If a posted sales invoice has not yet been paid, then you can use the **Correct** or **Cancel** functions on the posted sales invoice to reverse transactions. These functions work only for unpaid invoices, and they do not support partial returns or cancellations. For more information, see [Correct or Cancel Unpaid Sales Invoices](#).

A return or reimbursement may relate to only some of the items or services on the original sales invoice. In that case, you must edit information on the lines on the sales credit memo or sales return order. When you post the sales credit memo or sales return order, the sales documents that are affected by the change are reversed and a refund payment can be created for the customer. For more information, see [Making Payments](#).

In addition to the original posted sales invoice, you can apply the sales credit memo or sales return order to other sales documents, for example another posted sales invoice because the customer is also returning items delivered with that invoice.

You can send the posted sales credit memo to the customer to confirm the return or cancellation and communicate that the related value will be reimbursed, for example when the items are returned.

The credit memo posting will also revert any item charges that were assigned to the posted document, so that the item's value entries are the same as before the item charge was assigned.

Inventory Costing

To preserve correct inventory valuation, you typically want to put returned items back in inventory at the unit cost that they were sold at, not at their current unit cost. This is referred to as exact cost reversing.

Two functions exist to assign exact cost reversing automatically.

FUNCTION	DESCRIPTION
Get Posted Document Lines to Reverse function on the Sales Return Order page	Copies lines of one or more posted documents to be reversed into the sales return order. For more information, see To create a sales return order based on one or more posted sales documents .

FUNCTION	DESCRIPTION
Copy Document function in the Sales Credit Memo and Sales Return Order pages	<p>Copies both the header and lines of one posted document to be reversed.</p> <p>Requires that the Exact Cost Reversing Mandatory check box is selected on the Sales & Receivables Setup page.</p>

To assign exact cost reversing manually, you must choose the **Appl.-from Item Entry** field on any type of return document line, and then select the number of the original sales entry. This links the sales credit memo or sales return order to the original sales entry and ensures that the item is valued at the original unit cost.

For more information, see [Design Details: Inventory Costing](#).

To create a sales credit memo from a posted sales invoice

1. Choose the  icon, enter **Posted Sales Invoices**, and then choose the related link.
2. On the **Posted Sales Invoices** page, select the posted sales invoice that you want to reverse, and then choose the **Create Corrective Credit Memo** action.

The sales credit memo header contains some information from the posted sales invoice. You can edit this, for example, with new information that reflects the return agreement.

3. Edit information on the lines according to the agreement, such as the number of returned items or the amount to reimburse.
4. Choose the **Apply Entries** action.
5. On the **Apply Customer Entries** page, select the line with the posted sales document that you want to apply the sales credit memo to, and then choose the **Applies-to ID** action.

The identifier of the sales credit memo displays in the **Applies-to ID** field.

6. In the **Amount to Apply** field, enter the amount that you want to apply if it's smaller than the original amount.

At the bottom of the **Apply Customer Entries** page, you can see the total amount to apply to reverse all involved entries, namely when the value in the **Balance** field is zero.

7. Choose the **OK** button. When you post the sales credit memo, it is applied to the posted sales documents.

After you create or edit sales credit memo lines, and the single or multiple applications are specified, you can post the sales credit memo.

8. Choose the **Post and Send** action.

The **Post and Send Confirmation** dialog box opens showing the preferred sending method for the customer. You can change the sending method by choosing the lookup button for the **Send Document** to field. For more information, see [Set Up Document Sending Profiles](#).

The posted sales documents that you applied the credit memo to are now reversed, and a refund payment can be created for the customer. The sales credit memo is removed and replaced with a new document in the list of posted sales credit memos.

To create a sales credit memo by copying a posted sales invoice

1. Choose the  icon, enter **Sales Credit Memos**, and then choose the related link.
2. Choose the **New** action to open a new empty sales credit memo.

3. In the **Customer** field, enter the name of an existing customer.
4. Choose the **Copy Document** action.
5. On the **Copy Sales Document** page, in the **Document Type** field, select **Posted Invoice**.
6. Choose the **Document No.** field to open the **Posted Sales Invoices** page, and then select the posted sales invoice that contains lines that you want to reverse.
7. Select the **Recalculate Lines** check box if you want the copied posted sales invoice lines to be updated with any changes in item price and unit cost since the invoice was posted.
8. Choose the **OK** button. The copied invoice lines are inserted in the sales credit memo.
9. Complete the sales credit memo as explained in [To create a sales credit memo from a posted sales invoice](#).

To create a sales return order based on one or more posted sales documents

1. Choose the  icon, enter **Sales Return Orders**, and then choose the related link.
2. Choose the **New** action.
3. Fill in the fields on the **General** FastTab as necessary.
4. On the **Lines** FastTab, fill the lines manually, or copy information from other documents to fill the lines automatically:
 - Use the **Get Posted Document Lines to Reverse** function to copy one or more posted document lines from one or more posted documents. This function always exactly reverses the costs from the posted document line. This function is described in the following steps.
 - Use the **Copy Document** function to copy an existing document to the return order. Use this function to copy the entire document. It can be either a posted document or a document that is not yet posted. This function only enables exact cost reversing when the **Exact Cost Reversing Mandatory** check box is selected on the **Sales and Receivables Setup** page.
5. Choose the **Get Posted Document Lines to Reverse** action.
6. At the top of the **Posted Sales Document Lines** page, select the **Show Reversible Lines Only** check box if you want to see only lines that have quantities that have not yet been returned. For example, if a posted sales invoice quantity has already been returned, you may not want to return that quantity on a new sales return document.

NOTE

This field only works for posted shipments and posted invoice lines, not for posted return or posted credit memo lines.

At the left side of the page, the different document types are listed, and the number in brackets shows the number of documents available of each document type.

7. In the **Document Type Filter** field, select the type of posted document lines you would like to use.
8. Select the lines that you would like to copy to the new document.

NOTE

If you use Ctrl+A to select all lines, all lines within the filter you have set are copied, but the **Show Reversible Quantity Only** filter is ignored. For example, suppose you have filtered the lines to a particular document number with two lines, one of which has already been returned. Even if the **Show Reversible Quantity Only** field is selected, if you press Ctrl+A to copy all lines, both lines are copied, instead of only the one that has not yet been reversed.

