to open the **Customer Ledger Entries** or **Vendor Ledger Entries** page.

Any gains-and-loss adjustment required due to currency conversions is not handled automatically by Business Central.

NOTE

You cannot apply entries with a different sign than the sign on the payment. For example, to close both a negative-sign credit memo and its related positive-sign invoice, you must first apply the credit memo to the invoice, and then apply the payment to the invoice with the reduced remaining amount.

WARNING

If you use payment discounts, and if the payment date is before the payment due date, then the **Remaining Amt. Incl. Discount** field on the **Payment Application** page will be used for matching. Otherwise, the value in the **Remaining Amount** field will be used. If the payment was made with a discounted amount after the payment due date, or the full amount was paid but a discount was granted, then the amount will not be matched.

NOTE

You can only apply a payment to one account. If you want to split the application on multiple open entries, for example to apply a lump-sum payment, then the open entries must be for the same account. For more information, see steps 7 and 8 in the procedure in this topic.

To review or apply payments after automatic application

1. Choose the  icon, enter **Payment Reconciliation Journals**, and then choose the related link.
2. Open the payment reconciliation journal for a bank account that you want to reconcile payments for. For more information, see [Reconcile Payments Using Automatic Application](#).
3. On the **Payment Reconciliation Journal** page, select a payment that you want to review or manually apply to one or more open entries, and then choose the **Apply Manually** action.
4. Select the **Applied** check box on the line for the open entry that you want to apply the payment to.
5. The payment amount, which is also shown in the **Transaction Amount** field on the **Payment Application** page, is inserted in the **Applied Amount** field, but you can modify the field, for example if you want to apply the amount to several open entries.
6. To apply a part of the paid amount to another open entry for the account, for example to apply a lump-sum payment, select the **Applied** check box for the line. The applied amount is automatically deducted from the transactions amount to reflect the distribution on the two open entries.
7. To apply a part of a payment to one or more open entries that does not exist in the database, create a new line under the line for the same account. In the **Applied Amount** field, enter the amount to apply on the new line, and then adjust the **Applied Amount** field on the existing line.
8. Repeat steps 5, 6, or 7 for other open entries that you want to apply a full or partial payment amount to.
9. When you have reviewed a payment application or manually applied to one or more open entries, choose the **Accept Application** action.

The **Payment Application** page closes, and on the **Payment Reconciliation Journal** page, the value in the **Match Confidence** field is changed to **Accepted** to indicate to you that you have reviewed or manually applied the payment.

Reconcile Payments that Cannot be Applied Automatically

3/31/2019 • 2 minutes to read

You may sometimes have to handle payments to your bank account that cannot be applied to a related open customer, vendor or bank account ledger entry. Reasons may be that no document exists in Business Central that the payment can be applied to, or the related document in Business Central has a different amount than the transaction amount, for example, because of currency exchange. On the **Payment Reconciliation Journal** page, all transaction amounts for payments that are not yet applied appear in the **Difference** field, including amounts that cannot be applied because of reasons such as the above.

Payments that cannot be applied can appear on payment reconciliation journal lines in the following different ways:

- The value in the **Difference** field is equal to the value in the **Transaction Amount** field, which indicates that no part of the payment can be applied to a related open customer, vendor, or bank account ledger entry.
- The value in the **Difference** field is lower than the value in the **Transaction Amount** field, which indicates that a part of the payment can be applied to a related open customer, vendor, or bank account ledger entry. The remaining part of the payment cannot be applied and must be reconciled manually or by posting it directly to an account.

To reconcile such payments, you can choose the **Transfer Difference to Account** button and then specify to which account the amount in the **Difference** field will be posted when you post the payment reconciliation journal.

TIP

Similar functionality exists to set up automatic reconciliation of recurring payments that cannot be applied to related open customer, vendor, or bank account ledger entries. For more information, see [Map Text on Recurring Payments to Accounts for Automatic Reconciliation](#).

To reconcile payments that cannot be applied automatically

1. Choose the  icon, enter **Payment Reconciliation Journals**, and then choose the related link.
2. Open a payment reconciliation journal. For more information, see [Reconcile Payments Using Automatic Application](#).
3. Choose the **Transfer Difference to Account**. The **Transfer Difference to Account** page opens.
4. In the **Account Type** field, specify if the type of account that the payment amount will be posted to.
5. In the **Account No.** field, specify the account that the payment amount will be posted to.
6. In the **Description** field, specify text that describes this direct payment posting. By default, the text in the **Transaction Text** field on the payment reconciliation journal line is inserted.
7. Choose the **OK** button.

If the value in the **Difference** field was equal to the value in the **Transaction Amount** field when you post the payment reconciliation journal, the whole payment on the journal line will be posted directly to the specified balancing account.

If the value in the **Difference** field was lower than the value in the **Transaction Amount** field, then an additional journal line will be created with the same text and date and with the difference inserted in the **Transaction**

Amount field. On the original journal line, the difference will be deducted from the value in the **Transaction Amount** field, and the payment will remain applied to its related customer, vendor, or bank account ledger entry. When you post the payment reconciliation journal, one part of the payment will be posted as an applied payment. The other part of the payment will be posted directly to the specified account.

Map Text on Recurring Payments to Accounts for Automatic Reconciliation

3/31/2019 • 3 minutes to read

On the **Text-to-Account Mapping** page, which you open from the **Payment Reconciliation Journal** page, you can set up mappings between text on payments and specific debit, credit, and balancing accounts so that such payments are posted to the specified accounts when you post the payment reconciliation journal.

Similar functionality exists to reconcile excess amounts on payment reconciliation journal lines on an ad-hoc basis. For more information, see [Reconcile Payments that Cannot be Applied Automatically](#).

Payments posted based on text-to-account mapping are not applied to open entries, but are merely posted to the specified accounts in addition to creating bank account ledger entries. Accordingly, text-to-account mapping is suited for recurring cash receipts or expenses, such as frequent purchases of car fuel or bank fees and interest, that regularly occur on the bank statement and do not need a related business document. For more information, see the "Example - Text-to-Account Mapping for Fuel Expense" section in this topic.

NOTE

Payments on reconciliation journal lines are only set to posting according to text-to-account mapping if the automatic application function can only provide a match confidence of **Low** or **Medium**. If the automatic application function provides a match confidence of High, then the payment is automatically applied to one or more open entries, and the payment is not posted to the accounts specified on the **Text-to-Account Mapping** page. In other words, a match confidence of **High** overrules a text-to-account mapping.

On a payment reconciliation journal line where the payment has been set to posting according to text-to-account mapping, the **Match Confidence** field contains **High - Text-to-Account Mapping**, and the **Account Type** and **Account No.** fields contain the mapped accounts.

To map text on recurring payments to accounts for automatic reconciliation

1. Choose the  icon, enter **Payment Reconciliation Journals**, and then choose the related link.
2. Open a payment reconciliation journal. For more information, see [Reconcile Payments Using Automatic Application](#).
3. Choose the **Map Text to Account** action. The **Text-to-Account Mapping** page opens.
4. In the **Mapping Text** field, enter any text that occurs on payments that you want to post to specified accounts without applying to an open entry. You can enter up to 50 characters.

NOTE

If no other payments exist with the mapping text in question, then the text-to-account mapping will occur even when only a part of the text on the payment exists as a mapping text.

5. In the **Vendor No.** field, enter the vendor that the payments will be posted to.
6. In the **Bal. Source Type** field, specify if the payment will be posted to a general ledger account or to a

customer or vendor account.

7. In the **Bal. Source No.** field, specify the account that the payment will be posted to, depending on your selection in the **Bal. Source Type** field.

NOTE

Do not use the **Debit Acc. No.** and **Credit Acc. No.** fields in connection with payment reconciliation. They are used for incoming documents only. For more information, see [Use OCR to Turn PDF and Image Files into Electronic Documents](#).

8. Repeat steps 3 through 7 for all text on payments that you want to map to accounts for direct posting without application.

Next time you import a bank statement file or choose the **Apply Automatically** action on the **Payment Reconciliation Journal** page, journal lines for the payments that contain the specified mapping text will contain the mapped accounts in the **Account Type** and **Account No.** fields. The **Match Confidence** field will contain **High - Text-to-Account Mapping**. This is on the condition that the automatic application function can only provide a match confidence of **Low** or **Medium**.

Example: Text-to-Account Mapping for Fuel Expense

To always post fuel expenses incurred at Shell gas stations to the general ledger account for gasoline (account 8510), fill a line on the **Text-to-Account Mapping** page as follows.

MAPPING TEXT	DEBIT ACC. NO.	CREDIT ACC. NO.	BAL. SOURCE TYPE	BAL. SOURCE NO.
Shell	BLANK	8510	G/L Account	BLANK

Reconcile Customer Payments from a List of Unpaid Sales Documents

3/31/2019 • 12 minutes to read

When your customers have made payments to your electronic bank account, you must apply each amount paid to the related sales document and then post the payment to update the customer, general ledger, and bank ledger entries. Depending on your business needs, you can get paid and register that payment in different ways: manually, automatically, and through payment services.

NOTE

You can perform the same tasks, including vendor payments, on the **Payment Reconciliation Journal** page using functions for bank statement import, automatic application, and bank account reconciliation. For more information, see [Reconcile Payments Using Automatic Application](#).

The **Register Customer Payments** page is designed to support you in tasks involved in balancing internal accounts by using actual cash figures to make sure that payments are collected efficiently from customers. This payment processing tool enables you to quickly verify and post individual or lump-sum payments, process discounted payments, and find specific unpaid documents for which payment is made.

Payments for different customers that have different payment dates must be posted as individual payments. Payments for the same customer that have the same payment date can be posted as a lump-sum payment. This is useful, for example, when a customer has made a single payment that covers multiple sales invoices.

To set up the payment registration journal

Because you can post different payment types to different balancing accounts, you must select a balancing account on the **Payment Registration Setup** page before you start processing customer payments. If you always post to the same balancing account, you can set that account as the default and avoid this step every time that you open the **Register Customer Payments** page.

1. Choose the  icon, enter **Payment Registration Setup**, and then choose the related link.

Alternatively, on the **Register Customer Payments** page, choose the **Setup** action.

2. Fill in the fields on the **Payment Registration Setup** page. Choose a field to read a short description of the field or link to related information.

To register customer payments individually

1. Choose the  icon, enter **Register Customer Payments**, and then choose the related link.

The **Register Customer Payments** page shows all posted documents for which a payment can be registered. The page can also be opened from the **Customers** and **Customer Card** pages where it is automatically filtered for the specified customer.

2. Select the **Payment Made** check box on the line that represents the posted document for which a payment has been made.

If the **Auto Fill Date Received** check box is selected on the **Payment Registration Setup** page, then the work date is entered in the **Date Received** field.

3. In the **Date Received** field, enter the date when the payment was made. This date may be different from the work date.

4. In the **Amount Received** field, enter the amount that has been paid.

For full payments, this is the same as the amount in the **Remaining Amount** field on the line. For partial payments, this is lower than the amount in the **Remaining Amount** field on the line.

5. Repeat steps 2-4 for other lines that represent posted documents for which payments are made.

6. Choose the **Post Payments** action.

The payment information is posted for documents represented by lines where the **Payment Made** check box is selected.

Payments entries are posted to general ledger, bank, and customer accounts. Each payment is applied to the related posted sales document.

To reconcile lump-sum payments

1. Choose the  icon, enter **Payment Registration**, and then choose the related link.

2. Select the **Payment Made** check box on the lines that represent posted documents for the same customer for which a lump-sum payment has been made.

NOTE

The customer in the **Name** field must be the same on all lines that will be posted as a lump-sum payment.

If the **Auto Fill Date Received** check box is selected on the **Payment Registration Setup** page, then the work date is filled in the **Date Received** field.

3. In the **Date Received** field, enter the date when the payment was made. This date may be different from the work date.

NOTE

This date must be the same on all lines that will be posted as a lump-sum payment.

4. In the **Amount Received** field, enter amounts on multiple lines that sum up to the lump payment amount.

TIP

Try to post as many full payments as possible with the lump-sum amount. Enter amounts that are the same as the amount in the **Remaining Amount** field on as many lines as possible.

5. Repeat steps 2-4 for other lines that represent posted documents for the same customer for which a lump-sum payment has been made.

6. Choose the **Post As Lump Payment** action. The entered payment information is posted for documents represented by lines where the **Payment Made** check box is selected.

Payment entries are posted to general ledger, bank, and customer accounts. Each payment is applied to the related posted sales document.

If a payment in the bank is not represented by line on the **Payment Registration** page, it may be because the

related document has not yet been posted. In that case, you can use a search function to quickly find the document and post it to process the payment. For more information, see [To find a specific sales document that is not fully invoiced](#).

If a payment in the bank is not represented by any document in Business Central, then you can open a prefilled general journal from the **Payment Registration** page to post the payment directly to the balancing account without applying the payment to a document. Alternatively, you may want to record the payment in the journal until the origin of the payment has been resolved. For more information, see [To record or post a payment without a related document](#).

To process customer payments with discounts manually

If you have agreed on a payment discount with your customer, then the payment amounts can be lower than the invoice amounts if payment occurs before the agreed discount date.

The following procedures explain four different ways to post discounted payments on the **Payment Registration** page.

- The payment amount is equal to the remaining discounted amount, and the payment date is before the discount date. You post the payment as is.
- The payment amount is equal to the remaining discounted amount, but the payment date is after the discount date. You post the payment as partial. The document remains open to collect/pay the remaining amount. Alternatively, you set the discount date later to allow the payment in full.
- The payment amount is lower than the remaining discounted amount. You post the payment as partial. The document remains open to collect/pay the remaining amount.
- The payment amount is more than the remaining discounted amount. You post the payments as is. Only the remaining amount is posted. The additional amount is credited to the customer.

To process a payment amount that is equal to the discounted amount and where the payment date is before the discount date

1. Choose the  icon, enter **Payment Registration**, and then choose the related link.
2. Enter the payment amount in the **Amount Received** field. The amount is equal to the amount in the **Rem. Amt. after Discount** field.

The **Payment Made** check box is automatically selected, and the **Date Received** field is filled with the work date.

3. In the **Date Received** field, enter the payment date. The date is before the date in the **Pmt. Discount Date** field.
4. Verify that the **Remaining Amount** field contains zero (0).
5. Choose the **Post Payments** action to post the full payment to general ledger, bank, and customer accounts.

To process a payment amount that is equal to the discounted amount but where the payment date is after the discount date

1. Choose the  icon, enter **Payment Registration**, and then choose the related link.
2. Enter the payment amount in the **Amount Received** field. The amount is equal to the amount in the **Rem. Amt. after Discount** field.

The **Payment Made** check box is automatically selected, and the **Date Received** field is filled with the work date.

3. In the **Date Received** field, enter a payment date that is after the date in the **Pmt. Discount Date** field. Date fields change to red font, and an error message is shown at the bottom of the page.

TIP

If you want to make an exception and grant the discount even though the payment is late, follow these steps:

4. Choose the **Details** action.
5. On the **Payment Registration Details** page, in the **Pmt. Discount Date** field on the **Payment Discount** FastTab, enter a date that is after the date in the **Date Received** field on the **Payment Registration** page.
The error message and the red font disappear, and you can proceed to process the discounted payment.
6. Verify that the **Remaining Amount** field contains the amount that remains to pay the full invoice amount.
7. Choose the **Post Payments** action to post the partial payment to general ledger, bank, and customer accounts.

The related document remains open.

To process a payment that is lower than the remaining discounted amount

1. Choose the  icon, enter **Payment Registration**, and then choose the related link.
2. Enter the payment amount in the **Amount Received** field. The amount is lower than the amount in the **Rem. Amt. after Discount** field.

The **Payment Made** check box is automatically selected, and the **Date Received** field is filled with the work date.

3. In the **Date Received** field, enter the payment date. The date is before the date in the **Pmt. Discount Date** field.
4. Verify that the **Remaining Amount** field contains the amount that remains to pay the discounted amount.
5. Choose the **Post Payments** action to post the partial payment to general ledger, bank, and customer accounts.

The related document remains open.

To process a payment that is more than the remaining discounted amount

1. Choose the  icon, enter **Payment Registration**, and then choose the related link.
2. Enter the payment amount in the **Amount Received** field. The amount is more than the amount in the **Rem. Amt. after Discount** field.

The **Payment Made** check box is automatically selected, and the **Date Received** field is filled with the work date.

3. In the **Date Received** field, enter the payment date. The date is before the date in the **Pmt. Discount Date** field.
4. Verify that the **Remaining Amount** field contains zero (0).
5. Choose the **Post Payments** action to post the full payment to general ledger, bank, and customer accounts.

The related document is closed, and the customer is credited the excess payment amount.

To find a specific sales document that is not fully invoiced

The **Payment Registration** page supports you in tasks needed to balance internal accounts with actual cash figures to ensure effective collection from customers. It shows outstanding incoming payments as lines that

represent sales documents where an amount is due for payment.

Typically, when a payment has been made, recorded in the bank or otherwise, the related sales or purchase document is represented as a line on the **Payment Registration** page because the document in question is waiting for the payment to be posted against the outstanding amount. However, sometimes a payment that has been made is not represented by a line on the **Payment Registration** page, typically because the document in question has not been fully invoice posted.

On the **Document Search** page, you can search among documents that are not fully invoiced. You can search based on one or more of the following criteria:

- Document number
- Amount or amount range

The following procedure explains how to find a specific document by using both search criteria.

1. Choose the  icon, enter **Payment Registration**, and then choose the related link.
2. With the pointer on any line, Choose the **Search Documents** action.
3. On the **Document Search** page, enter a search value in the **Document No.** field.

NOTE

The value that you enter in this field is enclosed in hidden wildcard characters. This means that the function searches for all document numbers that contain the entered value.

4. In the **Amount** field, enter the specific amount that exists on the document that you want to find.
5. In the **Amount Tolerance %** field, enter a percentage value to define the range of amounts that you want to search to find the open document.

If you enter 10, then the function will search for amounts in a range between ten percent lower and ten percent higher than the value in the **Amount** field.

6. Choose the **Search** action.

The Search function searches among documents that are not fully invoiced based on the specified criteria.

If one or more documents match the criteria, then the **Document Search Result** page opens to display lines that represent those documents. Each line contains a document number, description, and amount so that you can easily find a specific document, for example based on information on your bank statement.

If a payment in the bank is not represented by any document in Business Central, then you can open a prefilled general journal from the **Payment Registration** page to post the payment directly to the balancing account without applying the payment to a document. Alternatively, you may want to record the payment in the journal until the origin of the payment has been resolved.

To record or post a payment without a related document

If a payment in the bank is not represented by any document in Business Central, then you can open a prefilled general journal line from the **Payment Registration** page to post the payment directly to the balancing account without applying the payment to a document. Alternatively, you may want to record the payment in the journal until the origin of the payment has been clarified.

1. Choose the  icon, enter **Payment Registration**, and then choose the related link.

Proceed to record an undocumented payment.

2. Choose the **General Journal** action.

The **General Journal** page opens with one line prefilled with the balancing account of the journal batch that is set up on the **Payment Registration Setup** page.

3. Fill in the remaining fields on the general journal line, such as the amount and the customer number or other information from the bank statement. For more information, see [Post Transactions Directly to the General Ledger](#).

You can either post the journal line to update the total on the balancing account. Alternatively, you can leave the journal line unposted, and perhaps append it with a note that the payment needs more analysis.

If you leave the journal line unposted, it will add to the value in the **Unposted Balance** field at the bottom of the **Payment Registration** page.

Reconcile Customer Payments with the Cash Receipt Journal or from Customer Ledger Entries

3/31/2019 • 9 minutes to read

When you receive a cash receipt from a customer, or you make a cash refund, you must decide whether to apply the payment or refund to close one or more open debit or credit entries. You can specify the amount you want to apply. For example, you can apply partial payments to customer ledger entries. Closing customer ledger entries makes sure that information such as customer statistics, account statements, and finance charges are correct.

TIP

On the **Customer Ledger Entries** page, red font means that the related payment is past its due date. If overdue payments are becoming a problem, we can help you reduce their frequency. You can enable the **Late Payment Predictions** extension, which uses a predictive model that we built in Azure Machine Learning to predict the timing of payments. These predictions help you reduce outstanding receivables and fine-tune your collections strategy. For example, if a payment is predicted to be late, you can adjust the terms of payment or the payment method for the customer. For more information, see [Late Payment Predictions](#).

You can apply customer ledger entries in several ways:

- By entering information on dedicated pages:
 - The **Payment Reconciliation Journal** page. For more information, see [Applying Payments Automatically and Reconciling Bank Accounts](#).
 - The **Payment Registration** page. For more information, see [Reconcile Customer Payments from a List of Unpaid Sales Documents](#).
 - The **Cash Receipt Journal**. This is described below.
- By filling in the **Applies-to Doc. No.** field on sales credit memo documents. This is described below.
- By using the **Set Applies-to ID** action on a customer ledger entry. This is described below.

NOTE

If the **Application Method** field on the customer card contains **Apply to Oldest**, payments are applied to the oldest open credit entry, unless you manually specify an entry. If the application method is **Manual**, you always apply entries manually.

To fill and post a cash receipt journal

A cash receipt journal is a type of general journal, so you can use it to post transactions to general ledger, bank, customer, vendor, and fixed assets accounts. You can apply the payment to one or more debit entries when you post the payment, or you can apply from the posted entries later.

1. Choose the  icon, enter **Cash Receipt Journal**, and then choose the related link.
2. Choose the **Edit Journal** action.
3. Select the relevant batch in the **Batch Name** field.
4. Fill in the **Posting Date** field.
5. In the **Document Type** field, select **Payment**.

The **Document No.** field is filled by the number series assigned to the batch.

6. Use the **External Document No.** field to store an identifier, such as the customer's check number.
7. In the **Account Type** field, select **Customer**.
8. In the **Account No.** field, select the relevant G/L account.
9. If you want to post the application at the same time as you post the journal, do one of the following.
10. In the **Balancing Account Type** field, select **G/L Account** for cash payments, and **Bank Account** for other payments.
11. In the **Balancing Account No.** field, select the cash account for cash payments, or the relevant bank account for other payments.
12. Post the journal.

To apply a payment to a single customer ledger entry

1. Choose the  icon, enter **Cash Receipt Journal** and choose the related link.
2. Choose the **Edit Journal** action.
3. On the first journal line, enter the relevant information about the entry to be applied.
4. In the **Document Type** field, enter **Payment**.
5. In the **Account Type** field, enter **Customer**.
6. In the **Bal. Account Type** field, enter **Bank Account**.
7. In the **Applies-to Doc. No.** field, choose the field to open the **Apply Customer Entries** page.
8. On the **Apply Customer Entries** page, select the entry to apply the payment to.
9. In the **Amount to Apply** field, enter the amount you want to apply to the entry. If you do not enter an amount, the maximum amount is applied.

At the bottom of the **Apply Customer Entries** page, you can see the specific amount in the **Applied Amount** field and also whether the application balances.

10. Choose the **OK** button. The **Cash Receipt Journal** page now shows the entry you have selected entered in the **Applies-to Doc. Type** and **Applies-to Doc. No.** fields.
11. Post the cash receipt journal.

To apply a payment to multiple customer ledger entries

1. Choose the  icon, enter **Cash Receipt Journal**, and then choose the related link.
2. Choose the **Edit Journal** action.
3. On the first journal line, enter the relevant information about the entry to be applied.
4. In the **Document Type** field, enter **Payment**.
5. In the **Account Type** field, enter **Customer**.
6. In the **Bal. Account Type** field, enter **Bank Account**.
7. In the **Amount** field, enter the full payment as a negative amount.

8. To apply the payment to multiple customer ledger entries when posting, choose the **Apply Entries** action.
9. Select the lines with the entries that you want the applying entry to be applied to, and then choose the **Set Applies-to ID** action.
10. On each line, in the **Amount to Apply** field, enter the amount you want to apply to the individual entry. If you do not enter an amount, the maximum amount is applied.

At the bottom of the **Apply Customer Entries** page, you can see the specific amount in the **Applied Amount** field and also whether the application balances.

11. Choose the **OK** button.
12. Post the cash receipt journal.

To apply a credit memo to a single customer ledger entry

1. Choose the  icon, enter **Sales Credit Memos**, and then choose the related link.
2. Open the relevant sales credit memo.
3. To apply the credit memo to a single customer ledger entry when posting, in the **Applies-to Doc. No.** field, select the entry to which you want to apply the payment.
4. On the line in the **Amount to Apply** field, enter the amount you want to apply to the entry.

If you do not enter an amount, the program automatically applies the maximum amount. At the bottom of the **Apply Customer Entries** page, you can see the specific amount in the **Applied Amount** field and also whether the application balances.

5. Choose the **OK** button. The **Sales Credit Memo** page now shows the entry you have selected entered in the **Applies-to Doc. Type** and **Applies-to Doc. No.** fields. And the amount of the credit memo to be posted, adjusted for any possible payment discounts.
6. Post the credit memo.

To apply a credit memo to multiple customer ledger entries

1. Choose the  icon, enter **Sales Credit Memos**, and then choose the related link.
2. Open the relevant sales credit memo.
3. To apply the credit memo to multiple customer ledger entries when posting, choose the **Apply Entries** action.
4. Select the lines with the entries that you want the applying entry to be applied to, and then choose the **Set Applies-to ID** action.
5. On each line, in the **Amount to Apply** field, enter the amount you want to apply to the individual entry. If you do not enter an amount, the maximum amount is applied.

At the bottom of the **Apply Customer Entries** page, you can see the specific amount in the **Applied Amount** field and also whether the application balances.

6. Choose the **OK** button. The **Sales Credit Memo** page now shows the amount of the credit memo to be posted, adjusted for any possible payment discounts.
7. Post the credit memo.

To apply posted customer ledger entries

1. Choose the  icon, enter **Customers**, and then choose the related link.
2. Open the customer card for the customer with entries that you want to apply.
3. Choose the **Ledger Entries** action, and then select the line with the entry that will be the applying entry.
4. Choose the **Apply Entries** action. The **Apply Customer Entries** page opens showing the open entries for the customer.
5. Select the lines with the entries that you want the applying entry to be applied to, and then choose the **Set Applies-to ID** action.
6. For each line in the **Amount to Apply** field, enter the amount you want to apply to the individual entry. If you do not enter an amount, the maximum amount is applied.

At the bottom of the **Apply Customer Entries** page, you can see the specific amount in the **Applied Amount** field.

7. Choose the **Post Application** action. The **Post Application** page appears with the document number of the applying entry and the posting date of the entry with the most recent posting date.
8. Choose the **OK** button to post the application.

If the posted application has resulted in closed customer ledger entries, the **Open** field is cleared for these ledger entries.

9. To see the ledger entries, choose the  icon, enter **Customers**, and then choose the related link. Browse to the card for the relevant customer to see the ledger entries.

On the ledger entry list, on the line that contains the ledger entry that was fully applied to, you can see that the **Open** check box is not selected.

NOTE

After you select an entry on the **Apply Customer Entries** page, or several entries by setting the **Applies-to ID**, the **Applied Amount** field on the journal line will contain the sum of the remaining amounts for the posted entries you have selected, unless the field contains something already. If you select **Apply to Oldest** in the **Application Method** field on the customer card, the application occurs automatically.

To apply customer ledger entries in different currencies to one another

If you sell to a customer in one currency and receive payment in another currency, you can still apply the invoice to the payment.

If you apply an entry (Entry 1) in one currency to an entry (Entry 2) in a different currency, the posting date on Entry 1 is used to find the relevant exchange rate to convert amounts on Entry 2. The relevant exchange rate is found on the **Currency Exchange Rates** page.

Applying customer ledger entries in different currencies must be enabled. For more information, see [Enable Application of Ledger Entries in Different Currencies](#).

1. Choose the  icon, enter **Cash Receipts Journal**, and then choose the related link.
2. Open the journal you want, and fill in the first empty journal line using a currency code.
3. Choose the **Apply Entries** action.
4. Select the line with the entry you want to apply to the entry in the cash receipt journal, choose the **Set Applies-to ID** action, and then select the entry you want to apply to.
5. Choose the **OK** button to return to the cash receipt journal.

6. Post the sales journal.

IMPORTANT

When you apply entries in different currencies, the entries are converted to USD. Although the exchange rates for the two currencies are fixed, for example between USD and EUR, there may be a small residual amount when they are converted to USD. These small residual amounts are posted as gains and losses to the account specified in the **Realized Gains Account** or **Realized Losses Account** fields on the **Currencies** page. The **Amount (USD)** field is also adjusted on the vendor ledger entries.

To correct an application of customer entries

When you correct an application, correcting entries that are identical to the original entry but with opposite sign in the amount field are created and posted for all entries, including all general ledger posting derived from the application, such as payment discount and currency gains/losses. The entries that were closed by the application are reopened.

1. Choose the  icon, enter **Customers**, and then choose the related link.
2. Open the relevant customer card.
3. Choose the **Ledger Entries** action.
4. Select the relevant ledger entry, and then choose the **Unapply Entries** action.
5. Alternatively, choose the **Detailed Ledger Entry** action.
6. Select the application entry, and then choose the **Unapply Entries** action.
7. Fill in the fields in the header, and then choose the **Unapply** action.

IMPORTANT

If an entry has been applied by more than one application entry, you must unapply the latest application entry first.

Reconcile Vendor Payments with the Payment Journal or from Vendor Ledger Entries

3/31/2019 • 6 minutes to read

When you send a payment or receive a refund from a vendor, you must decide whether to apply the payment or refund to one or more open entries. You can specify the exact amount that you want to apply to the payment receipt or refund, and then only partially apply vendor ledger entries. You must apply all vendor ledger entries to obtain correct vendor statistics and reports of the account statements and finance charges.

NOTE

Vendors may sometimes give a payment refund instead of a credit memo to offset against future invoices, especially when you return items that you have already paid for or when you have overpaid an invoice.

You can apply vendor ledger entries in three different ways:

- By entering information in dedicated pages, such as the **Payment Journal** page and the **Payment Reconciliation Journal** page.
- From purchase credit memo documents.
- From vendor ledger entries after purchase documents are posted but not applied.

NOTE

If the **Application Method** field on the vendor card contains **Apply to Oldest**, then payments will automatically be applied to the oldest open credit entry if you do not manually specify which entry to apply to. If the application method for a customer is **Manual**, then you must apply entries manually.

You can apply vendor payments manually to their related purchase documents when you post the payments on the **Payment Journal** page. For information about filling the payment journal, see [Making Payments](#).

You can also apply vendor payments, and customer payments, after the payments appear as negative bank transactions in your bank. On the **Payment Reconciliation Journal** page, you can use functions for bank statement import, automatic application, and bank account reconciliation. For more information, see [Reconcile Payments Using Automatic Application](#).

To apply a payment to a single or multiple vendor ledger entries

1. Choose the  icon, enter **Payment Journal**, and then choose the related link.
2. On the **Payment Journal** page, on the first journal line, enter the relevant information about the payment entry.
3. To apply a single vendor ledger entry:
 - a. In the **Applies-to Doc. No.** field, choose the field to open the **Apply Vendor Entries** page.
 - b. On the **Apply Vendor Entries** page, select the entry to apply the payment to.
 - c. On the line in the **Amount to Apply** field, enter the amount to apply to the entry.
4. Or, to apply multiple vendor ledger entries:
 - a. Choose the **Apply Entries** action.

- b. On the **Apply Vendor Entries** page, select the lines with the entries to apply the payment to.
- c. Choose the **Set Applies-to ID** action.
- d. On each line in the **Amount to Apply** field, enter the amount to apply to the individual entry.

If you do not enter an amount, then the maximum amount is automatically applied. At the bottom of the **Apply Vendor Entries** page, you can see the amount in the Applied Amount field, and you can see whether the application balances.

5. Choose the **OK** button.
6. Choose the **Post** action to post the payment journal.

To apply a credit memo to a single or multiple vendor ledger entries

1. Choose the  icon, enter **Purchase Credit Memo**, and then choose the related link.
2. Open the credit memo that you want to apply.
3. Enter the relevant information in the header.
4. To apply a single vendor ledger entry, on the **Application** FastTab, in the **Applies-to Doc. No.** field, select the entry to apply the credit to, and then, in the **Amount to Apply** field, enter the amount to apply to the entry.
5. Or, to apply multiple vendor ledger entries:
 - a. Choose the **Apply Entries** action.
 - b. Select the lines with the entries to apply the credit memo to.
 - c. Choose the **Set Applies-to ID** action.
 - d. On each line in the **Amount to Apply** field, enter the amount to apply to the individual entry.

If you do not enter an amount, then the maximum amount is automatically applied. At the bottom of the **Apply Vendor Entries** page, you can see the amount in the **Applied Amount** field, and you can see whether the application balances.

6. Choose the **OK** button.

The **Purchase Credit Memo** page shows the entry that you have selected in the **Applies-to Doc. Type** field and the **Applies-to Doc. No.** field. The page also shows the amount of the credit memo to be posted, adjusted for any payment discounts.
7. Choose the **Post** button to post the purchase credit memo.

To apply posted vendor ledger entries

1. Choose the  icon, enter **Vendors**, and then choose the related link.
2. Open the relevant vendor with entries that have already been posted.
3. Choose the **Ledger Entries** action, and then choose the **Apply Entries** action.
4. On the **Apply Vendor Entries** page, you can see the open entries for the vendor.
5. Select the line with the entry that will be applied.
6. Choose the **Set Applies-to ID** action.

The **Applies-to ID** field displays three asterisks if you work in a single-user system or your user ID if you

work in a multiuser system.

7. For each line in the **Amount to Apply** field, enter the amount to apply to the individual entry.

If you do not enter an amount, then the maximum amount is automatically applied. You can see the amount in the **Applied Amount** field at the bottom of the **Apply Vendor Entries** page.

8. Choose the **Post Application** action.

The **Post Application** page opens with the document number of the applying entry and the posting date of the entry with the most recent posting date.

9. Choose the **OK** button to post the application.

To apply vendor ledger entries in different currencies to one another

If you buy from a vendor in one currency and make payment in another currency, you can still apply the invoice to the payment.

If you apply an entry (Entry 1) in one currency to an entry (Entry 2) in a different currency, the posting date on Entry 1 is used to find the relevant exchange rate to convert amounts on Entry 2. The relevant exchange rate is found on the **Currency Exchange Rates** page. In that case, you must enable application of vendor ledger entries in different currencies. For more information, see [Enable Application of Ledger Entries in Different Currencies](#)

1. Choose the  icon, enter **Payment Journal**, and then choose the related link.
2. Open the journal you want, and fill in the first empty journal line using a currency code.
3. Choose the **Apply Entries** action.
4. Select the line with the entry you want to apply to the entry in the payment journal, choose the **Set Applies-to ID** action, and then select the entry you want to apply to.
5. Choose the **OK** button to return to the payment journal.
6. Post the payment journal.

IMPORTANT

When you apply entries in different currencies to one another, the entries are converted to USD. Even though the exchange rates for the two relevant currencies are fixed, for example between USD and EUR, there may be a small residual amount when these foreign-currency amounts are converted to USD. These small residual amounts are posted as gains and losses to the account specified in the **Realized Gains Account** or **Realized Losses Account** field on the **Currencies** page. The **Amount (USD)** field is also adjusted on the relevant vendor ledger entries.

To unapply an application of vendor entries

When you unapply an erroneous application, correcting entries that are identical to the original entry but with opposite sign in the amount field are created and posted for all entries, including all general ledger posting derived from the application, such as payment discount and currency gains/losses. The entries that were closed by the application are reopened.

1. Choose the  icon, enter **Vendors**, and then choose the related link.
2. Open the relevant vendor card.
3. Choose the **Ledger Entries** action.
4. Select the relevant ledger entry, and then choose the **Unapply Entries** action.
5. Alternatively, choose the **Detailed Ledger Entry** action.
6. Select the application entry, and then choose the **Unapply Entries** action.
7. Fill in the fields in the header, and then choose the **Unapply** action.

IMPORTANT

If an entry has been applied by more than one application entry, you must unapply the latest application entry first.

Collect Outstanding Balances

3/31/2019 • 15 minutes to read

Managing receivables includes checking whether amounts due are paid on time. If customers have overdue payments, you can begin by sending the Customer Statement report as a reminder. Alternatively, you can issue reminders.

You can use reminders to remind customers about overdue amounts. You can also use reminders to calculate finance charges, such as interest or fees and include them on the reminder. Use finance charge memos if you want to debit customers for interest or fees without reminding them of overdue amounts.

Reminders

Before you can create reminders, you must set up reminder terms and assign them to your customers. Each reminder term has predefined reminder levels. Each reminder level includes rules about when the reminder will be issued, for example, how many days after the invoice due date or the date of the previous reminder. The contents of the **Finance Charge Terms** page determines whether interest is calculated on the reminder.

You can periodically run the **Create Reminders** batch job to create reminders for all customers with overdue balances, or you can manually create a reminder for a specific customer and have the lines calculated and filled in automatically.

After you create the reminders, you can modify them. The text that appears at the beginning and end of a reminder is determined by the reminder level terms, and can be seen in the **Description** column. If a calculated amount has been inserted automatically in the beginning or ending text, the text will not be adjusted if you delete lines. Then you must use the **Update Reminder Text** function.

A customer ledger entry with the **On Hold** field filled in will not prompt the creation of a reminder. However, if a reminder is created on the basis of another entry, an overdue entry marked on hold will also be included on the reminder. Interest is not calculated on lines with these entries.

After you have created reminders and made any needed modifications, you can either print test reports or issue the reminders, typically as email.

Finance Charges

When a customer does not pay by the due date, you can have finance charges calculated automatically and add them to the overdue amounts on the customer's account. You can inform customers of the added charges by sending finance charge memos.

NOTE

You use finance charge memos to calculate interest and finance charges and to inform your customers about interest and finance charges without reminding them of overdue payments. Alternatively, you can calculate interest on overdue payments when you create reminders.

You can manually create a finance charge memo for an individual customer, and fill in the lines automatically. Alternatively, you can use the **Create Finance Charge Memos** function job to create finance charge memos for all or selected customers with overdue balances.

After you create the finance charge memos, you can modify them. The text that appears at the beginning and end

of the finance charge memo is determined by the finance charge terms, and can be seen in the **Description** column on the lines. If a calculated amount has been inserted automatically in the beginning or ending text, the text will not be adjusted if you delete lines. Then you must use the **Update Finance Charge Text** function.

After you have created finance charge memos and made any needed modifications, you can either print test reports or issue the finance charge memos, typically as email.

Multiple Interest rates

When you set up finance charge terms and reminder terms, for delayed payment penalty, you can specify multiple interest rates so that the penalty fee is calculated from different interest rates in different periods. If multiple interest rates are not set up, then the interest rate and period that is defined in the **Finance Charge Terms** and **Reminder Terms** pages for the whole period of calculation will be used. For more information, see [Set Up Multiple Interest Rates](#).

To send the Customer Statement report

1. Choose the  icon, enter **Customer Statement**, and then choose the related link.
2. Fill in the fields as necessary. Hover over a field to read a short description.
3. Under **Output Options**, select how to send the report to the customer.

NOTE

If you are using multiple currencies, the Customer Statement report is always printed in the customer's currency. The last date in a statement period is also used as the statement date and the aging date, if aging is included.

To set up reminder terms

If customers have overdue payments, you must decide when and how to send them a reminder. In addition, you may want to debit their accounts for interest or fees. You can set up any number of reminder terms. For each reminder terms code, you can define an unlimited number of reminder levels.

1. Choose the  icon, enter **Reminder Terms**, and then choose the related link.
2. Fill in the fields as necessary.
3. To use more than one combination of reminder terms, set up a code for each one.

To set up reminder levels

The first time a reminder is created for a customer, the setting from level 1 is used. When the reminder is issued, the level number is registered on the reminder entries that are created and linked to the individual customer ledger entries. If it is necessary to remind the customer again, all reminder entries linked to open customer ledger entries are checked to locate the highest level number. The conditions from the next level number will then be used for the new reminder.

If you create more reminders than you have defined levels for, the conditions for the highest level will be used. You can create as many reminders as are allowed by the **Max. No of Reminders** field in the reminder terms.

1. Choose the  icon, enter **Reminder Terms**, and then choose the related link.
2. On the **Reminder Terms** page, select the line with the terms you want to set up levels for, and then choose **Levels** action.
3. Fill in the fields as necessary.

For each reminder level, you can specify individual conditions, which can include additional fees in both

LCY and in foreign currency. You can define many additional fees in foreign currencies for each code on the **Reminder Levels** page.

4. Choose the **Currencies** action.
5. On the **Currencies for Reminder Levels** page, define for each reminder level code and corresponding reminder level number a currency code and an additional fee.

NOTE

When you create reminders in a foreign currency, the foreign currency conditions that you set up here will be used to create reminders. If there are no foreign currency reminder conditions set up, the LCY reminder conditions that are set up on the **Reminder Levels** page will be used and then converted to the relevant currency.

For each reminder level, you can specify text that will be printed before (**Beginning Text**) or after (**Ending Text**) on the entries on the reminder.

6. Choose the **Beginning Text** or **Ending Text** actions respectively, and fill on the **Reminder Text** page.
7. To automatically insert related values in the resulting reminder text, enter the following placeholders in the **Text** field .

PLACEHOLDER	VALUE
%1	Content of the Document Date field on the reminder header
%2	Content of the Due Date field on the reminder header
%3	Content of the Interest Rate field on the related finance charge terms
%4	Content of the Remaining Amount field on the reminder header
%5	Content of the Interest Amount field on the reminder header
%6	Content of the Additional Fee field on the reminder header
%7	The total amount of the reminder
%8	Content of the Reminder Level field on the reminder header
%9	Content of the Currency Code field on the reminder header
%10	Content of the Posting Date field on the reminder header
%11	The company name
%12	Content of the Add. Fee per Line field on the reminder header

For example, if you write **You owe %9 %7 due on %2.**, then the resulting reminder will contain the following text: **You owe USD 1.200,50 due on 02-02-2014.**

NOTE

The due date is calculated according to the date formula that you enter. For more information, see [Using Date Formulas](#).

After you have set up the reminder terms, with additional levels and text, enter one of the codes on each of the customer cards. For more information, see [Register New Customers](#).

To create a reminder automatically

A reminder is similar to an invoice. When you create a reminder, a reminder header as well as one or more reminder lines must be filled in. You can use a function to create reminders for all customers automatically.

1. Choose the  icon, enter **Reminders**, and then choose the related link.
2. On the **Reminder** page, choose the **Create Reminders** action.
3. On the **Create Reminders** page, fill in the fields to define how and to whom the reminders are created.
4. Choose the **OK** button.

To create a reminder manually

On the **Reminder** page, you can fill in the **General** FastTab manually and then have the lines filled in automatically.

1. Choose the  icon, enter **Reminders**, and then choose the related link.
2. Choose the **New** action.
3. On the **General** FastTab, fill in the fields as necessary.
4. Choose the **Suggest Reminder Lines** action.
5. In the **Suggest Reminder Lines** batch job, fill in the fields to define how and to whom the reminders are created.
6. Select the **Include Entries On Hold** check box if you want the reminders to contain overdue open entries that are on hold.

IMPORTANT

Open entries that are on hold will be inserted, irrespective of the setting in the Only Entries with Overdue Amounts check box.

7. Choose the **OK** button.

To replace reminder texts

There are several ways you can determine the text that appears on the printed reminder. In some cases, you may want to replace the beginning and ending texts that have been defined for the current level with those from a different level.

1. Choose the  icon, enter **Reminders**, and then choose the related link.
2. Open the relevant reminder, and then choose the **Update Reminder Text** action.
3. On the **Update Reminder Text** page, enter the required level in the **Reminder Level** field.
4. Choose the **OK** button to update the beginning and ending texts.

To issue a reminder

After you have created reminders and made any needed modifications, you can either print test reports or issue the reminders.

When you issue a reminder, the data is transferred to a separate page for issued reminders. At the same time, reminder entries are posted. If interest or an additional fee has been calculated, entries are posted to the customer ledger and the general ledger.

When a reminder is issued, the entries are posted according to your specifications on the **Reminder Terms** page. This specification determines whether interest and/or additional fees are posted to the customer's account and the general ledger. Setup on the **Customer Posting Groups** page determines which accounts are posted to.

For each customer ledger entry on the finance charge memo, an entry is created on the **Reminder/Fin. Charge Entries** page.

If the **Post Interest** or the **Post Additional Fee** check boxes are selected on the **Reminder Terms** page, then the following entries are also created:

- One entry on the **Cust. Ledger Entries** page
- One receivables entry in the relevant G/L account
- One interest and/or one additional fee entry in the relevant G/L account

In addition, issuing the reminder may result in VAT entries.

1. Choose the  icon, enter **Reminders**, and then choose the related link.
2. Select the relevant reminder, and then choose the **Issue** action.
3. On the **Issue Reminders** page, fill in the fields as necessary.
4. Choose the **OK** button

The reminder is either printed for sent to an specified email as a PDF attachment.

To set up finance charge terms

You must set up a code representing each finance charge calculation. Then you can enter this code in the **Fin. Charge Terms Code** field on customer or vendor cards.

Finance charges can be calculated using either the average daily balance method or the balance due method.

- Balance due method

The finance charge is simply a percentage of the overdue amount:

$$\text{Balance Due method - Finance Charge} = \text{Overdue Amount} \times (\text{Interest Rate} / 100)$$

- Average daily balance method

The number of days the payment is overdue is taken into account:

$$\text{Average Daily Balance method - Finance Charge} = \text{Overdue Amount} \times (\text{Days Overdue} / \text{Interest Period}) \times (\text{Interest Rate}/100)$$

In addition, each code in the Finance Charge Terms table is linked to a subtable, the Finance Charge Text table. For each set of finance charge terms, you can define a beginning and/or an ending text to be included on the finance charge memo.

1. Choose the  icon, enter **Finance Charge Terms**, and then choose the related link.
2. Fill in the fields as necessary.
3. To use more than one combination of finance charge terms, set up a code for each one.

For each finance charge term, you can specify individual conditions, which can include additional fees in both LCY and in foreign currency. You can define many additional fees in foreign currencies for each code on the **Finance Charge Terms** page.

4. Choose the **Currencies** action.
5. On the **Currencies for Fin. Chrg. Terms** page, define for each term a currency code and an additional fee.

NOTE

When you create finance charges in a foreign currency, the foreign currency conditions that you set up here will be used to create finance charge memos. If there are no foreign currency finance charge conditions set up, then the LCY finance charge conditions that are set up on the **Finance Charge Terms** page will be used and then converted to the relevant currency.

For each finance charge term, you can specify text that will be printed before (**Beginning Text**) or after (**Ending Text**) on the entries on the finance charge memo.

6. Choose the **Beginning Text** or **Ending Text** actions respectively, and fill on the **Finance Charge Text** page.
7. To automatically insert related values in the resulting finance charge text, enter the following placeholders in the **Text** field.

PLACEHOLDER	VALUE
%1	Content of the Document Date field on the finance charge memo header
%2	Content of the Due Date field on the finance charge memo header
%3	Content of the Interest Rate field on the related finance charge terms
%4	Content of the Remaining Amount field on the finance charge memo header
%5	Content of the Interest Amount field on the finance charge memo header
%6	Content of the Additional Fee field on the finance charge memo header
%7	The total amount of the reminder
%8	Content of the Currency Code field on the finance charge memo header
%9	Content of the Posting Date field on the finance charge memo header

To create a finance charge memo manually

A finance charge memo is similar to an invoice. You can fill in a header manually and have the lines filled in for you, or you can create finance charge memos for all customers automatically.