9. Choose the **OK** button to copy the lines to the new document.

The following processes occur:

- For posted document lines of the type **Item**, a new document line is created that is a copy of the posted document line, with the quantity that has not yet been reversed. The **Appl.-from Item Entry** field is filled in as appropriate with the number of the item ledger entry of the posted document line.
- For posted document lines that are not of the type **Item**, such as item charges, a new document line is created that is a copy of the original posted document line.
- Calculates the **Unit Cost (LCY)** field on the new line from the costs on the corresponding item ledger entries.
- If the copied document is a posted shipment, posted receipt, posted return receipt, or posted return shipment, the unit price is calculated automatically from the item card.
- If the copied document is a posted invoice or credit memo, the unit price, invoice discounts, and line discounts from the posted document line are copied.
- If the posted document line contains item tracking lines, the **Appl.-from Item Entry** field on the item tracking lines is filled with the appropriate item ledger entry numbers from the posted item tracking lines.

When you copy from a posted invoice or posted credit memo, the program copies any relevant invoice discounts and line discounts as valid at the time of posting that document from the posted document line to the new document line. Be aware, however, that if the **Calc. Inv. Discount** option is activated on the **Sales & Receivables Setup** page, then the invoice discount will be newly calculated when you post the new document line. The line amount for the new line may therefore be different than the line amount for the posted document line, depending on the new calculation of the invoice discount.

NOTE

If part of the quantity of the posted document line has already been reversed or sold or consumed, a line is created for only the quantity that remains in inventory or that has not been returned. If the full quantity of the posted document line has already been reversed, a new document line is not created.

If the flow of goods in the posted document is the same as the flow of goods in the new document, a copy of the original posted document line in the new document is created. The **Appl.-from Item Entry** field is not filled in because, in this case, exact cost reversing is not possible. For example, if you use the **Get Posted Document Lines to Reverse** function to get a posted sales credit memo line for a new sales credit memo, only the original posted credit memo line is copied to the new credit memo.

10. On the **Sales Return Order** page, in the **Return Reason Code** field on each line, select the reason for the return.

11. Choose the **post** action.

To create a replacement sales order from a sales return order

You may decide to compensate a customer for an item that you have sold them by replacing the item. You can make a replacement with the same item or a different item. This situation could occur if you mistakenly shipped the wrong item to the customer, for example.

1. On the **Sales Return Order** page for an active return process, on an empty line, make a negative entry for the replacement item by inserting a negative amount in the **Quantity** field.
2. Choose the **Move Negative Lines** action.
3. On the **Move Negative Sales Lines** page, fill in the fields as necessary.
4. Choose the **OK** button. The negative line for the replacement item is deleted from the sales return order and inserted in a new **Sales Order** page. For more information, see [Sell Products](#).

To create return-related documents from a sales return order

You can have replacement sales orders, purchase return orders, and replacement purchase orders created automatically during the sales return process. This is useful, for example, in situations where you want to handle items with warranties provided by vendors.

1. On the **Sales Return Order** page for an active return process, choose the **Create Return-Related Documents** action.
2. In the **Vendor No.** field, enter the number of a vendor if you want to create vendor documents automatically.
3. If a returned item must be returned to the vendor, select the **Create Purch. Ret. Order** check box.
4. If a returned item must be ordered from the vendor, select the **Create Purchase Order** check box.
5. If a replacement sales order must be created, select the **Create Sales Order** check box.

To create a restock charge

You may decide to charge your customer a restock fee to cover the physical handling costs of returning an item. This could occur if the customer mistakenly ordered the wrong item or changed their mind after receiving the item you sold them, for example.

You can post this increased cost as an item charge in a credit memo or a return order and assign it to the posted shipment. The following describes it for a sales return order, but the same steps apply to a sales credit memo.

1. Open the **Sales Return Order** page for an active return process.
2. On a new line, in the **Type** field, select **Charge (Item)**.
3. Fill in the fields as for any item charge line. For more information, see [Use Item Charges to Account for Additional Trade Costs](#).

When you post the sales return order, the restock charge is added to the relevant sales entry amount. In this way, you can maintain accurate inventory valuation.

To create a sales allowance

You can send a customer a credit memo with a price reduction if the customer has received slightly damaged items or received the items late.

You can post this reduced price as an item charge in a credit memo or a return order and assign it to the posted shipment. The following describes it for a sales credit memo, but the same steps apply to a sales return order.

1. Choose the  icon, enter **Sales Credit Memos**, and then choose the related link.
2. Choose the **New** action to open a new empty sales credit memo.
3. Fill in the credit memo header with relevant information about the customer that you want to give the sales allowance to.

4. On the **Lines** FastTab, in the **Type** field, select **Charge (Item)**.
5. In the **No.** field, select the appropriate item charge value.
You may want to create a special item charge number to cover sales allowances.
6. In the **Quantity** field, enter **1**.
7. In the **Unit Price** field, enter the amount of the sales allowance.
8. Assign the sales allowance as an item charge to the items in the posted shipment. For more information, see [Use Item Charges to Account for Additional Trade Costs](#). When you have assigned the allowance, return to the **Sales Credit Memo** page.

When you post the sales return order, the sales allowance is added to the relevant sales entry amount. In this way, you can maintain accurate inventory valuation.

To combine return receipts

You can combine return receipts if your customer returns several items that are covered by different sales return orders.

When you receive the items into your warehouse, post the relevant sales return orders as received. This creates posted return receipts.

When you are ready to invoice this customer, instead of invoicing each sales return order separately, you can create a sales credit memo and automatically copy the posted return receipt lines to this document. Then you can post the sales credit memo and conveniently invoice all the open sales return orders at once.

To combine return receipts, the **Combine Shipments** check box must be selected on the **Customer Card** page.

To manually combine return receipts

1. Choose the  icon, enter **Sales Credit Memo**, and then choose the related link.
2. Choose the **New** action.
3. On the **General** FastTab, fill in the fields as necessary.
4. Choose the **Get Return Receipt Lines** action.
5. Select the return receipt lines that you want to include in the credit memo:
 - To insert all lines, select all lines, and then choose the **OK** button.
 - To insert specific lines, select the lines, and then choose the **OK** button.
6. If an incorrect shipment line was selected or you want to start over, you can simply delete the lines on the credit memo and re-run the **Get Return Receipt Lines** function.
7. Post the invoice.

To automatically combine return receipts

You can automatically combine return receipts and have the option of automatically posting the credit memos using the **Combine Return Receipts** function.

1. Choose the  icon, enter **Combine Return Receipts**, and then choose the related link.
2. On the **Combine Return Receipts** page, fill in the fields to select the relevant return receipts.
3. Select the **Post Credit Memos** check box. If not, you must manually post the resulting purchase credit memos.
4. Choose the **OK** button.

To remove a received and invoiced return order

When you invoice return receipts in this way, the return orders from which the return receipts were posted still

exist, even if they have been fully received and invoiced.

When return receipts are combined on a credit memo and posted, a posted sales credit memo is created for the credited lines. The **Quantity Invoiced** field on the originating sales return order is updated based on the invoiced quantity.

1. Choose the  icon, enter **Delete Invoiced Sales Return Orders**, and then select the link.
2. Specify in the **No.** filter field which return orders to delete.
3. Choose the **OK** button.

Alternatively, delete individual sales return orders manually.

Work with Blanket Sales Orders

3/31/2019 • 6 minutes to read

A blanket sales order represents a framework for a long-term agreement between you and your customer.

A blanket order is typically made when a customer has committed to purchasing large quantities that are to be delivered in several smaller shipments over a certain period of time. Often blanket orders cover only one item with predetermined delivery dates. The main reason for using a blanket order rather than a sales order is that quantities entered on a blanket order do not affect item availability and thus can be used as a worksheet for monitoring, forecasting, and planning purposes.

On the blanket order, each separate shipment can be set up as an order line, which can then be converted into a sales order at the time of shipping.

An example of when a blanket sales order could be used is if a customer calls and places an order of 1000 units of an item and they want the items to be delivered in 250 units every week over the next month.

NOTE

Blanket purchase orders work in a similar way as blanket sales orders. This documentation covers blanket sales orders only.

To create a blanket sales order

1. Choose the  icon, enter **Blanket Sales Orders**, and then choose the related link.
2. Choose the **New** action.
3. Fill in the fields as necessary. Hover over a field to read a short description.
4. Leave the **Order Date** field blank. When the separate sales orders are created from the blanket order, the order date of the sales order is set to equal the actual work date.
5. On the **Lines** FastTab, create separate lines for each shipment. For instance, if your customer wants 1000 units split out equally between four weeks, you would enter four separate lines of 250 units each.

To create a sales order from a blanket sales order

1. To create an order for any of the lines in the blanket sales order, remove the quantity in the **Qty. to Ship** field on all the lines that you do not wish to ship at this time.
2. When you are ready to create orders, choose the **Make Order** action, and then choose **Yes**. A message appears informing you that the blanket order has been assigned an order number. Note that the blanket order has not been deleted.
3. Choose the **OK** button.
4. To see the results of the preceding steps, choose the **Line** action, choose the **Unposted Lines** action, and then choose the **Orders** action.
5. On the **Sales Lines** page, select the appropriate sales order, choose the **Line** action, and then choose the **Show Document** action.

The following applies to sales orders after they have been created from blanket sales orders:

- After the blanket order is converted into a sales order, the sales order contains all the lines from the blanket order. The lines where the quantity in the **Qty. to Ship** field was deleted appear, but with blank **Quantity** fields. You may choose to leave, edit, or delete the lines.

- It is important to remember that the sales order line quantity must not exceed the quantity of the associated blanket order line. Otherwise, posting of the sales order will not be possible.
- When the sales order is posted as shipped and/or invoiced, the **Quantity Shipped** and **Quantity Invoiced** fields are updated on the related blanket order.
- The blanket order number and line number are recorded as properties of the sales lines when created from a blanket order.
- When sales orders are not created directly from the blanket order but still relate to it, a link between a sales order and a blanket order can be established by entering the associated blanket order number in the **Blanket Order No.** field on the sales order line.
- After the sales order has been created for the total quantity of a blanket order line, no other sales order can be created for the same line. Users are prevented from entering a quantity in the **Qty. to Ship** field. If, however, additional quantities need to be added to a blanket order, the value in the **Quantity** field can be increased and additional orders can then be created.
- The invoiced blanket sales order remains in the system until it is deleted, either by deleting individual blanket orders or by running the **Delete Invoiced Blanket Sales Orders** batch job.
- If a customer is also recorded as a contact in the Marketing application area, and if you have specified an interaction template code for blanket sales order on the **Marketing Setup** page, an interaction is recorded in the Interaction Log Entry table when you select **Print** to print the blanket sales order.

To view the status of a blanket sales order

You can see the status of a blanket sales order on the **Blanket Sales Order Statistics** page. This may be relevant when you start to invoice the order that is created from the blanket sales order.

1. Choose the  icon, enter **Blanket Sales Orders**, and then choose the related link.
2. Select a blanket sales order, and then choose the **Statistics** action.
3. On the **Blanket Sales Order Statistics** page, on the **General** FastTab, you can see summary information about the entire order based on the total quantity in the various **Quantity fields** on the blanket sales order lines.
 - On the **Invoicing** FastTab, you can see summary information based on the total quantity in the **Qty. to Invoice** fields on the sales blanket order lines.
 - On the **Shipping** FastTab, you can see summary information based on the total quantity in the **Qty. to Receive** fields on the sales blanket order lines.
 - On the **Prepayment** FastTab, you can see summary information about any prepaid amounts.
 - On the **Vendor** FastTab, you can see certain basic information about the vendor.

To view unposted and posted blanket sales order lines

The link between the blanket sales order and the originating sales order, and any other sales document, is retained after posting as a list of posted and unposted sales order invoice lines.

1. Choose the  icon enter **Blanket Sales Orders**, and then choose the related link.
2. Open the blanket sales order you want to view.
3. To view unposted entries, select the line in question, choose the **Line** action, and then choose the **Unposted Lines** action. Choose one of the following options.

OPTION	DESCRIPTION
Orders	Specifies open orders associated with the selected line.

OPTION	DESCRIPTION
Invoices	Specifies open invoices that have been associated with the selected line. Open invoices are manually associated with a blanket order by entering the blanket order number on the sales invoice line.
Return Orders	Specifies open return orders that have been associated with the selected line.
Credit Memos	Specifies open credit memos that have been associated with the selected line.