1. Choose the  icon, enter **Finance Charge Memos**, and then choose the related link.
2. Choose the **New** action, and then fill in the fields as necessary.
3. Choose **Suggest Fin. Charge Memo Lines** action.
4. On the **Suggest Finance Charge Memo Lines** page, set a filter on the **Cust. Ledger Entry** FastTab if you want to create finance charge memos only for specific entries.
5. Choose the **OK** button to start the batch job.

To update finance charge memo texts

In some cases, you may want to modify the beginning and ending text that you have set up for the finance charge terms. If you do this at a time when you have created, but not yet issued, finance charge memos, you can update the memos with the modified text.

1. Choose the  icon, enter **Finance Charge Memo**, and then choose the related link.
2. open the finance charge memo that you want to change text for, and then choose the **Update Finance Charge Text** action.
3. On the **Update Finance Charge Text** page, you can set a filter if you want to update several memos.
4. Choose the **OK** button to update the beginning and ending texts.

To issue finance charge memos

After you have created finance charge memos and made any needed modifications, you can either print test reports or issue the finance charge memos.

When a reminder is issued, the entries are posted according to your specifications on the **Finance Charge Terms** page. This specification determines whether interest and/or additional fees are posted to the customer's account and the general ledger. Setup on the **Customer Posting Groups** page determines which accounts are posted to.

For each customer ledger entry on the finance charge memo, an entry is created on the **Reminder/Fin. Charge Entries** page.

If the **Post Interest** or the **Post Additional Fee** check boxes are selected on the **Finance Charge Terms** page, then the following entries are also created:

- One entry on the **Cust. Ledger Entries** page
- One receivables entry in the relevant G/L account
- One interest and/or one additional fee entry in the relevant G/L account

In addition, issuing the finance charge memo may result in VAT entries.

1. Choose the  icon, enter **Finance Charge Memos**, and then choose the related link.
2. Select the relevant memo, and then choose the **Issue** action.
3. On the **Issue Finance Charge Memos** page, fill in the fields as necessary.
4. Choose the **OK** button

The finance charge memo is either printed for sent to an specified email as a PDF attachment.

To view reminder and finance charge entries

When you issue a reminder, a reminder entry is created on the **Reminder/Fin. Charge Entries** page for each reminder line that contains a customer ledger entry. You can then get an overview of the created reminder entries for a specific customer.

1. Choose the  icon, enter **Customers**, and then choose the related link.
2. Open the relevant customer card, and then choose the **Ledger Entries** action.
3. On the **Customer Ledger Entries** page, select the line with the ledger entry you want to see the reminder entries for, and then choose the **Reminder/Fin. Charge Entries** action.

Collect Payments with SEPA Direct Debit

3/31/2019 • 9 minutes to read

With your customer's consent, you can collect payments directly from the customer's bank account according to the SEPA format.

First, set up the export format of the bank file that instructs your bank to perform a direct debit. Then, set up the customer's payment method. Last, set up the direct-debit mandate that reflects your agreement with the customer to collect their payments in a certain agreement period.

To instruct the bank to transfer the payment amount from the customer's bank account to your company's account, you create a direct-debit collection entry, which holds information about bank accounts, the affected sales invoices, and the direct-debit mandate. You then export an XML file that is based on the collection entry, which you send to your bank for processing. Any payments that could not be processed will be communicated to you by your bank, and you must then manually reject the direct debit-collection entries in question.

You can set up standard customer sales codes with the direct-debit payment method and mandate information. You can then use the **Create Standard Cust. Invoices** batch job to generate multiple sales invoices with the direct-debit information prefilled. This can be done manually or automatically, according to the payment due date.

When payments are successfully processed, as communicated by your bank, you can post the payment receipts either directly from the **Direct Debit Collect. Entries** page or by moving the payment lines to the journal where you post payment receipts, such as the **Cash Receipt Journal** page. Alternatively, depending on your cash management process, you can wait and just apply the payments as a part of bank reconciliation.

NOTE

To collect payments using SEPA Direct Debit, the currency on the sales invoice must be EURO.

Setting Up SEPA Direct Debit

From the **Direct Debit Collections** page, you can export instructions to your electronic bank to perform a direct debit collection from the customer's bank account to your bank account. Business Central supports the SEPA direct debit format, but in your country/region, other formats for electronic payments may be available.

To enable export of a bank file formats that are not supported out of the box in Business Central, you can set up a data exchange definition by using the data exchange framework. For more information, see [Set Up Data Exchange Definitions](#).

Before you can process customer payments electronically by exporting direct debit instructions in the SEPA Direct Debit format, you must perform the following setup steps:

- Set up the export format of the bank file that instructs your bank to perform a direct debit collection from the customer's bank account to your bank account.
- Set up the customer's payment method.
- Set up the direct-debit mandate that reflects your agreement with the customer to collect their payments in a certain agreement period.

To set up your bank account for SEPA direct debit

1. In the **Search** box, enter **Bank Accounts**, and then choose the related link.

2. Open the bank account that you want to use for direct debit.
3. On the **Transfer** FastTab, in the **SEPA Direct Debit Export Format** field, choose the option for SEPA direct debit.

To set up the customer's payment method for SEPA direct debit

1. In the **Search** box, enter **Payment Methods**, and then choose the related link.
2. Choose the **New** action.
3. Set up a payment method. Fill in the direct debit-specific fields as described in the following table.

FIELD	DESCRIPTION
Direct Debit	Specify if the payment method is for SEPA direct debit collection.
Direct Debit Pmt. Terms Code	Specify the payment terms, such as DON'T PAY, that are displayed on sales invoices that are paid with SEPA direct debit to indicate to the customer that the payment will be collected automatically. Alternatively, leave the field empty.

NOTE

Do not enter a value in the **Bal. Account No.** field.

4. Choose the **OK** button to close the **Payment Methods** page.
5. In the **Search** box, enter **Customers**, and then choose the related link.
6. Open the customer card for the customer that you want to set up for SEPA direct debit collection.
7. Choose the **Payment Method Code** field, and then select the payment method code that you specified in step 3.
8. Repeat steps 6 and 7 for all customers that you want to set up for SEPA direct debit collection.

To set up the direct-debit mandate that represents the customer agreement

1. In the **Search** box, enter **Customers**, and then choose the related link.
2. Open the card for the customer that you want to set up for SEPA direct debits.
3. Choose the **Bank Accounts** action.
4. On the **Customer Bank Account List** page, select the customer bank account that will use direct debits, and then, on the **Home** tab, in the **Process** group, choose **Direct Debit Mandates**.
5. On the **SEPA Direct Debit Mandates** page, fill in the fields as described in the following table.

FIELD	DESCRIPTION
Customer Bank Account Code	Specifies the bank account from which direct-debit payments are collected. This field is filled automatically.
Valid From	Specify the date when the direct-debit mandate starts.
Valid To	Specify the date when the direct-debit mandate ends.

FIELD	DESCRIPTION
Date of Signature	Specify the date when the customer signed the direct-debit mandate.
Sequence Type	Specify if the agreement covers multiple (Recurring) or a single (One Off) direct debit collection.
Expected Number of Debits	Specify how many direct debit collections you expect to make. This field is only relevant if you selected Recurring in the Sequence Type field.
Debit Counter	Specifies how many direct debit collections have been made using this direct-debit mandate. This field is automatically updated.
Blocked	Specify that direct debit collections cannot be made using this direct-debit mandate.

6. Repeat steps 1 through 5 for all customers that you want to set up for SEPA direct debits.

The direct-debit mandate is automatically inserted in the **Direct Debit Mandate ID** field when you create a sales invoice for the customer that you selected in step 2. For more information, see [Create Recurring Sales and Purchase Lines](#).

Creating SEPA Direct Debit Collection Entries and Export to a Bank File

To instruct the bank to transfer the payment amount from the customer's bank account to your company's account, you create a direct-debit collection, which holds information about the customer's bank account, the affected sales invoices, and the direct-debit mandate. From the resulting direct-debit collection entry, you then export an XML file that you send or upload to your electronic bank for processing. Any payments that could not be processed by the bank will be communicated to you by your bank, and you must then manually reject the direct debit-collection entries in question.

NOTE

To collect payments using SEPA Direct Debit, the currency on the sales invoice must be EURO.

To create a direct-debit collection

1. Choose the  icon, enter **Direct Debit Collections**, and then choose the related link.
2. On the **Direct Debit Collections** page, on the **Home** tab, in the **New** group, choose **Create Direct Debit Collection**.
3. On the **Create Direct Debit Collection** page, fill in the fields as described in the following table.

FIELD	DESCRIPTION
From Due Date	Specify the earliest payment due date on sales invoices that you want to create a direct-debit collection for.
To Due Date	Specify the latest payment due date on sales invoices that you want to create a direct-debit collection for.

FIELD	DESCRIPTION
Partner Type	Specify if the direct-debit collection is made for customers of type Company or Person .
Only Customers With Valid Mandate	Specify if a direct-debit collection is created for customers who have a valid direct-debit mandate. Note: A direct-debit collection is created even if the Direct Debit Mandate ID field is not filled on the sales invoice.
Only Invoices With Valid Mandate	Specify if a direct-debit collection is only created for sales invoices if a valid direct-debit mandate is selected in the Direct Debit Mandate ID field on the sales invoice.
Bank Account No.	Specify which of your company's bank accounts the collected payment will be transferred to from the customer's bank account.
Bank Account Name	Specifies the name of the bank account that you select in the Bank Account No. field. This field is filled automatically.

4. Choose the **OK** button.

A direct-debit collection is added to the **Direct Debit Collections** page, and one or more direct-debit collection entries are created.

To export a direct-debit collection entry to a bank file

1. On the **Direct Debit Collections** page, on the **Home** tab, in the **Process** group, choose **Direct Debit Collect. Entries**.
2. On the **Direct Debit Collect. Entries** page, select the entry that you want to export, and then, on the **Home** tab, in the **Process** group, choose **Create Direct Debit File**.
3. Save the export file to the location from where you send or upload it to your electronic bank.

On the **Direct Debit Collect. Entries** page, the **Direct Debit Collection Status** field is changed to File Created. On the **SEPA Direct Debit Mandates** page, the **Debit Counter** field is updated with one count.

If the exported file cannot be processed, for example because the customer is insolvent, you can reject the direct-debit collection entry. If the exported file is successfully processed by the bank, the due payments of the involved sales invoices are automatically collected from the involved customers. In that case you can close the collection.

To reject a direct-debit collection entry

- On the **Direct Debit Collect. Entries** page, select the entry that was not successfully processed, and then, on the **Home** tab, in the **Process** group, choose **Reject Entry**.

The value in the **Status** field on the **Direct Debit Collect. Entries** page is changed to **Rejected**.

To close a direct-debit collection

- On the **Direct Debit Collect. Entries** page, select the entry that was successfully processed, and then, on the **Home** tab, in the **Process** group, choose **Close Collection**.

The related direct-debit collection is closed.

You can now proceed to post receipts of payment for the involved sales invoices. You can do this as you typically

post payment receipts, such as on the **Payment Registration** page, or you can post the related payment receipts directly from the **Direct Debit Collect. Entries** page. For more information, see [Post SEPA Direct Debit Payment Receipts](#).

Posting SEPA Direct Debit Payment Receipts

When a direct debit collection is successfully processed by your bank, you can proceed to post receipt of the payment for the involved sales invoices. For more information, see [Create SEPA Direct Debit Collection Entries and Export to a Bank File](#).

You can post the payment receipt directly from the **Direct Debit Collections** page or the **Direct Debit Collect. Entries** page. Alternatively, you can relay the work to another user by preparing the related journal lines.

To post a direct-debit payment receipt from the Direct Debit Collections page

1. Choose the  icon, enter **Direct Debit Collections**, and then choose the related link.
2. Select a line for a direct debit collection that has been exported to a bank file and successfully processed by the bank. For more information, see [Create SEPA Direct Debit Collection Entries and Export to a Bank File](#).
3. Choose the **Post Payment Receipts** action.
4. On the **Post Direct Debit Collection** page, fill in the fields as described in the following table.

FIELD	DESCRIPTION
Direct Debit Collection No.	Specify the direct debit collection that you want to post payment receipt for.
General Journal Template	Specify which general journal template to use for posting the payment receipt, such as the template for cash receipts.
General Journal Batch Name	Specify which general journal batch to use for posting the payment receipt.
Create Journal Only	Select this check box if you do not want to post the payment receipt when you choose the OK button. The payment receipt will be prepared in the specified journal and will not be posted until someone posts the journal lines in question.

5. Choose the **OK** button.

Block Customers

3/31/2019 • 2 minutes to read

You can block a customer, for example because of insolvency, so that the customer cannot be added to sales documents or so that no transactions can be posted for the customer.

In addition to blocking a customer, you can set receivable transactions for the customer to be on hold in connection with reminders. For more information, see [Collect Outstanding Balances](#).

The following table describes the different blocking options.

OPTION	DESCRIPTION
Blank	Transactions are allowed for this customer.
Ship	New orders and new shipments cannot be created for this customer. Existing shipments not yet invoiced can be invoiced.
Invoice	New orders, new shipments, and new invoices cannot be created for this customer. Existing shipments not yet invoiced cannot be invoiced.
All	No transaction is allowed for this customer, including payments.

To block a customer

1. Choose the  icon, enter **Customers**, and then choose the related link.
2. Select a customer, and then choose the **Edit** action.
3. Fill in the **Blocked** field with one of the options described above.

Use Item Charges to Account for Additional Trade Costs

3/31/2019 • 4 minutes to read

To ensure correct valuation, your inventory items must carry any added costs, such as freight, physical handling, insurance, and transportation that you incur when purchasing or selling the items. For purchases, the landed cost of a purchased item consists of the vendor's purchase price and all additional direct item charges that can be assigned to individual receipts or return shipments. For sales, knowing the cost of shipping sold items can be as vital to your company as knowing the landed cost of purchased items.

In addition to recording the added cost in you inventory value, you can use the Item Charges feature for the following:

- Identify the landed cost of an item for making more accurate decisions on how to optimize the distribution network.
- Break down the unit cost or unit price of an item for analysis purposes.
- include purchase allowances into the unit cost and sales allowances into the unit price.

Before you can assign item charges, you must set up item charge numbers for the different types of item charges, including to which G/L accounts costs related to sales, purchases, and inventory adjustments are posted to. An item charge number contains a combination of general product posting group, tax group code, VAT product posting group, and item charge. When you enter the item charge number on a purchase or sales document, the relevant G/L account is retrieved based on the setup of the item charge number and the information on the document.

For both purchase and sales documents, you can assign an item charge in two ways:

- On the document where the items that the item charge relates to are listed. This you typically do for documents that are not yet fully posted.
- On a separate invoice by linking the item charge to a posted receipt or shipment where the items that the item charge relate to are listed.

NOTE

You can assign item charges to orders, invoices, and credit memos, for both sales and purchases. The following procedures describe how to work with item charges for a purchase invoice. The steps are similar for all other purchase and sales documents.

To set up item charge numbers

You use item charge numbers to distinguish between the different kinds of item charges that are used in your company.

1. Choose the  icon, enter **Item Charges**, and then choose the related link.
2. On the **Item Charges** page, choose the **New** action to create a new line.
3. Fill in the fields as necessary. Hover over a field to read a short description.

To assign an item charge directly to the purchase invoice for the item

If you know the item charge at the time when you post a purchase invoice for the item, follow this procedure.

1. Choose the  icon, enter **Purchase Invoices**, and then choose the related link.
2. Create a new purchase invoice. For more information, see [Record Purchases](#).
3. Make sure the purchase invoice has one or more lines of type Item.
4. On a new line, in the **Type** field, select **Charge (Item)**.
5. In the **Quantity** field, enter the units of the item charge that you have been invoiced for.
6. In the **Direct Unit Cost** field, enter the amount of the item charge.
7. Fill in the remaining fields as necessary. Hover over a field to read a short description.

In the following steps, you will perform the actual assignment. Until the item charge is fully assigned, the value in the **Qty. to Assign** field is in red font.

8. On the **Lines** tab, choose the **Item Charge Assignment** action.

The **Item Charge Assignment** page opens showing one line for each line of type Item on the purchase invoice. To assign the item charge to one or more invoice lines, you can use a function that assigns and distributes it for you or you can manually fill in the **Qty. to Assign** field. The following steps describe how to use the Suggest Item Charge Assignment function.

9. On the **Item Charge Assignment** page, choose the **Suggest Item Charge Assignment** action.
10. If there are more than one invoice lines of type Item, choose one of the four distribution options.

It the item charge is fully assigned, the value in the **Qty. to Assign** field on the purchase invoice is zero.

The item charge is now assigned to the purchase invoice. When you post the receipt of the purchase invoice, the items' inventory values are updated with the cost of the item charge.

To assign an item charge from a separate invoice to the purchase invoice for the item

If you received an invoice for the item charge after you posted the original purchase receipt, follow this procedure.

1. Repeat steps 1 through 8 in [To assign an item charge directly to the purchase invoice for the item](#).
2. On the **Item Charge Assignment** page, choose the **Get Receipt Lines** action.
3. On the **Purch. Receipt Lines** page, select the posted purchase receipt for the item that you want to assign the item charge to, and then choose the **OK** button.
4. Choose the **Suggest Item Charge Assignment** action.

The item charge on the separate purchase invoice is now assigned to the item on the posted purchase receipt, thereby updating the item's inventory value with the cost of the item charge.

Work with Payment Tolerances and Payment Discount Tolerances

6/13/2019 • 13 minutes to read

You can set up a payment tolerance to close an invoice when the payment does not fully cover the amount on the invoice. You can set up a payment discount tolerance to grant a payment discount after the payment discount date has passed.

You can use payment tolerances so that every outstanding amount has a set maximum allowed payment tolerance. If the payment tolerance is met, then the payment amount is analyzed. If the payment amount is an underpayment, then the outstanding amount is fully closed by the underpayment. A detailed ledger entry is posted to the payment entry so that no remaining amount is left on the applied invoice entry. If the payment amount is an overpayment, then a new detailed ledger entry is posted to the payment entry so that no remaining amount is left on the payment entry.

You can use payment discount tolerances so that if you accept a payment discount after the payment discount date, then it is always posted to either the payment discount account or a payment tolerance account.

Applying Payment Tolerance to Multiple Documents

A single document has the same payment tolerance whether it is applied on its own or with other documents. Acceptance of a late payment discount when you are applying payment tolerance to multiple documents automatically occurs for each document where the following rule is true:

payment discount date < payment date on the selected entry <= payment tolerance date

This rule also applies to determine whether to display warnings when you apply payment tolerance to multiple documents. The payment discount tolerance warning is displayed for each entry that meets the date criteria. For more information, see [Example 2 - Tolerance Calculations for Multiple Documents](#).

You can choose to display a warning that is based on different tolerance situations.

- The first warning is for the payment discount tolerance. You are informed that you can accept a late payment discount. You can then choose whether to accept tolerance on the discount date.
- The second warning is for the payment tolerance. You are informed that all entries can be closed because the difference is in the sum of the maximum payment tolerance for the applied entries. You can then choose whether to accept tolerance on the payment amount.

For more information, see [To enable or disable payment tolerance warning](#).

To set up tolerances

Tolerance on days and amounts allows you to close an invoice even though the payment does not fully cover the amount on the invoice, whether this is because the due date for the payment discount has been exceeded, goods have been deducted or because of a minor error. This also applies to refunds and credit memos.

To set up tolerance you have to set up various tolerance accounts, specify both payment discount tolerance and payment tolerance posting methods and then run the **Change Payment Tolerance** batch job.

1. Choose the  icon, enter **General Posting Setup**, and then choose the related link.
2. On the **General Posting Setup** page, set up a debit and a credit sales payment tolerance account and a debit and a credit purchase payment tolerance account.

3. Choose the  icon, enter **Customer Posting Groups**, and then choose the related link.
4. On the **Customer Posting Groups** page, set up a debit and a credit payment tolerance account. For more information, see [Setting Up Posting Groups](#).
5. Choose the  icon, enter **Vendor Posting Setup**, and then choose the related link.
6. On the **Vendor Posting Groups** page, set up a debit and a credit payment tolerance account.
7. Choose the  icon, enter **General Ledger Setup**, and then choose the related link.
8. Open the **General Ledger Setup** page.
9. On the **Application** FastTab, fill in the **Pmt. Disc. Tolerance Posting**, **Payment Discount Grace Period** and **Payment Tolerance Posting** fields.
10. Choose the **Change Payment Tolerance** action.
11. On the **Change Payment Tolerance** page, fill in the **Payment Tolerance %** and **Max Payment Tolerance Amount** fields, and then choose the **OK** button.

IMPORTANT

You have now set up tolerance for local currency only. If you want Business Central to handle tolerance on payments, credit memos, and refunds in a foreign currency, you must run the **Change Payment Tolerance** batch job with a value in the **Currency Code** field.

NOTE

If you want to get a payment tolerance warning every time that you post an application in the tolerance, you must activate the payment tolerance warning. For more information, see [To enable or disable payment tolerance warning](#) section.

To deactivate tolerance for a customer or vendor, you must block tolerances on the relevant customer or vendor card. For more information, see [To block payment tolerance for customers](#).

When you set up tolerance, Business Central also checks if there are any open entries and calculates the tolerance for these entries.

To enable or disable payment tolerance warnings

The payment tolerance warning appears when you post an application that has a balance in the allowed tolerance. You can then choose how you want to post and document the balance.

1. Choose the  icon, enter **General Ledger Setup**, and then choose the related link.
2. On the **General Ledger Setup** page, on the **Application** FastTab, select the **Payment Tolerance Warning** check box to activate the warning. To deactivate the warning, clear the check box.

NOTE

The default option for the **Payment Tolerance Warning** page is **Leave the Balance as Remaining Amount**. The default option for the **Pmt. Disc. Tolerance Warning** page is **Do Not Accept the Late Payment Discount**.

To block payment tolerance for customers

The default setting for payment tolerance is allowed. To disallow a certain customer or vendor payment tolerance you need to block tolerance on the respective customer or vendor card. The following describes how to do it for a customer. The steps are similar for a vendor.

1. Choose the  icon, enter **Customer** or **Vendor**, and then choose the related link.
2. On the **Payments** FastTab, select the **Block Payment Tolerance** check box.

NOTE

If the customer or vendor has open entries, you must first remove payment tolerance from entries that are currently open.

Example 1 - Tolerance Calculations for a Single Document

The following are some example scenarios showing the expected tolerance calculations and postings occurring in different situations.

The **G/L Setup** page contains the following setup:

- Payment Discount Grace Period: 5D
- Max Payment Tolerance: 5

Scenarios with alternative A or B represent the following:

- **A** In this case, the payment discount tolerance warning has been turned off OR the user has the warning on and has selected to allow the late payment discount (Post the Balance as Payment Tolerance).
- **B** In this case, the user has the warning on and has selected not to allow the late payment discount (Leave the Balance as Remaining Amount).

Payment Range Diagrams

In relation to the scenario above, the diagrams of payment ranges are as follows:

(1) Payment Date <=01/15/03 (Scenarios 1-3)

Remaining Amount per

Normal Application Rules

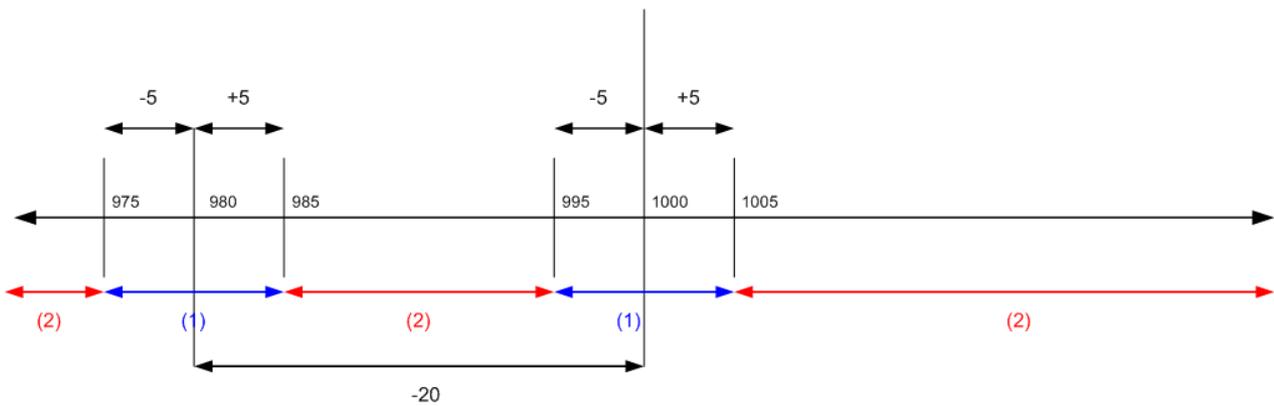

(1) If payment falls in these ranges, all application entries can be closed with or without tolerance.

(2) If payment falls in these ranges, all application entries cannot be closed even with tolerance.

(2) Payment Date is between 01/16/03 and 01/20/03 (Scenarios 4-9)

Remaining Amount per

Normal Application Rules

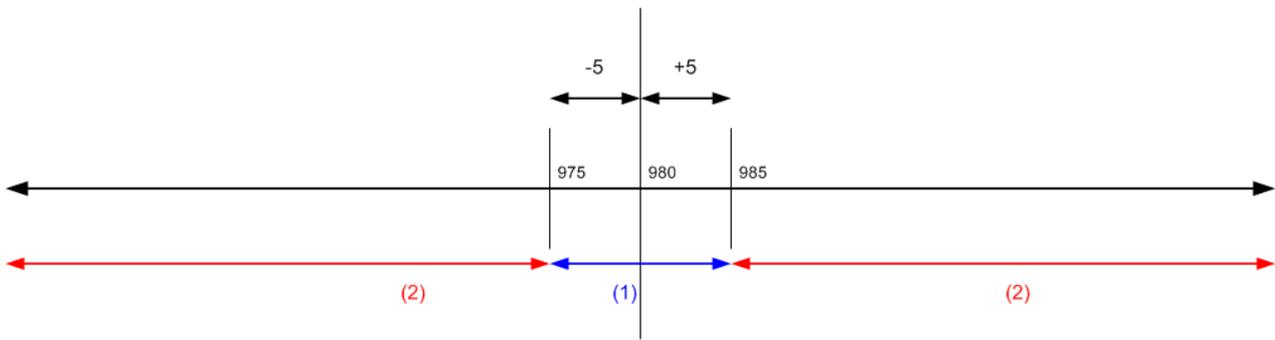

(1) If payment falls in these ranges, all application entries can be closed with or without tolerance.

(2) If payment falls in these ranges, all application entries cannot be closed even with tolerance.

(3) Payment Date is after 01/20/03 (Scenarios 10-15)

Remaining Amount per

Normal Application Rules

(1) If payment falls in these ranges, all application entries can be closed with or without tolerance.

(2) If payment falls in these ranges, all application entries cannot be closed even with tolerance.

Example 2 - Tolerance Calculations for Multiple Documents

The following are some example scenarios showing the expected tolerance calculations and postings occurring in different situations. The examples are limited to being only those scenarios that result in all entries in the application being closed.

The **G/L Setup** page contains the following setup:

- Payment Discount Grace Period 5D
- Max Payment Tolerance 5

Scenarios with alternative A, B, C, or D represent the following:

- **A** In this case the payment discount tolerance warning has been turned off, OR the user has the warning on and has selected to allow the late payment discount (Post as Tolerance) in any invoice.
- **B** In this case, the user has the warning on and has selected not to allow the late payment discount on any invoice.
- **C** - In this case, the user has the warning on and has selected to allow the late payment discount on the first invoice but not the second.
- **D** - In this case, the user has the warning on and has selected not to allow the late payment discount on the first invoice but allowed it on the second.

Payment Range Diagrams

In relation to the scenario above, the diagrams of payment ranges are as follows:

(1) Payment Date <=01/15/03 (Scenarios 1-3)

Remaining Amount per

Normal Application Rules

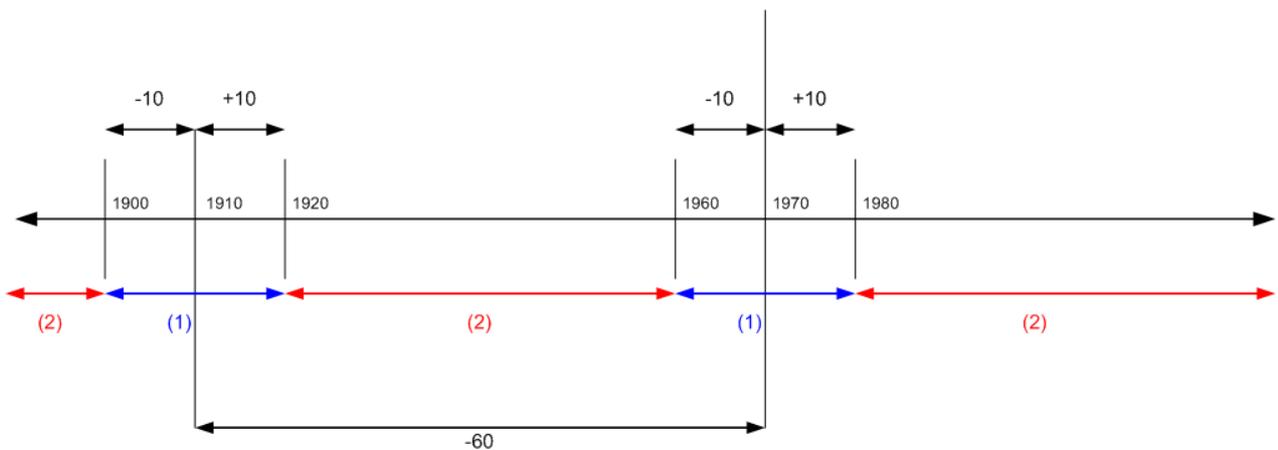

(1) If payment falls in these ranges, all application entries can be closed with or without tolerance.

(2) If payment falls in these ranges, all application entries cannot be closed even with tolerance.

(2) Payment Date is between 01/16/03 and 01/17/03 (Scenarios 4-9)

Remaining Amount per

Normal Application Rules

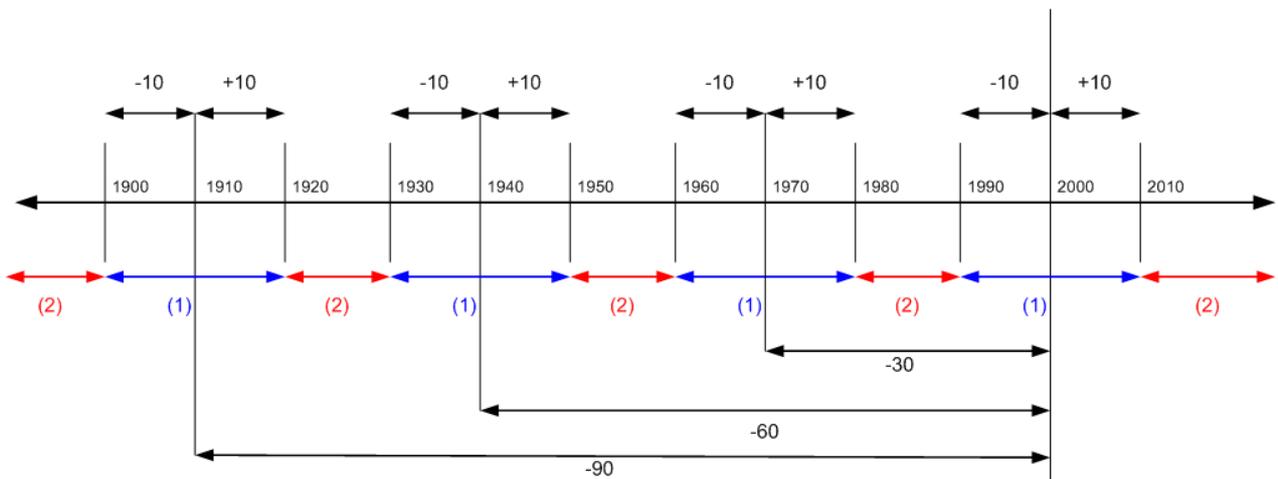

(1) If payment falls in these ranges, all application entries can be closed with or without tolerance.

(2) If payment falls in these ranges, all application entries cannot be closed even with tolerance.

(3) Payment Date is between 01/18/03 and 01/20/03 (Scenarios 10-21)

Remaining Amount per

Normal Application Rules

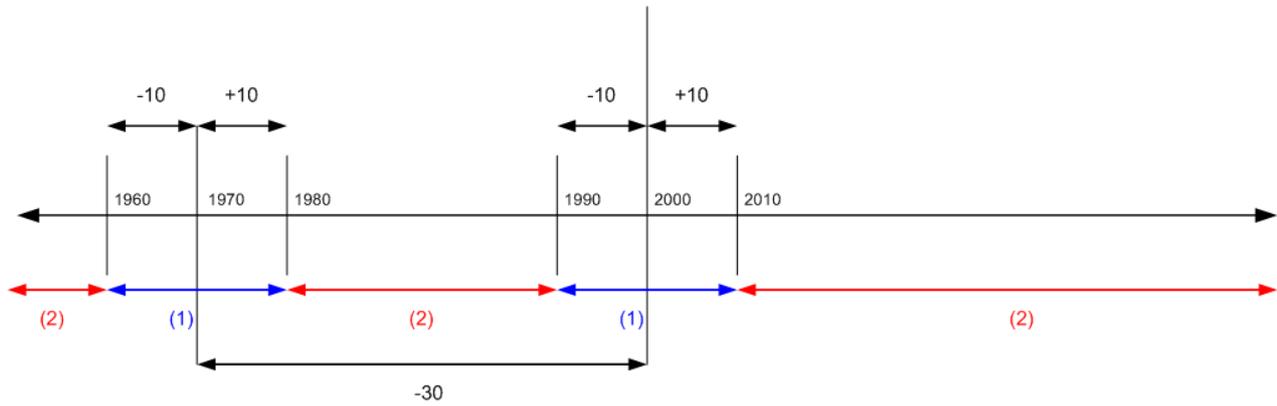

(1) If payment falls in these ranges, all application entries can be closed with or without tolerance.

(2) If payment falls in these ranges, all application entries cannot be closed even with tolerance.

(4) Payment Date is between 01/21/03 and 01/22/03 (Scenarios 22-27)

Remaining Amount per

Normal Application Rules

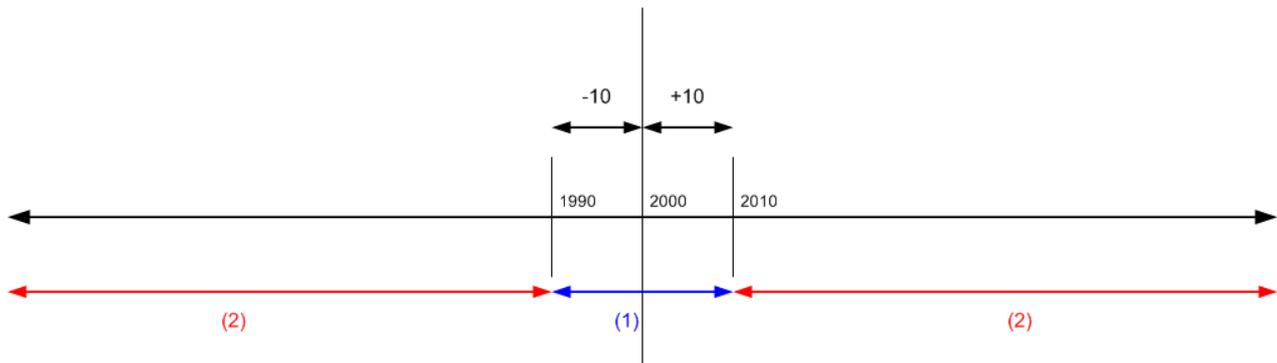

(1) If payment falls in these ranges, all application entries can be closed with or without tolerance.

(2) If payment falls in these ranges, all application entries cannot be closed even with tolerance.

(5) Payment Date is after 01/22/03 (Scenarios 28-30)

Remaining Amount per

Normal Application Rules

(1) If payment falls in these ranges, all application entries can be closed with or without tolerance.

(2) If payment falls in these ranges, all application entries cannot be closed even with tolerance.

The Late Payment Prediction Extension

3/31/2019 • 5 minutes to read

Effectively managing receivables is important to the overall financial health of a business. The Late Payment Prediction extension can help you reduce outstanding receivables and fine-tune your collections strategy by predicting whether sales invoices will be paid on time. For example, if a payment is predicted to be late, you might decide to adjust the terms of payment or the payment method for the customer.

What are Predictions Based On?

The Late Payment Prediction extension uses a predictive model that we developed in Azure Machine Learning Studio and trained using data that is representative of a range of small to medium sized businesses. Though we have already trained and evaluated it, our predictive model will continue to learn from your data. The more you use the model and the more data you feed it, the more accurate predictions will become. By default, the extension evaluates the model and updates the predictions on a weekly basis. However, you can update the predictions whenever you want by choosing the **Update Prediction** action on the **Customer Ledger Entries** page.

NOTE

We use a bit of your compute time each week when we evaluate the model and update your predictions. In addition to manually updating your predictions, other actions that consume compute time are when you train the model (which you might do if you've recently added data) and when you evaluate the model (which looks at the quality of the model).

Getting Started

The extension is free in Business Central, and we provide a subscription to Azure Machine Learning. The subscription offers 30 minutes of compute time per month. If you need more than that you can create your own predictive model and use it instead. For more information, see the section titled *Building Your Own Predictive Model* later in this topic.

When you open a posted sales document, a notification will display at the top of the page. To use the Late Payment Prediction Extension you can opt in by choosing **Enable** in the notification. Alternatively, you can set up the extension manually. For example, if you regret dismissing the notification.

To enable the extension manually, follow these steps:

1. Choose the  icon, enter **Service Connections**, and then choose the related link.
2. Choose the **Late Payment Prediction Setup** option, and then fill in the fields as necessary.

Viewing All Payment Predictions

If you enable the extension a **Payments Predicted to be Late** tile is available in the **Business Manager** Role Center. The tile displays the number of payments that are predicted to be late, and let's you open the **Customer Ledger Entries** page where you can dig deeper into the posted invoices. There are three columns to pay attention to:

- **Late Payment** - Indicates whether the payment for the invoice is predicted to be late.
- **Prediction Confidence** - Indicates how reliable you should consider the prediction to be. **High** means that the prediction is at least 90% sure, **Medium** is between 80 and 90%, and **Low** is below 80%.
- **Prediction Confidence %** - Shows the actual percentage behind the confidence rating. By default, this

column is not displayed, but you can add it if you want. For more information, see [Personalizing Your Workspace](#).

TIP

The Customer Ledger Entries page also shows a FactBox on the right. While you are reviewing predictions, the information in the **Customer Details** section can be helpful. When you choose the invoice in the list, the section shows information about the customer. It also lets you take immediate action. For example, if a customer frequently misplaces their wallet, you can open the Customer card from the FactBox and block the customer for future sales.

Viewing a Payment Prediction for a Specific Sales Document

You can also predict late payments up-front. On the **Sales Quotes**, **Sales Orders**, and **Sales Invoices** pages, you can use the **Predict Payment** action to generate a prediction for the sales document you're viewing.

Building Your Own Predictive Model

Interested in building your own predictive model? You can use Azure Machine Learning Studio to build your own predictive model and use it in Business Central. To use your own model, you must subscribe to Azure Machine Learning. For more information, see [Azure Machine Learning Studio Documentation](#).

We do, however, offer an easier way for you to create and use your own predictive model. You can share data from your invoices with our [Prediction Experiment for Dynamics 365 Business Central](#) in Azure Machine Learning, and let our experiment create and train a predictive model based on your data. To share your data, on the **Late Payment Prediction Setup** page, choose the **Create My Model** action. Afterward, predictions will be based on your model and your data, not ours.

NOTE

The quality of the model is important. When our predictive experiment uses your data to train a model it determines a quality value for the model as a percentage. The model quality indicates how accurate the model's predictions are likely to be. Several factors can impact the quality of a model. For example, these factors might be that there was not enough data, or the data did not contain enough variation. You can view the quality of the model you are currently using on the **Late Payment Prediction Setup** page. You can also specify a minimum threshold for the model quality. Models with a quality value below the threshold will not produce predictions.

To use your model instead of ours

If you create your own model in Azure Machine Learning Studio, without using the tools in Business Central, you must provide your credentials so that Business Central can access the model. There are a couple of steps to do that:

1. Choose the  icon, enter **Late Payment Prediction Setup**, and then choose the related link.
2. Choose the **Use My Azure Subscription** check box.
3. In the **Selected Model** field, choose **My Model**.
4. On the **My Model Credentials** FastTab, enter the API URL and API key for your model.

Invoicing Prepayments

3/31/2019 • 2 minutes to read

Prepayments are payments that are invoiced and posted to a sales or purchase prepayment order before final invoicing. You might require a deposit before you manufacture items to order, or you might require payment before you ship items to a customer. The prepayments functionality enables you to invoice and collect deposits required from customers or to remit deposits to vendors. Thus, you can ensure that all payments are posted against an invoice.

Prepayment requirements can be defined for a customer or vendor for all items or selected items. After you complete the required setup, you can generate prepayment invoices from sales and purchase orders for the calculated prepayment amount. You can change the amounts on the invoice as needed. For example, you can specify a total amount for the entire order. You can also send additional prepayment invoices if, for example, additional items are added to the order. You can increase quantities or add new lines to an order after issuing a prepayment, and then you can post another prepayment invoice. If you want to delete a line for which a prepayment has already been invoiced, you must issue a prepayment credit memo before you can delete the line.

The following table describes a sequence of tasks, with links to the topics that describe them.

TO	SEE
Set up prepayment posting groups and number series, and set up default prepayment percentages for customers, vendors, and items.	Set Up Prepayments
Create an order, adjust the prepayment amounts, and issue an invoice for prepayment amounts.	Create Prepayment Invoices
Issue an additional prepayment invoice, either for additional items or for an additional deposit on the original order, or issue a prepayment credit memo.	Correct Prepayments

Set Up Prepayments

3/31/2019 • 4 minutes to read

If you require your customers to submit payment before you ship an order to them, or if your vendor requires you to submit payment before they ship an order to you, you can use the Prepayment functionality. The functionality enables you to invoice and collect deposits required from customers or to remit deposits to vendors, and to ensure that all partial payments are posted against an invoice. For more information, see [Create Prepayment Invoices](#).

Before you can post prepayment invoices, you have to set up the posting accounts in the general ledger, and you have to set up number series for prepayment documents.

You can define the percentage of the line amount that will be invoiced for prepayment, for a customer or vendor, for all items or selected items. After you complete the setup, you can generate prepayment invoices from sales and purchase orders. You can use the default percentages for each sales or purchase line, or you can change the amounts on the invoice as needed. For example, you can specify a total amount for the entire order.

Because the prepaid amount belongs to the buyer until they have received the goods or services, you need to set up general ledger accounts to hold the prepayment amounts until the final invoice is posted. Sales prepayments must be recorded in a liabilities account until the items are shipped. Purchase prepayments must be recorded in an assets account until the items are received. In addition, you must set up a separate general ledger account for each VAT identifier.

IMPORTANT

Depending on your country or region, additional setup may be required. For more information, see the list of related articles in the [See Also](#) section.

To add prepayment accounts to the general posting setup

1. Choose the  icon, enter **General Posting Setup**, and then choose the related link.
2. On the **General Posting Setup** page, fill in the following fields:
 - **Sales Prepayments Account**
 - **Purch. Prepayments Account**

If you have not already set up general ledger accounts for prepayments, you can do that on the **G/L Account List** page.

To set up number series for prepayment documents

1. Choose the  icon, enter **Sales & Receivables Setup**, and then choose the related link.
2. On the **Sales & Receivables Setup** page, fill in the following fields:
 - **Posted Prepmt. Inv. Nos.**
 - **Posted Prepmt. Cr. Memo Nos.**
3. Choose the  icon, enter **Purchases & Payables Setup**, and then choose the related link.
4. On the **Purchases & Payables Setup** page, fill in the following fields:
 - **Posted Prepmt. Inv. Nos.**

- **Posted Prepmnt. Cr. Memo Nos.**

NOTE

You can use the same number series for prepayment invoices and regular invoices, or you can use different number series. If you use different series, they must not overlap because there must not be any numbers that exist in both series.

To set up prepayment percentages for items, customers, and vendors

For an item, you can set up a default prepayment percentage for all customers, a specific customer, or a customer price group.

1. Choose the  icon, enter **Items**, and then choose the related link.
2. Select an item, and then choose the **Prepayment Percentages** action.
3. On the **Sales Prepayment Percentages** page, fill in the fields as necessary. Hover over a field to read a short description.

For a customer or vendor, you can set up one default prepayment percentage for all items and all types of sales lines. You enter this on the customer or vendor card.

1. Choose the  icon, enter **Customers**, and then choose the related link.
2. Open the card for a customer.
3. Fill in the **Prepayment %** field.
4. Repeat the steps for other customers or for vendors.

To determine which prepayment percentage has first priority

An order may have a prepayment percentage on the sales header, and a different percentage for the items on the lines. To determine which prepayment percentage applies to each sale line, the system looks for the prepayment percentage in the following order and will apply the first default that it finds:

1. A prepayment percentage for the item on the line and the customer that the order is for.
2. A prepayment percentage for the item on the line and the customer price group that the customer belongs to.
3. A prepayment percentage for the item on the line for all customers.
4. The prepayment percentage on the sales or purchase header.

In other words, the prepayment percentage on the customer card will only apply if there is no prepayment percentage set up for the item. However, if you change the contents of the **Prepayment Percentage** field on the sales or purchase header after you create the lines, the prepayment percentage on all of the lines will be updated. This makes it easy to create an order with a fixed prepayment percentage, regardless of the percentage set up on items.

Create Prepayment Invoices

3/31/2019 • 3 minutes to read

If you require your customers to submit payment before you ship an order to them, or if your vendor requires you to submit payment before they ship an order to you, you can use the prepayment functionality.

After you create a sales or purchase order, you can create a prepayment invoice. You can use the default percentages for each sales or purchase line, or you can adjust the amount as necessary. For example, you can specify a total amount for the entire order.

The following procedure describes how to invoice a prepayment for a sales orders. The steps are similar for purchase orders.

To create a prepayment invoice

1. Choose the  icon, enter **Sales Orders**, and then choose the related link.
2. Create a new sales order. For more information, see [sell Products](#).

On the **Prepayment** FastTab, the **Prepayment %** field will be filled in automatically if there is a default prepayment percentage on the customer card. You can change the contents of the field. The prepayment percentage is only copied from the header to lines that do not copy the default prepayment percentage from the item.

If the **Compress Prepayment** field is selected, lines will be combined on the invoice if:

- They have the same general ledger account for prepayments as determined by the general posting setup.
- They have the same dimensions.

Leave the field blank if you want to specify a prepayment invoice with one line for each sales order line that has a prepayment percentage.

3. Fill in the sales lines.

If default prepayment percentages have been set up for your items, they are automatically copied to the **Prepayment %** field on the line. Otherwise, the prepayment percentage is copied from the header. You can change the contents of the **Prepayment %** field on the line.

4. If you want to apply one prepayment percentage to the entire order, change the **Prepayment %** field on the header after filling in the lines.
5. To view the total prepayment amount, choose the **Statistics** action.

If you want to adjust the total prepayment amount for the order, you can change the contents of the **Prepayment Amount** field on the **Sales Order Statistics** page.

If the **Prices Including VAT** field is selected, the **Prepayment Amount Incl. VAT** field is editable.