4. To view posted entries, select the line in question, choose the **Line** action, and then choose the **Posted Lines** action. Choose one of the following options.

OPTION	DESCRIPTION
Shipments	Posted shipments associated with the selected line.
Invoices	Posted invoices associated with the selected line.
Return Receipts	Posted return receipts that have been associated with the selected line.
Credit Memos	Posted credit memos that have been associated with the selected line.

5. On the **Sales Lines** page, choose the **Show Document** action to view the entry.

Combine Shipments on a Single Invoice

3/31/2019 • 2 minutes to read

If you want to invoice more than one shipment at a time, you can use the combined shipments feature.

Before you can create a combined shipment, more than one sales shipment for the same customer in the same currency must be posted. In other words, you must have filled in two or more sales orders and posted them as shipped, but not invoiced. To combine shipments, the **Combine Shipments** check box must be selected on the **Shipping** FastTab of the **Customer** card.

To manually combine shipments on a single invoice

1. Choose the  icon, enter **Sales Invoices**, and then choose the related link.
2. Choose the **New** action. For more information, see [Invoice Sales](#).
3. In the **Sell-to Customer No.** field, enter the customer who will receive the invoice for the shipped items.
4. On the **Lines** FastTab, choose the **Get Shipment Lines** action.
5. Select the shipment line that you want to include in the invoice:
 - To insert all lines, select all lines and choose the **OK** button.
 - To insert specific lines, select the lines and choose the **OK** button. You can use the Ctrl key to select multiple nonsequential lines.

If an incorrect shipment line was selected or you want to start over, you can simply delete the lines on the invoice and re-run the **Get Shipment Lines** function.

6. To post the invoice, choose the **Post** action.

To automatically combine shipments on a single invoice

1. Choose the  icon, enter **Combine Shipments**, and then choose the related link. The batch job request page opens.
2. Fill in the fields as necessary. Hover over a field to read a short description.
3. Select the **Post Invoices** check box.
4. Choose the **OK** button.

NOTE

You will need to manually post the invoices if the **Post Invoices** check box was not selected on the batch job.

To remove open sales orders after combined shipment posting

When shipments are combined on an invoice and posted, a posted sales invoice is created for the invoiced lines. The **Quantity Invoiced** field on the originating blanket sales order or sales order is updated based on the invoiced quantity.

When you invoice shipments in this way, the orders from which the shipments were posted still exist, even if they have been fully shipped and invoiced.

1. Choose the  icon, enter **Delete Invoiced Sales Orders**, and then select the link.

2. Specify in the **No.** filter field which sales orders to delete.
3. Choose the **OK** button.

Alternatively, delete individual sales orders manually.

Repeat steps 1 through 3 for any other affected documents, such as blanket sales orders.

Calculate Order Promising Dates

3/31/2019 • 7 minutes to read

A company must be able to inform their customers of order delivery dates. The **Order Promising Lines** page enables you to do this from a sales order line.

Based on an item's known and expected availability dates, Business Central instantly calculates shipment and delivery dates, which can then be promised to the customer.

If you specify a requested delivery date on a sales order line, then that date is used as the starting point for the following calculations:

- requested delivery date - shipping time = planned shipment date
- planned shipment date - outbound whse. handling time = shipment date

If the items are available to pick on the shipment date, then the sales process can continue. If the items are not available to be picked on the shipment date, then a stock-out warning is displayed.

If you do not specify a requested delivery date on a sales order line, or if the requested delivery date cannot be met, then the earliest date on which that the items are available is calculated. That date is then entered in the **Shipment Date** field on the line, and the date on which you plan to ship the items as well as the date on which they will be delivered to the customer are calculated using the following calculations:

- shipment date + outbound whse. handling time = planned shipment date
- planned shipment date + shipping time = planned delivery date

About Order Promising

The Order Promising functionality enables you to promise an order to be shipped or delivered on a specific date. The date that an item is available to promise or capable to promise is calculated, and order lines are created for those dates that you accept. The functionality calculates the earliest possible date that an item is available for shipment or delivery. It also creates requisition lines, in case the items must first be purchases, for those dates that you accept.

Business Central uses two fundamental concepts:

- Available to Promise (ATP)
- Capable to Promise (CTP)

Available to Promise

Available to promise (ATP) calculates dates based on the reservation system. It performs an availability check of the unreserved quantities in inventory with regard to planned production, purchases, transfers, and sales returns. Based on this information, Business Central automatically calculates the delivery date of the customer's order because the items are available, either in inventory or on planned receipts.

Capable to Promise

Capable to promise (CTP) assumes a "what if" scenario, which only applies to item quantities that are not in inventory or on scheduled orders. Based on this scenario, Business Central calculates the earliest date that the item can be available if it is to be produced, purchased, or transferred.

Example

If there is an order for 10 pieces, and 6 pieces are available in inventory or on scheduled orders, then the Capable-to-Promise calculation will be based on 4 pieces.

Calculations

When Business Central calculates the customer's delivery date, it performs two tasks:

- Calculates the earliest delivery date when the customer has not requested a specific delivery date.
- Verifies if the delivery date requested by the customer or promised to the customer is realistic.

If the customer does not request a specific delivery date, the shipment date is set to equal the work date, and availability is then based on that date. If the item is in inventory, Business Central calculates forward in time to determine when the order can be delivered. This is accomplished by the following formulas:

- $\text{Shipment Date} + \text{Outbound Warehouse Handling Time} = \text{Planned Shipment Date}$
- $\text{Planned Shipment Date} + \text{Shipping Time} = \text{Planned Delivery Date}$

Business Central then verifies if the calculated delivery date is realistic by calculating backward in time to determine when the item must be available to meet the promised date. This is accomplished by the following formulas:

- $\text{Planned Delivery Date} - \text{Shipping Time} = \text{Planned Shipment Date}$
- $\text{Planned Shipment Date} - \text{Outbound Warehouse Handling} = \text{Shipment Date}$

The shipment date is used to make the availability check. If the item is available on this date, Business Central confirms that therequested/promised delivery can be met by setting the planned delivery date to equal the requested/promised delivery date. If the item is unavailable, it returns a blank date and the order processor can then use the CTP functionality.