If you change the contents of the **Prepayment Amount** field, the amount will be distributed proportionately between all lines, except those that have **0** in the **Prepayment %** field.

6. To print a test report before posting the prepayment invoice, choose the **Prepayment** action, and then choose the **Prepayment Test Report** action.
7. To post the prepayment invoice, choose the **Prepayment** action, and then choose the **Post Prepayment**

Invoice action.

To post and print the prepayment invoice, choose the **Post and Print Prepmnt. Invoice** action.

You can issue additional prepayment invoices for the order. To do this, increase the prepayment amount on one or more lines, adjust the document date if necessary, and post the prepayment invoice. A new invoice will be created for the difference between the prepayment amounts invoiced so far and the new prepayment amount.

NOTE

If you are located in North America, you cannot change the prepayment percentage after the prepayment invoice has been posted. This is prevented in the North American version of Business Central because the calculation of sales tax will otherwise be incorrect.

When you are ready to post the rest of the invoice, post it as you would post any invoice, and the prepayment amount will automatically be deducted from the amount due.

Correct Prepayments

3/31/2019 • 2 minutes to read

You can make a correction to an order after you have posted a prepayment invoice for the order. You can add new lines to an order after issuing a prepayment, and then you can post another prepayment invoice, but you cannot delete a line from an order after a prepayment has been invoiced for the line.

To correct a prepayment

The following procedure shows how to issue a prepayment credit memo to cancel all invoiced prepayments for a sales order.

1. Choose the  icon, enter **Sales Orders**, and then choose the related link.
2. Open the relevant sales order.
3. Choose the **Prepayment** action, and then choose the **Post Prepayment Credit Memo** action or the **Post and Print Prepmt. Cr. Memo** action.
4. On the **Sales Credit Memo** page, proceed to correct the relevant entries, as for any sales credit memo. For more information, see [Process Sales Returns or Cancellations](#).

NOTE

To Reduce the amount in the **Line Amount** field, you must first increase the prepayment percentage on the line so that the value in the **Prepmt. Line Amount** field is not decreased below the value in the **Prepmt. Amt. Inv.** field.

5. To make a prepayment invoice for any new lines in the sales credit memo, choose the **Prepayment** action, and then choose the **Post Prepayment Invoice** action or the **Post and Print Prepmt. Invoice** action.
6. To issue an additional prepayment invoice, increase the prepayment amount on one or more lines and post the prepayment invoice. A new invoice will be created for the difference between the prepayment amounts invoiced and the new prepayment amounts.

Managing Bank Accounts

3/31/2019 • 2 minutes to read

At regular intervals, you must reconcile your bank ledger entries in Business Central with the related bank transactions in bank accounts at your bank, and then post the balance to your bank account. You can perform this task either as part of processing the payments represented on a bank statement in the **Payment Reconciliation Journal**. Alternatively, you can perform the task separately from payment processing, on the **Bank Acc. Reconciliation** page where you match (reconcile) bank statement lines in the left-hand pane with your internal bank account ledger entries in the right-hand pane. In both pages, you can fill in the bank statement information by importing a file or feed and you can use automatic matching suggestions.

NOTE

In North American versions, you can also perform bank reconciliation on the **Bank Rec. Worksheet** page, which is better suited for checks and deposits but does not offer import of bank statement files. To use this page instead of the **Bank Acc. Reconciliation** page, deselect the **Bank Recon. with Auto. Match** field on the **General Ledger Setup** page. For more information, see the "Reconcile Bank Accounts" section under United States Local Functionality.

Sometimes, you need to transfer amounts between bank account in Business Central to reflect transfers at your bank. You perform this task on the **General Journal** page, in different ways depending on the currency of the funds.

Before you can manage bank accounts, you must set each bank account up as a bank account card. In addition, you must set up electronic services that you may use for bank statement import and payment file export. For more information, see [Set Up Bank Accounts](#).

The following table describes a sequence of tasks, with links to the topics that describe them.

TO	SEE
Reconcile bank accounts in connection with payment processing on the Payment Reconciliation Journal page.	Applying Payments Automatically and Reconciling Bank Accounts
Reconcile bank accounts, including check ledger entries, as a separate task on the Bank Acc. Reconciliation page.	Reconcile Bank Accounts Separately
Post transfers between bank accounts in the same currency or in different currencies.	Transfer Bank Funds

Applying Payments Automatically and Reconciling Bank Accounts

3/31/2019 • 2 minutes to read

You must regularly reconcile your bank, receivables, and payables accounts by applying payments recorded in the bank to their related unpaid invoices and credit memos or other open entries in Business Central.

You can perform this task on the **Payment Reconciliation Journal** page by importing a bank statement file or feed to quickly register the payments. Payments are applied to open customer or vendor ledger entries based on matches between payment text and entry information. You can review and change automatic applications before you post the journal. You can choose to close any open bank account ledger entries related to the applied ledger entries when you post the journal. The bank account is automatically reconciled when all payments are applied.

You can also reconcile bank accounts without simultaneously applying payments. You perform this work on the **Bank Acc. Reconciliation** page. For more information, see [Reconcile Bank Account Separately](#).

To import bank statements as a bank feed, you must first set up and enable the Envestnet Yodlee Bank Feed service, and then link your bank accounts to the related online bank accounts. For more information, see [Set Up the Envestnet Yodlee Bank Feeds Service](#).

Alternatively, you can use the bank data conversion service to convert a bank statement file, from any format, to a data stream that you can import into Business Central. For more information, see [Set Up the Bank Data Conversion Service](#).

The following table describes a sequence of tasks, with links to the topics that describe them.

TO	SEE
Apply payments to open customer or vendor ledger entries by importing a bank statement, and reconcile the bank account when all payments are applied.	Reconcile Payments Using Automatic Application
Manually apply payments by viewing detailed information about matched data and suggestions for candidate open entries to apply payments to.	Review or Apply Payments After Automatic Application
Resolve payments that cannot be applied automatically to their related open ledger entries. For example because the amounts differ, or because a related ledger entry does not exist.	Reconcile Payments that Cannot be Applied Automatically
Link text on payments to specific customer, vendor, or general ledger accounts to always post recurring cash receipts or expenses to those accounts when no documents exist to apply to.	Map Text on Recurring Payments to Accounts for Automatic Reconciliation

Reconcile Bank Accounts Separately

3/31/2019 • 6 minutes to read

To reconcile bank accounts in Business Central with statements received from the bank, you begin by filling in the left-hand pane on the **Bank Acc. Reconciliation** page with bank statement information that you then match (reconcile) with bank account ledger entries in the right-hand pane. A smart way to fill in bank statement lines is by importing a bank statement file or feed.

NOTE

In North American versions, you can also perform this work on the **Bank Rec. Worksheet** page, which is better suited for checks and deposits but does not offer import of bank statement files. To use this page instead of the **Bank Acc. Reconciliation** page, deselect the **Bank Recon. with Auto. Match** field on the **General Ledger Setup** page. For more information, see the "Reconcile Bank Accounts" section under United States Local Functionality.

TIP

You can also reconcile bank accounts on the **Payment Reconciliation Journal** page. Any open bank account ledger entries related to the applied customer or vendor ledger entries will be closed when you choose the **Post Payments and Reconcile Bank Account** action. This means that the bank account is automatically reconciled for payments that you post with the journal. For more information, see [Reconcile Payments Using Automatic Application](#).

To enable import of bank statements as bank feeds, you must first set up and enable the Envestnet Yodlee Bank Feed service, and then link your bank accounts to the related online bank accounts. For more information, see [Set Up the Envestnet Yodlee Bank Feeds Service](#).

The lines on the **Bank Acc. Reconciliation** page are divided into two panes. The **Bank Statement Lines** pane shows either imported bank transactions or ledger entries with outstanding payments. The **Bank Account Ledger Entries** pane shows the ledger entries in the bank account.

The activity of finding and applying entries to be reconciled is referred to as *matching*. You can choose to perform matching automatically by using the **Match Automatically** function. Alternatively, you can manually select lines in both panes to link each bank statement line to one or more related bank account ledger entries, and then use the **Match Manually** function. The **Applied** checkbox is selected on lines where entries match.

You can fill in the **Bank Statement Lines** pane on the **Bank Acc. Reconciliation** page in the following ways:

- Automatically, by using the **Import Bank Statement** function to fill in the lines according to actual bank statements based on a file provided by the bank.
- Manually, by using the **Suggest Lines** function to fill in the lines with ledger entries for invoices that have outstanding payments.

When the value in the **Total Balance** field in the **Bank Statement Lines** pane equals the value in the **Balance To Reconcile** field in the **Bank Account Ledger Entries** pane, you can choose the **Post** action to reconcile the applied bank account ledger entries. Any non-applied bank account ledger entries will remain on the page, indicating that payments processed for the bank account are not reflected in the latest bank statement, or that some payments were received on checks.

NOTE

If bank statement lines relate to check ledger entries, then you cannot use the matching functions. Instead, you must choose the **Apply Entries** action, and then select the relevant check ledger entry to match the bank statement line with.

To fill bank reconciliation lines by importing a bank statement

1. Choose the  icon, enter **Bank Account Reconciliation**, and then choose the related link.
2. Choose the **New** action.
3. In the **Bank Account No.** field, select the relevant bank account. The bank account ledger entries that exist on the bank account appear in the **Bank Account Ledger Entries** pane.
4. In the **Statement Date** field, enter the date of the statement from the bank.
5. In the **Statement Ending Balance** field, enter the balance of the statement from the bank.
6. If you have a bank statement file, choose the **Import Bank Statement** action.
7. Locate the file, and then choose the **Open** button to import the bank transactions into the lines of the **Bank Acc. Reconciliation** page.

To fill bank reconciliation lines with the Suggest Lines function

1. On the **Bank Acc. Reconciliation** page, choose the **Suggest Lines** action.
2. In the **Starting Date** field, enter the earliest posting date for the ledger entries to be reconciled.
3. In the **Ending Date** field, enter the latest posting date for the ledger entries to be reconciled.
4. Select the **Include Checks** check box to any suggest check ledger entries instead of the corresponding bank account ledger entries.
5. Choose the **OK** button.

To match bank statement lines with bank account ledger entries automatically

The page offers automatic matching functionality that applies payments to their related open entries based on a matching of text on a bank statement line (left pane) with text on one or more bank account ledger entries (right pane). Note that you can overwrite the suggested automatic applications, and you can choose to not use automatic application at all. For more information, see the next procedure.

1. On the **Bank Acc. Reconciliation** page, choose the **Match Automatically. The Match Bank Entries** page opens.
2. In the **Transaction Date Tolerance (Days)** field, specify the span of days before and after the bank account ledger entry posting date within which the function will search for matching transaction dates in the bank statement.

If you enter 0 or leave the field blank, then the **Match Automatically** function will only search for matching transaction dates on the bank account ledger entry posting date.

3. Choose the **OK** button.

All bank statement lines and bank account ledger entries that can be matched change to green font, and the **Applied** check box is selected.

4. To remove a match, select the bank statement line, and then choose the **Remove Match** action.

To match bank statement lines with bank account ledger entries

manually

1. On the **Bank Acc. Reconciliation** page, select a non-applied line in the **Bank Statement Lines** pane.
2. In the **Bank Account Ledger Entries** pane, select one or more banks account ledger entries that can be matched with the selected bank statement line. To choose multiple lines, press and hold the Ctrl key.
3. Choose the **Match Manually** action.

The selected bank statement line and the selected bank account ledger entries change to green font, and the **Applied** check box in the right pane is selected.

4. Repeat steps 1 through 3 for all bank statement lines that are not matched.
5. To remove a match, select the bank statement line, and then choose the **Remove Match** action.

To create missing ledger entries to match bank transactions with

Sometimes a bank statement contain amounts for interest or fees charged. Such bank transactions cannot be matched because no related ledger entries exist in Business Central. You must then post a journal line for each transaction to create a related ledger entry that it can be matched with.

1. On the **Bank Acc. Reconciliation** page, choose the **Transfer to General Journal** action.
2. On the **Trans. Bank Rec. to Gen. Jnl.** page, specify which general journal to use, and then choose the **OK** button.

The **General Journal** page opens containing new journal lines for any banks statement lines with missing ledger entries.

3. Complete the journal line with relevant information, such as the balancing account. For more information, see [Working with General Journals](#).
4. To review the result of posting before you post, choose the **Test Report** action. The **Bank Account Statement** report opens and shows the same fields as at the header of the **Bank Acc. Reconciliation** page.
5. Choose the **Post** action.

When the entry is posted, proceed to match the bank transaction with to it.

6. Refresh or reopen the **Bank Acc. Reconciliation** page. The new ledger entry will appear in the **Bank Account Ledger Entries** pane.
7. Match the bank statement line with the bank account ledger entry, either manually or automatically.

Transfer Bank Funds

3/31/2019 • 2 minutes to read

You may sometimes need to transfer an amount from one bank account to another. To do this, you must post the a transaction in the general journal. The task varies depending on whether the bank accounts use the same currency or different currencies.

To post a transfer between bank accounts with the same currency code

1. Choose the  icon, enter **General Journal**, and then choose the related link.
2. On a journal line, fill in the **Posting Date** and **Document No.** fields.
3. In the **Account Type** field, select **Bank Account**.
4. In the **Account No.** field, select the bank from which you want to transfer the funds.
5. In the **Amount** field, enter the amount to be transferred.
6. Choose the **Show More Columns** action to view all available fields.
7. In the **Bal. Account Type** field, select **Bank Account**.
8. In the **Bal. Account No.** field, select the bank account to which you want to transfer the funds.
9. Post the journal.

To post a transfer between bank accounts with different currency codes

To transfer funds between bank accounts that use different currencies, you must post two general journal lines.

1. Choose the  icon, enter **General Journal**, and then choose the related link.
2. Create two journal lines, and fill in the **Posting Date** and **Document No.** fields.
3. On the first journal line, in the **Type** field, select **Bank Account**.
4. In the **Account No.** field, select the bank account from which you want to transfer the funds.
5. In the **Amount** field, enter the amount in the currency of the bank account. Enter credit amounts with a minus sign. Enter debit amounts without a minus sign.
6. In the **Bal. Account Type** field, select **Bank Account**.
7. In the **Bal. Account No.** field, select the bank account to which you want to transfer the funds.
8. On the second journal line, in the **Type** field, select **Bank Account**.
9. In the **Account No.** field, select the bank account to which you want to transfer the funds.
10. In the **Amount** field, enter the amount in the currency of the bank account. Enter credit amounts with a minus sign. Enter debit amounts without a minus sign.
11. In the **Bal. Account Type** field, select **Bank Account**.
12. In the **Bal. Account No.** field, select the bank account from which you want to transfer the funds.

NOTE

If the exchange rates used in the journal are different than the exchange rates on the **Currency Exchange Rates** page, enter a third line for the exchange rate gain or loss. Enter **G/L Account** in the **Account Type** field. Enter the G/L account number for exchange rate gain or loss in the **Account No.** field. Enter the exchange rate gain or loss in the **Amount** field with or without a minus sign for credits and debits respectively.

13. Post the journal.

Managing Intercompany Transactions

3/31/2019 • 2 minutes to read

Your organization may consist of several companies, but might not have the equivalent number of accounting and administrative teams. The Intercompany functionality lets you do business with your subsidiary and internal partner organizations in the same way as you engage with your external vendors and customers. You enter intercompany transaction information only once in the appropriate documents. You can use the functionality you are already familiar with, such as receivables and payables management. Mapping facilities for the chart of accounts and dimensions help ensure that information appears in the right places.

There are four main benefits to the Intercompany functionality:

- Increased productivity as a result of time saved and simplified transactions
- Minimized error potential with one-time entry of information and system-wide, automated updates
- Complete audit trail and full visibility into business activities and transaction histories
- Efficient, cost-effective transactions with affiliate and subsidiary companies

You are in full control of all transaction documents. For example, you can reject a document sent to you and, in this way, reverse postings that were incorrect. Or, when making a purchase from a partner or subsidiary company, you can update the purchase order as long as the selling company has not shipped any goods.

When you enter a transaction, you do not need to specify the accounts for an individual set of books, but simply give the identification of the partner company. The Intercompany functionality creates general journal lines that result in the balancing of the books of both companies involved in a transaction. In receivables and payables, you assign an intercompany partner code to any customer or vendor. From that moment on, all orders and invoices generated pertaining to transactions with these companies will produce corresponding documents in the partner company, resulting in correct balancing of the accounts.

After you set up business partners as customers and vendors in the system, and assign them intercompany partner codes, it is possible to exchange intercompany purchase and sales documents, including items and item charges. The Intercompany functionality allows intercompany transactions between multiple databases, for example, in different countries/regions, as well as multiple currencies, different charts of accounts, different dimensions, and different item numbering.

Consolidating financial data may especially be relevant in connection with intercompany processes. For more information, see [Consolidating Financial Data from Multiple Companies](#).

The following table describes a sequence of tasks, with links to the topics that describe them.

TO	SEE
Create your intercompany vendors and customers as so-called intercompany partners, and set up an intercompany chart of accounts.	Set Up Intercompany
Use intercompany documents or journals to post transactions with your intercompany partners.	Work with Intercompany Documents and Journals
Organize and process incoming and outgoing transactions that you exchange with your intercompany partners.	Manage the Intercompany Inbox and Outbox

Set Up Intercompany

3/31/2019 • 9 minutes to read

To send a transaction (such as a sales journal line) from one company and have the corresponding transaction (such as a purchase journal line) automatically created in the partner company, the companies involved must agree on a common chart of accounts and set of dimensions for use on intercompany transactions. The intercompany chart of accounts can be, for example, a simplified version of the parent company's chart of accounts. Each company maps their full chart of accounts to the shared intercompany chart of accounts, and each company maps their dimensions to the intercompany dimensions.

You must also set up an intercompany partner code for each partner company, which is agreed upon by all of the companies, and then assign them to customer and vendor cards respectively by filling in the **Intercompany Partner Code** field.

If you create or receive intercompany lines with items, you can either use your own item numbers, or you can set up your partner's item numbers for each relevant item, either in the **Vendor Item No.** field or in the **Common Item No.** field on the item card. You can also use the **Item Cross Reference** function: To map your items' numbers to your intercompany partners descriptions of the items, open the card of each item, and then choose the **Cross References** action to set up cross-references between your item descriptions and those of the intercompany partner.

If you will make intercompany sales transactions that include resources, you must fill in the **IC Partner Purch. G/L Acc. No.** field on the resource card for each relevant resource. This is the number of the intercompany general ledger account that the amount for this resource will be posted to in your partner's company. For more information, see [Set Up Resources](#).

To set up companies for intercompany transactions

1. Choose the  icon, enter **Company Information**, and then choose the related link.
2. On the **Company Information** page, fill in the **Intercompany Partner Code**, **Intercompany Inbox Type**, and **Intercompany Inbox Details** fields. Hover over a field to read a short description.

To set intercompany partners

1. Choose the  icon, enter **Intercompany Partners**, and then choose the related link.
2. Choose the **New** action.
3. On the **Intercompany Partner** page, fill in the fields as necessary.

To set up intercompany vendors and intercompany customers

1. Choose the  icon, enter **Vendors**, and then choose the related link.
2. Alternatively, access the vendor from the **Vendor No.** field on the **Intercompany Partner** page.
3. Open the card for a vendor that is an intercompany partner. For more information, see [Register New Vendors](#).
4. In the **Intercompany Partner Code** field, select the relevant intercompany partner code.
5. Repeat steps 1 through 4 for customers.

To set up intercompany charts of accounts

In order for a group of companies to make intercompany transactions, they must agree on a chart of accounts to use as a common reference. You must agree with your partner companies on the account numbers that all of you

will use when you create intercompany transactions. For example, the parent company of the group creates a simplified version of their own chart of accounts, exports this intercompany chart of accounts from their database into an XML file and distributes it to each of the companies in the group.

If your company is the parent company and has the defining intercompany chart of accounts that your group will use as a common reference, follow the [To set up the defining intercompany chart of accounts](#) procedure.

If your company is a subsidiary company and you receive an XML file containing the common intercompany chart of accounts, follow the [To Import the intercompany chart of accounts](#) procedure.

To set up the defining intercompany chart of accounts

1. Choose the  icon, enter **Intercompany Chart of Accounts**, and then choose the related link.
2. On the **Intercompany Chart of Accounts** page, enter each account on a line on the page.
3. If your intercompany chart of accounts will be identical or similar to your regular chart of accounts, you can fill on the page automatically by choosing the **Copy from Chart of Accounts** action. You can edit the new lines as needed.

To export an intercompany chart of accounts

To allow your intercompany partners to import the defining chart of accounts, you must export it to a file.

1. Choose the  icon, enter **Intercompany Chart of Accounts**, and then choose the related link.
2. On the **Intercompany Chart of Accounts** page, choose the **Export** action, and then choose the **Save** button.
3. Specify the file name and the location where you want to save the XML file, and then choose the **Save** button.

To import the intercompany chart of accounts

When a file exists for the defining intercompany chart of accounts, intercompany partners can import it to make sure they have the same accounts.

1. Choose the  icon, enter **Intercompany Chart of Accounts**, and then choose the related link.
2. On the **Intercompany Chart of Accounts** page, choose the **Import** action.
3. Select the file name and location of the XML file, and then choose the **Open** button.

The **IC Chart of Accounts** page is filled with new or edited G/L account lines according to the intercompany chart of accounts in the file. Any existing, unrelated lines on the page remain unchanged.

To map the intercompany chart of accounts to your company's chart of accounts

When you have defined or imported the intercompany chart of accounts that you and your intercompany partners have agreed to use, you must associate each of the intercompany G/L accounts with one of your company's G/L accounts. On the **IC Chart of Accounts** page, you specify how intercompany G/L accounts on incoming transactions will be translated into G/L accounts from your company's chart of accounts.

If the accounts in the intercompany chart of accounts have the same numbers as the corresponding accounts in the chart of accounts, you can map the accounts automatically.

1. Choose the  icon, enter **Intercompany Chart of Accounts**, and then choose the related link.
2. Select the lines that you want to map automatically, and then choose the **Map to Acc. with Same No** action.
3. For each intercompany general ledger account that was not mapped automatically, fill in the **Map-to G/L Acc. No.** field.

To set up default intercompany partner general ledger accounts

When you create an intercompany sales or purchase line to send as an outgoing transaction, you enter an account from the intercompany chart of accounts as a default for which account in your partner's company the amount is posted to. On the **Chart of Accounts** page, for accounts that you often use on outgoing intercompany sales or purchase lines, you can specify a default intercompany partner general ledger account. For example, for your

receivables accounts, you can enter the corresponding payables accounts from the intercompany chart of accounts.

Then, when you enter a general ledger account in the **Bal. Account No.** field on an intercompany line with **Intercompany Partner** in the **Account Type** field, the **IC Partner G/L Account** field is automatically filled in.

1. Choose the  icon, enter **Chart of Accounts**, and then choose the related link.
2. On the line for a G/L account that is used for intercompany transactions, in the **Default IC Partner G/L Account** field, enter the intercompany general ledger account that your partner will post to when you post to the general ledger account on the line.
3. Repeat step 2 for each account that you often enter in the **Bal. Account No.** field on a line in an intercompany journal or document.

To set up intercompany dimensions

If you and your intercompany partners want to be able to exchange transactions with dimensions linked to them, then you must agree on the dimensions that all of you will use. For example, the parent company of the group creates a simplified version of their own set of dimensions, exports these intercompany dimensions into an XML file and distributes it to each of the companies in the group. Each of the subsidiaries then imports the XML file into the **Intercompany Dimensions** page and maps the intercompany dimensions to the dimensions in their own **Dimensions** page.

If your company is the parent company and has the defining set of intercompany dimensions that your group will use as a common reference, follow the [To define the intercompany dimensions](#) procedure.

If your company is a subsidiary company and you receive an XML file containing the intercompany dimensions that your group will use as a common reference, follow the [To import intercompany dimensions](#) procedure.

To define the intercompany dimensions

1. Choose the  icon, enter **Intercompany Dimensions**, and then choose the related link.
2. On the **Intercompany Dimensions** page, enter each dimension on a line on the page.

If your intercompany dimensions will be similar or identical to your company dimensions, you can fill on the page automatically by using the **Copy from Dimensions** function, and then you can edit the resulting lines.

3. To export the intercompany dimensions to an XML file for distribution to your partner companies, choose the **Export** action.
4. Specify the file name and the location where you want to save the XML file, and then choose the **Save** button.

To import the intercompany dimensions

When a file exists for the defining intercompany dimensions, intercompany partners can import it to make sure they have the same dimensions.

1. Choose the  icon, enter **Intercompany Dimensions**, and then choose the related link.
2. On the **Intercompany Dimensions** page, choose the **Import** action.
3. Specify the file name and location of the XML file, and then choose the **Open** button.

The lines on the **Intercompany Dimensions** page and the **Intercompany Dimension Values** page are imported.

To map intercompany dimensions to your company's dimensions

When you have defined or imported the dimensions that you and your intercompany partners have agreed to use, you must associate each of the intercompany dimensions with one of your company's dimensions, and vice versa. On the **Intercompany Dimensions** page, you specify how intercompany dimensions on incoming transactions will be translated into dimensions from your company's list of dimensions. On the **Dimensions** page, you specify

how your dimensions will be translated into intercompany dimensions on outgoing transactions.

If any of the intercompany dimensions have the same code as the corresponding dimensions in your company's list of dimensions, then you can have the program automatically map the dimensions, then you can map the accounts automatically.

1. Choose the  icon, enter **Intercompany Dimensions**, and then choose the related link.
2. On the **Intercompany Dimensions** page, select the lines that you want to automatically map, and then choose the **Map to Dim. with Same Code** action.
3. For each intercompany dimension that is not mapped automatically, fill in the **Map-to Dimension Code** field.
4. Choose the **Intercompany Dimension Values** action.
5. On the **Intercompany Dimension Values** page, fill in the **Map-to Dimension Value Code** field.

Proceed to map dimensions to intercompany dimensions by performing similar steps.

6. Choose the  icon, enter **Dimensions**, and then choose the related link.
7. On the **Dimensions** page, select the lines that you want to automatically map, and then choose the **Map to IC Dim. with Same Code** action.
8. For each intercompany dimension that is not mapped automatically, fill in the **Map-to IC Dimension Value Code** field.
9. Choose the **Dimension Values** action.
10. On the **Dimension Values** page, fill in the **Map-to IC Dimension Value Code** field.

Work with Intercompany Documents and Journals

3/31/2019 • 2 minutes to read

You use intercompany documents or journals to post transactions with your intercompany partners. When you post an intercompany document or journal line in your company, a corresponding document or journal line is created in your intercompany outbox that you can transfer to your partner. Your partner can then post the corresponding transaction in their company, without having to re-enter the data.

For sales and purchase documents, the intercompany partner code on the involved customer or vendor ensures that all orders and invoices generated pertaining to transactions with these companies will produce corresponding documents in the partner company, resulting in correct balancing of the accounts.

For intercompany general journal lines, you do not need to specify the accounts for an individual set of books, but simply give the identification of the partner company. Corresponding intercompany general journal lines are then created in the partner company that result in the balancing of the books of both companies involved in a transaction.

To fill in and send an intercompany sales order

You can send sales and purchase orders and return orders before posting. Invoices and credit memos cannot be sent until they are posted.

The following procedure describes how to fill in and send an intercompany sales order. The same steps apply to intercompany purchase orders and return orders, and to posted intercompany invoices and credit memos.

1. Choose the  icon, enter **Sales Orders**, and then choose the related link.
2. Choose **New** to create a new sales order. For more information, see [Sell Products](#).
3. Fill in the fields as necessary. Hover over a field to read a short description.
4. Make sure the customer is an intercompany partner.
5. To send the sales order before you post it, choose the **Send IC Sales Order** action.

NOTE

If you do perform step 4, then the sales order will be moved to your intercompany outbox where you can send it later. For more information, see [Manage the Intercompany Inbox and Outbox](#).

To fill in and post an intercompany journal

When you post an intercompany general journal line in your company, a corresponding journal line is created in your intercompany outbox that you can transfer to your partner. Your partner can then post the corresponding transaction in their company, without having to re-enter the data.

1. Choose the  icon, enter **Intercompany General Journals**, and then choose the related link.
2. Open the relevant journal batch. For more information, see [Working with General Journals](#).
3. Fill in the fields as necessary.
4. In the **IC Partner G/L Acc. No.** field, enter the intercompany general ledger account that the amount will be posted to in your partner's company.

NOTE

This field must be filled in on a line with a bank account or general ledger account in either the **Account No.** field or the **Bal. Account No.** field.

5. Choose the **Post** action.

The involved entries are posted in your company and a journal with the corresponding entries are created in your intercompany outbox that you can send to your partner company. For more information, see [Manage the Intercompany Inbox and Outbox](#).

Manage the Intercompany Inbox and Outbox

3/31/2019 • 4 minutes to read

All of the intercompany transactions that you receive electronically from your intercompany partners are listed in the intercompany Inbox.

Organizing the Inbox

You can use the filter fields at the top of the inbox page to determine which transactions are shown on the page. For example, if you only want to look at transactions a particular partner created, you can enter filters in the **Transaction Source** and **Intercompany Partner Code** filters.

Transaction Source

What you can do with a transaction depends whether it was:

- Created by your intercompany partner
- Rejected by your intercompany partner and returned to you

You can use the **Show Transaction Source** field to filter the **Intercompany Inbox Transactions** page so that it displays only one of these types of transactions. (You can also filter by intercompany partner, or by the contents of the **Line Action** field.)

Created by Intercompany Partner

When you receive a new transaction that was created by your partner, you can choose to either:

- Accept the transaction
- Reject the transaction (Return to partner)
- Cancel the transaction (Delete the transaction but do not return it to your partner)

Returned from Intercompany Partner

If the transaction was rejected by your intercompany partner, your only choice is to cancel the transaction in the inbox. Then you must create correction lines or reverse the journal or document in your company.

Recreating Inbox Entries

If you accepted a transaction in your inbox but then deleted the document or journal instead of posting it, you can re-create the inbox entry and accept it again.

Getting an Overview of Intercompany Transactions for a Period

You can get an overview of all of the intercompany transactions that you have sent and received in a period. The **Intercompany Transactions** report lists all intercompany G/L entries, customer ledger entries, and vendor ledger entries.

NOTE

If the intercompany partners are in the same database, then transactions are transferred without the need for file or email. See the **Transfer Type** field on the **Intercompany Partner** page.

In that case, you can set the system up to bypass the inbox and outbox by selecting the **Auto. Accept Transactions** check box on the **Intercompany Partner** page and the **Auto. Send Transactions** check box on the **Intercompany Setup** page respectively.

To import intercompany transactions from a file

If you have an intercompany partner that is not in the same database as your company, you can receive intercompany transactions from that partner in an .xml file. Then you must import the transactions into your inbox.

1. Choose the  icon, enter **Company Information**, and then choose the related link.
2. Save the file to the location that you specified in the **Intercompany Inbox Details** field on the **Company Information** page.
3. Choose the  icon, enter **Intercompany Inbox Transactions**, and then choose the related link.
4. On the **Intercompany Inbox Transactions** page, choose the **Import Transaction File** action.
5. on the page that appears, select the .xml file that contains the transactions, and then choose the **Open** button.

The transactions are imported into the inbox and you can now process them.

To process incoming intercompany transactions

When your intercompany partners send you intercompany transactions, the transactions end up in your intercompany inbox. You must evaluate each transaction in your inbox and act upon it.

1. Choose the  icon, enter **Intercompany Inbox Transactions**, and then choose the related link.
2. On the **Intercompany Inbox Transactions** page, select a line, and then choose an action, such as **Accept**, to process the line.
3. On the **Complete IC Inbox Action** page, fill in the fields as necessary. Hover over a field to read a short description.
4. Choose the **OK** button.

For lines that you processed with the **Accept** action, document or journal lines will be created in your company. Open each document or journal, make any necessary changes, and then post them.

Lines that you processed with the **Return to Partner** action will be moved to the outbox from where you can then send them to your partner.

For lines that you processed with the **Returned by Partner** action, you must now post a correction to the original transaction that you posted in your company.

To process outgoing intercompany transactions

When you post an intercompany journal or document, or send an intercompany order confirmation, the transactions are sent to your intercompany outbox. In order for them to be sent on to your intercompany partners, you must open the outbox and process them.

1. Choose the  icon, enter **Intercompany Outbox Transactions**, and then choose the related link.
2. On the **Intercompany Outbox Transactions** page, select a line, and then choose an action, such as **Return to Inbox**, to process the line.

Lines that you processed with the **Send to Intercompany Partner** action will be sent to the relevant partner's inbox.

Lines that you processed with the **Return to Inbox** action will be moved to the inbox where you can then accept them to create documents or journal lines in your company.

For lines that you processed with the **Cancel** action, you must now post a correction to the original transaction that you posted in your company.

To recreate intercompany inbox transactions

Occasionally, you may want to re-create a transaction in the inbox or outbox. For example, if you accepted a transaction in your inbox but then deleted the document or journal instead of posting it, you can re-create the inbox entry and accept it again.

The following procedure describes to re-create inbox transactions, but the same steps also apply to the outbox.

1. Choose the  icon, enter **Handled IC Inbox Transactions**, and then choose the related link.
2. On the **Handled IC Inbox Transactions** page, select the line with the transaction that you want to re-create in the inbox, and then choose the **Re-create Inbox Transaction** action.

Terminology in Cost Accounting

3/31/2019 • 5 minutes to read

This topic defines the key terms that are used in cost accounting.

Key Terms

The following table shows definitions of the key terms in cost accounting.

TERM	DEFINITION
Allocation key	The allocation key is the basis that is used to allocate costs. It is typically a quantity, such as square meters occupied, number of employees, or man-hours used. For example, two departments, with 20 and 10 employees respectively, share canteen costs. The costs are distributed between the departments by using an allocation key that represents the number of employees. Two thirds of the costs are allocated to the first department, and one third of the costs are allocated to the second department.
Allocation source	The allocation source establishes which costs are allocated. Allocations are defined in allocation source and allocation target tables. Each allocation consists of an allocation source and one or more allocation targets. For example, all costs for the heating cost type, which is an allocation source, can be allocated to the workshop, production, and sales cost centers, which are three allocation targets.
Allocation target	The allocation targets determine where the costs are allocated. Allocations are defined in allocation source and allocation target tables. Each allocation consists of an allocation source and one or more allocation targets. For example, all costs for the heating cost type, which is an allocation source, can be allocated to the workshop, production, and sales cost centers, which are three allocation targets.
Cost accounting	In cost accounting, actual costs of operations, processes, departments, or products are recorded. These costs are allocated to cost centers and cost objects by using different cost allocation methods. Managers use statistics and reports, such as cost distribution sheet and profit and loss analysis to make decisions and reduce costs. Cost accounting retrieves data from the general ledger, but works independently. Therefore transactions posted in cost accounting do not affect the data in the general ledger.
Cost type	The chart of cost types has the same function as the chart of accounts in the general ledger. They are often structured similarly. Therefore it is possible to transfer the general ledger chart of accounts to the chart of cost types and then modify it. The chart of cost types can also be created from scratch.

TERM	DEFINITION
Cost center	Cost centers are most often departments and profit centers that are largely responsible for company's costs and income. Cost centers can be synchronized with dimensions in the general ledger. It is also possible to add new cost centers and define their own sorting with subtotals.
Cost object	Cost objects are products, product groups or services of a company, the finished goods of a company, that in the end carry the costs. Cost objects can be synchronized with dimensions in the general ledger. It is also possible to add new cost objects and define their own sorting with subtotals.
Cost allocation	Cost allocation is a process of allocating costs to cost centers or cost objects. For example, the wage of the truck driver of the sales department is allocated to the sales department cost center. It is not necessary to allocate the wage cost to other cost centers. Another example is that the cost of an expensive computer system is allocated to the products of the company that use the system.
Dynamic allocation	Dynamic allocations are dependent on changeable allocation bases, for example, the number of department employees, or the sales revenue of the project within a certain period of time. There are nine predefined dynamic allocation bases that users can define by using five filters.
Direct cost	Direct costs are the costs that can be directly allocated to a cost object, for example, material purchase for a specific product.
Fixed cost	Fixed costs are the costs that are not dependent on the level of goods or services produced by the company. They tend to be time-related, such as salary or rent being paid per month. They are in contrast to variable costs, which are volume-related, and are paid per quantity produced.
Indirect cost	Indirect costs are not directly accountable to a cost object, such as a particular function or product. Indirect costs may be either fixed or variable. Indirect costs can be tax, administration, personnel, and security costs and are also known as overhead costs.
Level	Level is used to define allocation order. Level is defined as a number between 1 and 99. The allocation posting follows the order of the levels. For example, level ensures that first administration is allocated to workshop before workshop is allocated to vehicle and production.
Static allocation	Static allocations are based on a fixed set of values, for example, the square meters used, or an established allocation ratio, such as 5:2:4.
Operational cost	Operational costs are the recurring expenses which are related to the operation of a business, a device, and a component.

TERM	DEFINITION
Overhead cost	Overhead costs refer to ongoing expenses of operating a business. They are all costs on the income statement except for direct labor, direct materials, and direct expenses. Overhead costs include accounting fees, advertising, depreciation, insurance, interest, legal fees, rent, repairs, supplies, taxes, telephone bills, travel, and utilities costs.
Step variable cost	Step variable costs are costs that change dramatically at certain points because they involve large purchases that cannot be spread out over time. For example, one employee can produce 100 tables in a month. The employee's wage is constant over a production range of 1 to 100 tables. If the company wants to produce 110 tables, the company needs two employees. So the cost will double.
Share	The portion or part that is allocated among cost centers or cost objects.
Static weighting	Costs are allocated according to allocation keys, which can be modified by using a multiplier. For example, two departments, with 20 and 10 employees respectively, share canteen costs. The costs are distributed between the departments by using an allocation key that represents the number of employees that eat in the canteen. In the first department, only 5 employees eat in the canteen, so this department has a multiplier of 0.25. The basis for allocation is $20 \times 0.25 = 5$. The total number of employees that eat in the canteen is 15. One third of the costs are allocated to the first department and two thirds of the costs are allocated to the second department.
Variable cost	Variable costs are expenses that change in proportion to the activity of a business. Variable costs are the sum of marginal costs over all units produced. Fixed costs and variable costs make up the two components of total costs.
Variant	A variant is used as an optional user-defined label for allocations. The purpose of the label is to filter groups of allocation.

About Cost Accounting

3/31/2019 • 3 minutes to read

Cost accounting can help you understand the costs of running a business. Cost accounting information is designed to analyze:

- What types of costs that you incur when you run a business?
- Where do the costs occur?
- Who bears the costs?

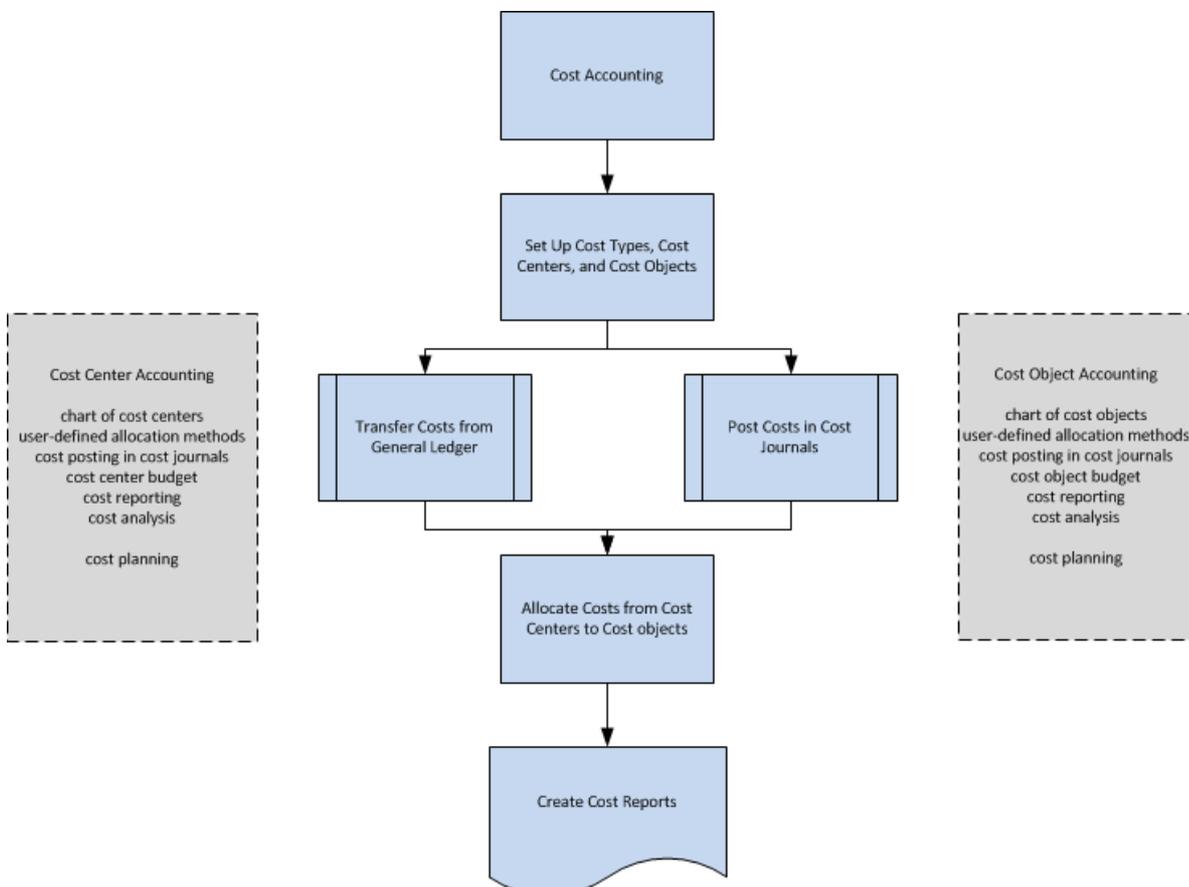

In cost accounting, you allocate actual and budgeted costs of operations, departments, products, and projects to analyze the profitability of your company.

Workflow in Cost Accounting

Cost accounting has the following main components:

- Cost types, cost centers, and cost objects
- Cost entries and cost journals
- Cost allocations
- Cost budgets
- Cost reporting

The following diagram shows the workflow in cost accounting.

Cost Types, Cost Centers, and Cost Objects

You define cost types, cost centers, and cost objects to analyze what the costs are, where the costs come from, and who should bear the costs.

You define a chart of cost types with a structure and functionality that resembles the general ledger chart of accounts. You can transfer the general ledger income statement accounts or create your own chart of cost types.

Cost centers are departments and profit centers that are responsible for costs and income. Often, there are more cost centers set up in cost accounting than in any dimension that is set up in the general ledger. In the general ledger, usually only the first level cost centers for direct costs and the initial costs are used. In cost accounting, additional cost centers are created for additional allocation levels.

Cost objects are products, product groups, or services of a company. These are the finished goods of a company that carry the costs.

You can link cost centers to departments and cost objects to projects in your company. However, you can link cost centers and cost objects to any dimensions in the general ledger and supplement them with subtotals and titles.

Cost Entries and Cost Journals

Operational costs can be transferred from the general ledger. You can automatically transfer the cost entries from the general ledger to cost entries with each posting. You can also use a batch job to transfer the general ledger entries to cost entries based on daily or monthly summary posting.

In cost journals, you can post cost and activities that do not come from the general ledger or are not generated by allocations. For example, you can post pure operational costs, internal charges, allocations, and corrective entries between cost types, cost centers, and cost objects individually or on a recurring basis.

Cost Allocations

Allocations move costs and revenues between cost types, cost centers, and cost objects. Overhead costs are first posted to cost centers and later charged to cost objects. For example, this might be done in a sales department that sells several products at the same time. Direct costs can be directly allocated to a cost object, such as a material purchased for a specific product.

The allocation base that is used and the accuracy of the allocation definition have an influence on the results of cost allocations. The allocation definition is used to allocate costs first from so-called pre-cost centers to main cost centers and then from cost centers to cost objects.

Each allocation consists of an allocation source and one or more allocation targets. You can allocate actual values or budgeted values by using the static allocation method that is based on a definite value, such as square footage, or an established allocation ratio of 5:2:4. You can also allocate actual values or budgeted values by using the dynamic allocation method with nine predefined allocation bases and 12 dynamic date ranges.

Cost Budgets

You can create as many cost budgets as you want. You can copy the cost budget to the general ledger budget and vice versa. You can transfer budgeted costs as actual costs.

Cost Reporting

Most reports and statistics are based on the posted cost entries. You can set the sorting of the results and use filters to define which data must be displayed. You can create reports for cost distribution analysis. In addition, you can use the standard account schedules to define how your reports for the chart of cost types are displayed.

Setting Up Cost Accounting

3/31/2019 • 10 minutes to read

Before you start working with cost accounting, you must perform setup tasks.

Balances Between Cost Type, Cost Center, and Cost Object

When you set up cost accounting, you must make sure that all entries are assigned to a cost type as well as a cost center or a cost object. This means that each cost entry must have a cost type assigned and a cost center code or a cost object assigned. This rule ensures that each cost entry appears in either the cost centers or the cost objects, but never in both places.

By doing this, you create the following accounting equation:

$$\text{Cost Type Balance} = \text{Cost Center Balance} + \text{Cost Object Balance}$$

When you print the chart of cost type, the chart of cost centers, and the chart of cost objects reports, you can analyze this relationship.

Setting Up Cost Types

The chart of cost types is similar to the chart of accounts in the general ledger. You can set up the chart of cost types in the following ways:

- Structure the chart of cost types similar to the income statement accounts in the general ledger chart of accounts. Then, you can transfer the general ledger chart of accounts to the chart of cost types. You can make any necessary adjustments after the transfer.
- Create new chart of cost types or add new cost types to existing chart of cost types. You must create each new cost type individually.

To transfer the general ledger chart of accounts to the chart of cost types

1. Choose the  icon, enter **Chart of Cost Types**, and then choose the related link.
2. Choose the **Get Cost Types from Chart of Accounts** action. In the dialog box, choose the **Yes** button to confirm the transfer. The function uses the chart of accounts to create a chart of cost types.

The chart of cost types now contain all income statement accounts in the general ledger and include headings and subtotals. You can change the chart of cost types, as necessary. For example, you can delete duplicate existing cost types.

IMPORTANT

The **Register Cost Types in Chart of Accounts** function updates the relationship between the chart of accounts and the chart of cost types. The **No.** field is filled and verified to make sure that each general ledger account is related to only one cost type. The function runs automatically before transferring general ledger entries to cost accounting.

To set up new cost types in the Chart of Cost Types page

1. Open the **Chart of Cost Types** page in edit mode.
2. Fill in the fields as described as necessary. Hover over a field to read a short description.

NOTE

You can set up and maintain cost types in either the **Cost Type Card** page or on the **Chart of Cost Types** page. In this procedure, you set up cost types on the **Chart of Cost Types** page.

3. After you have created all cost types, choose the **Indent Cost Types** action. In the dialog box, choose the **Yes** button.
4. Link the new cost type to the corresponding general ledger account.

IMPORTANT

If you have entered definitions in the **Totaling** fields for the line type of **End-Total** before you run the **Indent Cost Types** function, then you must enter the definitions again because the function overwrites the values in all **End-Total** fields.