Based on new dates and times, all related dates are calculated according to the formulas listed earlier in this section. The CTP calculation takes longer but it gives an accurate date when the customer can expect to have the item delivered. The dates that are calculated from CTP are presented in the **Planned Delivery Date** and **Earliest Shipment Date** fields on the **Order Promising Lines** page.

The order processor finishes the CTP process by accepting the dates. This means that a planning line and a reservation entry are created for the item before the calculated dates to ensure that the order is fulfilled.

In addition to the external order promising that you can perform on the **Order Promising Lines** page, you can also promise internal or external delivery dates for bill-of-material items. For more information, see [View the Availability of Items](#).

To set up order promising

1. Choose the  icon, enter **Order Promising Setup**, and then choose the related link.
2. Enter a number and time unit code in the **Offset(Time)** field. Select one of the following codes.

CODE	DESCRIPTION
d	Calendar day
w	Week
m	Month
q	Quarter
y	Year

For example, "3w" indicates that the offset time is three weeks. To indicate the current period, prefix to any

of these codes with the letter "c". For example, if you want the offset time to be the current month, enter **cm**.

3. Enter a number series in the **Order Promising Nos.** field by selecting a line from the list on the **No. Series** page.
4. Enter an order promising template in the **Order Promising Template** field by selecting a line from the list on the **Req. Worksheet Template List** page.
5. Enter a requisition worksheet in the **Order Promising Worksheet** field by selecting a line from the list on the **Req. Wksh. Names** page.

To enter inbound warehouse handling time in the inventory setup page

If you want to include warehouse handling time in the order promising calculation on the purchase line, you can set it up as a default for the inventory and for your location.

1. Choose the  icon, enter **Inventory Setup**, and then choose the related link.
2. On the **General** FastTab, in the **Inbound Whse. Handling Time** field, enter the number of days that you want to include in the order promising calculation.

NOTE

If you have filled in the **Inbound Whse. Handling Time** field on the **Location Card** for your location this field is used as the default inbound warehouse handling time.

To enter inbound warehouse handling time on location cards

1. Choose the  icon, enter **Location**, and then choose the related link.
2. Open the relevant location card.
3. On the **Warehouse** FastTab, in the **Inbound Whse. Handling Time** field, enter the number of days that you want to be included in the order promising calculation.

NOTE

If you leave the **Inbound Whse. Handling Time** field blank, then the calculation uses the value in the **Inventory Setup** page.

To enter outbound warehouse handling time in the inventory setup page

If you want to set up an outbound warehouse handling time to be included in the order promising calculation on the sales line, you can set this up as a default for the inventory.

1. Choose the  icon, enter **Inventory Setup**, and then choose the related link.
2. On the **General** FastTab, in the **Outbound Whse. Handling Time** field, enter the number of days you want to include in the order promising calculation.

NOTE

If you have filled in the **Outbound Whse. Handling Time** field on the Location card for your location, this field is used as the default outbound warehouse handling time.

To enter outbound warehouse handling time on location cards

1. Choose the  icon, enter **Locations**, and then choose the related link.
2. Open the relevant location card.
3. On the **Warehouse** FastTab, in the **Outbound Whse. Handling Time** field, enter the number of days that you want to include in the order promising calculation.

NOTE

If you leave the **Outbound Whse. Handling Time** field blank, then the calculation uses the value in the **Inventory Setup** page.

To make an item critical

Before an item can be included in the order promising calculation, it must be marked as critical. This setup ensures that non-critical items do not cause irrelevant order promising calculations.

1. Choose the  icon, enter **Items**, and then choose the related link.
2. Open the relevant item card.
3. On the **Planning** FastTab, select the **Critical** field.

To calculate an order promising date

1. Choose the  icon, enter **Sales Order**, and then choose the related link.
2. Open the relevant sales order and select the sales order lines that you want the program to calculate.
3. Choose the **Order Promising** action, and then choose the **Order Promising Lines** action.
4. Select a line, and then select one of the following options:
 - Select **Available-to-Promise** if you want to calculate the earliest date that the item will be available with respect to inventory, scheduled receipts, and gross requirements.
 - Select **Capable-to-Promise** if you know that the item is presently out of stock and you want to calculate the earliest date that the item can be available by issuing new replenishment requisitions.
5. Choose the **Accept** button to accept the earliest shipment date available.

Track Packages

3/31/2019 • 2 minutes to read

A number of shipping agents provide services on the Internet that allow you to track parcels you have handed over to the agent. If you use one or more of these shipping agents, you can set up certain basic information and use the automatic tracking feature from posted shipments. For more information, see [Set Up Shipping Agents](#).

To track a package

1. Choose the  icon, enter **Posted Sales Shipment**, and then choose the related link.
2. Open the relevant shipment.
3. In the **Package Tracking No.** field, enter the package number you have received from the shipping agent.
4. Choose the **Track Package** action.

Your default browser opens the shipping agent's tracking page.

Date Calculation for Sales

3/31/2019 • 2 minutes to read

Business Central automatically calculates the earliest possible date that an item on a sales order line can be shipped.

If the customer has requested a specific delivery date, then the date on which the items must be available to pick to meet that delivery date is calculated.

If the customer does not request a specific delivery date, then the date on which the items can be delivered is calculated, starting from the date on which the items are available for picking.

Calculating a Requested Delivery Date

If you specify a requested delivery date on the sales order line, then that date is used as the starting point for the following calculations.

- $\text{requested delivery date} - \text{shipping time} = \text{planned shipment date}$
- $\text{planned shipment date} - \text{outbound whse. handling time} = \text{shipment date}$

If the items are available to pick on the shipment date, then the sales process can continue.

If the items are not available to be picked on the shipment date, then a stock-out warning is displayed.

Calculating the Earliest Possible Delivery Date

If you do not specify a requested delivery date on the sales order line, or if the requested delivery date cannot be met, then the earliest date on which that the items are available is calculated. That date is then entered in the Shipment Date field on the line, and the date on which you plan to ship the items as well as the date on which they will be delivered to the customer are calculated using the following formulas.

- $\text{shipment date} + \text{outbound whse. handling time} = \text{planned shipment date}$
- $\text{planned shipment date} + \text{shipping time} = \text{planned delivery date}$

Create a Demand Forecast

3/31/2019 • 5 minutes to read

You can create sales and production forecasts with the **Demand Forecast** page.