To update cost types

1. On the **Cost Accounting Setup** page, select if you want the chart of cost types to be automatically updated when the chart of accounts is changed.
2. In the **Align G/L Account** field, you can choose from the following options.
 - **No Alignment** - There is no corresponding change in the chart of cost types when you change the chart of accounts.
 - **Automatic** - A corresponding change is made in the chart of cost types when you change the chart of accounts.
 - **Prompt** - A message is displayed asking if you want to make a corresponding change in the chart of cost types when you change the chart of accounts.

Defining the Relationship Between Cost Types and General Ledger Accounts

The relationship between the cost type and the general ledger account is created in the cost type and in the general ledger account.

- The **G/L Account Range** field in the **Cost Type** table establishes which general ledger accounts belong to a cost type.
- The **Cost Type No.** field in the chart of accounts establishes which cost type a general ledger account belongs to.

These two fields are filled automatically when you use the **Get Cost Types from Chart of Accounts** function.

Relationship Between General Ledger Accounts and Cost Types

There is an n:1 relationship between general ledger accounts and cost types. Several general ledger accounts can belong to one cost type, but each general ledger account belongs to only one cost type. The following table describes the details in the relationship.

RELATIONSHIP	G/L ACCOUNT RANGE	COST TYPE NO.
One general ledger account for each cost type	One general ledger account	One cost type

RELATIONSHIP	G/L ACCOUNT RANGE	COST TYPE NO.
Several general ledger accounts for one cost type	General ledger account range, for example, 7110..7193 for each general ledger account	For each general ledger account in the range, there is only one cost type
Cost types without corresponding general ledger accounts		
General ledger accounts whose entries will not be transferred		

Cost Types Without a Relationship to the General Ledger

A cost type may not have a relationship to general ledger accounts if one of the following conditions is true:

- Accounts for operational accounting, such as Calc. Interest and Depreciation, only take costs from the operational accounting.
- Helping cost types, such as cost types 9901, 9902, and 9903 in the Business Central database, are used as credit and debit accounts for allocations.
- The helping account, 9920 in the Business Central database, contains actual accruals that show the difference between costs and the expense from the general ledger.

Setting Up Cost Centers

Cost centers are departments that are responsible for costs and income. The chart of cost centers is similar to the dimension information for the general ledger. You can set up the chart of cost centers in the following ways:

- Transfer dimension values in the general ledger to the chart of cost centers. You can make any necessary adjustments after the transfer.
- Create a new chart of cost center that is independent of the general ledger or add a new cost center to an existing chart of cost center. You must create each cost center individually.

To transfer dimension values in the general ledger to the chart of cost centers

1. Set up a dimension to be the cost center dimension on the **Update Cost Acctg. Dimensions** page. Only the values from this dimension are transferred.
2. Choose the  icon, enter **Chart of Cost Centers**, and then choose the related link.
3. On the **Actions** tab, in the **Functions** group, choose **Get Cost Centers from Dimension** to transfer dimension values to the chart of cost centers. The function transfers the dimension values that you defined in step 1.

NOTE

You can set up the **Align Cost Center Dimension** field to define a one-way synchronization of dimension values from the general ledger to the chart of cost centers. You cannot define a synchronization of the chart of cost centers to dimension values from the general ledger.

The chart of cost centers now contains all specified dimension values from the general ledger and includes titles and subtotals.

To create new cost centers in the Chart of Cost Centers page

You can set up and maintain cost centers in either the **Cost Center Card** card or on the **Chart of Cost Centers** page. In this procedure, you set up cost centers on the **Chart of Cost Centers** page.

1. Open the **Chart of Cost Centers** page in edit mode.
2. In the **Code** field, enter the cost center code. All cost centers must have a code.
3. In the **Name** field, enter the cost center name.
4. Choose the drop-down arrow in the **Line Type** field to specify the purpose of the cost center.
 - For cost centers of the **Total** type, you must fill in the **Totaling** field. Use the **or** operator, which is a vertical line (|) to set ranges of cost centers.
 - For cost centers of the **End-Total** line type, this field is filled in automatically when you use the indent function.
5. Fill in the **Sorting Order** and **Cost Subtype** fields.
6. Choose the next empty line to create a new cost center, and then repeat steps 2 through 5.
7. After you have set up all the cost centers, choose the **Indent Cost Centers** action. Choose the **Yes** button.

IMPORTANT

If you have entered definitions in the **Totaling** fields for **End-Total** cost centers before you run the indent function, then you must enter them again. The function overwrites the values in all **End-Total** fields.

Setting Up Cost Objects

Cost objects are projects, products, or services of a company. The chart of cost objects is similar to the dimension information for the general ledger. You can set up the chart of cost objects in the following ways:

- Transfer dimension values in the general ledger to the chart of cost objects. You can make any necessary adjustments after the transfer.
- Create a new chart of cost object that is independent of the general ledger or add a new cost object to an existing chart of cost objects. You must create each cost object individually.

To transfer dimension values from the general ledger to the chart of cost objects

1. Set a dimension to be the cost object dimension on the **Update CA Dimensions** page. Only the values from this dimension are transferred.
2. Choose the  icon, enter **Chart of Cost Objects**, and then choose the related link.
3. Choose the **Get Cost Objects from Dimension** action to transfer dimension values to the chart of cost objects. The function transfers the dimension values that you defined in step 1.

NOTE

You can set up the **Align Cost Object Dimension** field to define a one-way synchronization of dimension values from the general ledger to the chart of cost objects. You cannot define a synchronization of the chart of cost objects to dimension values from the general ledger.

The chart of cost objects now contains all specified dimension values from the general ledger and includes titles and subtotals.

To create new cost objects in the Chart of Cost Objects page

You can set up and maintain cost objects in either the **Cost Object Card** card or on the **Chart of Cost Objects** page. In this procedure, you set up cost objects on the **Chart of Cost Objects** page.

1. Open the **Chart of Cost Objects** page in edit mode.

2. In the **Code** field, enter the cost object code. All cost objects must have a code.
3. In the **Name** field, enter the cost object name.
4. Choose the drop-down arrow in the **Line Type** field to specify the purpose of the cost object.
 - For cost objects of the **Total** line type, fill in the **Total From/To** field. Use the **or** operator, which is a vertical line (|), to set ranges of cost objects.
 - For cost objects of the **End-Total** line type, this field is filled in automatically when you use the indent function.
5. Fill in the **Sorting Order** field.
6. Choose the next empty line to create a new cost object, and then repeat steps 2 through 5.
7. After you have set up all the cost objects, choose the **Indent Cost Objects** action. Choose the **Yes** button.

IMPORTANT

If you have entered definitions in the **Total From/To** fields for **End-Total** cost objects before you run the indent function, then you must enter them again. The function overwrites the values in all **End-Total** fields.

Defining Cost Centers and Cost Objects for Chart of Accounts

You can automatically transfer the expense and income entries from the general ledger to cost accounting either for each general ledger posting or with a batch job. When you do the transfer, Business Central only transfers the entries that are already linked to a cost center or a cost object. To establish a meaningful transfer, you must ensure that the cost centers and cost objects are correctly defined.

Defining Default Dimension Values for General Ledger Accounts

For each general ledger account, you can define default dimension values in the **Default Dimension** table. The following example shows how to define that there should always be a DEPARTMENT cost center, but never be a PROJECT cost object when posting to a general ledger account.

DIMENSION CODE	VALUE POSTING
Department	Code Mandatory
Project	No Code

Defining Dimension Values for Overhead Costs and Direct Costs

You can transfer overhead costs to a cost center and direct costs to a cost object. The following table shows the optimal combination of the dimension setup values.

TRANSFER TO	COST CENTER POSTING	COST OBJECT POSTING
Cost Center	Code Mandatory	No Code
Cost Object	No Code	Code Mandatory

NOTE

To make sure that the predefined cost center and cost object that you set up in the general ledger are automatically carried over to cost accounting, select the **Check G/L Postings** check box in the Cost Accounting Setup page.

Transferring and Posting Cost Entries

3/31/2019 • 5 minutes to read

Before you define cost allocations, you must understand how cost entries come from the following sources:

- Automatic transfer of general ledger entries.
- Manual cost posting for pure cost entries, internal charges, and manual allocations.
- Automatic allocation postings for actual costs.
- Transfer of budget entries to actual.

Criteria for Transferring General Ledger Entries to Cost Entries

It is important to understand the criteria for transferring general ledger entries to cost entries. During the transfer, the **Transfer GL Entries to CA** batch job uses the following criteria to determine if and how the general ledger entries are transferred.

General ledger entries are transferred if:

- The entries have dimension values corresponding to either a cost center or a cost object.
- The entries have dimension values that correspond to a cost center and a cost object. For these entries, the cost center takes precedence. This helps avoid a situation where a cost type appears in both a cost object and a cost center and is therefore counted twice in the statistics.
- The document number in the entries is empty, so it will appear with a document number of 0000 in the cost entries.
- The entries are transferred to a cost type that allows for combined entries and these entries are transferred as a combined entry either monthly or daily.

General ledger entries are not transferred if:

- The entries have dimension values that do not correspond to a cost center or a cost object.
- The entries have an amount of zero.
- The entries have a general ledger account that has been deleted.
- The entries have a general ledger account that is not of the type **Income Statement**.
- The entries have a general ledger account that is not assigned a cost type.
- The entries have a posting date before the **Starting Date for G/L Transfer**.
- The entries have been posted with a closing date. These are typically entries that set back the balance of the income statement at the end of the year.

Transferring General Ledger Entries to Cost Entries

You can transfer general ledger entries to cost entries.

Before you run the process for transferring general ledger entries to cost entries, you must prepare the transfer to avoid manual correction posting.

To prepare the transfer

1. Choose the  icon, enter **Cost Accounting Setup**, and then choose the related link.
2. On the **Cost Accounting Setup** page, verify that the **Starting Date for G/L Transfer** field is set to the correct value.
3. Choose the  icon, enter **Chart of Cost Types**, and then choose the related link.

4. On the **Cost Type Card** page, verify that the **G/L Account Range** field is linked correctly for each cost type to take entries from the general ledger.
5. Choose the  icon, enter **Chart of Accounts**, and then choose the related link.
6. For each relevant general ledger account, on the **G/L Account Card** page, verify that the **Cost Type No.** field is linked correctly to a cost type. For more information, see [Setting Up Cost Accounting](#).
7. Verify that all relevant general ledger entries have dimension values that correspond to a cost center and a cost object.

To transfer general ledger entries to cost entries

1. Choose the  icon, enter **Transfer GL Entries to CA**, and then choose the related link.
2. Choose the **Yes** button to start the transfer. The process transfers all general ledger entries that have not already been transferred.

During the transfer, the process creates connections in the entries in the **Cost Entry** table and the **Cost Register** table. This makes it possible to trace the source of cost entries.

Automatic Transfer and Combined Entries

In cost accounting, you can transfer general ledger entries to a cost type by using a combined posting. You can specify if a cost type receives combined entries in the **Combine Entries** field in the cost type definition. The following table describes the different options.

COMBINE ENTRIES	DESCRIPTION
None	Each general ledger entry is transferred individually to the corresponding cost type.
Day	General ledger entries with the same posting date are transferred as one entry to the corresponding cost type.
Month	All general ledger entries in the same calendar month are transferred as one entry to the corresponding cost type.

IMPORTANT

If you have selected the **Auto Transfer from G/L** check box on the **Cost Accounting Setup** page, Business Central updates the cost accounting after every posting in the general ledger. Combined entries are not possible.

Results of Transferring General Ledger Entries to Cost Entries

During the transfer of general ledger entries to cost entries, Business Central creates connections in the entries in the **G/L Entry** table, the **Cost Entry** table, and the **Cost Register** table to make it possible to trace the connections between cost entries and general ledger entries.

General Ledger Entries

For each general ledger entry that is transferred to cost accounting, Business Central fills the cost **Entry No.** field.

Cost Entries

For each cost entry, Business Central saves the entry number of the corresponding general ledger entry in the **G/L Entry No.** field in the **Cost Entry** table.

For combined cost entries, Business Central saves the entry number of the last general ledger entry, which is the entry with the highest entry number.

The **G/L Account** field in the **Cost Entry** table contains the number of the general ledger account that the cost entry came from.

For single cost entries, Business Central transfers the posting text from the general ledger entry to the **Description** text field. For combined entries, the text field shows these entries are transferred as combined entries. For example, for a combined entry for the month of October in 2013, the text can be **Combined Entries, October 2013**.

Cost Register

In the **Cost Register** table, Business Central creates an entry with the source transfer from general ledger. The entry records the first and last entry numbers of the general ledger entries that are transferred, in addition to the first and last entry numbers of the cost entries that are created.

[Accounting for Costs](#)

Defining and Allocating Costs

3/31/2019 • 7 minutes to read

Cost allocations move costs and revenues between cost types, cost centers, and cost objects. You can define as many allocations as you need. Each allocation consists of:

- An allocation source.
- One or more allocation targets.

The allocation source establishes which costs must be allocated, and the allocation targets determine where the costs must be allocated. For example, an allocation source can be the costs for the Electricity and Heating cost type. You allocate all electricity and heating costs to three cost centers: Workshop, Production, and Sales. These cost centers are your allocation targets.

For each allocation source, you define an allocation level, a validity period, and a variant as grouping identifier. You can use a batch job to set filters to select allocation definitions and then run cost allocations automatically.

For each allocation target, you define an allocation base. The allocation base can be either static or dynamic.

- Static allocation bases are based on a definite value, such as square footage or an established allocation ratio, such as 5:2:4.
- Dynamic allocation bases depend on changeable values, such as the number of employees in a cost center or sales revenue of a cost object throughout a certain time period.

The following table describes a sequence of tasks, with links to the topics that describe them.

Setting Up Allocation Source and Targets

Each allocation consists of an allocation source and one or more allocation targets. The allocation source defines which costs will be allocated. The allocation targets determine where the costs will be allocated.

To set up cost allocations

1. Choose the  icon, enter **Cost Allocation**, and then chose the related link.
2. On the **Cost Allocation** page, choose the **Edit** action.
3. Enter an ID for the allocation source in the **ID** field.
4. Define a level as a number between 1 and 99 in the **Level** field. The allocation posting will follow the order of the levels.
5. Enter a cost type to define which cost types will be allocated in the **Cost Type Range** field. If all costs for a cost type are allocated, no range is defined.
6. Enter a cost center together with costs to be allocated in the **Cost Center Code** field.
7. Enter a cost object together with costs to be allocated in the **Cost Object Code** field. Most often, this field stays empty, because cost objects are rarely allocated to other cost objects.
8. Enter a cost type in the **Credit to Cost Type** field. The costs that are allocated will be credited to the source cost type. The credit posting will be posted to the cost type given here.
9. On the **Lines** FastTab, define the allocation targets. On the first line, enter a cost type in the **Target Cost Type** field. It defines which cost type the allocation is debited to.
10. On the first line, enter the first allocation target in the **Target Cost Center** field or **Target Cost Object** the field. These two fields define which cost center or cost object the allocation is debited to. You can only fill in one of these fields, but not both.
11. Repeat the same steps on the second line to set up additional allocation targets.

12. After you have set up the allocation target and sources, choose the **Calculate Allocation Key** action to calculate the total share values.

NOTE

Select the **Blocked** check box to deactivate the allocation setup.

Setting Filters for Dynamic Allocation Bases

The dynamic allocation method is based on changeable values. For example, the number of employees in a cost center or the items sold of a cost object in a specific time period. There are nine pre-defined allocation bases and twelve dynamic date ranges. You set different filters based on the allocation base.

Setting Filters for Dynamic Allocation Bases

The following table shows which filters are possible for different allocation bases and which values are valid in the **No. Filter** and **Group Filter** fields. Press F1 in the **Date Filter Code** field to read detailed descriptions.

BASE	NO. FILTER	DATE FILTER CODE	COST CENTER FILTER	COST OBJECT FILTER	GROUP FILTER
G/L Entries	G/L Account	Yes	Yes	Yes	N/A
G/L Budget Entries	G/L Account	Yes	Yes	Yes	G/L Budget Name
Cost Type Entries	Cost Type	Yes	Yes	Yes	N/A
Cost Budget Entries	Cost Type	Yes	Yes	Yes	Budget Name
No of Employees	N/A	Yes	Yes	Yes	N/A
Items Sold (Qty)	Item No.	Yes	Yes	Yes	Inventory Posting Group
Items Purchased (Qty)	Item No.	Yes	Yes	Yes	Inventory Posting Group
Items Sold (Amount)	Item No.	Yes	Yes	Yes	Inventory Posting Group
Items Purchased (Amount)	Item No.	Yes	Yes	Yes	Inventory Posting Group

Scenario 1: Defining Static Allocations Based on Allocation Ratio

Static allocation method is based on a definite value, such as square meters used, or an established allocation ratio such as 5:2:4.

This topic describes how to define three new allocation target cost objects for the allocation source PROD cost center using the established allocation ratio 5:2:4. The three target cost objects are ACCESSO, PAINT, and FITTINGS.

NOTE

The example uses the demo data in the Business Central.

To define the allocation source PROD cost center on the General FastTab

1. Choose the  icon, enter **Cost Allocation**, and then choose the related link.
2. On the **Cost Allocation** page, choose the **New** action.
3. In the **ID** field, press Enter or enter an ID.
4. In the **Level** field, enter **1**.
5. In the **Valid From** and **Valid To** fields, enter appropriate dates.
6. In the **Cost Center Code** field, enter **PROD**.
7. In the **Credit to Cost Type** field, enter the cost type **9903**.

To define the allocation target cost objects on the Lines FastTab

1. On the first line, in the **Target Cost Type** field, enter **9903**.
2. On the first line, in the **Target Cost Object** field, select **ACCESSO**.
3. On the first line, in the **Allocation Target Type** field, select **All Costs** to define how all accrued costs are allocated.
4. On the first line, in the **Base** field, select **Static** to use the static allocation method.
5. On the first line, in the **Share** field, enter the allocation ratio **5**.
6. On the second line, in the **Target Cost Type** field, enter **9903**.
7. On the second line, in the **Target Cost Object** field, select **PAINT**.
8. On the second line, in the **Allocation Target Type** field, select **All Costs** to define how all accrued costs are allocated.
9. On the second line, in the **Base** field, select **Static** to use the static allocation method.
10. On the second line, in the **Share** field, enter the allocation ratio **2**.
11. On the third line, in the **Target Cost Type** field, enter **9903**.
12. On the third line, in the **Target Cost Object** field, select **FITTINGS**.
13. On the third line, in the **Allocation Target Type** field, select **All Costs** to define how all accrued costs are allocated.
14. On the third line, in the **Base** field, select **Static** to use the static allocation method.
15. On the third line, in the **Share** field, enter the allocation ratio **4**.

IMPORTANT

Business Central automatically calculates the **Percent** field using a percentage rate that is dependent on all three allocation ratios that are entered in the **Share** field for all three lines.

Scenario 2: Defining Dynamic Allocations Based on Items Sold

This topic shows an example of how to define allocations by using the dynamic allocation method. In the example, you change the dynamic allocation of the costs for the SALES cost center to support the new cost object IT EQUIPMENT. IT EQUIPMENT packages have item numbers in the range from 8904-W to 8924-W. You use the previous year's sales figures to calculate the share. The allocation is posted to the helping cost type 9903.

NOTE

The example uses the demo data in the Business Central.

To define dynamic allocations based on items sold in the previous year

1. Choose the  icon, enter **Cost Allocations**, and then choose the related link.
2. On the **Cost Allocation** page, choose the **New** action.
3. In the **ID** field, press Enter or enter an ID.
4. In the **Level** field, enter **1**.
5. In the **Valid From** and **Valid To** fields, enter appropriate dates.
6. In the **Cost Center Code** field, enter **SALES**.
7. In the **Credit to Cost Type** field, enter the cost type **9903**.
8. In the **Target Cost Type** field, enter the cost type **9903**.
9. In the **Target Cost Object** field, choose **New** to create a new cost object IT EQUIPMENT and fill in fields as necessary. Select **IT EQUIPMENT**. Leave the **Target Cost Center** field blank.
10. In the **Allocation Target Type** field, select **All Costs** to define how all accumulated costs are allocated.
11. In the **Base** field, select the allocation base **Items Sold (Amount)**.
12. In the **No. Filter** field, enter **8904-W..8924-W**.
13. In the **Date Filter Code** field, enter **Last Year**.
14. Choose the **Calculate Allocation Key** action to calculate the share.

IMPORTANT

Business Central uses the previous years' sales figures to calculate a share of 1596.50 LCY with 100 percent for the IT EQUIPMENT packages. This means that all of the items sold last year will be allocated to the cost object IT EQUIPMENT.

Creating Cost Budgets

3/31/2019 • 2 minutes to read

Budgeting in cost accounting resembles budgeting in the general ledger. A cost budget is created based on cost types just as a budget for the general ledger is created based on general ledger accounts.

A cost budget is created for a certain period of time, for example, a fiscal year. You can create as many cost budgets as needed. You can create a new cost budget manually, or by importing a cost budget, or by copying an existing cost budget as the budget base. For more information, see [Create G/L Budgets](#).

You use the following pages to create and analyze cost budgets. Choose the  icon to find a page, and then read the tooltip for each.

TO	SEE
Transfer budgets from the general ledger.	Copy G-L Budget to Cost Acctg. batch job
Copy cost budgets.	Copy Cost Budget batch job
Allocate budgets.	Cost Allocation page
See cost budget registers and cost budget entries.	Cost Budget Registers page
Print cost budget comparisons using various reports.	Cost Acctg. Balance-Budget report Cost Acctg. Statement-Budget report Cost Budget by Cost Center report Cost Budget by Cost Object report

Delete Cost Budget Entries

3/31/2019 • 2 minutes to read

You use the **Delete Cost Budget Entries** batch job to cancel cost budget entries from the cost budget register.

To prevent any gaps in the cost budget entries and cost register entries, you cannot delete a single entry or a batch of entries in the middle of the list of register entries.

To delete a cost budget entry

1. Choose the  icon, enter **Delete Cost Budget Entries**, and then choose the related link.

The **To Register No.** field contains the last register entry number and cannot be changed.

You can use the **From Register No.** field to select a register entry number from which the deletion should begin.

2. Choose the **OK** button to delete the selected cost budget entries.

NOTE

To avoid an accidental deletion of cost budget entries, you can close register entries by marking the lines as **Closed** in the **Closed** field on the **Cost Budget Registers** page.

Managing Inventory Costs

3/31/2019 • 2 minutes to read

Cost management, also referred to as “costing”, is concerned with recording and reporting business operating costs. It includes the reporting of manufacturing costs and inventory costs, that is, the value of items.

Central principles to understand are that costing methods define how items are valued when they leave inventory, that cost adjustment updates the cost of goods sold with related purchase costs posted after the sale, and that inventory values must be posted to dedicated G/L accounts at regular intervals.

The following table describes a sequence of tasks, with links to the topics that describe them.

TO	SEE
Read various conceptual information to understand the principles and definitions that govern the inventory costing accounting functionality in Business Central.	About Inventory Costing
Learn about all mechanisms in the costing system.	Design Details: Inventory Costing
Read how inventory periods help a company to control inventory value over time by defining shorter periods that can be closed for posting as the fiscal year progresses.	Work with Inventory Periods
Read why standard costs are often used by manufacturing companies as a valuation base for components and end items.	About Calculating Standard Cost
Set up inventory periods, costing methods, and rounding methods.	Setting Up Inventory Valuation and Costing
Appreciate or depreciate the value of one or more items in inventory by posting their current, calculated value.	Revalue Inventory
Adjust item costs, either automatically or manually, to forward cost changes from inbound entries to their related outbound entries.	Adjust Item Costs
Use special costing functions for every-day item transactions in the item operations.	Handling Inventory and Manufacturing Costs
Periodically update the standard costs of components, in assembly or production BOMs, and roll the new costs up to the parent item.	Update Standard Costs
View and manually change certain item application entries that are created automatically during inventory transactions.	Remove and Reapply Item Ledger Entries

About Calculating Standard Cost

3/31/2019 • 6 minutes to read

Many manufacturing companies select a valuation base of standard cost. This also applies to companies that perform light manufacturing, such as assembly and kitting. A standard cost system determines inventory unit cost based on some reasonable historical or expected cost. Studies of past and estimated future cost data can then provide the basis for standard costs. These costs are frozen until a decision is made to change them. The actual cost to produce a product may differ from the estimated standard costs. For management control, the actual cost is compared to the standard cost for a specific item and differences, or *variances*, are identified and analyzed.

Standard costs can be maintained for items that are replenished through purchase, assembly, and production. For each replenishment method, standard costs can consist of the following elements.

REPLENISHMENT SYSTEM	STANDARD COST ELEMENTS
Purchase	Direct material cost and overhead material cost if it is required.
Assembly	Direct material cost, direct or fixed labor cost, and overhead cost.
Prod. Order	Direct material cost, labor cost, subcontractor cost, and overhead cost.

Setting Up Standard Costs

Because the standard cost of a produced or assembled item can consist of multiple cost elements, including material, capacity (labor) and direct and overhead subcontractor costs, standard costs must be established for each of these elements.

The accounting task for an item-processing company using standard costing is to:

- Estimate a standard cost of the finished item and set it up on the item card.
- Record and allocate the actual cost of the key cost elements and to account for variances.

To determine the direct cost of a finished item, all component costs must be totaled. An assembled or produced item can include subassemblies, which also consist of multiple components.

The following key cost elements make up the total direct cost of a finished processed item:

- Material costs.
- Capacity cost.
- Subcontracting costs for produced items only.

Material Costs

Material costs are costs that are associated with subassemblies and purchased raw material. Material unit cost can consist of direct and indirect cost elements.

- Direct material cost represents an invoiced amount for purchased raw materials or the processing cost of a subassembly.
- Indirect material cost, or *overhead*, can represent elements such as inventory carrying costs for the finished item after it is produced.

The setup of the material cost for purchased items that affect direct and indirect cost depends on the costing method that you have selected for the specified item. You set up cost information for either costing method on the item card. For more information, see [Register New Items](#).

The cost of scrap (production only) is an additional factor to consider when you calculate the total material cost. When a certain amount of raw material is scrapped when you assemble or produce an item, it generally causes an increase in the quantity of components that are required to produce this item. This increases the material cost of the components that are consumed when producing a parent item. You set up scrap cost for materials on either the production BOM or routing.

The material cost of a produced item can be represented in two ways that correspond to the following cost calculation bases.

COST CALCULATION BASIS	MATERIAL COST CALCULATION
Single level	Produced item is equal to the total cost of all purchased or subassembled items on that item's production BOM.
Rolled-up level or multilevel	Produced item is the sum of the material cost for all subassemblies on that item's BOM and the cost of all purchased items on that item's production BOM.

Capacity Costs

Capacity costs are the costs that are associated with internal labor and machine costs. You must set up these costs for each resource (in assembly management) and work or machine center on the routing (in production). As with materials, you can identify both direct and indirect elements of capacity cost. For example, the direct cost for a work center may be the established shop rate to perform a specific function. The indirect cost for a work center may represent some general factory expenses, such as lighting, heating, and so on. As with material costs, you can express capacity overhead as an indirect cost percentage or a fixed overhead rate.

The setup of the capacity costs of assembled items consists of the following elements:

- Direct and indirect unit cost of the resource.
- Fixed or direct resource usage type.

The setup of the capacity costs of produced items consists of the following elements:

- Direct and indirect unit cost of the machine or work center.
- Time and lot size setup.

To calculate standard capacity cost, you have to establish the standard time rates that are required to perform operations on machine and work centers. The total time to complete an operation typically consists of setup, run time, and wait and move time.

You set up the rates for each time type for each machine or work center on an individual routing.

NOTE

While run time rates apply for each item unit that is produced, the setup time rates apply for each lot. Therefore, you must prorate the routing setup time for each operation over the lot size. You specify the lot size in the corresponding field on the **Ordering** FastTab of the item card.

To specify setup time on the routing for planning but not include this expense in the standard cost calculation, clear the **Cost Incl. Setup** field on the **Manufacturing Setup** page.

On a single-level basis, this is the labor cost that is required to produce the finished production item and is

specified on the production item's routing. On a multi-level basis, this is the capacity cost that is specified for each individually produced item that is included in the parent item's BOM.

Subcontractor Costs

Subcontractor costs are the costs that are associated with services that are provided by a company's outside vendors or subcontractors. Similar to material and capacity, subcontractor costs can consist of both direct and overhead amounts. Direct subcontractor cost represents the actual charge for each unit of services that is provided. For example, overhead subcontractor cost can represent freight and handling costs that are incurred by the company with a subcontracted order.

Because subcontracting is an outsourced capacity, you set up the cost of both direct and indirect subcontracting services on the work center card that represents the subcontracting operation.

Updating Standard Costs

To update or calculate the standard cost of assembly items, use the function from the item card.

The process of updating or calculating standard costs typically consists of the following tasks:

1. Updating costs at the component and capacity levels. For more information, see the **Suggest Item Standard Cost** and **Suggest Capacity Standard Cost** batch jobs.
2. Consolidating and rolling up the component and capacity costs to calculate the total assembly or manufacturing cost of the items. For more information, see [To calculate the standard cost of an assembly item](#).
3. Implementing the standard costs that are entered when you run the previous batch jobs. The standard costs do not take effect until they are implemented. For more information, see the **Implement Standard Cost Changes** batch job.
4. Implementing the changes to update the **Unit Cost** field on the item card and perform inventory revaluation. For more information, see [Revalue Inventory](#).

Work with Inventory Periods

3/31/2019 • 2 minutes to read

Inventory periods define a period of time in which you can post changes to inventory. An inventory period is defined by the date on which it ends, or the ending date. When you close an inventory period, you cannot post any changes to inventory, either expected or invoiced, before this ending date. You cannot post any new values to inventory before the ending date. If you have open item entries in the closed period, meaning positive quantities that have not yet been applied to outbound transactions, you can still apply outbound quantities to these entries, even if the period is closed.

The following sections describe how to:

- Create inventory periods.
- Close inventory periods.
- Reopen inventory periods.

To create an inventory period

1. Choose the  icon, enter **Inventory Periods**, and then choose the related link.
2. Create a new line.
3. In the **Ending Date** field, enter the last date in the inventory period that you want to define. When the period is closed, you will not be able to post inventory changes before this date.
4. Enter a descriptive name in the **Name** field. Choose the **OK** button.

Closing Inventory Periods

The **Closed** field indicates whether or not the inventory period is closed to inventory value changes. You cannot edit this field.

You can close any inventory period, provided that the following is true:

- There are no open outbound item ledger entries, meaning negative inventory, in that period.
- The cost of all items has been adjusted using the **Adjust Cost – Item Entries** batch job.

This means that all outbound transaction quantities, such as those from sales orders, outbound transfers, sales invoices, purchase returns, or purchase credit memos, must be applied to existing quantity in inventory.

To close an inventory period

1. Before closing an inventory period, run the **Adjust Cost – Item Entries** batch job to ensure that all cost adjustments are posted. On the **Actions** tab, in the **Functions** group, choose **Adjust Cost – Item Entries**.

Run the **Close Inventory Period – Test** report to determine if there are any open outbound item entries within the inventory period or any items whose cost has not yet been adjusted.

2. Choose the **Close Inventory Period – Test** action.

Run the **Post Inventory Cost to G/L** batch job to ensure that all costs are posted to the general ledger.

3. Choose the **Post Inventory to G/L** action.
4. On the **Inventory Periods** page, select the inventory period you want to close.
5. Choose the **Close Period** action. After the inventory period has been closed, you cannot post inventory

changes before the ending date. The cost of all items must be adjusted with the **Adjust Cost – Item Entries** batch job before you close the inventory period.

6. Choose the **Yes** button to confirm that you want to close the period, or choose **No** to cancel the closing.
7. The inventory period is closed and a confirmation message is displayed when it is finished.

Reopening Inventory Periods

After you have closed the inventory period, you cannot delete the inventory period. You can, however, reopen it, if you would like to allow posting before the ending date of the inventory period. Reopening a period also reopens all inventory periods with ending dates later than the period you reopen.

To reopen an inventory period

1. Choose the  icon, enter **Inventory Periods**, and then choose the related link.
2. Select the inventory period you want to reopen.
3. Choose the **Reopen Period** period action. Confirm that you want to reopen the period.
4. All inventory periods with ending dates later than the period you selected are reopened.

Setting Up Inventory Valuation and Costing

3/31/2019 • 2 minutes to read

To make sure that inventory costs are recorded correctly, you must set up various fields and pages before you begin to make item transactions.

The following table describes a sequence of tasks, with links to the topics that describe them.

TO	SEE
Set a costing method for each item to govern how its incoming cost is used to assess inventory value and the cost of goods sold.	Register New Items
Ensure that the cost is automatically posted to the general ledger whenever an inventory transaction is posted.	Automatic Cost Posting field on the Inventory Setup page
Ensure that expected costs are posted to the general ledger to see from the interim G/L accounts an estimate of the amounts due and the cost of the traded items before they are actually invoiced.	Expected Cost Posting to G/L field on the Inventory Setup page
Set the system up to adjust for any cost changes automatically every time you post inventory transactions.	Adjust Item Costs
Define if the average cost is to be calculated per item only or per item for each stockkeeping unit and for each variant of the item.	Average Cost Calc. Type field on the Inventory Setup page
Select the period of time you would like the program to use for calculating the weighted average cost of items that use the average costing method.	Average Cost Period field on the Inventory Setup page
Define inventory periods to control inventory value over time by disallowing transaction posting in closed inventory periods.	Work with Inventory Periods
Ensure that sales returns are applied to the original outbound transaction to preserve inventory value.	Exact Cost Reversing Mandatory field on the Sales & Receivables page
Ensure that purchase returns are applied to the original inbound transaction to preserve inventory value.	Exact Cost Reversing Mandatory field on the Purchases & Payables page
Set up the rounding rules to apply when adjusting or suggesting item prices and when adjusting or suggesting standard costs.	Rounding Method page

Revalue Inventory

3/31/2019 • 2 minutes to read

If you want to appreciate or depreciate an item or a specific item ledger entry, you must use the revaluation journal.

To revalue inventory

1. Choose the  icon, enter **Revaluation Journal**, and then choose the related link.
2. Choose the **Calculate Inventory Value** action.
3. On the **Calculate Inventory Value** page, fill in the fields as necessary. Hover over a field to read a short description.
4. Choose the **OK** button.
5. On each line on the **Revaluation Journal** page, in the **Unit Cost (Revalued)** field, enter the new unit cost. Alternatively, enter the new total amount in the **Inventory Value (Revalued)** field.

The relevant fields are automatically updated. Note that the **Amount** field shows the actual change in inventory value for the selected item ledger entry. It calculates the difference between the **Inventory Value (Calculated)** field and the **Inventory Value (Revalued)** field.

6. When you have completed all lines in the revaluation journal, choose the **Post** action.

New value entries are now created to reflect the revaluations that you have posted. You can see the new values on the respective item cards.

Adjust Item Costs

3/31/2019 • 5 minutes to read

The cost of an item (inventory value) that you purchase and later sell may change during its lifetime, for example because a freight cost is added to its purchase cost after you have sold the item. Cost adjustment is especially relevant in situations where you sell goods before you invoice the purchase of those goods. To always know the correct inventory value, item costs must therefore regularly be adjusted. This ensures that sales and profit statistics are up to date and that financial KPIs are correct. For more information, see [Design Details: Cost Adjustment](#).

As a rule, the value in the **Unit Cost** field on the item card is based on the standard cost for items with costing method standard. For items with all other costing methods, it is based on the calculation of the inventory available (invoiced costs and expected costs) divided by the quantity on hand. For more information, see [Understanding Unit Cost Calculation](#).

In Business Central, item costs are automatically adjusted every time that an inventory transaction occurs, such as when posting a purchase invoice for an item.

You can also use a function to manually adjust the costs of one or more items. This is useful, for example, when you know that item costs have changed for other reasons than item transactions.

Item costs are adjusted by the FIFO or the Average costing method, depending on your selection in the **Set Up My Company** assisted setup guide or in the **Costing Method** field on the item card. For more information, see [Register New Items](#).

If you use the FIFO costing method, then an item's unit cost is the actual value of any receipt of the item. Inventory is valued with the assumption that the first items placed in inventory are sold first.

If you use the Average costing method, then an item's unit cost is calculated as the average unit cost at each point in time after a purchase. Inventory is valued with the assumption that all inventories are sold simultaneously. For items that use this costing method, you can choose the **Unit Cost** field on the item card to view the history of transactions that the average cost is calculated from

The cost adjustment function processes only value entries that have not yet been adjusted. If the function encounters a situation where changed inbound costs need to be forwarded to associated outbound entries, then new adjustment value entries are created, which are based on the information in the original value entries but contain the adjustment amount. The cost adjustment function uses the posting date of the original value entry in the adjustment entry, unless that date is in a closed inventory period. In that case, the program uses the starting date of the next open inventory period. If inventory periods are not used, then the date in the **Allow Posting From** field on the **General Ledger Setup** page will define when the adjustment entry is posted.

To adjust item costs manually

1. Choose the  icon, enter **Adjust Cost - Item Entries**, and then choose the related link.
2. On the **Adjust Cost - Item Entries** page, specify which items to adjust costs for.
3. Choose the **OK** button.

To make general changes in the direct unit cost

If you need to change the direct unit cost for several items, you can use the **Adjust Item Costs/Prices** batch job.

The batch job changes the contents in the **Unit Price** field on the item card. The batch job changes the content of

the field in the same way for all items or selected items. The batch job multiplies the value in the field by an adjustment factor that you specify.

1. Choose the  icon, enter **Adjust Item Costs/Prices**, and then choose the related link.
2. In the **Adjust Field** field, specify which item or SKU card field you want to adjust.
3. In the **Adjustment Factor** field, specify the factor by which the value will be adjusted. For example, enter **1.5** to increase the value by 50%.
4. On the **Item** FastTab, set filters to specify, for example, which items to process with the batch job.
5. Choose the **OK** button.

Understanding Unit Cost Calculation

As a rule, the value in the **Unit Cost** field on the item card is based on the standard cost for items with costing method standard. For items with all other costing methods, it is based on the calculation of the inventory available (invoiced costs and expected costs) divided by the quantity on hand.

How the contents of the **Costing Method** field influence the unit cost calculation for purchases and sales is described in more detail in the following sections.

Unit Cost Calculation for Purchases

When you purchase items, the value in the **Last Direct Cost** field on the item card is copied to the **Direct Unit Cost** field on a purchase line or to the Unit Amount line on an item journal line.

What you select in the **Costing Method** field influences how Business Central calculates the contents of the **Unit Cost** field on the lines.

Costing Method FIFO, LIFO, Specific, or Average

Business Central calculates the contents of the **Unit Cost (LCY)** field on the purchase line or the contents of the **Unit Cost** field on the item journal line according to the following formula:

$$\text{Unit Cost (LCY)} = (\text{Direct Unit Cost} - (\text{Discount Amount} / \text{Quantity})) \times (1 + \text{Indirect Cost \%} / 100) + \text{Overhead Rate}$$

Costing Method Standard

The **Unit Cost (LCY)** field on the purchase line or the **Unit Cost** field is filled on the item journal line by copying the value in the **Unit Cost** field on the item card. By using costing method set as Standard, this is always based on the standard cost.

When you post the purchase, the unit cost from the purchase line or item journal line is copied to the purchase item invoice entry, and it can be seen on the entry list for the item.

All Costing Methods

The unit cost from the source document line is used to calculate the contents of the **Cost Amount (Actual)** field, or if applicable, the **Cost Amount (Expected)** field that relates to this item entry, regardless of the costing method of the item.

Unit Cost Calculation for Sales

When you sell items, the unit cost is copied from the Unit Cost field on the item card to the sales line or the item journal line.

When you post, the unit cost is copied to the sales invoice item entry, and it can be seen on the entry list for the item. Business Central uses the unit cost from the source document line to calculate the contents of the **Cost Amount (Actual)** field, or if applicable, the **Cost Amount (Expected)** field in the value entry related to this item

entry.

Handling Inventory and Manufacturing Costs

3/31/2019 • 2 minutes to read

Although much of the cost accounting functionality is expressed in underlying processes with no user interaction, such as entry application and automatic cost adjustment, a number of fields, pages, and reports are aimed at users who directly or indirectly manage the cost of items or operations.

Assigning item charges to purchase documents is an example of an indirect cost accounting task. Updating the unit cost of assembly or production BOM item is an example of a more direct cost accounting task.

The following table describes a sequence of tasks, with links to the topics that describe them.

TO	SEE
Periodically or automatically update the unit cost of one or multiple items to forward any cost changes from inbound entries, such as those for purchases or production output, to the related outbound entries, such as consumption or transfers.	Adjust Item Costs
Get insight into average cost dynamics to make pricing decisions or to track cost fluctuations caused by data entry errors.	Register New Items
Create a manufacturing item's standard cost by entering the three cost elements: material cost, capacity cost, and subcontractor cost.	About Calculating Standard Cost
Calculate the unit cost of a BOM item based on the unit costs of its underlying components.	Work with Bills of Material
Complete the costing life cycle of a produced item by adjusting the costs and reconciling the value entries with the general ledger.	About Finished Production Order Costs
Change the value of an item in inventory or the value of one item ledger entry, such as a purchase transaction.	Revalue Inventory
Manually undo an item application or reapply item ledger entries created by the program.	Remove and Reapply Item Ledger Entries
Use the Applies-from Entry field in the item journal to manually create a fixed application between an inbound transaction and the original outbound transaction.	Close Open Item Ledger Entries Resulting from Fixed Application in the Item Journal

Update Standard Costs

3/31/2019 • 2 minutes to read

You must periodically update the standard costs of components and roll the new costs up to the parent item. The process typically consists of the following four steps:

1. Update costs at the component and capacity levels. For more information, see the **Suggest Item Standard Cost** batch job.
2. Consolidate and roll up the component and capacity costs to calculate the total manufacturing or assembly cost of the items.
3. Implement the standard costs that are entered when you run the previous batch jobs. The standard costs do not take effect until they are implemented. For more information, see [Implement Standard Cost Changes](#).
4. Implement the changes to update the **Unit Cost** field on the item card and perform inventory revaluation. For more information, see [Revalue Inventory](#).

For more information, see [About Calculating Standard Cost](#).

To update standard costs

1. Run the **Adjust Cost-Item Entries** batch job.
2. Run the **Post Inventory Cost to G/L** batch job.
3. Open the **Standard Cost Worksheet** and use one or more of the following functions:
 - a. Run the **Suggest Item Standard Cost** batch job.
 - b. Review the results and make changes as necessary.
 - c. Run the **Suggest Capacity Standard Cost** batch job.
 - d. Review the results and make changes as necessary.
 - e. Run the **Roll Up Standard Cost** batch job.
 - f. Review the results and make changes as necessary.
 - g. Run the **Implement Standard Cost Changes** batch job.
4. Review and post the **Revaluation Journal** page, which has been populated with entries from the previous steps in this process.

Remove and Reapply Item Ledger Entries

3/31/2019 • 5 minutes to read

On the **Application Worksheet** page, you can view and manually change certain item application entries that are created automatically during inventory transactions.

When you post a transaction where items are moved in or out of inventory, an item application is created between each inventory increase and inventory decrease. These applications determine the flow of costs from the goods that are received in inventory to the cost of goods going out of inventory. Because of the way the unit cost is calculated, an incorrect item application could lead to a skewed average cost and a skewed unit cost. For more information, see Design Details: Item Application.

The following scenarios might require that you undo an application or reapply item ledger entries:

- You have forgotten to make a fixed application.
- You have made an incorrect fixed application.
- You have to return an item to which a sale has already been applied.

If possible, use a document to reapply an item ledger entry. For example, if you must make a purchase return of an item to which a sale has already been applied, you can reapply by creating and posting the purchase return document by using the correct application in the **Appl.-to Item Entry** field on the purchase return line. You can use the **Get Posted Document Lines to Reverse** function or the **Copy Document** function in the purchase return document to make this easier. When you post the document, the item ledger entry is automatically reapplied. For more information, see [Process Purchase Returns or Cancellations](#).

If you cannot use a document to reapply, such as when you have to correct a fixed application, then use the **Application Worksheet** page to correct an application.

WARNING

The following are important considerations to remember when you are working with the application worksheet: - You should not leave application entries unapplied for long periods of time because other users cannot process the items until you reapply the application entries or close the **Application Worksheet** page. Users who try to perform actions that involve a manually unapplied application entry receive the following error message: "You cannot perform this action because entries for item XXX are unapplied in the Application Worksheet by user XXX." - You should only reapply item ledger entries during nonworking hours to avoid conflicts with other users who are posting transactions with the same items. - When you close the application worksheet, Business Central performs a check to make sure that all entries are applied. For example, if you remove a quantity application but do not create a new application, and then you close the application worksheet, a new application is created. This helps keep the cost intact. However, if you remove a fixed application, a new fixed application is not automatically created when you close the worksheet. You must do this manually by creating a new application in the worksheet. - It is possible to remove applications from more than one entry at a time in the application worksheet. However, because applying entries affects the set of entries that are available for application, you cannot create an application for more than one entry at a time. - The application worksheet cannot make an application in the following situation: If there is not enough quantity on stock to apply, the application worksheet cannot make an application when you are trying to apply an inventory decrease entry without item tracking information to an inventory increase entry with item tracking information.

To remove an item application by using the Application Worksheet

1. Choose the  icon, enter **Application Worksheet**, and then choose the related link.
2. The **Application Worksheet** page opens displaying existing item ledger entries for all items.
3. Enter filters on the **General** FastTab to make it easier to find the item ledger entry for which you want to

change the application.

4. Select the item ledger entry, and then choose the **Applied Entries** action. The **View Applied Entries – Applied Entries** page opens to show the item ledger entry or entries that are currently applied to the selected entry.
5. Select the item ledger entry for which you want to remove the application.
6. Choose the **Remove Application** action. This removes the item application entry that links the two item ledger entries and moves it to the **View Applied Entries – Unapplied Entries** page.
7. Close the **View Applied Entries – Applied Entries** page.

The **Remaining Quantity** field of the two item ledger entries are increased by the quantity that has been unapplied. The removed item ledger entry is now available for reapplication on the **View Applied Entries – Unapplied Entries** page.

IMPORTANT

You should not leave application entries unapplied for longer periods of time because other users cannot process the affected items until you reapply the application entries or close the **Application Worksheet** page. The following error message is displayed if you try to perform actions that involve a manually unapplied application entry:

You cannot perform this action because entries for item are unapplied in the Application Worksheet by user .

To reapply an item application by using the Application Worksheet

1. Choose the  icon, enter **Application Worksheet**, and then choose the related link.
2. The **Application Worksheet** page opens displaying existing item ledger entries for all items.
3. To reapply entries that were removed since the worksheet was opened, select the item ledger entry that you want to reapply. On the **Actions** tab, in the **Functions** group, choose **Reapply**.

NOTE

This reapplication to the original balance also occurs automatically when you close the **Application Worksheet** page.

4. To apply an available open item ledger entry to another entry, select the item ledger entry that you want to apply. Choose the **Unapplied Entries** action. The **View Applied Entries – Unapplied Entries** page opens.
5. Select one or more item ledger entries that you want to apply to the entry selected on the **Application Worksheet** page, and then choose the **OK** button.

An item application entry is created between the two item ledger entries. The **Remaining Quantity** fields of the two entries are reduced by the applied quantity.

NOTE

If you have chosen to make an application that would create an infinite loop in the cost adjustment process, then the application that you proposed is not made. This can occur when the original entries created negative stock. The application is not made. Therefore, you must select a different entry for the application.

6. If the **Automatic Cost Adjustment** field in the **Inventory Setup** is set to **Always**, then the cost adjustment batch job is automatically run after you make a reapplication. Otherwise, run the **Adjust Cost - Item Entries** batch job to make sure that all costs are up to date.

Close Open Item Ledger Entries Resulting from Fixed Application in the Item Journal

3/31/2019 • 2 minutes to read

You can use the **Applies-from Entry** field on the **Item Journal** page to create a fixed application between an inbound transaction and the original outbound transaction. For example, to correct the outbound transaction or to process its return. For more information, see [Applies-from Entry](#).

IMPORTANT

Fixed applications made in this manner only apply the cost, not the quantity. Accordingly, the posted positive item ledger entry will not close the applied outbound entry and will itself remain open. This also applies when you post a fixed application for a positive entry to a negative entry that has not been closed by a regular positive entry, then both the negative and the positive entries will remain open.

This also means that you cannot close an inventory period if such an entry exists.

The following procedure shows how to close such entries by performing two corrective postings in the item journal.

To close open item ledger entries that result from a fixed application in the item journal

1. Use the **Applies-from Entry** field to post a positive adjustment with the corresponding quantity. This closes the original negative entry with a fixed application.
2. Use the **Applies-to Entry** field to post a negative adjustment. This closes the original corrective positive entry with a fixed application.

Reporting Costs and Reconciling with the General Ledger

5/2/2019 • 2 minutes to read

At the end of accounting periods, monthly, yearly or other, a sequence of cost control and auditing tasks must be performed to report a correct and balanced inventory value to the finance department. Apart from the posting routine that transfers the individual item value entries to dedicated general ledger accounts, several reports, tracing functions, and a special reconciliation tool are available to the auditor or controller responsible for this business-critical work.

The following table describes a sequence of tasks, with links to the topics that describe them.

TO	SEE
View the inventory value of selected items, including information about the quantities and values of increases and decreases in inventory over a selected period.	Inventory Valuation report
View the inventory value of selected production orders in your WIP (work in process) inventory, such as the quantities and values of consumption, capacity usage, and output in ongoing production orders.	Inventory Valuation - WIP report
View the inventory value of selected items, including their actual and expected cost on the date specified.	Inv. Valuation - Cost Spec. report
Use a report to analyze the reasons for cost variances or to gain insight into the cost shares of sold items (COGS).	Cost Shares Breakdown report
Periodically post the value entries of item transactions from the inventory ledger to the related G/L accounts to reconcile the two ledgers.	Reconcile Inventory Costs with the General Ledger
Determine the WIP amount that needs to be posted to balance sheet accounts for period-end reporting.	Monitor Job Progress and Performance

Reconcile Inventory Costs with the General Ledger

3/31/2019 • 4 minutes to read

When you post inventory transactions, such as sales shipments, purchase invoices, or inventory adjustments, the changed item costs are recorded in item value entries. To reflect this change of inventory value in your financial books, the inventory costs are automatically posted to the related inventory accounts in the general ledger. For each inventory transaction that you post, the appropriate values are posted to the inventory account, adjustment account, and COGS account in the general ledger.

Automatic cost posting is defined by the **Automatic Cost Posting** field on the **Inventory Setup** page.

Even though inventory costs are automatically posted to the general ledger, it is still necessary to ensure that the costs of goods are forwarded to the related outbound sales transaction, especially in situations where you sell goods before you invoice the purchase of those goods. This is referred to as cost adjustment. Item costs are automatically adjusted when you post item transactions, but you can also adjust item costs manually. For more information, see [Adjust Item Costs](#).

To post inventory costs manually

1. Choose the  icon, enter **Post Inventory Cost to G/L**, and then choose the related link.
2. Post inventory costs to the general ledger manually by running the batch job. When you run this batch job, general ledger entries are created on the basis of value entries. You can post the entries so that they are summarized per posting group.

NOTE

When you run this batch job, you might encounter errors having to do with missing setup or incompatible dimension setup. If the batch job encounters errors in the dimension setup, it overrides these errors and uses the dimensions of the value entry. For any other errors, the batch job skips posting the value entries and lists them at the end of the report in a section titled "Skipped Entries." To post these entries, you must fix the errors.

To see a list of errors before running the posting batch job, you can run the **Post Invt. Cost to G/L - Test** report. The test report lists all the errors encountered during a test posting. You can then fix the errors, and run the inventory cost posting batch job without skipping any entries.

If you would like to simply get an overview of what values could be posted to the general ledger without actually performing the posting, you can run the **Post Inventory Cost to G/L** batch job without actually posting the values to the general ledger. You do this by clearing the check mark from the **Post** field on the request page. This way, when you run the batch job, the report is produced showing the values that are ready to be posted to the general ledger, but they are not posted.

To audit the reconciliation between the inventory ledger and the general ledger

The **Inventory - G/L Reconciliation** page provides the following:

- Exposes reconciliation differences by comparing what is recorded in G/L and what is recorded in the inventory ledger (value entries).
- Displays unreconciled cost amounts in the value entries in the inventory ledger as if they were mapped to corresponding inventory-related accounts in G/L and compares those to the totals actually recorded in the

same accounts in G/L.

- Reflects the double entry structure of G/L by visually presenting data as such. For example, a COGS entry has a corresponding inventory entry.
- Lets users drill down and see the entries that make up the cost amounts.
- Includes filters to narrow the analysis by date, item, and location.
- Explains reasons for reconciliation differences in informative messages.

The **Name** column on the far left in the grid lists the various G/L account types that are associated with inventory.

The **Inventory**, **Inventory (Interim)**, and **WIP Inventory** columns show the invoiced, non-invoiced, and WIP totals of each G/L account type. These are calculated from value entries, that is, they are projected onto the G/L account types where they will end when they are eventually posted to G/L.

The **Total** column shows the sum (in bold font) of the value entry amounts in the three inventory columns.

The **G/L Total** column shows the amounts (in bold font) for each G/L account type that exists in G/L. These are calculated from G/L entries, that is, they represent inventory costs already posted to G/L.

The **Difference** column represents the difference between the value in the **G/L Total** and **Total** fields.

In the top of the **Inventory - G/L Reconciliation** page, you can enter filters to limit, for example, the period of time for which you want information.

If you select the **Show Warning** check box and if there are any discrepancies between the inventory totals and G/L totals, the program shows messages in the **Warning** field of the grid that explain the discrepancy. If you choose the Warning field, the program gives you more information on what the warning means.

When you have entered all relevant filters, choose the **Show Matrix** action. The data is calculated and the matrix page appears.

On the far left column in the grid, you see the various general ledger account types that are associated with inventory. The grid then shows the invoiced, non-invoiced (interim), and WIP inventory totals for each of these account types. These totals are calculated from the value entries.

The next columns show the totals for the same account types calculated from the general ledger entries.

Choose the amount in any of the total fields to see the inventory report entries that were used to calculate the totals. For inventory totals, the inventory report entries are the sums of the value entries for the items. For the G/L totals, the inventory report entries are the sums from the general ledger entries.

[General Business Functionality](#)

Monitor Job Progress and Performance

3/31/2019 • 4 minutes to read

As a job progresses, materials, resources, and other expenses are consumed and must be posted to the job. Work in Process (WIP) is a feature that enables you to estimate the financial value of jobs in the general ledger while the jobs are ongoing. In many cases, you might post expenses for a job before invoicing a job. When only expenses have been posted, your financial statement will be inaccurate. For more information, see [Understanding WIP Methods](#).

To track the value in the general ledger, you can calculate WIP and post the value to the general ledger.

You can calculate WIP based on the following:

- Cost Value
- Sales Value
- Recognizable Cost
- Percentage of Completion
- Completed Contract

If you want to view the result using a different method, you can change the method and calculate WIP again. There is no limit to the number of times that you calculate WIP. WIP is only calculated, it does not get posted to the general ledger. After you have calculated WIP, you can post to the general ledger.

To create a job WIP method

You can create a job WIP method that reflects the needs of your organization. After you have created it, you can set it as the default job WIP calculation method that will be used in your organization.

NOTE

After you have used your new method to create WIP entries, you cannot delete the method or modify it.

1. Choose the  icon, enter **Job WIP Methods**, and then choose the related link.
2. Choose the **New** action, and then fill in the fields as necessary. Hover over a field to read a short description.
3. Close the page.
4. To make this new method the default, choose the  icon, enter **Jobs Setup**, and then choose the related link.
5. In the **Default WIP Method** field, choose the method from the list.

To define a WIP method for a job

When you create a new job, you must specify which job WIP method that applies. In some cases, which Job WIP method that you can use has been set up for you as a default.

1. Choose the  icon, enter **Jobs**, and then choose the related link.
2. Choose the **New** action. For more information, see [Create Jobs](#).
3. On the **Job Card** page, in the **WIP Method** field, select a WIP method from the list. If a default method has been defined, you can select another option if needed.

To calculate WIP

You can determine the WIP amount that is to be posted to balance sheet accounts for the period end reporting. You use the **Job Calculate WIP** batch job to do this.

1. Choose the  icon, enter **Job Calculate WIP**, and then choose the related link.
2. Choose the **Calculate WIP** action.
3. On the **Job Calculate WIP** page, fill in the fields as necessary.
4. Choose the **OK** button.

NOTE

The batch job only calculates the WIP. It is not posted to the general ledger. To do so, you must run the **Post WIP to G/L** batch job when you have calculated the WIP. For more information, see the following procedure.

To post WIP

When you have calculated WIP, you can post it to balance sheet accounts for the period end reporting. You use the **Job Post WIP to G/L** batch job to do this.

1. Choose the  icon, enter **Job Post WIP to G/L**, and then choose the related link.
2. On the **Job Post WIP to G/L** page, fill in the fields as necessary.
3. Choose the **OK** button.

To view job usage estimates and post updates

You can view job usage up to the completion of a project in one step. To do so, you use the **Job Calc. Remaining Usage** batch job for all the tasks up to and including the end of a job.

This lets you track and compare your original estimates against actual results and make modifications or new entries as needed. For example, you may have estimated that a job required 10 hours, and to date, it has taken 15 hours. You can add the extra five hours to the existing journal line or create a new journal line to report these five hours as overtime, which is another work type. The appropriate cost and price are calculated, and you can then post to the journal.

NOTE

Item entries create item ledger entries and reduce the inventory quantity. The **Post Inventory Cost to G/L** batch job transfers the cost from inventory to the general ledger. Resource entries create resource ledger entries.

1. Choose the  icon, enter **Job Journals**, and then choose the related link.
2. Select a relevant job journal, and then choose the **Calc. Remaining Usage** action.
3. On the **Job Calc. Remaining Usage** page, enter the document number and posting date that is to be inserted in the journal, and then choose the **OK** button.
4. Update the journal with any modifications that may be needed.
5. Choose the **Post**.

To view job ledger entries

All job-related entries are recorded in job registers and are numbered sequentially, starting with 1. From the job register, you can get an overview of all job ledger entries.

1. Choose the  icon, enter **Job Registers**, and then choose the related link.
2. Select a relevant register, and then choose **Job Ledger** action.

On the **Job Ledger Entries** page you can review the entries that are associated with any job.

Closing Years and Periods

3/31/2019 • 2 minutes to read

At the end of a fiscal year, there are a number of administrative tasks that you have to perform, like making sure all documents and journals are posted, making sure currency data are up-to-date, closing the books, and more. The actual tasks will depend your company.

The following table provides an overview of tasks that you typically perform to close a year and period.

TO	SEE
Define your fiscal year, and divide it into time periods for which to report financial performance.	Working with Accounting Periods and Fiscal Years
Specify system-wide and user-specific posting date ranges. Depending on your business needs, you may want to restrict user posting date ranges at the start of the period-end process or after it.	Specify Posting Periods
Get an overview of activities that are commonly performed at the end of a period, such as posting all documents and journals, or running account schedules.	Closing Periods
Update currency exchange rates and adjust the exchange rates of posted customer, vendor, and bank account entries.	Update Currency Exchange Rates
Allocate costs and income among accounts and dimensions.	Allocating Costs and Income
Prepare to report value-added tax amounts that you have collected for sales to the tax authorities' web service.	How To: Report VAT to Tax Authorities
Print reports to verify general ledger, customer, vendor and bank account balances before closing a period.	Preparing Pre-Closing Reports
Close accounting periods and fiscal year, transfer income statement balances to balance sheet accounts and post the year end closing entry.	Closing Books
Print reports that can assist you in creating financial statements.	Preparing Closing Statements

Working with Accounting Periods and Fiscal Years

3/31/2019 • 3 minutes to read

Accounting periods, which are also known as reporting periods, are periods of time for which a company or organization reports financial performance, for example, by generating their income statement or balance sheet. Typically, accounting periods refer to the company's fiscal year, which can contain several accounting periods, such as months or quarters.

For many companies the fiscal year does not align with the calendar year. For example, the fiscal year might end on June 30th rather than December 31st. For newly created companies, the fiscal might actually be longer than 12 months.

Business Central only requires accounting periods only if you want to close an income statement, or run data compression tasks.

You can use accounting periods in reporting. For example, when you are reviewing posted entries on the **Balance/Budget** page where the reporting interval can be specified. One of the options you may specify to report by accounting period. You can also build an account schedule that compares results for different accounting periods.

Creating a new fiscal year

You can create accounting periods in bulk, by using the **Create Fiscal Year** batch job, or manually.

How to create accounting periods in-bulk

Use the **Create Fiscal Year** batch job to divide a fiscal year into periods of equal length.

1. Choose the  icon, enter **Accounting Periods**, and then choose the related link.
2. Choose the **Create Year** action.
3. In the **Starting Date** field, enter the date on which the fiscal year starts.
4. In the **No. of Periods** field, enter the number of accounting periods to divide the fiscal year into. There can be up to 365 periods in a year.
5. In the **Period Length** field, enter a duration for each period. For example, 1M for one month, 1Q for one quarter, and 1Y for one year.
6. Choose **OK**.

How to create accounting periods manually

If the accounting periods in your fiscal year have different durations, like the 4-4-5 calendar used in retail, you can manually set it up.

1. Choose the  icon, enter **Accounting Periods**, and then choose the related link.
2. In the **Starting Date** field, enter the date on which the fiscal year starts. The **Name** field will show the name of the month.
3. Choose the **New Fiscal Year** check box to indicate that this is the first period in the year. Business Central will use this period to determine which periods to close at year-end.
4. Repeat steps 2 and 3 for each remaining period.

Closing a Fiscal Year

Closing the fiscal year is one of the tasks for closing the books. After you close a fiscal year, the **Closed** and **Date Locked** check boxes are selected for all periods in the year. You cannot reopen a year or clear the check boxes.

NOTE

You must always have at least one open fiscal year. When closing a year, ensure that a new year has been created. Also, note that after you close one year, you cannot change the starting date of the following year.

1. Choose the  icon, enter **Accounting Periods**, and then choose the related link.
2. Choose the **Close Year** action.

Posting Entries to a Closed Fiscal Year

Although a fiscal year is closed, you can still post general ledger entries to it. When you do, the entries are marked as posted to a closed fiscal year and the **Prior Year Entry** check box is selected. By default, the check box is not displayed on the page, but you can add it. The next steps are to close the income statement accounts and transfer the year's results to an account in the balance sheet. Repeat these steps each time you post entries to a closed fiscal year.

Specify Posting Periods

3/31/2019 • 2 minutes to read

Use posting periods to specify when users can post to the general ledger.

To specify posting periods

1. Choose the  icon, enter **General Ledger Setup**, and then choose the related link.
2. On the **General Ledger Setup** page, define the period by entering dates in the **Allow Posting From** and **Allow Posting To** fields.

NOTE

These posting periods apply to the company and to all users. To allow for exceptions, you can define different posting periods for specific users on the **User Setup** page. These posting periods overrule those specified on the **General Ledger Setup** page. For more information, see [To set up user time constraints](#).

Overview of Tasks to Close Accounting Periods

3/31/2019 • 2 minutes to read

Business Central does not force you to close periods, however, there are many period-end (month-end) activities that you can do. This topic provides an overview of optional processes and activities for closing periods.

General Ledger

- Specify system-wide and user-specific posting periods.

This specifies the dates between which you allow posting. Depending on your business, you may want to allow posting at the start of the period, or toward the end. For more information, see [Specify Posting Periods](#).

- Make all necessary G/L adjustments.
- Update and post Recurring Journals.
- Run account schedules as follows:
 - Open the **Account Schedule** page, and then choose the **Print** action.

Sales and Receivables

- Post all sales orders, invoices, credit memos, and return orders.
- Post all cash receipt journals.
- Update and post recurring journals that are related to sales and receivables.
- Reconcile accounts receivable to the general ledger.
- Run the **Delete Invoiced Sales Orders** batch job.

Purchases and Payables

- Post all purchase orders, invoices, credit memos, and return orders.
- Post all payment journals.
- Update and post recurring journals that are related to purchases & payables.
- Run the **Aged Accounts Payable** report and reconcile accounts payable to the general ledger.
- Run the **Delete Invoiced Purchase Orders** batch job.

Fixed Assets

- Post all maintenance costs have been posted through the fixed asset journals or invoices.
- Post adjustments.
- Post appreciation.
- Post depreciation.
- Update and post the recurring fixed asset journal.

Intercompany

- Process Intercompany Transactions

Calculate and Process Sales Tax

- [Complete Tax Statements.](#)

Update Currency Exchange Rates

6/6/2019 • 4 minutes to read

As companies operate in increasingly more countries/regions, it becomes more important that they be able to trade and report financials in more than one currency. You must set up a code for each currency you use if you buy or sell in currencies other than your local currency, have receivables or payables in other currencies, or record G/L transactions in different currencies.

Your general ledger is set up to use your local currency (LCY), but you can set it up to also use another currency with a current exchange rate assigned. By designating a second currency as a so-called additional reporting currency, Business Central will automatically record amounts in both LCY and this additional reporting currency on each G/L entry and other entries, such as VAT entries. For more information, see [Set Up an Additional Reporting Currency](#).

Adjusting Exchange Rates

Because exchange rates fluctuate constantly, additional currency equivalents in your system must be adjusted periodically. If these adjustments are not done, amounts that have been converted from foreign (or additional) currencies and posted to the general ledger in LCY may be misleading. In addition, daily entries posted before a daily exchange rate is entered into the program must be updated after the daily exchange rate information is entered.

The **Adjust Exchange Rates** batch job is used to manually adjust the exchange rates of posted customer, vendor and bank account entries. It can also update additional reporting currency amounts on G/L entries. You can also have the exchange rates adjusted automatically by using a service. For more information, see [To set up a currency exchange rate service](#).

Effect on Customers and Vendors

For customer and vendor accounts, the batch job adjusts the currency by using the exchange rate that is valid on the posting date that is specified in the batch job. The batch job calculates the differences for the individual currency balances and posts the amounts to the general ledger account that is specified in the **Unrealized Gains Acc.** field or the **Unrealized Losses Acc.** field on the **Currencies** page. Balancing entries are automatically posted to the receivables/payables account in the general ledger.

The batch job processes all open customer ledger entries and vendor ledger entries. If there is an exchange rate difference for an entry, the batch job creates a new detailed customer or vendor ledger entry which reflects the adjusted amount on the customer or vendor ledger entry.

Dimensions on Customer and Vendor Ledger Entries

The adjustment entries are assigned the dimensions from the customer/vendor ledger entries, and the adjustments are posted per combination of dimension values.

Effect on Bank Accounts

For bank accounts, the batch job adjusts the currency by using the exchange rate that is valid on the posting date specified in the batch job. The batch job calculates the differences for each bank account that has a currency code and posts the amounts to the general ledger account that is specified in the **Realized Gains Acc.** field or the **Realized Losses Acc.** field on the **Currencies** page. Balancing entries are automatically posted to the general ledger bank accounts that are specified in the bank account posting groups. The batch job calculates one entry per currency per posting group.

Dimensions on Bank Account Entries

The adjustment entries for the bank account's general ledger account and for the gain/loss account are assigned the

bank account's default dimensions.

Effect on G/L Accounts

If you post in an additional reporting currency, you can have the batch job create new general ledger entries for currency adjustments between LCY and the additional reporting currency. The batch job calculates the differences for each general ledger entry and adjusts the general ledger entry depending on the contents of the **Exchange Rate Adjustment** field for each general ledger account.

Dimensions on G/L Account Entries

The adjustment entries are assigned the default dimensions from the accounts they are posted to.

IMPORTANT

Before you can use the batch job, you must enter the adjustment exchange rates that are used to adjust the foreign currency balances. You do so on the **Currency Exchange Rates** page.

To set up a currency exchange rate service

You can use an external service to keep your currency exchange rates up to date, such as FloatRates.

1. Choose the  icon, enter **Currency Exchange Rate Services**, and then choose the related link.
2. Choose the **New** action.
3. On the **Currency Exchange Rate Service** page, fill in the fields as necessary. Hover over a field to read a short description.
4. Choose the **Enabled** check box to enable the service.

To update currency exchange rates through a service

1. Choose the  icon, enter **Currencies**, and then choose the related link.
2. Choose the **Update Exchange Rates** action.

The value in the **Exchange Rate** field on the **Currencies** page is updated with the latest currency exchange rate.

Allocate Costs and Income

3/31/2019 • 2 minutes to read

You can allocate an entry in a general journal to several different accounts when you post the journal. The allocation can be made by three different methods:

- Quantity
- Percentage (%)
- Amount

The allocation features can be used with recurring general journals and in fixed assets journals.

The following procedures describe how to prepare to allocate costs in a recurring general journal by defining allocation keys. When allocation keys are defined, you complete and post the journal like any other recurring general journal. For more information, see [Working with General Journals](#).

To set up allocation keys

You can allocate an entry in a recurring general journal to several different accounts when you post the journal. The allocation can be made by quantity, percentage, or amount.

1. Choose the  icon, enter **Recurring General Journal**, and then choose the related link.
2. Choose the **Batch Name** field to open the **General Journal Batches** page.
3. You can either modify allocations on an existing batch in the list or create a new batch with allocations.
 - To create a new batch, choose the **New** action, and go to the next step.
 - To change the allocations of an existing journal, select the journal and go to step 7.
4. In the **Name** field, enter a name for the batch, such as CLEANING. In the **Description** field, enter a description, such as Cleaning Expenses Journal.
5. When you are done, close the page. A new, empty recurring journal opens.
6. Fill in the fields on the line.
7. Choose the **Allocations** action.
8. Add a line for each allocation. You must fill in either the **Allocation %**, **Allocation Quantity**, or **Amount** field. You must also fill in the **Account No.** field and, if you are allocating the transaction among global dimensions, the global dimension fields.
9. If you enter a percentage on a line, the amount in the **Amount** field is calculated automatically. These amounts have the opposite sign from the total amount in the **Amount** field in the recurring journal.
10. After entering the allocations lines, choose **OK** to return to the **Recurring General Journal** page. The **Allocated Amt. (USD)** field is filled in and matches the **Amount** field.
11. Post the journal.

To change an allocation key that has already been set up

1. Choose the  icon, enter **Recurring General Journal**, and then choose the related link.
2. On the **Recurring General Journal** page, select the journal with the allocation.
3. Choose the line with the allocation, and then choose **Allocations** action.
4. Change the relevant fields, and then choose the **OK** button.

Working with Business Central

Report VAT to a Tax Authority

5/2/2019 • 7 minutes to read

This topic describes the reports in Business Central that you can use to submit information about value-added tax (VAT) amounts for sales and purchases to tax authorities in your region.

You can use the following reports :

- The **EC Sales List** European Community (EC) Sales List report lists the value added tax (VAT) amounts that you have collected for sales to VAT-registered customers in the European Union (EU) countries.
- The **VAT Return** report includes VAT for sales and purchases to customers in all countries that use VAT.

If you want to view a complete history of VAT entries, every posting that involves VAT creates an entry on the **VAT Entries** page. These entries are used to calculate your VAT settlement amount, such as your payment and refund, for a specific period. To view VAT entries, choose the  icon, enter **VAT Entries**, and then choose the related link.

About the EC Sales List report

In the UK, all companies that sell goods and services to VAT-registered customers, including customers in other European Union (EU) countries, must submit an electronic version of the European Community (EC) Sales List report in XML format through Her Majesty's Revenue and Customs (HMRC) website. The EC Sales List report works only for countries in the EU.

The report includes one line for each type of transaction with the customer, and displays the total amount for each type of transactions. There are three types of transactions that the report can include:

- B2B Goods
- B2B Services
- B2B Triangulated Goods

B2B goods and services specify whether you sold a good or a service, and are controlled by the **EU Service** setting in the VAT posting setup. B2B Triangulated Goods indicate whether you engaged in trade with a 3rd party, and are controlled by the **EU 3-Party Trade** setting on sales documents, such as sales orders, invoices, credit memos, and so on.

After the tax authority reviews your report, they will send an email to the contact person for your company. In Business Central, the contact person is specified on the **Company Information** page. Before you submit the report, make sure that a contact person is chosen.

About the VAT Return report

Use this report to submit VAT for sales and purchase documents, such as purchase and sales orders, invoices, and credit memos. The information in the report is in the same format as on the declaration form from the customs and tax authorities.

VAT is calculated based on the VAT posting setup and the VAT posting groups that you have set up.

For the VAT return, you can specify the entries to include:

- Submit open transactions only, or open and closed. For example, this is useful when you prepare your final annual VAT return.
- Submit only entries from the specified periods, or also include entries from previous periods. This is useful for updating a VAT return that you have already submitted, for example, if a vendor sends you a late invoice.

To connect to your tax authority's web service

Business Central provides service connections to tax authority websites. For example, if you are in the UK, you can enable the **GovTalk** service connection to submit the EC Sales List and VAT Return reports electronically. If you want to submit the report manually, for example by entering your data on the tax authority's website, this is not required.

To report VAT to a tax authority electronically, you need to connect Business Central to the tax authority's web service. This requires that you set up an account with your tax authority. When you have an account, you can enable a service connection that we provide in Business Central.

1. Choose the  icon, enter **Service Connections**, and then choose appropriate link.
2. Fill in the required fields. Hover over a field to read a short description.

NOTE

It is a good idea to test your connection. To do this, choose the **Test Mode** check box, then prepare and submit your VAT report as described in the *To prepare and submit a VAT report* section. While in Test Mode, the service tests whether the tax authority can receive your report, and the status of the report will indicate whether the test submission was successful. It is important to remember that this is not an actual submission. To submit the report for real, you must clear the **Test Mode** check box, and then repeat the submission process.

To set up VAT reports in Business Central

1. Choose the  icon, enter **VAT Report Setup**, and then choose the related link.
2. To let users change and resubmit this report, choose the **Modify Submitted Reports** check box.
3. Choose the number series to use for each report.

To prepare and submit a VAT report

1. Choose the  icon, enter **EC Sales List** or **VAT Return**, and then choose the related link.
2. Choose **New**, and then fill in the required fields. Hover over a field to read a short description.
3. To generate the content of the report, choose the **Suggest Lines** action.

NOTE

For the EC Sales List report, you can review the transactions included in the report lines before you submit the report. To do that, choose the line, and then choose the **Show VAT Entries** action.

4. To validate and prepare the report for submission, choose the **Release** action.

NOTE

Business Central validates whether the report is set up correctly. If the validation fails, the errors display under **Errors and Warnings** so that you know what to fix. Typically, if the message is about a missing setting in Business Central, you can click the message to open the page that contains the information to correct.

5. To submit the report, choose the **Submit** action.

After you submit the report, Business Central monitors the service and keeps a record of your communications. The **Status** field indicates where the report is in the process. For example, when the authorities process your report,

the status of the report changes to **Succeeded**. If the tax authority found mistakes in the report you submitted, the status of the report will be **Failed**. You can view the errors under **Errors and Warnings**, correct them, and then submit the report again. To view a list of all your EC Sales List reports, go to the **EC Sales List Reports** page.

Viewing communications with your tax authority

In some countries, you exchange messages with the tax authority when you submit reports. You can view the first and the last message you sent or received by choosing the **Download Submission Message** and **Download Response Message** actions.

Submitting VAT reports manually

If you use another method to submit the report, for example by exporting the XML and uploading it to a tax authority website, afterward you can choose **Mark as Submitted** to close the reporting period. When you mark the report as released, it becomes non-editable. If you must change the report after you mark it as released, you must reopen it.

VAT settlement

Periodically, you must remit the net VAT to the tax authorities. If you need to settle VAT frequently, you can run the **Calc. and Post VAT Settlement** batch job to close the open VAT entries and transfer purchase and sales VAT amounts to the VAT settlement account.

When you transfer VAT amounts to the settlement account, the purchase VAT account is credited, and the sales VAT account is debited with the amounts calculated for the specified period. The net amount is credited or debited, if the purchase VAT amount is larger, to the VAT settlement account. You can post the settlement immediately or print a test report first.

NOTE

When you use the **Calc. and Post VAT Settlement** batch job, if you do not specify a **VAT Bus. Posting Group** and a **VAT Prod. Posting group**, entries with all business posting groups and product posting group codes are included.

Configuring your own VAT reports

You can use the EC Sales List report out-of-the-box, however, you can also create your own reports. This requires that you create a few codeunits. If you need help with that, contact a Microsoft Partner.

The following table describes the codeunits that you must create for your report.

CODEUNIT	WHAT IT MUST DO
Suggest Lines	Fetch information from the VAT Entries table, and display it in lines on the VAT report.
Content	Control the format of the report. For example, whether it is XML or JSON. The format to use depends on the requirements of your tax authority's web service.
Submission	Control how, and when, you submit the report based on the requirements of your tax authority.
Response Handler	Handle the return from the tax authority. For example, it might send an email message to your company's contact person.

CODEUNIT	WHAT IT MUST DO
Cancel	Send a cancellation of a VAT report that was submitted earlier to your tax authority.

NOTE

When create codeunits for the report, pay attention to the value in the **VAT Report Version** field. This field must reflect the version of the report that is, or was, required by the tax authority. For example, you might enter **2017** in the field to indicate that the report conforms to the requirements that were in place that year. To find the current version, contact your tax authority.

Using Pre-Closing Reports

3/31/2019 • 2 minutes to read

There are many standard reports that you can use to verify the accuracy of the accounts before closing the books at the end of a year or period. For example, you can use the **Customer - Trial Balance** report to verify that the balance for a customer posting group is equal to the balance on the corresponding general ledger account on a certain date.

The following table describes a number of reports that may be useful in this process.

TO	SEE THIS REPORT
Print a detailed trial balance report for one or more bank accounts with additional information about individual entries.	Bank Acc. - Detail Trial Bal.
Print a detail trial balance for selected customers.	Customer - Trial Balance
Print a detail trial balance with detailed information about individual entries, for selected customers during a selected period.	Customer - Detail Trial Bal.
Print a detail trial balance for selected vendors.	Vendor - Trial Balance
Print a detail trial balance with detailed information about individual entries, for selected vendors during a selected period.	Vendor - Detail Trial Balance
Print a trial balance with the current year's and the previous year's figures.	Closing Trial Balance
Print a detailed trial balance report for general ledger account balances.	Detail Trial Balance
Print a trial balance report with balances and net changes for general ledger accounts.	Trial Balance
Print a trial balance for a consolidated company.	Consolidated Trial Balance

To see a report, choose the  icon, type the name as it appears in the table, and then choose the related link.

Closing the Books

3/31/2019 • 3 minutes to read

After you ensure that all your accounts are up-to-date, and you allocate costs and income, then you can close the books for a fiscal year or period.

You are not required to close a year, but doing so will make working in the system easier for you because you will be able to take advantage of the convenient filtering options provided. You also do not have to worry about losing details of transactions when you close because all details are retained, even after you close the year.

Closing Book Process

The process for closing the book includes these main tasks:

1. Closing the accounting period.

A fiscal year is defined as one or more open periods as defined on the **Accounting Periods** page. A typical fiscal year contains 12 periods of one month each, but you can also choose another method of defining a year.

For more information, see [Close Accounting Periods](#).

2. Registering prior-year entries.

When you close a fiscal year, you must enter a number of administrative transactions (such as prepaid and accrued items). These transactions are called adjusting entries. There are no special rules for posting these entries, and they (like other entries) contain a check mark in the **Prior-Year Entry** field if they are posted on a date in a closed fiscal year. Even though a fiscal year has been closed, you can still post general ledger entries to it.

3. Transferring balances from the income statement accounts to the balance sheet.

After a fiscal year has been closed and all prior-year entries have been posted, the income statement accounts must be closed and the net income for the year must be transferred to an account under owners' equity on the balance sheet. Use the Close Income Statement batch job for this purpose. The batch job processes all general ledger accounts of the type Income Statement and creates entries that reverse their balances. These entries are placed in a journal from which they can be posted. The batch job does not post them automatically, except when an additional reporting currency is used. When an additional reporting currency is used, the batch job posts directly to the general ledger.

For more information, see [Close Income Statement](#).

4. Posting the year-end closing entry along with the offsetting equity account entries.

When the Close Income Statement batch job is finished, you post the entries generated by the job. If you did not specify a retained earnings account in the batch job, then enter one line with a balancing entry that posts the net income to the correct general ledger account under owners' equity on the balance sheet. Finally, post the journal.

For more information, see [Post Year-End Closing Entry](#).

What Happens When You Close

When you close at the end of the year, the system moves your earnings from calculated earnings to the Retained

Earnings account. The system also marks the fiscal year as "closed," and marks all subsequent entries for the closed year as "prior year entries."

The system then generates a closing entry, but it does not post the entry automatically. You are given the opportunity to make the offsetting equity account entry or entries, which allows you to decide how to allocate your closing entry. For example, if your company has several divisions, you can let the system generate a single closing entry for all the divisions, and you can then make an offsetting entry for each division's equity account.

You can post in a previous fiscal year, even after the income statement accounts have been closed, if you run the Close Income Statement batch job again afterward.

Preparing Closing Statements

3/31/2019 • 2 minutes to read

There are a number of standard reports that you can use to gather the information that you need to prepare your company's closing statements.

The following table describes a number of reports that may be useful in this process, with links to the topics that describe them.

TO	SEE THIS REPORT
Print a trial balance report with balances and net changes for general ledger accounts.	Trial Balance
Get an overview of accounts receivable, with the age of amounts receivable calculated from the due date, posting date, or document date.	Aged Accounts Receivable
Get an overview of accounts payable, with the age of amounts payable calculated from the due date, posting date or document date.	Aged Accounts Payable
Compare the trial balance with a budget.	Trial Balance/Budget
Print a trial balance report with balances and net changes for general ledger accounts calculated for a series of periods.	Trial Balance by Period
Print an account schedule to analyze figures in general ledger accounts or compare actual general ledger entries with general ledger budget entries.	Account Schedule
Check whether customer and vendor ledger entries balance with corresponding general ledger entries.	Reconcile Cust. and Vend. Accs

To see a report, choose the  icon, type the name as it appears in the table, and then choose the related link.

Close Accounting Periods

3/31/2019 • 2 minutes to read

When a fiscal year is over, you must close the periods that comprise it.

To close accounting periods

1. Choose the  icon, enter **Accounting Periods**, and then choose the related link.
2. On the **Accounting Periods** page, choose the **Close Year** action.

If more than one fiscal year is open, the earliest one is automatically selected to be closed. A message displays identifying the year that will close and the consequences of closing the year.

3. To close the year, choose the **Yes** button.

The fiscal year is closed, and the **Closed** and **Date Locked** fields for all the periods in the year are selected. The fiscal year cannot be opened again and you cannot remove the check mark from the **Closed** or **Date Locked** fields.

NOTE

You cannot close a fiscal year before you create a new one. Notice that when a fiscal year has been closed, you cannot change the starting date of the following fiscal year.

Even though a fiscal year has been closed, you can still post general ledger entries to it. When you do this, the entries will be marked as posted to a closed fiscal year and the **Prior-Year Entry** field will be selected.

After a fiscal year is closed, you must close the income statement accounts and transfer the year's results to an account in the balance sheet. You can repeat this every time that you post to the closed fiscal year.

Close Income Statement Accounts

3/31/2019 • 2 minutes to read

When a fiscal year is over, you must close the periods that comprise it. To do this, you run the **Close Income Statement** batch job. This job transfers the year's result to an account in the balance sheet and closes the income statement accounts. You do this by creating lines in a journal, which you then can post.

To run the Close Income Statement batch job

1. Close the fiscal year. The fiscal year must be closed before the batch job can be run. For more information, see [Close Accounting Periods](#).
2. Choose the  icon, enter **Close Income Statement**, and then choose the related link.
3. Choose the **OK** button to run the batch job.

About the Close Income Statement Batch Job

The batch job processes all general accounts of the income statement type and creates entries that cancel out their respective balances. That is, each entry is the sum of all the general ledger entries on the account in the fiscal year. These new entries are placed in a journal in which you must specify a balancing account and retained earnings account in the balance sheet before you post. When you post the journal, an entry is posted to each income statement account so that its balance becomes zero and at the same time the year's result is transferred to the balance sheet.

You must post the journal yourself. The batch job does not post the entries automatically, except when an additional reporting currency is being used. When an additional reporting currency is being used, the batch job posts entries directly to the general ledger.

The date on the lines that the batch job inserts in the journal is always a closing date for the fiscal year. The closing date is a fictitious date between the last day of the old fiscal year and the first day of the new year. The advantage of posting on a closing date is that you maintain the correct balances for the ordinary dates of the fiscal year.

The **Close Income Statement** batch job can be used several times. You can post in a previous fiscal year, even after the income statement accounts have been closed, if you run the batch job again.

Post the Year-End Closing Entry

3/31/2019 • 2 minutes to read

After you use the **Close Income Statement** batch job to generate the year-end closing entry or entries, you must open the journal you specified in the batch job, and then review and post the entries.

To post the year end closing entry

1. Choose the  icon, enter **General Journal**, and then choose the related link.
2. On the **General Journal** page, in the **Batch Name** field, select the batch that contains the closing entries.
3. Review the entries.
4. To post the journal, choose the **Post** action.

NOTE

If an error is detected, an error message is displayed. If the posting is successful, the posted entries are removed from the journal. After posting is complete, an entry is posted to each income statement account so that its balance becomes zero and the year's result is transferred to the balance sheet.

Understanding the General Ledger and the COA

3/31/2019 • 2 minutes to read

The general ledger stores your financial data, and the chart of accounts shows the accounts that all general ledger entries are posted to. Business Central includes a standard chart of accounts that is ready to support your business.

General Ledger Setup and General Posting Setup

The setup of the general ledger is at the core of financial processes because it defines how you post data.

On the **General Ledger Setup** page, you specify how to handle certain accounting issues in your company, such as:

- Invoice rounding details
- Address formats
- Financial reporting

Similarly, on the **General Posting Setup** page, you specify how you want to set up combinations of general business and general product posting groups. Posting groups map entities like customers, vendors, items, resources, and sales and purchase documents to general ledger accounts. You fill in a line for each combination of business posting group and product posting group. For more information, see [Posting Group Setups](#)

The Chart of Accounts

The chart of accounts shows all general ledger accounts. From the chart of accounts, you can do things like:

- View reports that show general ledger entries and balances.
- Close your income statement.
- Open the G/L account card to add or change settings.
- See a list of posting groups that post to that account.
- View separate debit and credit balances for a single account

You can add, change, or delete general ledger accounts. However, to prevent discrepancies, you can't delete a general ledger account if its data is used in the chart of accounts.

Account Categories

You can personalize the structure of your financial statements by mapping general ledger accounts to account categories.

The **G/L Account Categories** page shows your categories and subcategories, and the G/L accounts that are assigned to them. You can create new subcategories and assign those categories to existing accounts.

You create a category group by indenting other subcategories under a line on the **G/L Account Categories** page. This makes it easy for you to get an overview, because each grouping shows a total balance. For example, you can create subcategories for different types of assets, and then create category groups for fixed assets versus current assets.

You can specify whether the accounts in each subcategory must be included in specific types of reports. The account categories help define the layout of your financial statements.

For example, the default balance statement has a subcategory for Cash under Current Assets. If you want the balance statement consider petty cash and checking, you can:

1. Add two new subcategories. One for petty cash, and one for your checking account.
2. Specify the additional report definition **Cash Accounts** for these subcategories.
3. Indent them under the **Cash** subcategory.

The next time you generate account schedules your balance statement will show a total balance for cash and two lines with balances for petty cash and the checking account.

Consolidating Financial Data from Multiple Companies

3/31/2019 • 10 minutes to read

If you have more than one company in Business Central, the Consolidated Trial Balance report on the Accountant Role Center can give you an overview of the financial health of your overall business.

The report combines general ledger entries from each of your companies in a new company that you create to contain the consolidated data. This company is typically referred to as the "consolidated company". The consolidated company is just a container for the consolidated data, and does not have any live business data. The companies that you include in the consolidated company become **Business Units** in the report.

Consolidating financial data may especially be relevant in connection with intercompany processes. For more information, see [Managing Intercompany Transactions](#).

You can consolidate:

- Across companies that have different charts of accounts.
- Companies that use different fiscal years and different currencies.
- Either the full amount or a percentage of a company's financial information
- Using different currency exchange rates in individual G/L accounts

Depending on the complexity of your businesses, there are two ways to set up the report:

- If you do not need advanced settings, such as including a company that you only own part of, you can use the **Company Consolidation** assisted setup guide to quickly set up a consolidation. The guide helps you through the basic steps.
- If you do need more advanced settings, you can set up the consolidated company and business units yourself.

To do a simple consolidation setup

If your consolidation is straightforward, for example because you wholly-own the business units to consolidate, the **Company Consolidation** assisted setup guide will help you through the following steps:

- Choose whether to create a new consolidated company, or whether to consolidate the data in a company that you have already created for the consolidation. The company should not contain transactions.
- Preview the results. Business Central verifies that the master data and transactions can be successfully transferred to the consolidated company.

To use the assisted setup guide, follow these steps:

1. On the **Accountant** Role Center, choose the **Assisted Setup** action.
2. Choose **Set up consolidation reporting**, and then complete each step in the assisted setup guide.

To do an advanced consolidation setup

If you need more advanced settings for your consolidation, you can set up consolidation manually. For example, if you have companies that you own only partially, or you have companies that you do not want to include in the consolidation. You set up the consolidated company in the same way that you set up other companies. For more information, see [Getting Ready for Doing Business](#).

Business Central lets you set up a list of companies to consolidate, verify the accounting data before you

consolidate it, import files, and generate consolidation reports.

1. Sign in to the consolidated company.
2. Choose the  icon, enter **Business Units**, and then choose the related link.
3. Choose **New**, and then fill in the required fields. Hover over a field to read a short description.

IMPORTANT

When you fill in the **Starting Date** and **Ending Date** fields, make sure you comply with GAAP rules concerning the fiscal periods of the business unit versus the parent company.

If your business unit uses a foreign currency, you must specify the exchange rate to use in the consolidation. You must also enter consolidation information about the business unit's general ledger accounts. These processes are described in the following sections.

To prepare general ledger accounts for consolidation

If the chart of accounts in the business unit differs from the consolidated company, you must prepare general ledger accounts for consolidation. You can specify the accounts to post debits and credits to, and the method to use to translate currencies in the consolidated company. For example, this is useful if you frequently run the report.

1. Choose the  icon, enter **Chart of Accounts**, and then choose the related link.
2. Open the card for the account, and then fill in the fields on the **Consolidation** FastTab.

To specify exchange rates for consolidations

If a business unit uses a different currency than the consolidated company, you must specify exchange rate methods for each account before you consolidate. For each account, the content of the **Consol. Translation Method** field determines the exchange rate. On each business unit card, in the **Currency Exchange Rate Table** field, you specify whether consolidation will use exchange rates from the business unit or the consolidated company. If you use exchange rates from the consolidated company, you can change the exchange rates for a business unit. For business units, if the **Currency Exchange Rate Table** field on the business unit card contains **Local**, you can change the exchange rate from the business unit card. The exchange rates are copied from the **Currency Exchange Rate** table, but you can change them before consolidating.

The following table describes the exchange rate methods you can use for accounts.

EXCHANGE RATE	TYPICAL USE
Average Rate (Manual)	You manually calculate the average rate for the period to consolidate. Calculate the average either as an arithmetic average or as a best estimate, and specify the result for each business unit. Used for income statement accounts.
Closing Rate	Used for balance sheet accounts.
Last Closing Rate	The rate that was valid in the foreign exchange market on the date for which the balance sheet or income statement is being prepared. You enter this rate for each business unit. Used for balance sheet accounts.
Historical Rate	The exchange rate that was valid when the transaction occurred.

EXCHANGE RATE	TYPICAL USE
Composite Rate	The current period amounts are translated at the average rate and added to the previously recorded balance in the consolidated company. This method is typically used for retained earnings accounts because they include amounts from different periods and are therefore a composite of amounts translated with different exchange rates.
Equity Rate	This is similar to Composite . Differences are posted to separate general ledger accounts.

To specify exchange rates for business units, follow these steps:

1. Choose the  icon, enter **Business Units**, and then choose the related link.
2. On the **Business Unit List** page, choose the business unit, and then choose the **Average Rate (Manual)** action.
3. On the **Change Exchange Rate** page, the contents of the **Relational Exch. Rate** field have been copied from the **Currency Exchange Rate** table, but you can modify them. Close the page.
4. Choose the **Closing Rate** action.
5. In the **Relational Exch. Rate Amount** field, enter the exchange rate.

To exclude a company from consolidation

If you do not want to include a business unit in the consolidation, you can exclude it. To do that, go to the business unit card, and clear the **Consolidate** check box.

To include a partially-owned company in consolidation

If you own only part of a company, you can include a percentage of each transaction that corresponds to the percentage of the company you own. For example, if you own 70% of the company, consolidation will include \$70 of an invoice for \$100. To specify the percentage of the company you own, go to the business unit card, and enter the percentage in the **Consolidation %** field.

To test the data before you consolidate

You can test your data before you transfer it to the consolidated company. Business Central looks for differences in the information in the business units and the consolidated company. For example, whether account numbers or dimension codes are different. You must correct errors before you can run the report. You can test the database or, if you are importing data from an XML file, you can test the file.

1. Open the consolidated company.
2. Choose the  icon, enter **Business Units**, and then choose the related link.
3. Do one of the following:
 - To test a file, choose the **Test File** action, enter the name of the file to test, and then choose **Print**.
 - To test the database, choose **Test Database**.

To run the consolidation

After you have tested the data, you can transfer it to the consolidated company.

1. Sign in to the consolidated company.
2. On the **Accountant Role Center**, choose the **Run Consolidation** action.
3. Fill in the required fields.
4. In the **Where** field, choose **Company Name**, and then choose the consolidated company in the **is** field.

To eliminate repeated transactions

After you have consolidated all the companies, you must find any transactions that are recorded more than once across companies and then post elimination entries to remove them.

Processing consolidation eliminations is a manual process. You can follow these steps:

1. Find transactions that potentially need to be adjusted and enter general journal lines to eliminate them.
2. Run the **G/L Consolidation Eliminations** report to help you assess the effect of the general journal lines before posting.
3. Post the adjusting transactions.

The **G/L Consolidation Eliminations** report displays a tentative trial balance where you can simulate the consequences of eliminating entries by comparing the entries in the consolidated company with the eliminations that have been entered in the general journal.

Before a business unit can be included in the report, it must be set up on the **Business Units** page and the **Consolidate** field must be selected.