Forecasting functionality is used to create anticipated demand; actual demand is created from sales and production orders. During creation of the Master Production Schedule (MPS), the forecast is netted against the sales and production orders. The *Component* option on the forecast determines which type of requirements to take into consideration in the netting process. If the forecast is for a sales item, only sales orders net the forecast. If it is for components, only dependent demand from production order components net the forecast.

Forecasting allows your company to create "what if" scenarios and efficiently and cost-effectively plan for and meet demand. Accurate forecasting can make a critical difference in customer satisfaction levels with regard to order promising dates and on-time delivery.

Sales Forecasts and Production Forecasts

The forecasting functionality in the program can be used to create sales or production forecasts, in combination or independently. For example, most make-to-order companies do not carry finished goods inventory, because each item is produced when it is ordered. Anticipating orders (sales forecasting) is critical for a reasonable turnaround time on the finished goods (production forecasting). As an example, component parts with lengthy delivery times, if not on order or on inventory, can delay production.

- The sales forecast is the sales department's best guess at what will be sold in the future, and is specified by item and by period. However, the sales forecast is not always adequate for production.
- The production forecast is the production planner's projection of how many end items and derived subassemblies to produce in specific periods to meet the forecasted sales.

In most cases, then, the production planner modifies the sales forecast to fit the conditions of production, yet still satisfies the sales forecast.

You create forecasts manually on the **Demand Forecast** page. Multiple forecasts can exist in the system, and are differentiated by name and type. Forecasts can be copied and edited as necessary. Note that only one forecast is valid for planning purposes at a time.

The forecast consists of a number of records each stating item number, forecast date, and forecasted quantity. The forecast of an item covers a period, which is defined by the forecast date and the forecast date of the next (later) forecast record. From a planning point of view, the forecasted quantity should be available at the start of the demand period.

You must designate a forecast as *Sales Item*, *Component*, or *Both*. The forecast type *Sales Item* is used for sales forecasting. The production forecast is created using the *Component* type. The forecast type *Both* is only used to give the planner an overview of both the sales forecast and the production forecast. With this option, the forecast entries are not editable. By designating these forecast types here, you can use the same worksheet to enter a sales forecast as you do a production forecast, and use the same sheet to view both forecasts simultaneously. Note that the system treats the different inputs (sales and production) differently when calculating planning, based on item, manufacturing, and production setup.

Component Forecast

The component forecast can be seen as an option forecast in relation to a parent item. This can, for example, be useful if the planner can estimate the demand for the component.

As the component forecast is designed to define options for a parent item, the component forecast should be equal or less than the sales item forecast quantity. If the component forecast is higher than the sales item forecast, the system treats the difference between these two types of forecast as independent demand.

Forecasting Periods

The forecast period is valid from its starting date until the date the next forecast starts. The time interval page gives you multiple choices to insert the demand at a specific date in a period. It is therefore recommended not to change the forecast period scope unless you want to move all forecast entries to the starting date of this period.

Forecast by Locations

It can be stated in the manufacturing setup if you want filter forecast according to location when calculating a plan. Note, though, that if location-based forecasts are viewed in isolation, the overall forecast may not be representative.

To create a demand forecast

1. Choose the  icon, enter **Demand Forecast**, and then choose the related link.
2. On the **General** FastTab, select a forecast in the **Demand Forecast Name** field. Multiple forecasts can exist and are differentiated by name and forecast type.
3. In the **Location Filter** field, select the location to which this forecast will apply.
4. In the **Forecast Type** field, select **Sales Item**, **Component**, or **Both**. If you select **Sales Item** or **Component**, then you can edit the quantity by period. If you select **Both**, then you cannot edit the quantity, but you can choose the drop-down arrow button and view the demand forecast entries.
5. Specify a **Date Filter** if you want to limit the amount of data displayed.
6. On the **Demand Forecast Matrix** FastTab, enter the forecasted quantities of **Sales Item** or **Component** forecast for the various periods.
7. On the **Matrix Options** FastTab, set the time interval in the **View by** field to change the period that is displayed in each column. You can select from the following intervals: **Day**, **Week**, **Month**, **Quarter**, **Year**, or the **Accounting Period**, as set up in Financial Management.

NOTE

You should consider which time interval that you want to use for future forecasts so that the time interval is consistent throughout. When you enter a forecast quantity, it is valid on the first day of the time interval that you select. For example, if you select a month, then you enter the forecast quantity on the first day of the month. If you select a quarter, then you enter the forecast quantity on the first day of the first month in the quarter.

8. In the **View as** field, select how the forecast quantities are shown for the time interval. If you select **Net Change**, then the net change in balance is displayed for the time interval. If you select **Balance at Date**, then the page displays the balance as of the last day in the time interval.

NOTE

You can also edit an existing forecast. On the **Demand Forecast Matrix** page, choose the **Copy Demand Forecast** action and populate the **Demand Forecast** page with an existing forecast. You can then edit quantities as appropriate.

Merge Duplicate Records

3/31/2019 • 4 minutes to read

As different users create new customer, vendor, or contact cards over time, or the new records are created automatically during migration, a customer, vendor, or contact may be represented in the system with more than one record. In this case, you can use the **Merge Duplicate** page from the card of the record that you want to keep. The page gives you an overview of duplicated field values and provides functions to select which values to keep or discard when merging two records into one.

NOTE

Only users with the MERGE DUPLICATES permission set can use this functionality.

TIP

The **Merge Duplicate** page shows all fields where the values are different for the two records being compared. Therefore, a duplicate is indicated by the page showing very few fields. Whereas, if the page shows many fields, then the suspected record is probably not a duplicate.

The following procedure is based on a customer card. The steps are similar for a vendor and contact cards.

1. Choose the  icon, enter **Customers**, and then choose the related link.
2. Select the customer that you know or suspect that a duplicate record exists for, and then choose the **Edit** action.
3. On the **Customer Card** page, choose the **Merge With** action.
4. On the **Merge Duplicate** page, in the **Merge With** field, select the customer that you believe is a duplicate of the one you have opened, indicated in the **Current** field.

The **Fields** FastTab lists fields where the values are different for the two customers. This means that if the selected customer is really a duplicate, then only very few fields should be listed, such as typing errors and other data entry mistakes.