Each account appears on a line by itself, following the structure of the chart of accounts. An account is not shown if all the amounts on the line are 0. The following information is shown for each account:

- Account number
- Account name.
- If you have selected one or more business unit codes in the **Business Unit Code** field on the request page, a total is shown for the consolidated company excluding the selected business units and eliminations. If you have not filled in the **Business Unit Code** field, a total is shown for the consolidated company excluding eliminations.
- If you have selected a business unit code in the **Business Unit Code** field on the request page, a total is shown for the imported entries from the business unit. If you have not filled in the **Business Unit Code** field, a total is shown for the posted eliminations in the consolidated company.
- The total for the consolidated company with all the business units and all posted eliminations.
- The eliminations to be made in the consolidated company, that is, the entries in the general journal that is selected on the request page.
- The posting text copied from the general journal.
- The consolidated company's total after the eliminations, if they are posted.

To export and import consolidated data between databases

If data for a business unit is in another database, you must export the data to a file before you can include it in the consolidation. Each company must be exported separately. For this purpose, use the **Export Consolidation** batch job.

After you run the batch job, all entries in general ledger accounts are processed. For every combination of selected dimensions and date, the contents of the entries' **Amount** fields are totaled and exported. The next combination of selected dimensions and date with the same account number is processed, then the combinations in the next account number are processed, and so on.

The exported entries contain the following fields: **Account No.**, **Posting Date**, and **Amount**. If dimensions information was also exported, dimension codes and dimension values are also included.

1. For each exported line, if the total of the **Amount** fields is a debit, the account number that is set up in the business unit's **Consol. Debit Acc.** field is exported to the line. If the total is a credit, the corresponding number in the **Consol. Credit Acc.** field is exported to the line.
2. The date used for each exported line is either the period's ending date or, if the transfer occurs each day, the

exact date of the calculation.

3. The dimension value exported for the entry will be the consolidated company dimension value that is set up in the **Consolidation Code** field for that dimension value. If no consolidated company dimension value has been entered in the **Consolidated Code** field for that dimension value, the dimension value itself will be exported to the line.
4. The XML files also contain the currency exchange rates in the consolidation period. These rates are included in a separate section at the beginning of the file.

Working with Dimensions

3/31/2019 • 14 minutes to read

To make it simpler to perform analysis on documents such as sales orders, you can use dimensions. Dimensions are attributes and values that categorize entries so you can track and analyze them. For example, dimensions can indicate the project or department an entry came from.

For example, instead of setting up separate general ledger accounts for each department and project, you can use dimensions. This gives a rich opportunity for analysis, without creating a complicated chart of accounts. For more information, see [Business Intelligence](#).

Another example is to set up a dimension called *Department*, and use this dimension when you post sales documents. This will let you use business intelligence tools to see which department sold which items. The more dimensions you use, the more detailed reports you can base your business decisions on. For example, a single sales entry can include multiple dimension information, such as:

- The account the item sale was posted to
- Where the item was sold
- Who sold it
- The kind of customer who bought it

Analyzing by Dimensions

The Dimensions functionality plays an important role in business intelligence, such as when defining analysis views. For more information, see [Analyze Data by Dimensions](#).

TIP

As a quick way to analyze transactional data by dimensions, you can filter totals in the chart of accounts and entries in all **Entries** pages by dimensions. Look for the **Set Dimension Filter** action.

Dimension Sets

A dimension set is a unique combination of dimension values. It is stored as dimension set entries in the database. Each dimension set entry represents a single dimension value. The dimension set is identified by a common dimension set ID that is assigned to each dimension set entry that belongs to the dimension set.

When you create a journal line, document header, or document line, you can specify a combination of dimension values. Instead of explicitly storing each dimension value in the database, a dimension set ID is assigned to the journal line, document header, or document line to specify the dimension set.

Setting Up Dimensions

You can define the dimensions and dimension values to categorize journals and documents, such as sales orders and purchase orders. You set up dimensions on the **Dimensions** page, where you create one line for each dimension, such as *Project*, *Department*, *Area*, and *Salesperson*.

You also set up values for dimensions. For example, values might be departments in your company. Dimension values can be set up in a hierarchical structure similar to the chart of accounts, so that data can be broken down into various levels of granularity, and subsets of dimension values can be totaled. You can define as many

dimensions and dimension values as you need, and everyone in your company can use them.

When dimensions and values are set up, you can define global and shortcut dimensions on the **General Ledger Setup** page that will always be available to select as fields on journal and document lines, without having to open the **Dimensions** page first. For more information, see [To set up global and shortcut dimensions](#).

- **Global dimensions** are used as filters, for example, on reports and batch jobs. You can use only two global dimensions, so choose dimensions you will use often.
- **Shortcut dimensions** are available as fields on journal and document lines. You can create up to six of these.

To set up default dimensions for customers, vendors, and other accounts

You can assign a default dimension for a specific account. The dimension will be copied to the journal or document when you enter the account number on a line, but you can delete or change the code on the line if appropriate. You can also make a dimension required for posting an entry with a specific type of account.

1. Choose the  icon, enter **Dimensions**, and then choose the related link.
2. On the **Dimensions** page, select the relevant dimension, and then choose the **Account Type Default Dim** action.
3. Fill in a line for each new default dimension that you want to set up. Hover over a field to read a short description.

TIP

If you want to make a dimension required but you do not want to assign a default value to the dimension, leave the **Dimension Value Code** field blank and then select **Code Mandatory** in the **Value Posting** field.

WARNING

If an account is used in the **Adjust Exchange Rates** batch job or the **Post Inventory Cost to G/L** batch job, do not select **Code Mandatory** or **Same Code**. These batch jobs cannot use dimension codes.

NOTE

If an account must have a different dimension assigned to it than the default dimension already set up for the account type, you must set up a default dimension for this account. The default dimension for the individual account then replaces the default dimension for the account type.

To set up default dimension priorities

Different account types, such as a customer account and an item account, can have different default dimensions set up. As a result, an entry can have more than one default dimension proposed for a dimension. To avoid such conflicts, you can apply priority rules to the different sources.

1. Choose the  icon, enter **Default Dimension Priorities**, and then choose the related link.
2. On the **Default Dimension Priorities** page, in the **Source Code** field, enter the source code for the entry table to which default dimension priorities will apply.
3. Fill in a line for each default dimension priority that you want for the selected source code.
4. Repeat the procedure for each source code for which you want to set up default dimension priorities.

IMPORTANT

If you set up two tables with the same priority for the same source code, Business Central will always select the table with the lowest table ID.

To set up dimension combinations

To avoid posting entries with contradictory or irrelevant dimensions, you can block or limit specific combinations of two dimensions. A blocked dimension combination means that you cannot post both dimensions on the same entry regardless of what the dimension values are. A limited dimension combination lets you post both dimensions to the same entry, but only for certain combinations of dimension values.

1. Choose the  icon, enter **Dimension Combinations**, and then choose the related link.
2. On the **Dimension Combinations** page, choose the field of the dimension combination and select one of the following options.

FIELD	DESCRIPTION
No limitation	This dimension combination has no restrictions. All dimensions values are allowed.
Limited	This dimension combination has restrictions depending on which dimension values that you enter. You must define the limitations on the Dimension Value Combination page.
Blocked	This dimension combination is not allowed.

3. If you selected the **Limited** option, you must define which combinations of dimension values are blocked. To do this, choose the field to define the dimension combination.
4. Now select a dimension value combination that is blocked and enter **Blocked** in the field. A blank field means that the dimension value combination is allowed. Repeat if multiple combinations are blocked.

NOTE

The same dimensions are displayed in both rows and columns and, therefore, all dimension combinations appear two times. Business Central automatically displays the setting in both fields. You cannot select anything in the fields from the upper-left corner and down, because these fields have the same dimension in both rows and columns.

The selected option is not visible before you exit the field.

To show the name of the dimensions instead of the code, select the **Show Column Name** field.

To set up global and shortcut dimensions

Global and shortcut dimensions can be used as a filter anywhere in Business Central, including on reports, batch jobs, and analysis views. Global and shortcut dimensions are always available to be inserted directly without first opening the **Dimensions** page. On journal and document lines, you can select global and shortcut dimensions in a field on the line. You can set up two global dimensions and eight shortcut dimensions. Choose the dimensions that you use most frequently.

IMPORTANT

Changing a global or shortcut dimension requires that all entries posted with the dimension are updated. You can perform this task with the **Change Global Dimensions** function, but it can be time-consuming and may affect performance. Therefore, choose your global and shortcut dimensions carefully so that you do not have to change them later.

NOTE

When you add or change a global or shortcut dimension, you are automatically signed out and back in so that the new value is prepared for use all over the application.

1. Choose the  icon, enter **General Ledger Setup**, and then choose the related link.
2. On the **Dimensions** FastTab, fill in the fields. Hover over a field to read a short description.

To change global dimensions

1. Choose the  icon, enter **Change Global Dimensions**, and then choose the related link.
2. Hover over actions and fields on the page to learn how to change global and shortcut dimensions.

Example of Dimension Setup

Let's say that your company wants to track transactions based on organizational structure and geographic locations. To do that, you can set up two dimensions on the **Dimensions** page:

- **AREA**
- **DEPARTMENT**

CODE	NAME	CODE CAPTION	FILTER CAPTION
AREA	Area	Area Code	Area Filter
DEPARTMENT	Department	Department Code	Department Filter

For **AREA**, you add the following dimension values:

CODE	NAME	DIMENSION VALUE TYPE
10	Americas	Begin-Total
20	North America	Standard
30	Pacific	Standard
40	South America	Standard
50	Americas, Total	End-Total
60	Europe	Begin-Total
70	EU	Standard
80	Non-EU	Standard
90	Europe, Total	End-Total

For the two main geographic areas, Americas and Europe, you add subcategories for regions by indenting the dimension values. This will let you report on sales or expenses in regions, and get totals for the larger geographic areas. You could also choose to use countries or regions as your dimension values, or counties or cities, depending on your business.

NOTE

To set up a hierarchy, the codes must be in alphabetical order. This includes the codes of the dimension values that are provided in Business Central.

For **DEPARTMENT**, you add the following dimension values:

CODE	NAME	DIMENSION VALUE TYPE
ADMIN	Administration	Standard
PROD	Production	Standard
SALES	Sales	Standard

With this set up, you can add your two dimensions as the two global dimensions on the **General Ledger Setup** page. This means that you can use AREA and DEPARTMENT as filters for general ledger entries, as well as on all reports and account schedules. Both global dimensions are also automatically available for use on entry lines and document headers as shortcut dimensions.

Getting an Overview of Dimensions used Multiple Times

The **Default Dimensions-Multiple** page specifies how a group of accounts use dimensions and dimension values. You can do this by highlighting multiple accounts and then specifying default dimensions and dimension values for all the accounts you have highlighted in the account list. When you specify default dimensions for the highlighted accounts, the program will suggest these dimensions and dimension values whenever one of these accounts is used, for example on a journal line. This makes entry posting easier for the user, as the dimension fields are filled in automatically. However, the dimension values that are suggested can be changed on, for example, a journal line.

The **Default Dimensions-Multiple** page contains the following fields:

FIELD	DESCRIPTION
Dimension Code	Shows all dimensions that have been defined as default dimensions on one or more of the highlighted accounts. By choosing the field, you can see a list of all available dimensions. If you select a dimension, the selected dimension will be defined as a default dimension for all highlighted accounts.

FIELD	DESCRIPTION
Dimension Value Code	Shows either a single dimension value or the term (Conflict). If a dimension value is shown in the field, then all highlighted accounts have the same default dimension value for a dimension. If the term (Conflict) is shown in the field, then not all of the highlighted accounts have the same default dimension value for a dimension. By choosing the field, you can see a list of all available dimension values for a dimension. If you select a dimension value, the selected dimension value will be defined as a default dimension value for all highlighted accounts.
Value Posting	Shows either a single value posting rule or the term (Conflict). If a value posting rule is shown in the field, then all highlighted accounts have the same value posting rule for a dimension value. If the term (Conflict) is shown in the field, then not all of the highlighted accounts have the same value posting rule for a dimension value. By choosing the Value Posting field, you can see a list of value posting rules. If you select a value posting rule, it will be applied for all highlighted accounts.

Using Dimensions

In a document such as a sales order, you can add dimension information for both an individual document line and the document itself. For example, on the **Sales Order** page, you can enter dimension values for the first two shortcut dimensions on the individual sales lines, and you can add more dimension information if you choose the **Dimensions** button.

If you work in a journal instead, you can add dimension information to an entry in the same way, if you have set up shortcut dimensions as fields directly on journal lines.

You can set up default dimensions for accounts or account types, so that dimensions and dimension values are filled in automatically.

To view global dimensions in ledger entry pages

Global dimensions are always company-defined and company-named. To see the global dimensions for your company, open the **General Ledger Setup** page.

In a ledger entry page, you can see whether there are global dimensions for the entries. The two global dimensions differ from the rest of your dimensions because you can use them as filters anywhere in Business Central.

1. Choose the  icon, enter **Chart of Accounts**, and then choose the related link.
2. On the **Chart of Accounts** page, choose the **Ledger Entries** action.
3. To see only the entries that are relevant, set one or more filters on the page.
4. To see all the dimensions for an entry, select the entry, and then choose the **Dimensions** action.

NOTE

The **Ledger Entry Dimensions** page displays the dimensions for one ledger entry at a time. As you scroll through the ledger entries, the content on the **Ledger Entry Dimensions** page changes accordingly.

Troubleshooting Dimensions Errors

When you post documents or journal lines that contain dimensions, various errors may occur that are typically related to wrong dimension setup or assignment.

NOTE

In the following list of potential error messages, the %X codes are placeholders for the data variables that the actual message will contain in the UI depending on the context. For example, %1 %2 is blocked. could appear in the UI as "Dimension Code AREA is blocked."

ISSUE	ERROR MESSAGE	POSSIBLE SOLUTION
Blocked dimension	%1 %2 is blocked.	<ul style="list-style-type: none"> - Find non-posted documents containing the dimension set with the blocked dimension and unblock it. - Remove the dimension set line for the blocked dimension.
Deleted dimension	%1 %2 can't be found.	<ul style="list-style-type: none"> - Restore the missing dimension. - Find non-posted documents containing the dimension set with the missing dimension and add it. - Remove the dimension set line for the missing dimension.
Blocked dimension value	%1 %2 - %3 is blocked.	<ul style="list-style-type: none"> - Find non-posted documents containing the dimension set with the blocked dimension value and unblock it. - Remove the dimension set line for the blocked dimension value.
Deleted dimension value	%1 for %2 is missing.	<ul style="list-style-type: none"> - Restore the missing dimension value. - Find non-posted documents containing the dimension set with the missing dimension value and add it. - Remove the dimension set line for the missing dimension value.
Disallowed dimension value	Dimension Value Type for %1 %2 - %3 must not be %4.	<ul style="list-style-type: none"> - Change the Dimension Value Type field on the Dimension Values page to Standard or Begin-Total. - Remove the dimension set line for the blocked dimension value.
Blocked dimension combination	Dimensions %1 and %2 can't be used concurrently.	<ul style="list-style-type: none"> - Find non-posted documents containing the dimension set with the blocked dimension combination and unblock it. - Modify one of the conflicting permission set line for the dimension combination.

ISSUE	ERROR MESSAGE	POSSIBLE SOLUTION
Blocked dimension value Combination	Dimension combinations %1 - %2 and %3 - %4 can't be used concurrently.	<ul style="list-style-type: none"> -Find non-posted documents containing the dimension set with the blocked dimension value combination and unblock it. -Modify one of the conflicting permission set line for the dimension value combination.
Blank dimension value code for default dimension where the Value Posting field contains Code Mandatory	<ul style="list-style-type: none"> -Select a %1 for the %2 %3. -Select a %1 for the %2 %3 for %4 %5. 	<ul style="list-style-type: none"> -Change the Value Posting field on the Default Dimension page. -Enter a non-blank dimension value for the conflicting dimension in the dimension set.
Wrong dimension value code for default dimension where the Value Posting field contains Same Code	<ul style="list-style-type: none"> -Select %1 %2 for the %3 %4. -Select %1 %2 for the %3 %4 for %5 %6 	<ul style="list-style-type: none"> -Change the Value Posting field on the Default Dimension page. -Enter the required dimension value for the conflicting dimension in the dimension set.
Non-blank dimension value code for blank default dimension where the Value Posting field contains Same Code	<ul style="list-style-type: none"> -%1 %2 must be blank. -%1 %2 must be blank for %3 %4. 	<ul style="list-style-type: none"> -Change the Value Posting field on the Default Dimension page. -Enter a blank dimension value code for the conflicting dimension in the dimension set.
Unexpected dimension value for default dimension where the Value Posting field contains No Code	<ul style="list-style-type: none"> -%1 %2 must not be mentioned. -%1 %2 must not be mentioned for %3 %4 	<ul style="list-style-type: none"> -Change the Value Posting field on the Default Dimension page. -Remove the conflicting line from the dimension set.

Create G/L Budgets

6/13/2019 • 3 minutes to read

You can have multiple budgets for identical time periods by creating budgets with separate names. First, you set up the budget name and enter the budget figures. The budget name is then included on all the budget entries you create.

When you create a budget, you can define four dimensions for each budget. These budget-specific dimensions are called budget dimensions. You select the budget dimensions for each budget from among the dimensions you have already set up. Budget dimensions can be used to set filters on a budget and to add dimension information to budget entries. For more information, see [Working with Dimensions](#).

Budgets play an important role in business intelligence, such as in financial statement based on account schedules that include budget entries or when analyzing budgeted versus actual amounts in the chart of accounts. For more information, see [Business Intelligence](#).

In cost accounting, you work with cost budgets in a similar way. For more information, see [Creating Cost Budgets](#).

To create a new G/L budget

1. Choose the  icon, enter **G/L Budgets**, and then choose the related link.
2. Choose the **Edit List** action, and then fill in the fields as necessary. Hover over a field to read a short description.
3. Choose the **Edit Budget** action.
4. At the top of the **Budget** page, fill in the fields as necessary to define what is displayed.

Only entries that contain the budget name that you entered in the **budget Name** field are shown. Because the budget name has just been created, there are no entries that match the filter. Therefore, the page is empty.

5. To enter an amount, choose the relevant cell in the matrix. The **G/L Budget Entries** page opens.
6. Create a new line and fill in the **Amount** field. Close the **G/L Budget Entries** page.
7. Repeat steps 5 and 6 until you have entered all of the budget amounts.

NOTE

On the **Filters** FastTab, you can filter the budget information by budget dimensions you have set up under the budget name.

Exporting and Importing G/L Budgets with Excel

As for practically all other pages, you can export data on budget pages to Excel for further processing or analysis. For more information, see [Exporting Your Business Data to Excel](#).

NOTE

The chart of accounts, that G/L budgets are based on, have lines of account type Heading that contain the total of the lines below it. When you export a G/L budget, data on all lines is exported regardless of the account type. However, only data on lines of account type Posting can be imported back in. Accordingly:

When you import a G/L budget, any values that existed on Heading lines will be deleted.

This is to avoid wrong totals after importing data that has been created or edited in Excel.

Scenario: You know that the new budgeted salaries cost is going to be LCY 1.200.000. You want to let the Salaries department budget for the three specific lines (of account type Posting) for Full-time Employees, Part-time Employees, and Temp Help. The three lines are grouped under a Salaries heading line.

You enter 1.200.000 on the Heading line, export the budget to Excel, and then send it to the Salaries department, telling them to distribute the LCY 1.200.000.

The Salaries department distributes the amount on the three posting accounts. When you import back into the G/L budget, the three accounts are filled in with the new Excel data, summing to LCY 1.200.000, and the Heading line is blank.

[Setting Up Finance](#)

[The General Ledger and the Chart of Accounts](#)

[Working with Business Central](#)

Post Transactions Directly to the General Ledger

3/31/2019 • 2 minutes to read

You use general journals to post financial transactions directly to general ledger accounts and other accounts, such as bank, customer, vendor, and employee accounts.

A typical use of the general journal is to post employees' expenditure of own money during business activities, for later reimbursement. For more information, see [Record and Reimburse Employees' Expenses](#).

General journals post financial transactions directly to general ledger accounts and other accounts, such as bank, customer, vendor, and employee accounts. Posting with a general journal always creates entries on general ledger accounts. This is true even when, for example, you post a journal line to a customer account, because an entry is posted to a general ledger receivables account through a posting group. You can personalize your version of a general journal by setting up a journal batch or template. For more information, see [Working with General Journals](#).

Unlike for entries that are posted with documents, which require a credit memo process, you can correctly reverse entries that are posted with the general journal. For more information, see [Reverse Postings](#).

To post a transaction directly to a general ledger account

1. Choose the  icon, enter **General Journals**, and then choose the related link.
2. Open the relevant general journal batch. For more information, see [Working with General Journals](#).
3. On a new journal line, fill in the fields as necessary. Hover over a field to read a short description.

NOTE

The general journal only shows a limited number of fields on the journal line by default. If you want to see additional fields, such as the **Account Type** field, choose the **Show More Columns** action. To hide the additional fields again, choose the **Show Fewer Columns** action.

4. Repeat step 3 for all the separate transactions that you want to post.

TIP

If you want to enter multiple transaction lines above one balance-account line, for example, for one bank account, then select the **Suggest Balancing Amount** check box on the line for your batch on the **General Journal Batches** page. Then the **Amount** field on the balance-account line is automatically prefilled with the value that is required to balance the transactions.

5. Choose the **Post** action to record the transactions on the specified G/L accounts.

[Finance](#)

[Working with Business Central](#)

Reverse Postings

3/31/2019 • 3 minutes to read

To undo an erroneous journal posting, you select the entry and create a reverse entry (entries identical to the original entry but with opposite sign in the amount field) with the same document number and posting date as the original entry. After reversing an entry, you must make the correct entry.

You can only reverse entries that are posted from a general journal line. An entry can only be reversed once.

For more information about posting from a general journal, see [Post Transactions Directly to the General Ledger](#).

If you have made an incorrect negative quantity posting, such as a purchase order with the wrong number of items and posted it as received but not invoiced, then you can undo the posting.

If you have made an incorrect positive quantity posting, such as a purchase return order with the wrong number of items and posted it as shipped but not invoiced, then you can undo the posting.

To reverse the journal posting of a general ledger entry

You can reverse entries from all **Ledger Entries** pages. The following procedure is based on the **General Ledger Entries** page.

1. Choose the  icon, enter **General Ledger Entries**, and then choose the related link.
2. Select the entry that you want to reverse, and then choose the **Reverse Transaction** action. Note that it must originate from a journal posting.
3. On the **Reverse Transaction Entries** page, select the relevant entry, and then choose the **Reverse** action.
4. Choose the **Yes** button on the confirmation message.

To undo a quantity posting on a posted purchase receipt

1. Choose the  icon, enter **Posted Purchase Receipts**, and then choose the related link.
2. Open the posted receipt that you want to undo.
3. Select the line or lines that you want to undo.
4. Choose **Undo Receipt** action.

A corrective line is inserted under the selected receipt line.

If the quantity was received in a warehouse receipt, then a corrective line is inserted in the posted warehouse receipt.

The **Quantity Received** and **Qty. Rcd. Not Invoiced** fields on the related purchase order are set to zero.

To undo and then redo a quantity posting on a posted return shipment

1. Choose the  icon, enter **Posted Return Shipments**, and then choose the related link.
2. Open the posted return shipment that you want to undo.
3. Select the line or lines you want to undo.

4. Choose the **Undo Return Shipment** action.

A corrective line is inserted in the posted document, and the **Return Qty. Shipped** and **Return Shpd. Not Invd.** fields on the return order are set to zero.

Now go back to the purchase return order to redo the posting.

5. On the **Posted Return Shipment** page, take a note of the number in the **Return Order No.** field.
6. Choose the  icon, enter **Purchase Return Orders**, and then select the related link.
7. Open the return order in question, and then choose the **Reopen** action.
8. Correct the entry in the **Quantity** field and post the purchase return order again.

To post a negative entry

You can use the **Correction** field to post a negative debit instead of a credit, or to post a negative credit instead of a debit on an account. To meet legal requirements, this field is visible by default in all journals. The **Debit Amount** and **Credit Amount** fields include both the original entry, and the corrected entry. These fields have no effect on the account balance.

1. Choose the  icon, enter **General Journals**, and then choose the related link
2. In the **Batch Name** field, select the required batch name.
3. Enter information into the relevant fields.
4. In the journal line that you want to activate for negative entries, select the **Correction** check box.
5. To post the journal, choose the **Post** action, and then choose the **Yes** button.

Allocate Costs and Income

3/31/2019 • 2 minutes to read

You can allocate an entry in a general journal to several different accounts when you post the journal. The allocation can be made by three different methods:

- Quantity
- Percentage (%)
- Amount

The allocation features can be used with recurring general journals and in fixed assets journals.

The following procedures describe how to prepare to allocate costs in a recurring general journal by defining allocation keys. When allocation keys are defined, you complete and post the journal like any other recurring general journal. For more information, see [Working with General Journals](#).

To set up allocation keys

You can allocate an entry in a recurring general journal to several different accounts when you post the journal. The allocation can be made by quantity, percentage, or amount.

1. Choose the  icon, enter **Recurring General Journal**, and then choose the related link.
2. Choose the **Batch Name** field to open the **General Journal Batches** page.
3. You can either modify allocations on an existing batch in the list or create a new batch with allocations.
 - To create a new batch, choose the **New** action, and go to the next step.
 - To change the allocations of an existing journal, select the journal and go to step 7.
4. In the **Name** field, enter a name for the batch, such as CLEANING. In the **Description** field, enter a description, such as Cleaning Expenses Journal.
5. When you are done, close the page. A new, empty recurring journal opens.
6. Fill in the fields on the line.
7. Choose the **Allocations** action.
8. Add a line for each allocation. You must fill in either the **Allocation %**, **Allocation Quantity**, or **Amount** field. You must also fill in the **Account No.** field and, if you are allocating the transaction among global dimensions, the global dimension fields.
9. If you enter a percentage on a line, the amount in the **Amount** field is calculated automatically. These amounts have the opposite sign from the total amount in the **Amount** field in the recurring journal.
10. After entering the allocations lines, choose **OK** to return to the **Recurring General Journal** page. The **Allocated Amt. (USD)** field is filled in and matches the **Amount** field.
11. Post the journal.

To change an allocation key that has already been set up

1. Choose the  icon, enter **Recurring General Journal**, and then choose the related link.
2. On the **Recurring General Journal** page, select the journal with the allocation.
3. Choose the line with the allocation, and then choose **Allocations** action.
4. Change the relevant fields, and then choose the **OK** button.

Use Item Charges to Account for Additional Trade Costs

3/31/2019 • 4 minutes to read

To ensure correct valuation, your inventory items must carry any added costs, such as freight, physical handling, insurance, and transportation that you incur when purchasing or selling the items. For purchases, the landed cost of a purchased item consists of the vendor's purchase price and all additional direct item charges that can be assigned to individual receipts or return shipments. For sales, knowing the cost of shipping sold items can be as vital to your company as knowing the landed cost of purchased items.

In addition to recording the added cost in you inventory value, you can use the Item Charges feature for the following:

- Identify the landed cost of an item for making more accurate decisions on how to optimize the distribution network.
- Break down the unit cost or unit price of an item for analysis purposes.
- include purchase allowances into the unit cost and sales allowances into the unit price.

Before you can assign item charges, you must set up item charge numbers for the different types of item charges, including to which G/L accounts costs related to sales, purchases, and inventory adjustments are posted to. An item charge number contains a combination of general product posting group, tax group code, VAT product posting group, and item charge. When you enter the item charge number on a purchase or sales document, the relevant G/L account is retrieved based on the setup of the item charge number and the information on the document.

For both purchase and sales documents, you can assign an item charge in two ways:

- On the document where the items that the item charge relates to are listed. This you typically do for documents that are not yet fully posted.
- On a separate invoice by linking the item charge to a posted receipt or shipment where the items that the item charge relate to are listed.

NOTE

You can assign item charges to orders, invoices, and credit memos, for both sales and purchases. The following procedures describe how to work with item charges for a purchase invoice. The steps are similar for all other purchase and sales documents.

To set up item charge numbers

You use item charge numbers to distinguish between the different kinds of item charges that are used in your company.

1. Choose the  icon, enter **Item Charges**, and then choose the related link.
2. On the **Item Charges** page, choose the **New** action to create a new line.
3. Fill in the fields as necessary. Hover over a field to read a short description.

To assign an item charge directly to the purchase invoice for the item

If you know the item charge at the time when you post a purchase invoice for the item, follow this procedure.

1. Choose the  icon, enter **Purchase Invoices**, and then choose the related link.
2. Create a new purchase invoice. For more information, see [Record Purchases](#).
3. Make sure the purchase invoice has one or more lines of type Item.
4. On a new line, in the **Type** field, select **Charge (Item)**.
5. In the **Quantity** field, enter the units of the item charge that you have been invoiced for.
6. In the **Direct Unit Cost** field, enter the amount of the item charge.
7. Fill in the remaining fields as necessary. Hover over a field to read a short description.

In the following steps, you will perform the actual assignment. Until the item charge is fully assigned, the value in the **Qty. to Assign** field is in red font.

8. On the **Lines** tab, choose the **Item Charge Assignment** action.

The **Item Charge Assignment** page opens showing one line for each line of type Item on the purchase invoice. To assign the item charge to one or more invoice lines, you can use a function that assigns and distributes it for you or you can manually fill in the **Qty. to Assign** field. The following steps describe how to use the Suggest Item Charge Assignment function.

9. On the **Item Charge Assignment** page, choose the **Suggest Item Charge Assignment** action.
10. If there are more than one invoice lines of type Item, choose one of the four distribution options.

It the item charge is fully assigned, the value in the **Qty. to Assign** field on the purchase invoice is zero.

The item charge is now assigned to the purchase invoice. When you post the receipt of the purchase invoice, the items' inventory values are updated with the cost of the item charge.

To assign an item charge from a separate invoice to the purchase invoice for the item

If you received an invoice for the item charge after you posted the original purchase receipt, follow this procedure.

1. Repeat steps 1 through 8 in [To assign an item charge directly to the purchase invoice for the item](#).
2. On the **Item Charge Assignment** page, choose the **Get Receipt Lines** action.
3. On the **Purch. Receipt Lines** page, select the posted purchase receipt for the item that you want to assign the item charge to, and then choose the **OK** button.
4. Choose the **Suggest Item Charge Assignment** action.

The item charge on the separate purchase invoice is now assigned to the item on the posted purchase receipt, thereby updating the item's inventory value with the cost of the item charge.

Record and Reimburse Employees' Expenses

3/31/2019 • 2 minutes to read

Business Central supports transactions for employee in a similar way as for vendors. Accordingly, employee posting groups exist to make sure that employee ledger entries are posted to the relevant accounts in the general ledger.

NOTE

Employee transactions can be posted in the local currency only. Reimbursement payments to employees do not support discounts and payment tolerances.

If employees spend their own money during business activities, you can post the expense to the employee's account. Then you can reimburse the employee by making a payment to the employee's bank account, similarly to how you pay vendors.

To record an employee's expense

You post employees' expenses on the **General Journal** page.

1. Choose the  icon, enter **General Journals**, and then choose the related link.
2. Open the relevant general journal batch. For more information, see [Working with General Journals](#).
3. On a new journal line, fill in the fields as necessary. Hover over a field to read a short description.

NOTE

The general journal only shows a limited number of fields on the journal line by default. If you want to see additional fields, such as the **Account Type** field, choose the **Show More Columns** action. To hide the additional fields again, choose the **Show Fewer Columns** action.

4. Repeat step 3 for all the expenses that the employee has incurred.

TIP

If you want to enter multiple expense lines above one balance-account line for the employee's bank account, then select the **Suggest Balancing Amount** check box on the line for your batch on the **General Journal Batches** page. Then the **Amount** field on the balance-account line is automatically prefilled with the value that is required to balance the expenses.

5. Choose the **Post** action to record the expenses on the employee's account.

To reimburse an employee

You reimburse employees by posting payments to their bank account on the **Payment Journal** page.

1. Choose the  icon, enter **Payment Journals**, and then choose the related link.
2. Open the relevant payment journal batch. For more information, see [Working with General Journals](#).
3. Fill in the fields as necessary. For more information, see [Making Payments](#).

4. Alternatively, choose the **Suggest Employee Payment** action to automatically insert journal lines for pending employee reimbursements.
5. Choose the **Post** action to register the reimbursement.

To reconcile reimbursements with employee ledger entries

You apply employee payments to their related open employee ledger entries in the same way as you do for vendor payments, for example on the **Payment Reconciliation Journal** page, based on the related bank statement entries. For more information, see [Applying Payments Automatically and Reconciling Bank Accounts](#). Alternatively, you can apply manually on the **Employee Ledger Entries** page. For more information, see the related [Reconcile Vendor Payments with the Payment Journal](#) or [from Vendor Ledger Entries](#).

Defer Revenues and Expenses

3/31/2019 • 4 minutes to read

To recognize a revenue or an expense in a period other than the period in which the transaction was posted, you can use functionality to automatically defer revenues and expenses over a specified schedule.

To distribute revenues or expenses on the involved accounting periods, you set up a deferral template for the resource, item, or G/L account that the revenue or expense will be posted for. When you post the related sales or purchase document, the revenue or expense are deferred to the involved accounting periods, according to a deferral schedule that is governed by settings in the deferral template and the posting date.

To set up a G/L account for deferral

1. Choose the  icon, enter **Chart of Accounts**, and then choose the related link.
2. Choose the **New** action.
3. Fill in the fields as necessary to create a G/L account for deferred revenues. For more information, see [The General Ledger and the Chart of Accounts](#).
4. Repeat steps 2 and 3 to create a new G/L account for deferred expenses.

For both types of deferral, select **Balance Sheet** in the **Type** field, and name the accounts appropriately, such as "Unearned Income" for deferred revenues and "Unpaid Expenses" for deferred expenses.

To set up a deferral template

1. Choose the  icon, enter **Deferral Templates**, and then choose the related link.
2. Choose the **New** action.
3. Fill in the fields as necessary.
4. In the **Calc. Method** field, specify how the **Amount** field for each period on the **Deferral Schedule** page is calculated. You can choose between the following options:
 - **Straight-Line:** The periodic deferral amounts are calculated according to the number of periods, distributed according to period length.
 - **Equal Per Period:** The periodic deferral amounts are calculated according to the number of periods, distributed evenly on periods.
 - **Days Per Period:** The periodic deferral amounts are calculated according to the number of days in the period.
 - **User-Defined:** The periodic deferral amounts are not calculated. You must manually fill the **Amount** field for each period in the Deferral Schedule page. For more information, see the "To change a deferral schedule from a sales invoice" section.
5. In the **Period Desc.** field, specify a description that will be shown on entries for the deferral posting. You can enter the following placeholder codes for typical values, which will be inserted automatically when the period description is displayed.
 - %1 = The day number of the period posting date
 - %2 = The week number of the period posting date
 - %3 = The month number of the period posting date
 - %4 = The month name of the period posting date

- %5 = The accounting period name of the period posting date
- %6 = The fiscal year of the period posting date

Example: The posting date is 02/06/2016. If you enter "Expenses deferred for %4 %6", then the description displayed will be "Expenses deferred for February 2016".

To assign a deferral template to an item

1. Choose the  icon, enter **Deferral Templates**, and then choose the related link.
2. Open the card for the item for which revenues or expenses must be deferred to the accounting periods when the item was sold or purchased.
3. In the **Default Deferral Template** field, select the relevant deferral template.

To change a deferral schedule from a sales invoice

NOTE

The steps in this procedure are the same as when you change a deferral schedule, for expenses, from a purchase invoice.

1. Choose the  icon, enter **Sales Invoices**, and then choose the related link.
2. Create a sales invoice for an item that has a deferral template assigned. For more information, see [Invoice Sales](#).

Notice that as soon as you enter the item (or resource or G/L account) on the invoice line, the **Deferral Code** field is filled with the code of the assigned deferral template.

3. Choose the **Deferral Schedule** action.
4. On the **Deferral Schedule** page, change settings on the header or values on the lines, for example to defer the amount to an additional accounting period.
5. Choose the **Calculate Schedule** action.
6. Choose the **OK** button. The deferral schedule is updated for the sales invoice. The related deferral template is unchanged.

To preview how deferred revenues or expenses will be posted to the general ledger

NOTE

The steps in this procedure are the same as when you preview how expense deferrals are posted.

1. On the **Sales Invoice** page, choose the **Preview Posting** action.
2. On the **Posting Preview** page, choose the **G/L Entry** action, and then choose the **Show Related Entries** action.

G/L entries to be posted to the specified deferral account, for example, Unearned Income, are denoted by the description that you entered in the **Period Desc.** field in the deferral template, for example, "Expenses deferred for February 2016".

To review posted deferrals in the Sales Deferral Summary report

NOTE

The steps in this procedure are the same as when you review the Purchasing Deferral Summary report.

1. Choose the  icon, enter **Sales Deferral Summary**, and then choose the related link.
2. On the **Sales Deferral Summary** page, in the **Balance as of** field, enter the date up to which you want to see deferred revenues.
3. Choose the **Preview** button.

[Working with Business Central](#)

Update Currency Exchange Rates

6/6/2019 • 4 minutes to read

As companies operate in increasingly more countries/regions, it becomes more important that they be able to trade and report financials in more than one currency. You must set up a code for each currency you use if you buy or sell in currencies other than your local currency, have receivables or payables in other currencies, or record G/L transactions in different currencies.

Your general ledger is set up to use your local currency (LCY), but you can set it up to also use another currency with a current exchange rate assigned. By designating a second currency as a so-called additional reporting currency, Business Central will automatically record amounts in both LCY and this additional reporting currency on each G/L entry and other entries, such as VAT entries. For more information, see [Set Up an Additional Reporting Currency](#).

Adjusting Exchange Rates

Because exchange rates fluctuate constantly, additional currency equivalents in your system must be adjusted periodically. If these adjustments are not done, amounts that have been converted from foreign (or additional) currencies and posted to the general ledger in LCY may be misleading. In addition, daily entries posted before a daily exchange rate is entered into the program must be updated after the daily exchange rate information is entered.

The **Adjust Exchange Rates** batch job is used to manually adjust the exchange rates of posted customer, vendor and bank account entries. It can also update additional reporting currency amounts on G/L entries. You can also have the exchange rates adjusted automatically by using a service. For more information, see [To set up a currency exchange rate service](#).

Effect on Customers and Vendors

For customer and vendor accounts, the batch job adjusts the currency by using the exchange rate that is valid on the posting date that is specified in the batch job. The batch job calculates the differences for the individual currency balances and posts the amounts to the general ledger account that is specified in the **Unrealized Gains Acc.** field or the **Unrealized Losses Acc.** field on the **Currencies** page. Balancing entries are automatically posted to the receivables/payables account in the general ledger.

The batch job processes all open customer ledger entries and vendor ledger entries. If there is an exchange rate difference for an entry, the batch job creates a new detailed customer or vendor ledger entry which reflects the adjusted amount on the customer or vendor ledger entry.

Dimensions on Customer and Vendor Ledger Entries

The adjustment entries are assigned the dimensions from the customer/vendor ledger entries, and the adjustments are posted per combination of dimension values.

Effect on Bank Accounts

For bank accounts, the batch job adjusts the currency by using the exchange rate that is valid on the posting date specified in the batch job. The batch job calculates the differences for each bank account that has a currency code and posts the amounts to the general ledger account that is specified in the **Realized Gains Acc.** field or the **Realized Losses Acc.** field on the **Currencies** page. Balancing entries are automatically posted to the general ledger bank accounts that are specified in the bank account posting groups. The batch job calculates one entry per currency per posting group.

Dimensions on Bank Account Entries

The adjustment entries for the bank account's general ledger account and for the gain/loss account are assigned

the bank account's default dimensions.

Effect on G/L Accounts

If you post in an additional reporting currency, you can have the batch job create new general ledger entries for currency adjustments between LCY and the additional reporting currency. The batch job calculates the differences for each general ledger entry and adjusts the general ledger entry depending on the contents of the **Exchange Rate Adjustment** field for each general ledger account.

Dimensions on G/L Account Entries

The adjustment entries are assigned the default dimensions from the accounts they are posted to.

IMPORTANT

Before you can use the batch job, you must enter the adjustment exchange rates that are used to adjust the foreign currency balances. You do so on the **Currency Exchange Rates** page.

To set up a currency exchange rate service

You can use an external service to keep your currency exchange rates up to date, such as FloatRates.

1. Choose the  icon, enter **Currency Exchange Rate Services**, and then choose the related link.
2. Choose the **New** action.
3. On the **Currency Exchange Rate Service** page, fill in the fields as necessary. Hover over a field to read a short description.
4. Choose the **Enabled** check box to enable the service.

To update currency exchange rates through a service

1. Choose the  icon, enter **Currencies**, and then choose the related link.
2. Choose the **Update Exchange Rates** action.

The value in the **Exchange Rate** field on the **Currencies** page is updated with the latest currency exchange rate.

Import Payroll Transactions

3/31/2019 • 2 minutes to read

To account for salary payments and related transactions, you must import and post financial transactions made by your payroll provider to the general ledger. To do this, you first import a file that you receive from the payroll provider into the **General Journal** page. Then you map the external accounts in the payroll file to the relevant G/L accounts. Lastly, you post the payroll transactions according to the account mapping.

NOTE

To use this functionality, an extension for payroll import must be installed and enabled. The Ceridian Payroll and the Quickbooks Payroll File Import extensions are pre-installed in Business Central. For more information, see [Customizing Business Central Using Extensions](#).

To import a payroll file

1. Choose the  icon, enter **General Journals**, and then choose the related link.
2. In the relevant general journal batch, choose the **Import Payroll Transactions** action. An assisted setup guide opens.
3. Follow the steps on the **Import Payroll Transactions** page.

TIP

In the step about mapping the external payroll records to your G/L accounts, the mappings that you make will be remembered next time the same records are imported. This will save you time as you do not have to manually fill in the **Account No.** field in the general journal every time you have imported recurring payroll transactions.

When you choose the **OK** button in the assisted setup guide, the **General Journal** page is filled with lines representing the transactions that the payroll file contains and with the relevant accounts prefilled in the **G/L Account** fields according to mappings you made in the guide.

4. Edit or post the journal lines as for any other general ledger transactions. For more information, see [Post Transactions Directly to the General Ledger](#).

[Customizing Business Central Using Extensions](#)

[Working with General Journals](#)

Work with VAT on Sales and Purchases

3/31/2019 • 12 minutes to read

If your country or region requires you to calculate value-added tax (VAT) on sales and purchase transactions so that you can report the amounts to a tax authority, you can set up Business Central to calculate VAT automatically on sales and purchase documents. For more information, see [Setting Up to Calculations and Posting Methods for Value-Added Tax](#).

There are, however, some VAT-related tasks that you can do manually. For example, you might need to correct a posted amount if you discover that a vendor uses a different rounding method.

Calculating and Displaying VAT Amounts in Sales and Purchase Documents

You can calculate and display VAT amounts in sales and purchase documents differently, depending on the type of customer or vendor that you are dealing with. You can also override the calculated VAT amount to match the VAT amount calculated by your vendor on a given transaction.

Unit Price and Line Amount Including/Excluding VAT on sales documents

When you choose an item number in the **No.** field on a sales document, Business Central fills in the **Unit Price** field. The unit price comes from either the **Item** card or the item prices allowed for the item and customer. Business Central calculates the **Line Amount** when you enter a quantity for the line.

If you are selling to retail consumers, you may want prices on sales documents to include VAT. To do this, choose the **Prices Including VAT** check box on the document.

Including or excluding VAT on prices

If the **Prices Including VAT** check box is chosen on a sales document, the **Unit Price** and **Line Amount** fields include VAT, and the field names will also reflect this. By default, VAT is not included in these fields.

If the field is not selected, the program will fill in the **Unit Price** and **Line Amount** field excluding VAT and the field names will reflect this.

You can set up the default setting of the **Prices Including VAT** for all sales documents for a customer in the **Prices Including VAT** field on the **Customer** card. You can also set up item prices to include or exclude VAT. Normally, item prices contained in the Item Card will be the price excluding VAT. The program uses the information from the **Price Includes VAT** field on the **Item** card to determine the unit price amount for sales documents.

The following table provides an overview of how the program calculates the unit price amounts for a sales document when you have not set up prices on the **Sales Prices** page:

PRICE INCLUDES VAT FIELD ON ITEM CARD	PRICES INCLUDING VAT FIELD IN SALES HEADER	ACTION PERFORMED
No check mark	No check mark	The Unit Price on the Item Card is copied to Unit Price Excl. VAT field on the sales lines.

PRICE INCLUDES VAT FIELD ON ITEM CARD	PRICES INCLUDING VAT FIELD IN SALES HEADER	ACTION PERFORMED
No check mark	Check mark	The program calculates the VAT amount per unit and adds to the Unit Price on the Item Card. This total Unit Price is then entered in the Unit Price Incl. VAT field on the sales lines.
Check mark	No check mark	The program calculates the VAT amount included in the Unit Price on the Item Card using the VAT% related to the VAT Bus. Posting Gr. (Price) and the VAT Prod. Posting Group combination. The Unit Price on the Item Card, reduced by the VAT amount, is then entered in the Unit Price Excl. VAT field in the sales lines.
Check mark	Check mark	The Unit Price on the Item Card is copied to Unit Price Incl. VAT field on the sales lines.

Correcting VAT Amounts Manually in Sales and Purchase Documents

You can make corrections to posted VAT entries. This allows you to change the total sales or purchase VAT amounts without changing the VAT base. You may need to do this, for example, if you receive an invoice from a vendor that has calculated VAT incorrectly.

Although you may have set up one or more combinations to handle import VAT, you must set up at least one VAT product posting group. For example, you can name it **CORRECT** for correction purposes, unless you can use the same general ledger account in the **Purchase VAT Account** field on the VAT posting setup line. For more information, see [Setting Up to Calculations and Posting Methods for Value-Added Tax](#).

If a payment discount has been calculated on the basis of an invoice amount that includes VAT, you revert the payment discount part of the VAT amount when the payment discount is granted. Note that you must activate the **Adjust for Payments Disc.** field in both the general ledger setup in general and the VAT posting setup for specific combinations of a VAT business posting group and a VAT product posting group.

To manually enter VAT in sales documents

1. On the **General Ledger Setup** page, specify a **Max. VAT Difference Allowed** between the amount calculated by the program and the manual amount.
2. On the **Sales & Receivables Setup** page, place a check mark in the **Allow Vat Difference** field.

To adjust VAT for a sales document

1. Open the relevant sales order.
2. Choose the **Statistics** action.
3. Choose the **Invoicing** FastTab.

NOTE

The total VAT amount for the invoice, grouped by VAT identifier, is displayed in the lines. You can manually adjust the amount in the **VAT Amount** field on the lines for each VAT identifier. When you modify the **VAT Amount** field, the program checks to ensure that you have not changed the VAT by more than the amount you have specified as the maximum difference allowed. If the amount is outside the range of the **Max. VAT Difference Allowed**, a warning will be displayed stating the maximum allowed difference. You will be unable to proceed until the amount is adjusted to within the acceptable parameters. Click **OK** and enter another **VAT Amount** that is within the allowed range. If the VAT difference is equal to or lower than the maximum allowed, the VAT will be divided proportionally among the document lines that have the same VAT identifier.

Calculating VAT Manually Using Journals

You can also adjust VAT amounts in general, sales, and purchase journals. For example, you might need to do this when you enter a vendor invoice in your journal and there is a difference between the VAT amount that Business Central calculated and the VAT amount on the vendor's invoice.

Before you manually enter VAT on a general journal

1. On the **General Ledger Setup** page, specify a **Max. VAT Difference Allowed** between the amount calculated by the program and the manual amount.
2. On the **General Journal Templates** page, choose the **Allow VAT Difference** check box for the relevant journal.

Before you manually enter VAT on sales and purchase journals

1. On the **Purchases & Payables Setup** page, choose the **Allow VAT Difference** check box.
2. After you complete the setup described above, you can adjust the **VAT Amount** field on the general journal line, or the **Bal. VAT Amount** field on the sales or purchase journal line. Business Central will check that the difference is not greater than the specified maximum.

NOTE

If the difference is greater, a warning will be displayed stating the maximum allowed difference. To continue, you must adjust the amount. Choose **OK** and then enter an amount that is within the allowed range. If the VAT difference is equal to or lower than the maximum allowed, Business Central will show the difference in the **VAT Difference** field.

To post import VAT with purchase invoices

Instead of using a general journal to post an import VAT invoice, you can use a purchase invoice.

To set up purchasing for posting import VAT invoices

1. Set up a vendor card for the import authority that sends you the import VAT invoice. The **Gen. Bus. Posting Group** and **VAT Bus. Posting Group** must be set up in the same way as the general ledger account for the import VAT.
2. Create a **Gen. Product Posting Group** for the import VAT and set up an import VAT **Def. VAT Product Posting Group** for the related **Gen. Product Posting Group**.
3. Choose the  icon, enter **Chart of Accounts**, and then choose the related link.
4. Select the import VAT general ledger account, and then on the **Home** tab, in the **Manage** group, choose **Edit**.
5. On the **Posting** FastTab, select the **Gen. Prod. Posting Group** setup for import VAT. Business Central automatically fills in the **VAT Prod. Posting Group** field.
6. Choose the  icon, enter **General Posting Setup**, and then choose the related link.
7. Create a combination of the **Gen. Bus. Posting Group** for the VAT authority and the **Gen. Prod. Posting**

Group for import VAT. For this new combination, in the **Purchase Account** field, choose the import VAT general ledger account.

To create a new invoice for the import authority vendor once you have completed the setup

1. Choose the  icon, enter **Purchase Invoices**, and then choose the related link.
2. Create a new purchase invoice.
3. In the **Buy-from Vendor No.** field, choose the import authority vendor, and then choose the **OK** button.
4. In the purchase line, in the **Type** field, choose **G/L Account**, and in the **No.** field, choose the import VAT general ledger account.
5. In the **Quantity** field, type **1**.
6. In the **Direct Unit Cost Excl. VAT** field, specify the VAT amount.
7. Post the invoice.

To process certificates of supply

When you sell goods to a customer in another EU country/region, you must send the customer a certificate of supply that the customer must sign and return to you. The following procedures are for processing certificates of supply for sales shipments, but the same steps apply for service shipments of items, and return shipments to vendors.

To view certificate of supply details

1. Choose the  icon, enter **Posted Sales Shipments**, and then choose the related link.
2. Choose the relevant sales shipment to a customer in another EU country/region.
3. Choose **Certificate of Supply Details**.
4. By default, if the **Certificate of Supply Required** check box is selected for VAT Posting Group setup for the customer, the **Status** field is set to **Required**. You can update the field to indicate whether the customer has returned the certificate.

NOTE

If the VAT Posting Group setup does not have the **Certificate of Supply Required** check box selected, then a record is created and the **Status** field is set to **Not Applicable**. You can update the field to reflect the correct status information. You can manually change the status from **Not Applicable** to **Required**, and from **Required** to **Not Applicable** as needed.

When you update the **Status** field to **Required**, **Received**, or **Not Received**, a certificate is created.

TIP

You can use the **Certificates of Supply** page to get a view of the status of all posted shipments for which a certificate of supply has been created.

5. Choose **Print Certificate of Supply**.

NOTE

You can preview or print the document. When you choose **Print Certificate of Supply** and print the document, the **Printed** check box is automatically selected. In addition, if not already specified, the status of the certificate is updated to **Required**. If needed, you include the printed certificate with the shipment.

To print a certificate of supply

1. Choose the  icon, enter **Posted Sales Shipments**, and then choose the related link.
2. Choose the relevant sales shipment to a customer in another EU country/region.
3. Choose the **Print Certificate of Supply** action.

NOTE

Alternatively, you can print a certificate from the **Certificate of Supply** page.

4. To include information from the lines on the shipment document in the certificate, select the **Print Line Details** check box.
5. Choose the **Create Certificates of Supply if Not Already Created** check box to have Business Central create certificates for posted shipments that do not have one at the moment of execution. When you choose the check box, new certificates will be created for all posted shipments that do not have certificates within the selected range.
6. By default, the filter settings are for the shipment document that you have selected. Fill in the filter information to select a specific certificate of supply that you want to print.
7. On the **Certificate of Supply** page, choose the **Print** action to print the report, or choose the **Preview** action to view it on the screen.

NOTE

The **Certificate of Supply Status** field and the **Printed** field are updated for the shipment on the **Certificates of Supply** page.

8. Send the printed certificate of supply to the customer for signature.

To update the status of a certificate of supply for a shipment

1. Choose the  icon, enter **Posted Sales Shipments**, and then choose the related link.
2. Choose the relevant sales shipment to a customer in another EU country/region.
3. In the **Status** field, choose the relevant option.

If the customer has returned the signed certificate of supply, choose **Received**. The **Receipt Date** field is updated. By default, the receipt date is set to the current work date.

You can modify the date to reflect the date that you received the customer's signed certificate of supply. You can also add a link to the signed certificate using standard Business Central linking.

If the customer does not return the signed certificate of supply, choose **Not Received**. You must then send the customer a new invoice that includes VAT, because the original invoice will not be accepted by the tax authority.

To view a group of certificates, you start from the **Certificates of Supply** page, and then update the information about the status of outstanding certificates as you receive them back from your customers. This can be useful when you want to search for all certificates that have a certain status, for example, **Required**, for which you want to update their status to **Not Received**.

To update the status of a group of certificates of supply

1. Choose the  icon, enter **Certificates of Supply**, and choose the related link.

2. Filter the **Status** field to the value that you want in order to create the list of certificates that you want to manage.
3. To update the status information, choose **Edit List**.
4. In the **Status** field, choose the relevant option.

If the customer has returned the signed certificate of supply, choose **Received**. The **Receipt Date** field is updated. By default, the receipt date is set to the current work date.

You can modify the date to reflect the date that you received the signed the certificate of supply. You can also add a link to the signed certificate using standard Business Central document linking.

NOTE

You cannot create a new certificate of supply on the **Certificate of Supply** page when you navigate to it using this procedure. To create a certificate for a shipment that was not set up to require one, open the posted sales shipment, and use either of two procedures described above:

- To manually create a certificate of supply certificate
- To print a certificate of supply.

[How To: Report VAT to a Tax Authority](#)

Report VAT to a Tax Authority

5/2/2019 • 7 minutes to read

This topic describes the reports in Business Central that you can use to submit information about value-added tax (VAT) amounts for sales and purchases to tax authorities in your region.

You can use the following reports :

- The **EC Sales List** European Community (EC) Sales List report lists the value added tax (VAT) amounts that you have collected for sales to VAT-registered customers in the European Union (EU) countries.
- The **VAT Return** report includes VAT for sales and purchases to customers in all countries that use VAT.

If you want to view a complete history of VAT entries, every posting that involves VAT creates an entry on the **VAT Entries** page. These entries are used to calculate your VAT settlement amount, such as your payment and refund, for a specific period. To view VAT entries, choose the  icon, enter **VAT Entries**, and then choose the related link.

About the EC Sales List report

In the UK, all companies that sell goods and services to VAT-registered customers, including customers in other European Union (EU) countries, must submit an electronic version of the European Community (EC) Sales List report in XML format through Her Majesty's Revenue and Customs (HMRC) website. The EC Sales List report works only for countries in the EU.

The report includes one line for each type of transaction with the customer, and displays the total amount for each type of transactions. There are three types of transactions that the report can include:

- B2B Goods
- B2B Services
- B2B Triangulated Goods

B2B goods and services specify whether you sold a good or a service, and are controlled by the **EU Service** setting in the VAT posting setup. B2B Triangulated Goods indicate whether you engaged in trade with a 3rd party, and are controlled by the **EU 3-Party Trade** setting on sales documents, such as sales orders, invoices, credit memos, and so on.

After the tax authority reviews your report, they will send an email to the contact person for your company. In Business Central, the contact person is specified on the **Company Information** page. Before you submit the report, make sure that a contact person is chosen.

About the VAT Return report

Use this report to submit VAT for sales and purchase documents, such as purchase and sales orders, invoices, and credit memos. The information in the report is in the same format as on the declaration form from the customs and tax authorities.

VAT is calculated based on the VAT posting setup and the VAT posting groups that you have set up.

For the VAT return, you can specify the entries to include:

- Submit open transactions only, or open and closed. For example, this is useful when you prepare your final annual VAT return.
- Submit only entries from the specified periods, or also include entries from previous periods. This is useful

for updating a VAT return that you have already submitted, for example, if a vendor sends you a late invoice.

To connect to your tax authority's web service

Business Central provides service connections to tax authority websites. For example, if you are in the UK, you can enable the **GovTalk** service connection to submit the EC Sales List and VAT Return reports electronically. If you want to submit the report manually, for example by entering your data on the tax authority's website, this is not required.

To report VAT to a tax authority electronically, you need to connect Business Central to the tax authority's web service. This requires that you set up an account with your tax authority. When you have an account, you can enable a service connection that we provide in Business Central.

1. Choose the  icon, enter **Service Connections**, and then choose appropriate link.
2. Fill in the required fields. Hover over a field to read a short description.

NOTE

It is a good idea to test your connection. To do this, choose the **Test Mode** check box, then prepare and submit your VAT report as described in the *To prepare and submit a VAT report* section. While in Test Mode, the service tests whether the tax authority can receive your report, and the status of the report will indicate whether the test submission was successful. It is important to remember that this is not an actual submission. To submit the report for real, you must clear the **Test Mode** check box, and then repeat the submission process.

To set up VAT reports in Business Central

1. Choose the  icon, enter **VAT Report Setup**, and then choose the related link.
2. To let users change and resubmit this report, choose the **Modify Submitted Reports** check box.
3. Choose the number series to use for each report.

To prepare and submit a VAT report

1. Choose the  icon, enter **EC Sales List** or **VAT Return**, and then choose the related link.
2. Choose **New**, and then fill in the required fields. Hover over a field to read a short description.
3. To generate the content of the report, choose the **Suggest Lines** action.

NOTE

For the EC Sales List report, you can review the transactions included in the report lines before you submit the report. To do that, choose the line, and then choose the **Show VAT Entries** action.

4. To validate and prepare the report for submission, choose the **Release** action.

NOTE

Business Central validates whether the report is set up correctly. If the validation fails, the errors display under **Errors and Warnings** so that you know what to fix. Typically, if the message is about a missing setting in Business Central, you can click the message to open the page that contains the information to correct.

5. To submit the report, choose the **Submit** action.

After you submit the report, Business Central monitors the service and keeps a record of your communications.

The **Status** field indicates where the report is in the process. For example, when the authorities process your report, the status of the report changes to **Succeeded**. If the tax authority found mistakes in the report you submitted, the status of the report will be **Failed**. You can view the errors under **Errors and Warnings**, correct them, and then submit the report again. To view a list of all your EC Sales List reports, go to the **EC Sales List Reports** page.

Viewing communications with your tax authority

In some countries, you exchange messages with the tax authority when you submit reports. You can view the first and the last message you sent or received by choosing the **Download Submission Message** and **Download Response Message** actions.

Submitting VAT reports manually

If you use another method to submit the report, for example by exporting the XML and uploading it to a tax authority website, afterward you can choose **Mark as Submitted** to close the reporting period. When you mark the report as released, it becomes non-editable. If you must change the report after you mark it as released, you must reopen it.

VAT settlement

Periodically, you must remit the net VAT to the tax authorities. If you need to settle VAT frequently, you can run the **Calc. and Post VAT Settlement** batch job to close the open VAT entries and transfer purchase and sales VAT amounts to the VAT settlement account.

When you transfer VAT amounts to the settlement account, the purchase VAT account is credited, and the sales VAT account is debited with the amounts calculated for the specified period. The net amount is credited or debited, if the purchase VAT amount is larger, to the VAT settlement account. You can post the settlement immediately or print a test report first.

NOTE

When you use the **Calc. and Post VAT Settlement** batch job, if you do not specify a **VAT Bus. Posting Group** and a **VAT Prod. Posting group**, entries with all business posting groups and product posting group codes are included.

Configuring your own VAT reports

You can use the EC Sales List report out-of-the-box, however, you can also create your own reports. This requires that you create a few codeunits. If you need help with that, contact a Microsoft Partner.

The following table describes the codeunits that you must create for your report.

CODEUNIT	WHAT IT MUST DO
Suggest Lines	Fetch information from the VAT Entries table, and display it in lines on the VAT report.
Content	Control the format of the report. For example, whether it is XML or JSON. The format to use depends on the requirements of your tax authority's web service.
Submission	Control how, and when, you submit the report based on the requirements of your tax authority.

CODEUNIT	WHAT IT MUST DO
Response Handler	Handle the return from the tax authority. For example, it might send an email message to your company's contact person.
Cancel	Send a cancellation of a VAT report that was submitted earlier to your tax authority.

NOTE

When create codeunits for the report, pay attention to the value in the **VAT Report Version** field. This field must reflect the version of the report that is, or was, required by the tax authority. For example, you might enter **2017** in the field to indicate that the report conforms to the requirements that were in place that year. To find the current version, contact your tax authority.

Convert Service Contracts that Include VAT Amounts

3/31/2019 • 3 minutes to read

Because the VAT rate change tool cannot convert service contracts, these contracts must be converted manually. This topic describes several alternative methods that you can use for service contract conversion.

NOTE

This topic provides a high-level workflow.

The following procedure describes how to correct an invoice for a prepaid service contract that has been created a year in advance.

NOTE

For this example, you must change your work date to 01.01.2017.

To correct an invoice for a prepaid service contract

1. Choose the  icon, enter **Contract Management**, and then choose the related link.
2. Under **Lists**, choose **Service Contracts**.
3. Create a new prepaid service contract. Enter a start date of **01.01.2017** and an invoice period year for customer **20000**.
4. This contract must be signed. On the **Home** tab, in the **Process** group, choose **Sign Contract**.
5. Create a service invoice.
6. The invoice is listed as an unposted service invoice. To view the service invoice, choose **Service**, choose **Contract Management**, and then choose **Service Invoices**.
7. Post the service invoice.

NOTE

Do not change the unposted service invoice. Since the service ledger entries are created when the invoice is created, a change in the unposted invoice will not change the already created service ledger entries. However, the VAT entries are created when the invoice is posted. This lets you change the general product posting group and the GSP product posting group on the unposted service invoice.

To create a credit memo for VAT difference

The following procedure describes how to create a credit memo that only includes the VAT difference for the already invoiced period starting on **01.07.2017**. In this example, the VAT amount is only posted to the Financial Management module, not to the Service Management module. The VAT entries that are linked to the service ledger entry will not be corrected.

1. Create a new general ledger account for the VAT difference. This account will be used for direct posting of the VAT correction.
2. Add a new line to the VAT posting setup.

To create contract expiration dates in contract lines

The following procedure describes how to create new contracts by working with contract expiration dates in service contract lines.

1. On the **Service Contract** page, set the contract expiration date to **30.06.2017**.
2. Choose the **Create Credit Memo** action to automatically create a credit memo for July 2017 to December 2017.
3. Because the contract has expired, you need to create a new contract for the period with the new VAT rate for July 1, 2017 to December 31, 2017.

To create a new credit memo

The following procedure describes how to create a new credit memo using the **Get Prepaid Contract Entries** batch job. Entries that you do not want to correct from January 2017 to June 2017 will be deleted.

1. Run the VAT rate change tool on July 1, 2017. The general product posting group or the VAT product posting group is changed. For more information, see [Work with VAT on Sales and Purchases](#).
2. After running the VAT rate change tool, enter a contract expiration date for the service contract. You can now delete the service contract line and create a new line that is identical to the old one.
3. Create a new invoice for the period of January 2017 to December 2012 using the new VAT rate.
4. To create another credit memo, on the **Service Credit Memos** page, choose **New** to create a new service credit memo.
5. Choose the **Get Prepaid Contract Entries** action.
6. After the conversion is complete, VAT and service ledger entries will be correct.

Analyzing Cash Flow in Your Company

3/31/2019 • 2 minutes to read

As they say, cash is king. The charts on the Accountant Role Center provide insight that can help you make solid decisions about what to do with your cash.

TO ANSWER QUESTIONS LIKE THESE	USE THIS CHART
How long does the sales process tie up my cash? Should I increase or reduce inventory levels?	Cash Cycle
When did cash move in and out of my company? Are some periods better than others?	Cash Flow
Do the numbers seem off for a period? Should I investigate?	Income & Expense
When might a cash surplus or deficit happen? Should I pay down debt, or borrow to meet upcoming expenses?	Cash Flow Forecasts

On the Accountant Role Center, under **Finance Performance**, the **Cash Cycle**, **Cash Flow**, and **Income & Expense** charts offer ways to analyze cash flow:

- See figures for a period by using the timeline slider.
- Filter the chart by choosing the source in the legend.
- Change the length of the period, or go to the previous or next period, by choosing options on the **Finance Performance** drop down.
- View the entries by choosing a point in the chart. For example, a point on the timeline or a column segment. If the numbers seem off, this is where you can make adjustments.

Although it's separate, the **Cash Flow Forecast** chart is similar. You view details, filter results, and change what is displayed in the same ways. If you change a setting, you can refresh the forecast by choosing **Cash Flow Forecast**, and then **Recalculate Forecast**.

If you want to examine the forecast, in addition to forecast entries, you can also look at the cash flow worksheet. For example, you can see how the forecast:

- Handles confirmed sales and purchases.
- Subtracts payables and adds receivables.
- Skips duplicate sales orders and purchase orders.

To view a cash flow worksheet

1. Search for **Cash Flow Forecasts**, and then choose the related link.
2. Choose a cash flow forecast, and then choose the **Cash Flow Worksheet** action.
3. On the **Cash Flow Worksheet** page, choose the **Suggest Worksheet Lines** action.

Setting Up Cash Flow Analysis

Walkthrough: Making Cash Flow Forecasts by Using Account Schedules

3/31/2019 • 2 minutes to read

This walkthrough describes how you can use account schedules to make cash flow forecasts. Account schedules perform calculations that cannot be done directly in the chart of cash flow accounts. In the account schedules, you can set up subtotals for cash flow receipts and disbursements. These subtotals can be included in new totals that can then be used in making cash flow forecasts.

About This Walkthrough

This walkthrough describes the following tasks:

- Setting up a new cash flow account schedule name.
- Setting up account schedule lines.
- Setting up a new column layout.
- Assigning a column layout to an account schedule.
- Viewing and printing the cash flow forecast.

Prerequisites

To complete this walkthrough, you will need:

- Business Central installed.
- The cash flow worksheet lines are registered.

Roles

This walkthrough demonstrates tasks that are performed by the following user role:

- Controller

Story

Ken is a controller at CRONUS who makes monthly cash flow forecasts. He includes finance, sales, purchase, and fixed assets in the forecast, and then he presents it to CFO Sara for business insight.

Setting Up a New Account Schedule Name

An account schedule consists of a cash flow account schedule name with a series of lines and a column layout.

To set up a new account schedule name

1. Choose the  icon, enter **Account Schedules**, and then choose the related link.
2. On the **Account Schedule Names** page, choose the **New** to create a new cash flow account schedule name.
3. In the **Name** field, enter **Forecast**.
4. In the **Description** field, enter **Cash Flow Forecast**.
5. Leave the **Default Column Layout** and **Analysis View Name** fields blank.

Setting Up Account Schedule Lines

After an account schedule name is set up, Ken defines each line that appears in the cash flow account schedule. Ken defines lines that can be shown in reports in addition to lines that are only for calculation purposes.

To set up account schedule lines

1. On the **Account Schedule Names** page, select the new **Forecast** account schedule name that you have created. On the **Home** tab, in the **Process** group, choose **Edit Account Schedule**.
2. On the **Account Schedule** page, enter each line exactly as shown in the following table.

NOTE

Using the **Insert CF Accounts** function, you can quickly mark the cash flow accounts from the chart of cash flow accounts and copy them to account schedule lines.

Row No.	Description	Totaling Type	Totaling	Row Type	Amount Type	Show
-----	-----	-----	-----	-----	-----	-----
C10	Amount	Net Change	Entries	Net Amount	Always	
C20	Amount until Date	Balance at Date	Entries	Net Amount	Always	
C30	Entire Fiscal Year	Entire Fiscal Year	Entries	Net Amount	Always	

3. Choose the **OK** button.

Assigning the Column Layout to the Account Schedule Name

Ken is now ready to assign the column layout to the account schedule name.

To assign the column layout to the account schedule name

1. On the **Account Schedule Names** page, select **Forecast** in the **Name** field.
2. In the **Default Column Layout** field, choose the column layout **Cash Flow** to assign as the default column layout.

To view and print the cash flow forecast

1. On the **Account Schedule Names** page, choose the **Overview** action to view the cash flow forecast.
2. On the **Acc. Schedule Overview** page, you can select an amount and then view the cash flow forecast entries that make up the amount. In addition, you can view the formula that is used to calculate the amount. You can also filter the amounts by date and dimension.
3. Choose the **Print** action to print the cash flow forecast.

Analyzing Financial Statements in Microsoft Excel

3/31/2019 • 2 minutes to read

In Business Central, you can see KPIs and get overviews of the company's financial state. You can also open lists in Excel and analyze the data there. But you can also export heavy financial statements such as the balance sheet or the income statement to Excel, analyze the data, and print the reports.

In the Business Manager and Accountant Role Centers, you can choose which financial statements to view in Excel from a drop-down menu in the Reports section of the ribbon. When you choose a statement, it will be opened in Excel or Excel Online. An add-in connects the data to Business Central. However, you have to sign in with the same account that you use with Business Central.

Getting the Overview and the Details in Excel

In the ribbon, choose the relevant Excel report, and let it open so you can get the overview that you were looking for. In this version of Business Central, we offer the following Excel reports:

- Balance Sheet
- Income Statement
- Cash Flow Statement
- Retained Earnings Statement
- Aged Accounts Payable
- Aged Accounts Receivable

Let's say you want to dig deeper into your cash flow. From the Business Manager or Accountant Role Center, you can open the Cash Flow Statement report in Excel, but what actually happens is that we export the relevant data for you and create an Excel workbook based on a predefined template. Depending on your browser, you might be prompted to open or save the workbook.

In Excel, you see a tab where the data is laid out for you on the first worksheet. All the data that was exported is also present in other worksheets in case you need it. You can print the report right away, or you can modify it until you have the overview and the details that you want. Use the Business Central Excel Add-in to further filter and analyze data.

The Business Central Excel Add-in

Your Business Central experience includes an add-in for Excel. Depending on your subscription, you are logged in automatically, or you must specify the same login details that you use for Business Central.

With the add-in, you can get fresh data from Business Central, and you can push changes back into Business Central. However, the ability to push data back to the database is disabled for the financial Excel reports in the list above.

Accountant Experiences in Dynamics 365 Business Central

5/2/2019 • 3 minutes to read

Any business must do its books and sign off on the accounting. Some businesses employ an external accountant, and others have an accountant on staff. No matter which type of accountant you are, you can use the **Accountant** Role Center as your Home in Business Central. From here, you can access all pages that you need in your work.

Accountant Role Center

The Role Center is a dashboard with activity tiles that show you real-time key figures and give you quick access to data. In the ribbon at the top of the page, you have access to more actions, such as opening the most commonly used financial reports and statements in Excel. In the navigation bar at the top, you can quickly switch between the lists you use most often. Here, you will see other areas, such as **Posted Documents** with the various types of documents that the company has posted.

If you are new to Business Central, you can launch a list of videos right from your Role Center. You can also launch a **Getting Started** tour that points out key areas.

Accountant Hub

If you are an accountant with several clients, you can use Dynamics 365 — Accountant Hub for a better overview of your clients. From there, you can access each client's tenant in Business Central and use the Accountant Role Center as described above. For more information see [Welcome to Dynamics 365 — Accountant Hub](#).

Inviting Your External Accountant to Your Business Central

If you use an external accountant to manage your books and financial reporting, you can invite them to your Business Central so they can work with you on your fiscal data.

Once your accountant has gained access to your Business Central, they can use the **Accountant** Role Center that gives easy access to the most relevant pages for their work.

We have made it easy for you to invite your external accountant. Simply open the **Users** page, and then choose the **Invite External Accountant** action in the ribbon. An email is made ready for you, just add your accountant's work email, and send the invitation.

INVITE EXTERNAL ACCOUNTANT

Please enter the email address of the accountant.

Please enter the first name.

Please enter the last name.

Welcome Email

A vertical scrollbar is located on the right side of the text area, with up and down arrowheads.

TIP

This requires that you have set up SMTP email. You can do this yourself or ask your Business Central partner. Also, you must be logged in to Business Central as a user administrator, not as the business owner or other users. Finally, you must have left the trial company so that you have an Azure Active Directory administrator.

IMPORTANT

The accountant's email address must be a work address that is based on Azure Active Directory. If the accountant uses another type of email, then the invitation cannot be sent.

Separate License

Behind the scenes, the accountant is added to your Active Directory tenant. Your administrator can verify that the accountant accepts the invitation and is assigned the correct license. The steps for doing this depends on the type of account that you used when you signed up for Business Central. This topic is based on the use of an Office 365 account, which uses Microsoft Azure Active Directory.

If you have activated your subscription of Business Central and are no longer using the evaluation company, you have an Azure Active Directory tenant. Your administrator or Business Central partner manages this tenant in the [Azure portal](#). This is where new users are added and licenses are applied and removed. For more information, see the [Microsoft Azure portal overview](#).

One of the license types for Business Central is the *External Accountant* license. This license type is intended for use by users such as external accountants. This means that you do not have to buy an extra seat in your current Active Directory or use one of your existing Business Central user accounts on your external accountant. For example, if your current Office 365 subscription includes 10 users for Business Central, and you are currently using 10 *Full User* licenses, your administrator can simply add your external accountant as a guest user in the Azure portal and assign this user the *External Accountant* license at no additional cost. However, you can only have one user with the *External Accountant* license. If you want to add more users, you must update your Office 365 subscription accordingly.

Business Intelligence

3/31/2019 • 2 minutes to read

Businesses capture a tremendous amount of data through daily activity. This data, which reflects such things as the organization's sales figures, purchases, operational expenses, employee salaries, and budgets, can become valuable information, or business intelligence, for decision makers. Business Central contains a number of features that help you gather, analyze, and share your company data.

The Dimensions functionality plays an important role in business intelligence. A dimension is data that you can add to an entry as a kind of marker. This data is used to group entries with similar characteristics, such as customers, regions, products, and salesperson, and easily retrieve these groups for analysis. Among other uses, you use dimensions when defining analysis views and when creating account schedules for reporting. For more information, see [Working with Dimensions](#).

TIP

As a quick way to analyze transactional data by dimensions, you can filter totals in the chart of accounts and entries in all **Entries** pages by dimensions. Look for the **Set Dimension Filter** action.

The following table describes a sequence of tasks, with links to the topics that describe them.

TO	SEE
View actual amounts compared to budgeted amounts for all accounts and for several periods.	Analyze Actual Amounts Versus Budgeted Amounts
Create new account schedules to define financial statements for reporting or for display as charts.	Prepare Financial Reporting with Account Schedules and Account Categories
Analyze your financial performance by setting up KPIs based on account schedules, which you then publish as web services. The published account-schedule KPIs can be viewed on a web site or imported to Microsoft Excel using OData web services.	Set Up and Publish KPI Web Services Based on Account Schedules
Set up analysis views to analyze data using dimensions.	Analyze Data by Dimensions
Create new analysis reports for sales, purchases, and inventory, and set up analysis templates.	Create Analysis Reports
Enable global financial reporting by to international accounting organizations with the eXtensible Business Reporting Language standard.	Create Reports with XBRL

Analyze Actual Amounts Versus Budgeted Amounts

3/31/2019 • 2 minutes to read

As a part of gathering, analyzing, and sharing your company data, you view actual amounts compared to budgeted amounts for all accounts and for several periods.

To analyze budgeted amounts, you must first create G(L budgets. For more information, see [Create G/L Budgets](#).

To view a G/L budget

In a budget with dimensions, you can filter the entries and see specific budgets.

1. Choose the  icon, enter **G/L Budgets**, and then choose the related link.
2. On the **G/L Budgets** page, open the budget that you want to view.
3. At the top of the page, fill in the fields as necessary to define what is shown. Hover over a field to read a short description.

NOTE

If you have selected **Period** in either the **Show as Lines** or the **Show as Columns** field, then you must fill in the **View by** field. If you have not selected **Period** in either the **Show as Lines** or **Show as Columns** field, then enter the appropriate period in **Date Filter** field.

NOTE

Only entries from the general ledger budget with the filter codes that you enter on the **Filters** FastTab are included in the calculation. Budget entries with other filter codes or without any filter codes are not included. As long as the filter remains on the page, the budget only displays the budget entries with these filter codes.

TIP

If you want to modify the budget, you can modify the budget entries. Choose an amount to view the underlying general ledger budget entries.

To view actual and budgeted amounts for all accounts

You can view general ledger budgets and compare them with actual figures in several areas of Business Central.

1. Choose the  icon, enter **Chart of Accounts**, and then choose the related link.
2. On the **Chart of Accounts** page, choose the **G/L Balance/Budget** action.
3. At the top of the page, fill in the fields as necessary to define what is shown.
4. To see a specification that makes up the amount shown, choose the field.

NOTE

The filters you set on the page header will be applied to general ledger entries and also budget entries.

The leftmost columns contain the chart of accounts. Of the five columns on the rightmost side, the first four

columns show actual and budgeted debit and credit amounts for each account. The fifth column shows the proportional relationship between the actual and the budgeted amounts on the general ledger account.

TIP

Use the **View by** field on the **G/L Balance/Budget** page to select the period length. Use the **View as** field to select the way the amounts will be calculated, **Net Change** or **Balance at Date**. Choose the **Previous Period** or **Next Period** action to change the period.

To view actual and budgeted amounts for several periods

Instead of viewing the actual and budgeted amounts for all accounts within a single period, you can view a number of periods for a single account.

1. Choose the  icon, enter **Chart of Accounts**, and then choose the related link.
2. On the **Chart of Accounts** page, select the relevant general ledger account, and then choose the **G/L Account Balance/Budget** action.
3. At the top of the page, fill in the fields as necessary to define what is shown.
4. To see a specification of an amount shown, choose the field.

Prepare Financial Reporting with Account Schedules and Account Categories

3/31/2019 • 9 minutes to read

Use account schedules to get insight into the financial data stored in your chart of accounts. Account schedules analyze figures in G/L accounts, and compare general ledger entries with general ledger budget entries. The results display in charts on your Role Center, such as the Cash Flow chart, and in reports, such as the Income Statement and the Balance Sheet reports.

You access these two reports, for example, with the **Financials Statements** action on the Business Manager and Accountant Role Centers.

Business Central provides a few sample account schedules that you can use right away, or you can set up your own rows and columns to specify the figures to compare. For example, you can create account schedules to calculate profit margins on dimensions like departments or customer groups. You can create as many customized financial statements as you want.

Setting up account schedules requires an understanding of the financial data in the chart of accounts. For example, you can view general ledger entries as percentages of budget entries. This requires that budgets are created. For more information, see [Create G/L Budgets](#).

Account Schedules

Account schedules are used to arrange accounts listed in the chart of accounts in ways suited for presentation of information about those accounts. You can set up various layouts to define the information that you want to extract from the chart of accounts. One of the main functions of account schedules is to provide a place for calculations that cannot be made directly in the chart of accounts, such as creating subtotals for groups of accounts, which can be included in new totals and can then be used in other totals. For example, users can create account schedules to calculate profit margins on such dimensions as departments or customer groups. In addition, general ledger entries and general ledger budget entries can be filtered, for example, by net change or debit amount.

You can also compare two or more account schedules and column layouts by using formulas. This kind of comparison provides the ability to:

- Create customized financial reports.
- Create as many account schedules as needed, each with a unique name.
- Set up various report layouts and print the reports with the current figures.

Account Categories

You can use account categories to change the layout of your financial statements. After you set up your account categories on the **G/L Account Categories** page, and you choose the **Generate Account Schedules** action, the underlying account schedules for the core financial reports are updated. The next time you run one of these reports, such as the Balance Statement report, new totals and subentries are added, based on your changes. For more information, see [Account Categories](#).

To create a new account schedule

You use account schedules to analyze figures in general ledger accounts or to compare general ledger entries

with general ledger budget entries. For example, you can view the general ledger entries as percentages of the budget entries.

The account schedules in the standard version of Business Central are the basis of the standard financial reports, which may not suit the needs of your business. To quickly create your own financial reports, you can start by copying an existing account schedule. See step 3 below.

The **Acc. Schedule Overview** page is where you preview the financial report that the account schedule defines. In the following, it is important to understand that what you set up as account schedule rows and columns can only be seen and validated on the **Acc. Schedule Overview** page, which you open from an account schedule by choosing the **Overview** action. The **Account Schedule** page itself is only a setup area.

1. Choose the  icon, enter **Account Schedules**, and then choose the related link.
2. On the **Account Schedules** page, choose the **New** action to create a new account schedule name.
3. Alternatively, choose the **Copy Account Schedule** action, fill in the two fields, and then choose the **OK** button.
4. Fill in the fields as necessary. In the **Default Column Layout** field select an existing layout. You can edit it later if you want.

You use column layouts to define columns for different parameters by which the financial data on the rows are shown. For example, you can design a column layout to compare net change and balance for the same period this year and last year, with four columns. For more information, see [To edit a column layout](#).

5. Choose the **Edit Account Schedule** action.
6. Create a row for each financial element that you want to appear in the report, such as one row for current assets and another row for fixed assets. For inspiration, see existing account schedules in the CRONUS demonstration company.
7. Choose the **Overview** action to see the resulting financial report.
8. On the **Acc. Schedule Overview** page, in the **Column Layout Name** field, select another column layout to see the financial data by other parameters.
9. Choose the **OK** button.

You have now defined the basis of the account schedule, the rows of financial data to be displayed, and an existing layout of columns to show the data on the rows per different parameters. If the default column layout that you selected in step 4 does not suit your purpose, follow the next procedure.

To edit a column layout

You use column layouts to define what columns should be included in the resulting report. For example, you can design a layout to compare net change and balance for the same period this year and last year.

NOTE

A printed/previewed/saved version of an account schedule can display a maximum of five columns. If the account schedule is only meant for analysis on the **Acc. Schedule Overview** page, you can create as many columns as you want.

1. On the **Account Schedules** page, select the relevant account schedule, and then choose the **Edit Column Layout Setup** action.
2. On the **Column Layouts** page, create a row for each column by which financial data is shown in the financial report. Hover over a field to read a short description.
3. Choose the **OK** button.

4. Open the **Acc. Schedule Overview** page from time to time to verify that the new column layout works as intended.

NOTE

The columns that you define on each row represent columns 3 and up on the **Acc. Schedule Overview** page. The first two columns, **Row No.** and **Description**, are fixed.

To create a column that calculates percentages

Sometimes you may want to include a column in an account schedule to calculate percentages of a total. For example, if you have a number of rows that break down sales by dimension, you may want a column to indicate the percentage of total sales that each row represents.

1. Choose the  icon, enter **Account Schedules**, and then choose the related link.
2. On the **Account Schedule Names** page, select an account schedule.
3. Choose the **Edit Account Schedule** action to set up an account schedule row to calculate the total on which the percentages will be based.
4. Insert a line immediately above the first row for which you want to display a percentage.
5. Fill in the fields on the line as follows: In the **Totaling Type** field, enter **Set Base for Percent**. In the **Totaling** field, enter a formula for the total that the percentage will be based on. For example, if row 11 contains the total sales, enter **11**.
6. Choose the **Edit Column Layout Setup** action to set up a column.
7. Fill in the fields on the line as follows: In the **Column Type** field, select **Formula**. In the **Formula** field, enter a formula for the amount that you want to calculate a percentage for, followed by %. For example, if column number N contains the net change, enter **N%**.
8. Repeat steps 4 through 7 for each group of rows that you want to break down by percentage.

To set up account schedules with overviews

You can use an account schedule to create a statement comparing general ledger figures and general ledger budget figures.

1. Choose the  icon, enter **Account Schedules**, and then choose the related link.
2. On the **Account Schedule Names** page, select an account schedule.
3. Choose the **Edit Account Schedule** action
4. On the **Account Schedule** page, in the **Name** field, select the default account schedule name.
5. Choose the **Insert Accounts** action.
6. Select the accounts that you want to include in your statement, and then choose the **OK** button.

The accounts are now inserted into your account schedule. If you want you can also change the column layout.

7. Choose the **Overview** action.
8. On the **Acc. Schedule Overview** page, on the **Dimension Filters** FastTab, set the budget filter to the desired filter name.
9. Choose the **OK** button.

Now you can copy and paste your budget statement into a spreadsheet.

Comparing Accounting Periods using Period Formulas

Your account schedule can compare the results of different accounting periods, such as this month versus same month last year. To do that, you add a column with the **Comparison Period Formula** field, and then set that field to a period formula.

An accounting period does not have to match the calendar, but each fiscal year must have the same number of accounting periods, even though each period can be different in length.

Business Central uses the period formula to calculate the amount from the comparison period in relation to the period represented by the date filter on the report request. The comparison period is based on the period of the start date of the date filter. The abbreviations for period specifications are:

ABBREVIATION	DESCRIPTION
P	Period
LP	Last period of a fiscal year, half-year or quarter.
CP	Current period of a fiscal year, half-year or quarter.
FY	Fiscal year. For example, FY[1..3] denotes first quarter of the current fiscal year

Examples of formulas:

FORMULA	DESCRIPTION
<Blank>	Current period
-1P	Previous period
-1FY[1..LP]	Entire previous fiscal year
-1FY	Current period in previous fiscal year
-1FY[1..3]	First quarter of previous fiscal year
-1FY[1..CP]	From the beginning of previous fiscal year to current period in previous fiscal year, inclusive
-1FY[CP..LP]	From current period in previous fiscal year to last period of previous fiscal year, inclusive

If you want to calculate by regular time periods, you must enter a formula in the **Comparison Date Formula** field instead.

NOTE

It is not always transparent which periods you are comparing because you can set a date filter on a report that spans different dates than the accounting periods that are reflected in the data in the chart of accounts. For example, you create an account schedule where you want to compare this period with the same period last year, so you set the **Comparison Date Period Filter** field to *-1FY*. Then, you run the report on February 28th and set the date filter to January and February. As a result, the account schedule compares January and February this year to January last year, which is the only completed accounting period of the two for last year.

Set Up and Publish KPI Web Services Based on Account Schedules

3/31/2019 • 2 minutes to read

On the **Account Schedule KPI Web Service Setup** page, you set up how to show the account-schedule KPI data and which specific account schedules to base the KPIs on. When you choose the **Publish Web Service** button, the specified account-schedule KPI data is added to the list of published web services on the **Web Services** page.

To set up and publish a KPI web service that is based on account schedules

1. Choose the  icon, enter **Account Schedule KPI Web Service Setup**, and then choose the related link.
2. On the **General** FastTab, fill in the fields as described in the following table.

FIELD	DESCRIPTION
Forecasted Values Start	Specify at what point in time forecasted values are shown on the account-schedule KPI graphic. The forecasted values are retrieved from the general ledger budget that you select in the G/L Budget Name field. Note: To obtain KPIs that show forecasted figures after a certain date and actual figures before the date, you can change the Allow Posting From field on the General Ledger Setup page. For more information, see Allow Posting From.
G/L Budget Name	Specify the name of the general ledger budget that provides forecasted values to the account-schedule KPI web service.
Period	Specify the period that the account-schedule KPI web service is based on.
View By	Specify which time interval the account-schedule KPI is shown in.
Web Service Name	Specify the name of the account-schedule KPI web service. This name will appear in the Service Name field on the Web Services page.

Specify one or more account schedules that you want to publish as a KPI web service according to the setup that you made in the previous table.

3. On the **Account Schedules** FastTab, fill in the fields as described in the following table.

FIELD	DESCRIPTION
-------	-------------

FIELD	DESCRIPTION
Acc. Schedule Name	Specify the account schedule that the KPI web service is based on.
Acc. Schedule Description	Specify the description of the account schedule that the KPI web service is based on.

4. Repeat step 3 for all the account schedules that you want to base the account-schedule KPI web service on.
5. To view or edit the selected account schedule, on the **Account Schedule** FastTab, choose the **Edit Account Schedule** action.
6. To view the account-schedule KPI data that you have set up, choose the **Account Schedule KPI Web Service** action.
7. To publish the account-schedule KPI web service, choose the **Publish Web Service** action. The web service is added to the list of published web services on the **Web Services** page.

NOTE

You can also publish the KPI web service by pointing to the **Account Schedule KPI Web Service Setup** page object from the **Web Services** page. For more information, see [Publish a Web Service](#).

[Working with Business Central](#)

Analyze Data by Dimensions

3/31/2019 • 4 minutes to read

In financial analysis, a dimension is data that you can add to an entry as a kind of marker. This data is used to group entries with similar characteristics, such as customers, regions, products, and salesperson, and easily retrieve these groups for analysis. Dimensions can be used on entries in journals, documents, and budgets. The term dimension describes how analysis occurs. A two-dimensional analysis, for example, would be sales per area. However, by using more than two dimensions when creating an entry, you can carry out a more complex analysis, such as sales per sales campaign per customer group per area. For more information, see [Working with Dimensions](#).

Analyzing data by dimensions gives you greater insight into your business, so you can evaluate information, such as how well your business is operating, where it is thriving and where it is not, and where more resources should be allocated.

TIP

As a quick way to analyze transactional data by dimensions, you can filter totals in the chart of accounts and entries in all **Entries** pages by dimensions. Look for the **Set Dimension Filter** action.

To set up an analysis view

An analysis by dimensions displays a selected combination of dimensions. You can store and retrieve each analysis you have set up. The information for setting up an analysis is stored on an **Analysis View** card to simplify future analysis.

1. Choose the  icon, enter **Analysis Views**, and then choose the related link.
2. On the **Analysis View List** page, choose the **New** action.
3. Fill in the fields as necessary. Hover over a field to read a short description.
4. To add other dimension codes in addition to the four on the **Dimensions** FastTab, choose the **Filter** action, fill in the fields, and then choose the **OK** button.
5. To update the view, choose the **Update** action.

To analyze by dimensions

You can use the **Analysis by Dimensions** matrix to view the amounts in your general ledger by using the analysis views that you have already set up. You fill on the **Analysis by Dimensions** page to define what will be shown in the matrix, and then you choose the **Show Matrix** action to view the matrix.

1. Choose the  icon, enter **Analysis Views**, and then choose the related link.
 2. Select the relevant analysis view, and then choose the **Analysis by Dimensions** action.
 3. On the **Analysis by Dimensions** page, fill in the fields to define which data is shown and how.
 4. Choose the **Show Matrix** action to open the respective matrix page for the defined analysis view.
 5. To see a specification of an amount shown in the matrix page, choose the amount to drill down.
- The leftmost columns contain information based on what you have selected in the **Show as Lines** field in the header.
 - The rightmost columns contain information based on to what you have selected in the **Show as Columns** field in the header.

IMPORTANT

You cannot select a period length shorter than the period specified for the date compression on the **Analysis View** card. The **Next Set** and **Previous Set** commands are inactive if you have selected **Period** in either the **Show as Lines** or the **Show as Columns** field.

NOTE

You can use the **Dimensions - Detail** report to display a detailed classification of how dimensions have been used on entries over a selected period. You can use the **Dimensions - Total** report to display only the total amounts.

TIP

You can also change the view by changing the contents of the **Show as Lines** field and **Show as Columns** field. To reverse a view setting, choose the **Reverse Lines and Columns** action.

To update an analysis view

The amounts that are displayed on the **Analysis by Dimensions** page give you a picture of the company's state at the time of the last update. To get a picture of the current state, you must update the analysis view by running the update function.

The following procedure is for updating an analysis view from the **Analysis by Dimensions** page. The steps are similar from the **Analysis View Card** and the **Analysis View List** pages.

1. Choose the  icon, enter **Analysis Views**, and then choose the related link.
2. Select the relevant analysis view, and then choose the **Analysis by Dimensions** action.
3. On the **Analysis by Dimensions** page, choose the **Analysis View Code** field.
4. Select the line with the relevant analysis view.
5. On the **Analysis Views** page, select the analysis view, and then choose the **Update** action.

TIP

If you select the **Update on Posting** check box on an analysis view card, the view is automatically updated when an involved transaction is posted.

NOTE

To update some or all analysis views at the same time, you must use the **Update Analysis Views** batch job.

Create Analysis Reports

3/31/2019 • 6 minutes to read

Sales managers need to analyze turnover, gross profit and other key sales performance indicators on a regular basis. Purchasers, are more interested in the dynamics of purchase volumes, vendors' performance and purchase prices. Whereas logistics/inventory managers need information on inventory turnover, analysis of inventory movement, and statistics on inventory value.

You can use analysis reports to create customized reports based on records of your posted transactions, for example, sales, purchases, transfers and inventory adjustments. In a customizable report, the source data, which is derived from the item ledger (with associated value entries), can be combined, compared and presented in meaningful user-defined ways. In this sense, the analysis report is very similar to a PivotTable report in Microsoft Excel.

You can create your personalized report that focuses on your key accounts in terms of total turnover both in amounts and quantities sold, gross profit and gross profit percentage during the current month, and have it compare those figures with the results from previous months or the same month last year, and calculate deviations. All this can be done in one and the same view, with the possibility to navigate to the cause of identified problem areas by choosing the drop-down button to access details on the level of individual transactions.

The analysis report consists of the objects that you want to analyze, such as customers, customer groups, sales people and so on, represented as lines, and the analysis parameters, that is, the way you want to analyze the object, represented as columns, such as profit calculations, periodic comparisons of sales amounts and volumes or periodic comparisons of actual and budgeted figures.

In addition to analysis reports, you can create and view similar information in analysis views, which are based on dimensions. For more information, see [Analyze Data by Dimensions](#).

Example

You can set up lines like these:

- Computers
- Displays
- Spare Parts

Then you can set up columns like these:

- Sales Current Month
- Sales Last Month
- Sales in Pct. of last Month

Setting Up Line and Column Layouts

On the **Analysis Report** page, you can view different line and column layouts according to what you have set up. You set up your lines or line templates on the **Analysis Line Templates** page. In this page, you can define the name of the report and the objects you want to show in the lines of your report. You set up your columns on the **Analysis Column Templates** page. In this page, you can define the name of the column template and the analysis parameters that you want to show in the report as columns. On the **Analysis Column Templates** page, each line represents a column in your report. Note that analysis lines and analysis columns are independent from each other.

Based on the lines and columns you have set up, the program will aggregate the result of your report in the

Analysis Report matrix page, such as in this example:

	SALES CURRENT MONTH	SALES LAST MONTH	SALES LAST MONTH %
Computers			
Displays			
Spare parts			
Total			

You can, for example, set up one set of lines and several sets of column layouts to show monthly and annual reports respectively.

To set up analysis column templates

The following procedure is based on analysis views for sales. The steps are similar for purchase and inventory analysis views.

In an analysis report, your analysis parameters are shown as columns. You can define the columns that you want to include in your analysis report by setting up analysis column templates.