The **Related Tables** FastTab lists tables where there are fields with a relation to both customers. The **Current Count** and **Duplicate Count** fields show the number of fields in related tables where the **No.** value of both the current and the duplicate customer is used. On the **Merge Duplicate** page, this section is informational only, however, if merge conflicts exist, you will resolve them on the **Merge Duplicate Conflicts** page. See steps 8 through 12.

5. For each field where you want to use another value than the current one, select the **Override** check box. The value in the **Alternate Value** field will then be transferred to the current record when you complete the process.
6. When you have finished selecting which values to keep or override, choose the **Merge** action.

The system checks if the merge of values for the duplicate customer into the current customer causes any conflicts. A conflict exists if a value in at least one primary-key field is the same for both customers while the value in the **No.** field is different for the two customers.

7. If no conflicts are found, choose the **Yes** button in the confirmation message box.

The duplicate customer is renamed so that all usage of its **No.** value in all fields with relations to the customer table will be replaced with the **No.** value of the current customer.

8. If conflicts exist, choose the **Resolve (xx) conflicts before merge.** action on the **Conflicts** FastTab, which will appear if conflicts exist.
9. On the **Merge Duplicate Conflicts** page, select the line for a related table with a conflict, and then choose the **View Details** action.

The **Merge Duplicate** page now shows the fields in the selected table that cause a merge conflict between the two customer records. Notice in both the summarized values in the **Current** and **Conflicts With** fields and on the lines that at least one primary-key field is the same for both customers and the value of the **No.** field is different for the two customers.

10. If you do not want to keep the duplicate customer record, choose the **Remove Duplicate** action, and then choose the **Close** button.

Identical field values, other than the value in the **No.** field, are removed from the duplicate record and inserted on the current record.

11. If you want to keep the duplicate customer record after the merge, choose the **Rename Duplicate.**
12. On lines, not for the **No.** field, where the field has the same value on both records, change the value in the **Alternate Value** field, and then choose the **Close** button.

The conflicting field value is updated on the duplicate record so that it can be merged with the current record. The duplicate record continues to exist after the merge.

13. Repeat steps 8 through 12 until all conflicts are resolved. The **Conflicts** FastTab disappears.
14. On the **Merge Duplicate** page, choose the **Merge** action again, and then select the **Yes** button in the confirmation message box.

NOTE

For contacts, you can use functionality to find duplicate contacts before you use the **Merge Duplicate** page. For more information, see [Searching for Duplicate Contacts](#).

Purchasing

3/31/2019 • 2 minutes to read

You create a purchase invoice or purchase order to record the cost of purchases and to track accounts payable. If you need to control an inventory, purchase invoices are also used to dynamically update inventory levels so that you can minimize your inventory costs and provide better customer service. The purchasing costs, including service expenses, and inventory values that result from posting purchase invoices contribute to profit figures and other financial KPIs on your Role Center.

You must use purchase orders if your purchasing process requires that you record partial receipts of an order quantity, for example, because the full quantity was not available at the vendor. If you sell items by delivering directly from your vendor to your customer, as a drop shipment, then you must also use purchase orders. For more information, see [Make Drop Shipments](#). In all other aspects, purchase orders work the same way as purchase invoices.

You can have purchase invoices created automatically by using the OCR (Optical Character Recognition) service to convert PDF invoices from your vendors to electronic documents, which are then converted to purchase invoices by a workflow. To use this functionality, you must first sign up for the OCR service, and then perform various setup. For more information, see [Process Incoming Documents](#).

Products can be both inventory items and services. For more information, see [Register New Items](#).

For all purchase processes, you can incorporate an approval workflow, for example, to require that large purchases are approved by the accounting manager. For more information, see [Using Approval Workflows](#).

The following table describes a sequence of tasks, with links to the topics that describe them.

TO	SEE
Create a purchase invoice to record your agreement with a vendor to purchase products on certain delivery and payment terms.	Record Purchases
Create a purchase quote to reflect a request for quote from your vendor, which you can later convert to a purchase order.	Request Quotes
Create a purchase invoice for all or selected lines on a sales invoice.	Purchase Items for a Sale
Perform an action on an unpaid posted purchase invoice to automatically create a credit memo and either cancel the purchase invoice or recreate it so you can make corrections.	Correct or Cancel Unpaid Sales Invoices
Create a purchase credit memo to revert a specific posted purchase invoice to reflect which products you are returning to the vendor and which payment amount you will collect.	Process Purchase Returns or Cancellations

TO	SEE
Prepare to invoice multiple receipts from the same vendor once by combining the receipts on one invoice.	Combine Receipts on a Single Invoice
Convert, for example, electronic invoices from your vendors to purchase invoices inside Business Central.	Receive and Convert Electronic Documents
Learn how Business Central calculates when you must order an item to receive it on a certain date.	Date Calculation for Purchases
Resolve confusion when two or more records exist for the same vendor.	Merge Duplicate Records

Record Purchases

3/31/2019 • 4 minutes to read

You create a purchase invoice or purchase order to record the cost of purchases and to track accounts payable. If you need to control an inventory, purchase invoices and purchase orders are also used to dynamically update inventory levels so that you can minimize your inventory costs and provide better customer service. The purchasing costs, including service expenses, and inventory values that result from posting purchase invoices or orders contribute to profit figures and other financial KPIs on your Role Center.

NOTE

You must use purchase orders if your purchasing process requires that you record partial receipts of an order quantity, for example, because the full quantity was not available at the vendor. If you sell items by delivering directly from your vendor to your customer, as a drop shipment, then you must also use purchase orders. For more information, see [Make Drop Shipments](#). In all other aspects, purchase orders work the same way as purchase invoices. The following procedure is based on a purchase invoice. The steps are similar for a purchase order.

When you receive the inventory items, or when the purchased service is completed, you post the purchase invoice or order to update inventory and financial records and to activate payment to the vendor according to the payment terms. For more information, see [Making Payments](#).

Caution

Do not post a purchase invoice until you receive the items and know the final cost of the purchase, including any additional charges. Otherwise, your inventory value and profit figures may be skewed.

You can easily correct or cancel a posted purchase invoice before you pay the vendor. This is useful if you want to correct a typing mistake or if you want to change the purchase early in the order process. For more information, see [Correct or Cancel Unpaid Purchase Invoices](#). If you have already paid for items on the posted purchase invoice, then you must create a purchase credit memo to reverse the purchase. For more information, see [Process Purchase Returns or Cancellations](#).