A template contains a set of lines each representing the analysis columns that you see in the analysis report. To define a column you must assign an analysis type code to a line. This analysis type code determines the type of source data in the item ledger entries that the analysis will be based on. Source data includes cost, sales amount, or quantity, and their associated value entries. You can set up as many column templates as you like, and then use them to create new analysis reports.

1. Choose the  icon, enter **Sales Column Templates**, and then choose the related link.
2. Select the first empty line, and then fill in the fields as necessary.
3. Choose the **Columns** action.
4. On the **Analysis Columns** page, fill in the fields to specify the columns that you want to include in your analysis report.

NOTE

To define a column, you must fill in the **Analysis Type Codes** field for all column types except **Formula**. Set up the analysis type codes on the **Analysis Types** page.

Also, in the **Ledger Entry Type** field, if you select **Item Entries**, the actual figures from the item ledger entry are copied. If you select **Item Budget Entries**, the budgeted figures from the budget are copied.

5. Choose the **OK** button to save your changes.

To set up analysis line templates

The following procedure is based on analysis reports for sales. The steps are similar for purchase and inventory analysis reports.

In an analysis report your analysis objects are shown on the lines. You can define the lines that you want to include in your analysis report by setting up analysis line templates.

A template contains a set of lines representing the analysis lines that you see in the analysis report. A line can

specify one or a range of items, customers, vendors, or groups. You can also create a formula in a line to sum up the other lines. You can set up as many line templates as you like, and then use them to create new analysis reports.

1. Choose the  icon, enter **Sales Line Templates**, and then choose the related link.
2. Select the first empty line, and then fill in the fields as necessary.
3. Choose the **Lines** action.
4. On the **Analysis Lines** page, create lines for the items, customers, vendors, or salespeople you want to view figures for in your analysis report. You must fill in the **Type**, **Range**, and the **Description** fields.

NOTE

Alternatively, when you want to create many individual lines for each item, customer, and so on, you can select the appropriate insert option to fill in all the relevant fields on the line. If you need to, you can then edit the lines manually. To insert lines, choose the **Insert Items** action or the **Insert Item Groups** action.

To create a new sales analysis report

The following procedure is based on analysis reports for sales. The steps are similar for purchase and inventory analysis reports.

You use analysis reports to analyze the dynamics of your sales according to key sales performance indicators that you select, for example, sales turnover in both amounts and quantities, contribution margin, or progress of actual sales against the budget. You can also use the report to analyze your average sales prices and evaluate the sales performance of your sales force.

1. Choose the  icon, enter **Sales Analysis Reports**, and then choose the related link.
2. On the **Analysis Report Sale** page, choose the **New** action.
3. Fill in the fields as necessary. Hover over a field to read a short description.
4. Choose the **Edit Analysis Report** action.
5. On the **Sales Analysis Report** page, choose the **Show Matrix** action

NOTE

Building combinations of line and column templates to create reports and assigning them unique names is optional. If you do this, selecting a report name means that you will not need to select line and column templates on the **Sales Analysis Report** page. After you have chosen a report name, you can change line and column templates independently and then later select the report name again to restore the original combination.

Create Reports with XBRL

3/31/2019 • 7 minutes to read

XBRL, which stands for eXtensible Business Reporting Language, is an XML-based language for tagging financial data, and enabling businesses to efficiently and accurately process and share their data. The XBRL initiative enables global financial reporting by numerous ERP software companies and international accounting organizations. The goal of the initiative is to provide a standard for the uniform reporting of financial information for banks, investors, and government authorities. Such business reporting can include:

- Financial statements
- Financial information
- Non-financial information
- Regulatory filings, such as annual and quarterly financial statements

Business Central enables companies to implement data in XBRL, and take advantage of the flexibility and automation it provides for both collecting and sharing data.

eXtensible Business Reporting Language

XBRL (eXtensible Business Reporting Language) is an XML-based language for financial reporting. XBRL provides a standard for uniform reporting for all users of the financial information supply chain; such as public and private companies, the accounting profession, regulators, analysts, the investment community, capital markets and lenders, as well as key third parties such as software developers and data aggregators.

Taxonomies are maintained by www.xbrl.org. You can download taxonomies or read more detailed information on the XBRL website.

Someone who wants financial information from you, provides you with a taxonomy (an XML document) containing one or more schemas, each with one or more lines to fill out. The lines correspond to the individual financial facts required by the sender. You import this taxonomy into the program and then fill out the schema(s) by entering which account or accounts correspond to each line, what kind of timeframe to use, for example net change or balance at date. In some cases you can enter a constant instead, for example, number of employees. You are now ready to send the instance document (an XML document) to the someone who requests the information. The idea is that this might be a recurring event, so unless changes have been made to the taxonomy, you just export new instance documents for new periods on request.

XBRL is comprised of the following components

The XBRL **Specification** explains what XBRL is, how to build XBRL instance documents and XBRL taxonomies. The XBRL Specification explains XBRL in technical terms and is intended for a technical audience.

The XBRL **Schema** are the core low-level components of XBRL. The schema is the physical XSD file which express how instance documents and taxonomies are to be built.

The XBRL **Linkbases** are the physical XML files which contain various information about the elements defined in the XBRL Schema, such as labels in one or more languages, how they relate to each other, how to sum up elements, etc.

An XBRL **Taxonomy** is a "vocabulary" or "dictionary" created by a group, compliant with the XBRL Specification, in order to exchange business information.

An XBRL **Instance document** is a business report, such as a financial statement prepared to the XBRL

specification. The meaning of the values in the instance document is explained by the taxonomy. An instance document is somewhat useless unless you know the taxonomy to which it is prepared.

Layered Taxonomies

A taxonomy can consist of a base taxonomy, for example, us-gaap or IAS, and then have one or more extensions. To reflect this, a taxonomy refers to one or more schemas which all are separate taxonomies. When the additional taxonomies are loaded into the database, the new elements are simply added to the end of the existing elements.

Linkbases

In XBRL Spec. 2, the taxonomy is described in several XML-files. The primary XML file is the taxonomy schema file itself (.xsd file) which only contains an unordered list of elements or facts to be reported. In addition to this, there are usually associated some linkbase files (.xml). The linkbase files contain data which is complementary to the raw taxonomy (.xsd file). There are six types of linkbases files of which four have relevance for Product Name XBRL. These are:

- **Label linkbase:** This linkbase contains labels or names for the elements. The file may contain labels in different languages which are identified with an XML property called 'lang'. The XML language identifier usually contains a two-letter abbreviation, and although it should be easy to guess what the abbreviation means, there is no connection to the Windows language code or to the language codes defined in the demo data. Therefore, when the user looks up the languages for a specific taxonomy, he will see all the labels for the first element in the taxonomy, meaning that he can then see an example of each language. A taxonomy can have several label linkbases attached to it as long as these linkbases contain different languages.
- **Presentation linkbase:** This linkbase contains information about the structure of the elements, or more precisely; how the issuer of the taxonomy suggests that the program presents the taxonomy to the user. The linkbase contains a series of links that each connect two elements as parent and child. When applying all these links, the elements can be shown in a hierarchical way. Note that the presentation linkbase deals with just that: the presentation of elements to the user.
- **Calculation linkbase:** This linkbase contains information about which elements roll up to which. The structure is quite similar to the presentation linkbase, except that each link or 'arc', as they are called, has a weight property. The weight can be either 1 or -1 indicating whether the element should be added to or subtracted from its parent. Note that the rollups are not necessarily in keeping with the visual presentation.
- **Reference linkbase:** This linkbase is an xml file that contains supplementary information about the data that is required by the taxonomy issuer.

To set up XBRL lines

After you import or update the taxonomy, the lines of the schemas must be supplied with all the information that is required. This information will include basic company information, the actual financial statements, notes to the financial statements, supplemental schedules, and other information that is required to satisfy the particular financial reporting requirements.

You set up the XBRL Lines by mapping the data in the taxonomy to the data in your general ledger.

1. Choose the  icon, enter **XBRL Taxonomies**, and then choose the related link.
2. On the **XBRL Taxonomies** page, select a taxonomy from the list.
3. Choose the **Lines** action.
4. Select a line and fill in the fields.
5. To read detailed information about what to fill in, choose the **Information** action.
6. To set up the mapping of the general ledger accounts in the chart of accounts to the XBRL lines, choose the **G/L Map Lines** action.

7. To add notes to the financial statement, choose the **Notes** action.

NOTE

You can only export data that correspond to the source type you have selected in the **Source Type** field that includes description and notes.

NOTE

Lines that are not relevant can be marked as line type **NOT APPLICABLE** so the lines are not exported.

To import an XBRL taxonomy

The first step in working with the XBRL functionality is to import the taxonomy into your company database. A taxonomy consists of one or more schemas and some linkbases. After you have completed the import of both schemas and linkbases and have applied the linkbases to the schema, you can set up the lines and map the general ledger accounts in the chart of accounts to the appropriate taxonomy lines.

1. Choose the  icon, enter **XBRL Taxonomies**, and then choose the related link.
2. On the **XBRL Taxonomies** page, create a new line and enter the name and description of the taxonomy.
3. Choose the **Schemas** action, and then insert the description of the schema.
4. To import the schema, on the **XBRL Schemas** page, choose the **Import** action, and then select a folder and an XSD file. Choose the **Open** button.
5. To import the linkbase, on the **XBRL Schemas** page, choose the **Linkbases** action, and then select a folder and an XML file. Choose the **Open** button.
6. You can now choose to apply the linkbase to the schema. Repeat until you have imported all linkbases.
7. Choose the **Apply to Taxonomy** action to apply the linkbase to the schema.

IMPORTANT

Instead of individually applying the linkbases after the import, you can wait until you have imported all linkbases and then apply them at the same time. To do this, choose the **NO** button when you are prompted to apply the newly imported linkbase to the schema. Then select the lines with the linkbases that you want to apply.

To update an XBRL taxonomy

When a taxonomy changes you need to update the current taxonomy accordingly. The reason for the update can be an altered schema, an altered linkbase, or a new linkbase. After updating the taxonomy, you only need to map the lines for the changed or new lines.

1. Choose the  icon, enter **XBRL Taxonomies**, and then choose the related link.
2. On the **XBRL Taxonomies** page, choose the **Schemas** action.
3. To update a schema, select the schema you want to update, and then choose the **Import** action.
4. To update or add a new linkbase, choose the **Linkbases** action.
5. Select the relevant linkbase or press Ctrl+N for a new line, select the type of linkbase, and then insert a description.
6. To import the linkbase, choose the **Import** action.
7. Choose the **Yes** button to apply the linkbase to the schema.

Sales

3/31/2019 • 3 minutes to read

You create a sales invoice or sales order to record your agreement with a customer to sell certain products on certain delivery and payment terms.

You must use sales orders if your sales process requires that you can ship parts of an order quantity, for example, because the full quantity is not available at once. If you sell items by delivering directly from your vendor to your customer, as a drop shipment, then you must also use sales orders. In all other aspects, sales orders work the same way as sales invoices. With sales orders, you can also use the Order Promising functionality to communicate certain delivery dates to your customers.

You can negotiate with the customer by first creating a sales quote, which you can convert to a sales invoice or sales order when you agree on the sale. After the customer has confirmed the agreement, you can send an order confirmation to record your obligation to deliver the products as agreed.

You can easily correct or cancel a posted sales invoice before it is paid. This is useful if you want to correct a typing mistake or if the customer requests a change early in the order process. If the posted sales invoice is paid, then you must create a sales credit memo or a sales return order to reverse the sale.

Good sales and marketing practices are all about how to make the best decisions at the right time. Marketing functionality in Business Central provides precise and timely overview of your contact information so that you can serve your prospective customers more efficiently and increase customer satisfaction. For more information, see [Relationship Management](#).

In business environments where the customer must pay before products are delivered, such as in retail, you must wait for the receipt of payment before you deliver the products. In most cases, you process incoming payments some weeks after delivery by applying the payments to their related posted, unpaid sales invoices. For more information, see [Reconcile Payments Using Automatic Application](#).

Sales documents can be sent as PDF files attached to email. The email body will contain an extract of the sales document, such as products, total amount, and a link to the PayPal site. For more information, see [Send Documents by Email](#).

For all sales processes, you can incorporate an approval workflow, for example, to require that large sales to certain customers are approved by the accounting manager. For more information, see [Using Workflows](#).

The following table describes a sequence of tasks, with links to the topics that describe them.

TO	SEE
Create a customer card for each customer that you sell to.	Register New Customers
Create a sales quote where you offer products on negotiable terms before converting the quote to a sales invoice.	Make Sales Quotes

TO	SEE
Create a sales invoice to record your agreement with a customer to sell products on certain delivery and payment terms.	Invoice Sales
Process a sales order that involves partial shipping or drop shipment.	Sell Products
Set up standard sales or purchase lines that you can quickly insert on documents, for example, for recurring replenishment orders.	Create Recurring Sales and Purchase Lines
Link a sales order to a purchase order to sell a drop-shipment item that will be delivered directly from your vendor to your customer.	Make Drop Shipments
Have a catalog item shipped from a vendor to your warehouse so that you can ship the item on to your customer.	Create Special Orders
Perform an action on an unpaid posted sales invoice to automatically create a credit memo and either cancel the sales invoice or recreate it so you can make corrections.	Correct or Cancel Unpaid Sales Invoices
Create a sales credit memo to revert a specific posted sales invoice to reflect which products the customer returns and which payment amount you will refund.	Process Sales Returns or Cancellations
Manage your customer's commitment to purchase large quantities delivered in several shipments over time.	Work with Blanket Sales Orders
Sell assembly items that are not currently available by creating a linked assembly order to supply the full or partial sales order quantity.	Sell Items Assembled to Order
Invoice a customer once for multiple shipments by combining the shipments on one invoice.	Combine Shipments on a Single Invoice
Inform your customers of order delivery dates by calculating either the capable-to-promise date or the available-to-promise date.	Calculate Order Promising Dates
Register your estimates for future sales, specified by item and by period, to function mainly as input to production planning.	Create a Forecast
Resolve confusion when two or more records exist for the same customer.	Merge Duplicate Records

Register New Customers

3/31/2019 • 2 minutes to read

Customers are the source of your income. You must register each customer you sell to as a customer card. Customer cards hold the information that is required to sell products to the customer. For more information, see [Invoice Sales](#) and [Register New Items](#).

Before you can register new customers, you must set up various sales codes that you can select from when you fill in customer cards. For more information, see [Setting Up Sales](#).

NOTE

If customer templates exist for different customer types, then a page appears when you create a new customer card from where you can select an appropriate template. If only one customer template exists, then new customer cards always use that template.

To create a new customer card

1. Choose the  icon, enter **Customers**, and then choose the related link.
2. On the **Customers** page, choose the **New** action.

If only one customer template exists, then a new customer card opens with some fields filled with information from the template.

If more than one customer template exists, then a page opens from which you can select a customer template. In that case, follow the next two steps.

3. On the **Select a template for a new customer** page, choose the template that you want to use for the new customer card.
4. Choose the **OK** button. A new customer card opens with some fields filled with information from the template.
5. Proceed to fill or change fields on the customer card as necessary. Hover over a field to read a short description.

On the **Sales Prices** FastTab, you can view special prices or discounts that you grant for the customer if certain criteria are met, such as item, minimum order quantity, or ending date. Each row represents a special price or line discount. Each column represents a criterion that must apply to warrant the special price that you enter in the **Unit Price** field, or the line discount that you enter in the **Line Discount %** field. For more information, see [Record Sales Price, Discount, and Payment Agreements](#).

The customer is now registered, and the customer card is ready to be used on sales documents.

If you want to use this customer card as a template when you create new customer cards, you can save it as a template. For more information, see the following section.

To save the customer card as a template

1. On the **Customer Card** page, choose the **Save as Template** action. The **Customer Template** page opens showing the customer card as a template.
2. Fill in the fields as necessary. Hover over a field to read a short description.

3. To reuse dimensions in templates, choose the **Dimensions** action. The **Dimension Templates** page opens showing any dimension codes that are set up for the customer.
4. Edit or enter dimension codes that will apply to new customer cards created by using the template.
5. When you have completed the new customer template, choose the **OK** button.

The customer template is added to the list of customer templates, so that you can use it to create new customer cards.

Make Sales Quotes

3/31/2019 • 4 minutes to read

You create a sales quote to record your offer to a customer to sell certain products on certain delivery and payment terms. You can send the sales quote to the customer to communicate the offer. You can email the document as a PDF attachment. You can also have the email body prefilled with a summary of the quote. For more information, see [Send Documents by Email](#).

While you negotiate with the customer, you can change and resend the sales quote as much as needed. When the customer accepts the quote, you convert the sales quote to a sales invoice or a sales order in which you process the sale. For more information, see [Invoice Sales](#) or [Sell Products](#).

You can fill customer fields on the sales quote in two ways depending on whether the customer is already registered. See steps 2 and 3 in the following procedure.

To create a sales quote

1. Choose the  icon, enter **Sales Quotes**, and then choose the related link.
2. In the **Customer** field, enter the name of an existing customer.

Other fields on the **Sales Quote** page contain standard information of the selected customer. If the customer is not registered, follow these steps:

3. In the **Customer** field, enter the name of the new customer.
4. In the dialog box about registering the new customer, choose the **Yes** button.
5. On the **Select a template for a new customer** page, choose a template to base the new customer card on, and then choose the **OK** button.
6. A new customer card displays the information on the selected customer template. Fill in the remaining fields. For more information, see [Register New Customers](#).
7. When you have completed the customer card, choose the **OK** button to return to the **Sales Quote** page.

Several fields on the sales quote are now filled with information that you specified on the new customer card.

8. Fill in the remaining fields on the **Sales Quote** page as necessary. Hover over a field to read a short description.

You are now ready to fill in the sales order lines for products that you are selling to the customer or for any transaction with the customer that you want to record in a G/L account.

If you have set up recurring sales lines for the customer, such as a monthly replenishment order, then you can insert these lines on the order by choosing the **Get Recurring Sales Lines** action.

9. On the **Lines** FastTab, in the **Type** field, select what type of product, charge, or transaction that you will post for the customer with the sales line.
10. In the **No.** field, select a record to post according to the value in the **Type** field.

You leave the **No.** field empty in the following cases:

- If the line is for a comment. Write the comment in the **Description** field.

- If the line is for a catalog item. Choose the **Select Catalog Items** action. For more information, see [Work With Catalog Items](#).

11. In the **Quantity** field, enter how many units of the product, charge, or transaction that the line will record for the customer.

NOTE

If the item is of type **Item - Service** or **Resource**, the quantity is a time unit, such as hours, as indicated in the **Unit of Measure Code** field on the line.

The value in the **Line Amount** field is calculated as *Unit Price x Quantity*.

The price and line amounts are with or without sales tax, depending on what you selected in the **Prices Including Tax** field on the customer card.

12. If you want to give a discount, enter a percentage in the **Line Discount %** field. The value in the **Line Amount** field updates accordingly.

If special item prices are set up on the **Sales Prices and Sales Line Discounts** FastTab on the customer or item card, the price and amount on the sales line automatically update if the price criteria is met. For more information, see [Record Sales Price, Discount, and Payment Agreements](#).

13. Repeat steps 9 through 12 for every product you want to offer the customer.

The totals under the lines are automatically calculated as you create or modify lines.

14. In the **Invoice Discount Amount** field, enter an amount that should be deducted from the value shown in the **Total Incl. Tax** field.

If you have set up invoice discounts for the customer, then the specified percentage value is automatically inserted in the **Invoice Discount %** field if the criteria are met, and the related amount is inserted in the **Inv. Discount Amount Excl. Tax** field. For more information, see [Record Sales Price, Discount, and Payment Agreements](#).

TIP

To have the **Quote Valid Until Date** filled in automatically with a certain number of days after quote creation, you can fill in the **Quote Validity Calculation** field on the **Sales & Receivables** page.

15. When the sales quote lines are completed, choose the **Send by Email** action.
16. On the **Send Email** page, fill in any remaining fields and review the embedded sales quote. For more information, see [Send Documents by Email](#).
17. If the customer accepts the quote, choose the **Make Invoice** or the **Make Order** action.

The sales quote is removed from the database. A sales invoice or a sales order is created based on the information in the sales quote in which you can process the sale. In the **Quote No.** field on the sales invoice or sales order, you can see the number of the sales quote that it was made from. For more information, see [Invoice Sales](#) or [Sell Products](#).

Invoice Sales

3/31/2019 • 7 minutes to read

You create a sales invoice or sales order to record your agreement with a customer to sell certain products on certain delivery and payment terms.

There are a couple of scenarios where you must use a sales order instead of a sales invoice:

- If you need to ship only part of an order quantity, for example, because the full quantity is not on hand.
- If you sell items that your vendor delivers directly to your customer, known as drop shipment. For more information, see [Make Drop Shipments](#).

In all other aspects, sales orders and sales invoices work in the same way. For more information, see [Sell Products](#).

You can negotiate with the customer by first creating a sales quote, which you can convert to a sales invoice when you agree on the sale. For more information, see [Make Sales Quotes](#).

If the customer decides to buy, you post the sales invoice to create the related quantity and value entries. When you post the sales invoice, you can also email the document as a PDF attachment. You can have the email body prefilled with a summary of the invoice and payment information, such as a link to PayPal. For more information, see [Send Documents by Email](#). When the customer then pays the invoice, you can register that payment in different ways, depending on the size and preferred workflows of your organization. For more information, see the [Registering Payments](#) section.

You can easily correct or cancel a posted sales invoice before it is paid. For example, this is useful if you want to correct a typing mistake or if the customer requests a change early in the order process. For more information, see [Correct or Cancel Unpaid Sales Invoices](#). If the posted sales invoice is paid, then you must create a sales credit memo to reverse the sale. For more information, see [Process Sales Returns or Cancellations](#).

The item card can be of type **Inventory**, **Service**, and **Non-Inventory** to specify if the item is a physical inventory unit, a labor time unit, or a physical unit that is not kept on inventory. For more information, see [Register New Items](#). The sales invoice process is the same for all three item types.

You can fill customer fields on the sales invoice in two ways depending on whether the customer is already registered. See steps 2 and 3 in the following procedure.

To create a sales invoice

1. Choose the  icon, enter **Sales Invoices**, and then choose the related link.

2. In the **Customer** field, enter the name of an existing customer.

Other fields on the **Sales Invoice** page contain standard information about the selected customer. If the customer is not registered, follow these steps:

3. In the **Customer** field, enter the name of the new customer.

4. In the dialog box about registering the new customer, choose the **Yes** button.

5. On the **Select a template for a new customer** page, choose a template to base the new customer card on, and then choose the **OK** button.

6. A new customer card displays the information on the selected customer template. Fill in the

remaining fields. For more information, see [Register New Customers](#).

7. When you have completed the customer card, choose the **OK** button to return to the **Sales Invoice** page.

Several fields on the sales invoice are now filled with information that you specified on the new customer card.

8. Fill in the remaining fields on the **Sales Invoice** page as necessary. Hover over a field to read a short description.

NOTE

If you allow the customer to pay immediately, for example, by cash or by PayPal, then fill in the **Payment Method Code** field. The payment is then recorded as soon as you post the sales invoice. If you select CASH, then the payment is recorded in a specified balancing account.

You are now ready to fill in the sales invoice lines for products that you are selling to the customer or for any transaction with the customer that you want to record in a G/L account.

If you have set up recurring sales lines for the customer, such as a monthly replenishment order, then you can insert these lines on the order by choosing the **Get Recurring Sales Lines** action.

9. On the **Lines** FastTab, in the **Type** field, select what type of product, charge, or transaction that you will post for the customer with the sales line.
10. In the **No.** field, select a record to post according to the value in the **Type** field.

You leave the **No.** field empty in the following cases:

- If the line is for a comment. Write the comment in the **Description** field.
 - If the line is for a catalog item. Choose the **Select Catalog Items** action. For more information, see [Work With Catalog Items](#).
11. In the **Quantity** field, enter how many units of the product, charge, or transaction that the line will record for the customer.

NOTE

If the item is of type **Service**, or the **Type** field contains **Resource**, then the quantity is a time unit, such as hours, as indicated in the **Unit of Measure Code** field on the line.

The value in the **Line Amount** field is calculated as *Unit Price x Quantity*.

The price and line amounts are with or without sales tax, depending on what you selected in the **Prices Including Tax** field on the customer card.

12. If you want to give a discount, enter a percentage in the **Line Discount %** field. The value in the **Line Amount** field updates accordingly.

If special item prices are set up on the **Sales Prices and Sales Line Discounts** FastTab on the customer or item card, the price and amount on the sales line automatically update if the price criteria is met. For more information, see [Record Sales Price, Discount, and Payment Agreements](#).

13. Repeat steps 9 through 12 for every product or charge that you want to invoice the customer for.

The totals under the lines are automatically calculated as you create or modify lines.

14. In the **Invoice Discount Amount** field, enter an amount that should be deducted from the value

shown in the **Total Incl. Tax** field.

If you have set up invoice discounts for the customer, then the specified percentage value is automatically inserted in the **Invoice Discount %** field if the criteria are met, and the related amount is inserted in the **Inv. Discount Amount Excl. Tax** field. For more information, see [Record Sales Price, Discount, and Payment Agreements](#).

15. When the sales invoice lines are completed, choose the **Post and Send** action.

The **Post and Send Confirmation** dialog box displays the customer's preferred method of receiving documents. You can change the sending method by choosing the lookup button for the **Send Document to** field. For more information, see [Set Up Document Sending Profiles](#).

The related item and customer ledger entries are now created in your system, and the sales invoice is output as a PDF document. The sales invoice is removed from the list of sales invoices and replaced with a new document in the list of posted sales invoices.

Registering Payments

Depending on your business needs, you can get paid and register that payment in different ways: manually, automatically, and through payment services.

You can process the payments straight from the customer card. Use the **Register Customer Payments** action to get an overview of unpaid invoices for that customer. Then, mark the invoice as paid partially or in full. This payment reconciliation processes your customer payments by matching amounts received on your bank account with the related unpaid sales invoices, and then posts the payments. For more information, see [To reconcile payments individually](#).

In business environments where the customer pays some time after delivery, according to the payment term, a posted sales invoice remains open (unpaid) until the Accounts Receivable department verifies that payment is received and applies the payment to the posted sales invoice. This can be done manually or automatically. For more information, see [Reconcile Customer Payments with the Cash Receipt Journal or from Customer Ledger Entries](#) and [Reconcile Payments Using Automatic Application](#).

In business environments where the customer pays immediately, for example by PayPal or cash, payment is recorded immediately when you post the sales invoice, that is, the posted sales invoice is closed as fully applied. You select the relevant method in the **Payment Method Code** field on the sales order. See under step 8. For electronic payments, such as PayPal, you must also fill in the **Payment Service** field. For more information, see [Enable Customer Payments Through Payment Services](#).

You can even create directly-paid invoices for non-registered customers by first setting up a "cash customer" card, which you point to on the sales invoice. For more information, see [Set Up Cash Customers](#).

Sell Products

3/31/2019 • 9 minutes to read

You create a sales order or sales invoice to record your agreement with a customer to sell certain products on certain delivery and payment terms.

NOTE

You use sales orders if your sales process requires that you can ship parts of an order quantity, for example, because the full quantity is not available at once. If you sell items by delivering directly from your vendor to your customer, as a drop shipment, then you must also use sales orders. For more information, see [Make Drop Shipments](#). In all other aspects, sales orders work the same way as sales invoices. For more information, see [Invoice Sales](#).

You can negotiate with the customer by first creating a sales quote, which you can convert to a sales order when you agree on the sale. For more information, see [Make Sales Quotes](#).

After the customer has confirmed the agreement, for example after a quote process, you can send an order confirmation to record your obligation to deliver the products as agreed.

When you deliver the products, either fully or partially, you post the sales order as shipped or as shipped and invoiced to create the related item and customer ledger entries in your system. When you post the sales order, you can also email the document as a PDF attachment. You can have the email body prefilled with a summary of the order and payment information, such as a link to PayPal. For more information, see [Send Documents by Email](#).

In business environments where the customer pays some time after delivery, according to the payment term, a posted sales invoice remains open (unpaid) until the Accounts Receivable department verifies that payment is received and applies the payment to the posted sales invoice. For more information, see [Reconcile Payments Using Automatic Application](#).

In business environments where the customer pays immediately, for example by PayPal or cash, payment is recorded immediately when you post the sales order as invoiced, that is, the posted sales invoice is closed as fully applied. You select the relevant method in the **Payment Method Code** field on the sales order. See under step 8. For electronic payments, such as PayPal, you must also fill in the **Payment Service** field. For more information, see [Enable Customer Payments Through Payment Services](#).

You can even create directly-paid orders for non-registered customers by first setting up a "cash customer" card, which you point to on the sales order. For more information, see [Set Up Cash Customers](#).

You can easily correct or cancel a posted sales invoice resulting from a sales order before it is paid. This is useful if you want to correct a typing mistake or if the customer requests a change early in the order process. For more information, see [Correct or Cancel Unpaid Sales Invoices](#). If the posted sales invoice is paid, then you must create a sales credit memo to reverse the sale. For more information, see [Process Sales Returns or Cancellations](#).

The item card can be of type **Inventory**, **Service**, and **Non-Inventory** to specify if the item is a physical inventory unit, a labor time unit, or a physical unit that is not kept on inventory. For more information, see [Register New Items](#). The sales order process is the same for all three item types.

You can fill customer fields on the sales order in two ways depending on whether the customer is already registered. See steps 2 and 3 in the following procedure.

To create a sales order

1. Choose the  icon, enter **Sales Orders**, and then choose the related link.
2. In the **Customer** field, enter the name of an existing customer.

Other fields on the **Sales Order** page are now filled with the standard information of the selected customer. If the customer is not registered, then follow these steps:

3. In the **Customer** field, enter the name of the new customer.
4. In the dialog box about registering the new customer, choose the **Yes** button.
5. On the **Select a template for a new customer** page, choose a template to base the new customer card on, and then choose the **OK** button.

A new customer card opens, prefilled with the information on the selected customer template. The **Name** field is prefilled with the new customer's name that you entered on the sales order.

6. Proceed to fill in the remaining fields on the customer card. For more information, see [Register New Customers](#).
7. When you have completed the customer card, choose the **OK** button to return to the **Sales Order** page.

Several fields on the sales order are now filled with information that you specified on the new customer card.

8. Fill in the remaining fields on the **Sales Order** page as necessary. Hover over a field to read a short description.

NOTE

If you allow the customer to pay immediately, for example, by credit card or PayPal, then fill in the **Payment Method Code** field. The payment is then recorded as soon as you post the sales order as invoiced. If you select CASH, then the payment is recorded in a specified balancing account.

You are now ready to fill in the sales order lines with inventory items or services that you want to sell to the customer.

If you have set up recurring sales lines for the customer, such as a monthly replenishment order, then you can insert these lines on the order by choosing the **Get Recurring Sales Lines** action.

9. On the **Lines** FastTab, in the **Item** field, enter the number of an inventory item or service.
10. In the **Quantity** field, enter the number of items to be sold.

NOTE

For items of type Service, the quantity is a time unit, such as hours, as indicated in the **Unit of Measure Code** field on the line.

The **Line Amount** field is updated to show the value in the **Unit Price** field multiplied by the value in the **Quantity** field.

The price and line amounts are shown with or without sales tax depending on what you selected in the **Prices Including Tax** field on the customer card.

11. In the **Line Discount %** field, enter a percentage if you want to grant the customer a discount on the product. The value in the **Line Amount** field is updated accordingly.

If you have set up special item prices on the **Sales Prices and Sales Line Discounts** FastTab on the customer or item card, then the price and amount on the quote line are automatically updated if the agreed price criteria are met. For more information, see [Record Sales Price, Discount, and Payment Agreements](#).

12. To add a comment about the quote line that the customer can see on the printed sales quote, write a text in the **Description** field on an empty line.

13. Repeat steps 9 through 12 for every item that you want to sell to the customer.

The totals under the lines are automatically calculated as you create or modify lines.

14. A new customer card displays the information on the selected customer template. Fill in the remaining fields. For more information, see [Register New Customers](#).

15. When you have completed the customer card, choose the **OK** button to return to the **Sales Order** page.

Several fields on the sales order are now filled with information that you specified on the new customer card.

16. Fill in the remaining fields on the **Sales Order** page as necessary. Hover over a field to read a short description.

You are now ready to fill in the sales order lines for products that you are selling to the customer or for any transaction with the customer that you want to record in a G/L account.

If you have set up recurring sales lines for the customer, such as a monthly replenishment order, then you can insert these lines on the order by choosing the **Get Recurring Sales Lines** action.

17. On the **Lines** FastTab, in the **Type** field, select what type of product, charge, or transaction that you will post for the customer with the sales line.

18. In the **No.** field, select a record to post according to the value in the **Type** field.

You leave the **No.** field empty in the following cases:

- If the line is for a comment. Write the comment in the **Description** field.
- If the line is for a catalog item. Choose the **Select Catalog Items** action. For more information, see [Work With Catalog Items](#).

19. In the **Quantity** field, enter how many units of the product, charge, or transaction that the line will record for the customer.

NOTE

If the item is of type **Item - Service** or **Resource**, the quantity is a time unit, such as hours, as indicated in the **Unit of Measure Code** field on the line. For more information, see [Set Up Item Units of Measure](#).

The value in the **Line Amount** field is calculated as *Unit Price x Quantity*.

The price and line amounts are with or without sales tax, depending on what you selected in the **Prices Including Tax** field on the customer card.

20. If you want to give a discount, enter a percentage in the **Line Discount %** field. The value in the **Line Amount** field updates accordingly.

If special item prices are set up on the **Sales Prices and Sales Line Discounts** FastTab on the customer or item card, the price and amount on the sales line automatically update if the price criteria is met. For more information, see [Record Sales Price, Discount, and Payment Agreements](#).

21. Repeat steps 9 through 12 for every product or charge you want to sell to the customer.

The totals under the lines are automatically calculated as you create or modify lines.

22. In the **Invoice Discount Amount** field, enter an amount that should be deducted from the value shown in the **Total Incl. Tax** field.

If you have set up invoice discounts for the customer, then the specified percentage value is automatically inserted in the **Invoice Discount %** field if the criteria are met, and the related amount is inserted in the **Inv. Discount Amount Excl. Tax** field. For more information, see [Record Sales Price, Discount, and Payment Agreements](#).

23. To only ship a part of the order quantity, enter that quantity in the **Qty. to Ship** field. The value is copied to the **Qty. to Invoice** field.

24. To only invoice a part of the shipped quantity, enter that quantity in the **Qty. to Invoice** field. The quantity must be lower than the value in the **Qty. to Ship** field.

25. When the sales order lines are completed, choose the **Post and Send** action.

The **Post and Send Confirmation** dialog box displays the customer's preferred method of receiving documents. You can change the sending method by choosing the lookup button for the **Send Document to** field. For more information, see [Set Up Document Sending Profiles](#).

The related item and customer ledger entries are now created in your system, and the sales order is output as a PDF document. When the sales order is fully posted, it is removed from the list of sales orders and replaced with new documents in the list of posted sales invoices and the list of posted sales shipments.

Posting Sales

3/31/2019 • 2 minutes to read

In the **Posting group** on a sales document, you can choose between the following posting functions:

- **Post**
- **Test Report**
- **Post and Send**
- **Post and Print**
- **Post and Email**
- **Post Batch**
- **Preview Posting**

When you have completed all the lines and entered all the information on the sales order, you can post it. This creates a shipment and an invoice.

When a sales order is posted, the customer's account, the general ledger, and the item ledger entries are updated.

For each sales order, a sales entry is created in the **G/L Entry** table. An entry is also created in the customer's account in the **Cust. Ledger Entry** table and a general ledger entry is created in the relevant receivables account. In addition, posting the order may result in a VAT entry and a general ledger entry for the discount amount. Whether an entry for the discount is posted depends on the contents of the **Discount Posting** field on the **Sales & Receivables Setup** page.

For each sales order line, an item ledger entry will be created in the **Item Ledger Entry** table (if the sales lines contain item numbers) or a general ledger entry will be created in the **G/L Entry** table (if the sales lines contain a general ledger account). In addition to this, sales orders are always recorded in the **Sales Shipment Header** and **Sales Invoice Header** tables.

IMPORTANT

When you post an order, you can create both a shipment and an invoice. These can be done at the same time or independently. You can also create a partial shipment and a partial invoice by completing the **Qty. to Ship** and **Qty. to Invoice** fields on the individual sales order lines before you post. Note that you cannot create an invoice for something that is not shipped. That is, before you can invoice, you must have recorded a shipment, or you must choose to ship and invoice at the same time.

When the posting is completed, the posted sales lines are removed from the order. A message tells you when the posting is completed. After this, you will be able to see the posted entries in the various pages that contain posted entries, such as the **Cust. Ledger Entries**, **G/L Entries**, **Item Ledger Entries**, **Posted Sales Shipments**, and **Posted Sales Invoices** pages.

Create Recurring Sales and Purchase Lines

4/29/2019 • 3 minutes to read

If you often need to create sales and purchase lines with similar information, you can set up standard lines that you can then insert on recurring sales and purchase documents, for example, for recurring replenishment orders.

The following procedures show how to work with standard sales lines on a sales invoice. It works in a similar way for all other sales documents and for all purchase documents.

To set up standard sales lines

1. Choose the  icon, enter **Standard Sales Lines**, and then choose the related link.
2. On the **Standard Sales Lines** page, choose the **New** action.
3. On the **General** FastTab, fill the fields as necessary. Hover over a field to read a short description.
4. On the **Lines** FastTab, enter information in the fields to prepare sales lines that reflect the standard lines that you expect to use as recurring lines on sales documents.

NOTE

You cannot define prices on standard sales lines because prices, discounts, etc. are calculated on the actual sales documents after you insert the standard sales lines.

To assign standard sales lines to a customer

Assign one or more standard sales lines to a customer so that they are available to insert on sales documents for that customer.

1. Choose the  icon, enter **Customers**, and then choose the related link.
2. Open the card for a relevant customer.
3. Choose the **Recurring Sales Lines** action.
4. On the **Recurring Sales Lines** page, select codes for the recurring sales lines that you want to be able to insert on sales documents for the customer.
5. Fill in the additional fields to define when, how, and where the recurring sales lines are to be used.
6. In the four fields where you select how the lines are inserted on four document types, select one of the following options:

OPTION	DESCRIPTION
Manual	You must manually look up and insert a recurring sales line that exists for the customer.
Automatic	If multiple recurring sales lines exist for the customer, you will get a notification from where you can pick which one to insert. If only one recurring sales line exists, it will be inserted automatically.
Always Ask	A notification appears and all existing recurring sales lines are shown so that you can select one.

To insert recurring sales lines on a sales invoice

If recurring sales lines exist for the customer, you can insert them on all types of sales documents, such as a sales invoice. If you have activated the notification in question, you will be informed if recurring sales lines exist.

1. Choose the , enter **Invoices**, and then choose the related link.
2. Open the sales invoice that you want to insert one or more standard sales lines on.
3. Choose the **Get Recurring Sales Lines** action.
4. On the **Recurring Sales Lines** page, choose the lookup button in the **Code** field, and then select a set of standard sales lines.

NOTE

To use the recurring sales lines set together with the **Create Recurring Sales Invoices** batch job, you must also fill in the **Valid From Date** and **Valid To Date** fields on the **Recurring Sales Lines** page. For more information, see [To create multiple sales invoices based on standard sales lines](#).

5. Choose the **OK** button to insert the standard sales lines on the invoice where you can reuse them as is or edit the information.

To create multiple sales invoices based on standard sales lines

You can use the **Create Recurring Sales Invoices** batch job to create sales invoices according to standard sales lines that are assigned to the customers and with posting dates within the valid-from and valid-to dates that you specify on the standard sales lines.

NOTE

On the **Recurring Sales Lines** page, you can also specify a direct-debit payment method and a direct-debit mandate. The sales invoices that are created with the **Create Recurring Sales Inv.** batch job will then include information required to collect payment for the sales invoices with SEPA direct debit. For more information, see [Collect Payments with SEPA Direct Debit](#).

1. Choose the , enter **Create Recurring Sales Invoices**, and then choose the related link.
2. On the **Create Recurring Sales Invoices** page, fill in the fields as necessary.
3. In the **Code** filter field, enter the code for standard sales lines that are assigned to a customer that you want to create sales invoices for.
4. Choose the **OK** button.

Sales invoices are created for the customers with the specified standard customer sales code, and any specified direct-debit information, for posting on the specified date.

Make Drop Shipments

3/31/2019 • 2 minutes to read

A drop shipment is the shipment of items from one of your vendors directly to one of your customers.

When a sales order is marked for drop shipment, and you create a purchase order specifying the customer in the **Sell-to Customer No.** field, you can link the two documents and thereby instruct the vendor to ship directly to the customer.

To create a sales order for drop shipment

To prepare a drop shipment, you create a sales order for an item as normal, except you must indicate on the sales line that the sale requires drop shipment.

1. Create a sales order for an item. For more information, see [Sell Products](#).
2. On the sales order line for the drop shipment, select the **Drop Shipment** check box. Use the **Choose Columns** function if the field is not visible. For more information, see [Personalizing Your Workspace](#).

To create the purchase order for drop shipment

To prepare a drop shipment for the item to be sold, you create a purchase order as normal, except you must indicate on the purchase order that it must be shipped to your customer, not to yourself.

1. Create a purchase order. Do not fill any fields on the lines. For more information, see [Record Purchases](#).
2. In the **Sell-to Customer No.** field, select the customer that you are selling to.
3. Choose the **Drop Shipments** action, and then choose the **Get Sales Order** action.
4. On the **Sales List** page, select the sales order that you prepared in [To create a sales order for drop shipment](#).
5. Choose the **OK** button.

The line information from the sales order is inserted on the purchase order line(s).

You can now instruct the vendor to ship the items to your customer, for example, by mailing the purchase order as a PDF.

To view the linked purchase order from the sales order

- Select the drop-shipment sales order line, choose the **Order** action, choose the **Drop Shipment** action, and then choose the **Purchase Order** action.

To post a drop shipment

After the vendor ships the items, you can post the sales order as shipped. You can also post the purchase order, but only with the **Receive** option until the sales order has been invoiced.

1. Choose the  icon, enter **Sales Orders**, and then choose the related link.
2. Open the sales order that you created in .
3. In the **Qty. to Ship** field, specify how many of the order quantity to ship, the full or a partial order quantity.
4. Choose the **Post** or **Post and Send** action.
5. Choose either the **Ship** option to invoice later, or the **Ship and Invoice** option to invoice immediately.

Create Special Orders

3/31/2019 • 2 minutes to read

You can create a special order for a specific catalog item to be shipped to a specific customer. Your vendor ships the item to your warehouse and you can then ship the item on to your customer either independently or together with other items on another order.

Special orders imply that the purchase and sales order are linked to ensure that the specific catalog item is picked and delivered to the customer.

Before you can use this feature, you must first set up the customer, vendor, and item cards necessary for the order.

To create a special order

1. Choose the  icon, enter **Sales Order**, and then choose the related link.
2. Choose the **New** action. Create and fill in a sales order for the item. For more information, see [Sell Products](#).
3. On the **Lines** FastTab, fill in the sales line. In the **Purchasing Code** field, select a purchasing code that has the **Special Order** field selected.

You must now create a purchase order from a requisition worksheet.

4. Choose the  icon, enter **Requisition Worksheet**, and then choose the related link.
5. Choose the **Special Order** action, and then choose the **Get Sales Orders** action.
6. On the **Get Sales Orders** page, show results where the **Document No.** is the sales order number. Choose the **OK** button. A requisition worksheet line is created for the item.
7. On the requisition worksheet line, in the **Action Message** field, select **New**.
8. On the **Req. Worksheet** page, choose the **Carry Out Action Message** action. The **Carry Out Action Msg. - Req.** page opens. Choose the **OK** button.

A message appears telling you that the purchase orders have been created. Choose the **OK** button.

A purchase order created as a special order for a sales order is respected by the planning system as it balances demand and supply. That is, the purchase order (supply) remains linked to the sales order (demand), even if that purchase order could supply another earlier demand. For more information, see [Design Details: Reordering Policies](#).

NOTE

You cannot use the special order functionality if the item is already reserved. Therefore, for items that are sold on special orders, make sure the **Reserve** field on the item card is not set to **Always**.

Correct or Cancel Unpaid Sales Invoices

3/31/2019 • 2 minutes to read

You can correct or cancel a posted sales invoice. This is useful if you make a mistake or if the customer requests a change.

NOTE

After a posted sales invoice has been partially or fully paid, you cannot correct or cancel it from the posted sales invoice itself. Instead, you must manually create a sales credit memo to void the sale and reimburse the customer, optionally managed with a sales return order. For more information, see [Process Sales Returns or Cancellations](#).

On the **Posted Sales Invoice** page, you can choose the **Correct** action or the **Cancel** action to perform the actions that are described in the following table.

ACTION	DESCRIPTION
Correct	The posted sales invoice is canceled. A new sales invoice with the same information is created. You can make the correction and then continue the sales process. The new sales invoice has a different number than the initial sales invoice. A corrective sales credit memo is automatically created and posted to void the initial posted sales invoice. On the initial posted sales invoice, the Canceled and Paid check boxes are selected.
Cancel	The posted sales invoice is canceled. A corrective sales credit memo is automatically created and posted to void the initial posted sales invoice. On the initial posted sales invoice, the Canceled and Paid check boxes are selected.

When you correct or cancel a posted sales invoice, the corrective sales credit memo is applied to all general ledger and inventory ledger entries that were created when the initial sales invoice was posted. This reverses the posted sales invoice in your financial records and leaves the corrective posted sales credit memo for your audit trail.

To correct a posted sales invoice

1. Choose the  icon, enter **Posted Sales Invoices**, and then choose the related link.
2. Select the posted sales invoice that you want to correct.

NOTE

If the **Canceled** check box is selected, then you cannot correct the posted sales invoice because it has already been corrected or canceled.

3. On the **Posted Sales Invoice** page, choose the **Correct** action.
4. A new sales invoice with the same information is created where you can make the correction. The **Canceled** field on the initial posted sales invoice is changed to **Yes**.

A sales credit memo is automatically created and posted to void the initial posted sales invoice.

5. Choose the **Show Corrective Credit Memo** action to view the posted sales credit memo that voids the initial posted sales invoice.

To cancel a posted sales invoice

1. Choose the  icon, enter **Posted Sales Invoices**, and then choose the related link.
2. Select the posted sales invoice that you want to cancel.

NOTE

If the **Canceled** check box is selected, then you cannot cancel the posted sales invoice because it has already been canceled or corrected.

3. On the **Posted Sales Invoice** page, choose the **Cancel** action.

A sales credit memo is automatically created and posted to void the initial posted sales invoice. The **Canceled** field on the initial posted sales invoice is changed to **Yes**.

4. Choose **Show Corrective Credit Memo** to view the posted sales credit memo that voids the initial posted sales invoice.

Process Sales Returns or Cancellations

3/31/2019 • 15 minutes to read

If a customer wants to return items or be reimbursed for items or services that you have sold and received payment for, you must create and post a sales credit memo that specifies the requested change. To include the correct sales invoice information, you can create the sales credit memo directly from the posted sales invoice or you can create a new sales credit memo with copied invoice information.

If you need more control of the sales return process, such as warehouse documents for the item handling or better overview when receiving items from multiple sales documents with one sales return, then you can create sales return orders. A sales return order automatically issues the related sales credit memo and other return-related documents, such as a replacement sales order, if needed. For more information, see [To create a sales return order based on one or more posted sales documents](#).

NOTE