The item card can be of type **Inventory**, **Service**, and **Non-Inventory** to specify if the item is a physical inventory unit, a labor time unit, or a physical unit that is not kept on inventory. For more information, see [Register New Items](#). The purchase invoice process is the same for all three item types.

You can fill vendor fields on the purchase invoice in two ways depending on whether the vendor is already registered.

To create a purchase invoice

1. Choose the  icon, enter **Purchase Invoices**, and then choose the related link.
2. In the **Vendor** field, enter the name of an existing vendor.

Other fields on the **Purchase Invoice** page are now filled with the standard information of the selected vendor. If the vendor is not registered, then follow these steps:

3. In the **Vendor** field, enter the name of the new vendor.
4. In the dialog box about registering the new vendor, choose the **Yes** button.
5. On the **Select a template for a new vendor** page, choose a template to base the new vendor card on, and then choose the **OK** button.

6. A new vendor card opens, prefilled with the information on the selected vendor template. The **Name** field is prefilled with the new vendor's name that you entered on the purchase invoice.
7. Proceed to fill in the remaining fields on the vendor card. For more information, see [Register New Vendors](#).
8. When you have completed the vendor card, choose the **OK** button to return to the **Purchase Invoice** page.

Several fields on the **Purchase Invoice** page are filled with information that you specified on the new vendor card.

9. Fill in the remaining fields on the **Purchase Invoice** page as necessary. Hover over a field to read a short description.

You are now ready to fill in the purchase invoice lines with inventory items or services that you have purchased from the vendor.

NOTE

If you have set up recurring purchase lines for the vendor, such as a monthly replenishment order, then you can insert these lines on the invoice by choosing the **Get Recurring Purchase Lines** action.

10. On the **Lines** FastTab, in the **Item No.** field, enter the number of an inventory item or service.
11. In the **Quantity** field, enter the number of items to be purchased.

NOTE

For items of type **Service**, the quantity is a time unit, such as hours, as indicated in the **Unit of Measure Code** field on the line.

The **Line Amount** field is updated to show the value in the **Direct Unit Cost** field multiplied by the value in the **Quantity** field.

The price and line amount are shown with or without sales tax depending on what you selected in the **Prices Including Tax** field on the vendor card.

12. In the **Invoice Discount Amount** field, enter an amount that should be deducted from the value shown in the **Total Incl. Tax** field at the bottom of the invoice.

NOTE

If you have set up invoice discounts for the vendor, then the specified percentage value is automatically inserted in the **Vendor Invoice Discount %** field if the criteria are met, and the related amount is inserted in the **Invoice Discount Amount** field.

13. When you receive the purchased items or services, choose **Post**.

The purchase is now reflected in inventory and financial records, and the vendor payment is activated. The purchase invoice is removed from the list of purchase invoices and replaced with a new document in the list of posted purchase invoices.

Working with Business Central

Request Quotes

3/31/2019 • 2 minutes to read

A purchase quote can be used as a preliminary draft for a purchase order, and the order can then be converted to a purchase invoice or an order.

To create a purchase quote

1. Choose the  icon, enter **Purchase Quotes**, and then choose the related link.
2. Create a new document, in the same way as you make a purchase order. For more information, see [Record Purchases](#).

To convert a purchase quote to a purchase order

When you have accepted the vendor's quote, you can convert it to a purchase invoice or order to process the purchase.

1. Open a purchase quote that is ready to convert, and then choose the **Make Order** action.

The purchase quote is removed from the database. A purchase invoice or a purchase order is created based on the information in the purchase quote in which you can process the purchase. In the **Quote No.** field on the purchase invoice or purchase order, you can see the number of the purchase quote that it was made from.

Purchase Items for a Sale

3/31/2019 • 2 minutes to read

From sales orders and sales invoices, you can use functions to quickly create purchase documents for missing item quantities that are required by the sale. You can use two different functions depending on the document type.

NOTE

This functionality is for replenishing sales items into your own inventory. To purchase items for direct delivery from your vendor to your customer, you must create a drop shipment. For more information, see [Make Drop Shipments](#).

FUNCTION	DESCRIPTION
Create Purchase Orders	From a sales order, this function creates a purchase order for each vendor of items on the sales order. You can edit the purchase quantity before you create the purchase orders. Only unavailable sales quantities are suggested.
Create Purchase Invoice	From a sales order and from a sales invoice, this function creates a purchase invoice for a selected vendor for all lines or selected lines on the sales document. The full sales quantity is suggested.

To create one or more purchase orders from a sales order

To create a purchase order for each unavailable item quantity on the sales order, you use the **Create Purchase Orders** function.

1. Choose the  icon, enter **Sales Orders**, and then choose the related link.
2. Open a sales order that you want to purchase items for.
3. Choose the **Create Purchase Orders** action.

The **Create Purchase Orders** page opens showing a line for each different item on the sales order. Lines for both fully available sales quantities and unavailable sales quantities (grayed) are shown by default. You can choose the **Show Unavailable** action to only see lines for unavailable sales quantities.

The **Quantity to Purchase** field contains the unavailable sales quantity by default.

4. To purchase another quantity than the unavailable sales quantity, edit the value in the **Quantity to Purchase** field.

NOTE

You can also change the **Quantity to Purchase** field on grayed lines even though they represent fully available sales quantities.

5. Choose the **OK** button.

A purchase order is created for each vendor of items on the sales order, including any quantity changes that you made on the **Create Purchase Orders** page.

6. Proceed to process the purchase order or orders, for example, by editing or adding purchase order lines. For more information, see [Record Purchases](#).

To create a purchase invoice from a sales order or sales invoice

To create a single purchase invoice for one or more lines on a sales document by first selecting which vendor to buy from, you use the **Create Purchase Invoice** function.

NOTE

This function creates a purchase invoice for the exact item quantity on the selected sales document. To change the purchase quantity, you must edit the purchase invoice after it is created.

1. Choose the  icon, enter **Sales Orders**, and then choose the related link.
2. Open a sales invoice that you want to purchase items for.
3. Select one or more sales invoice lines that you want to use on the purchase invoice. To use all the sales invoice lines, select either all of them or do not select any lines.
4. Choose the **Create Purchase Invoice** action.
5. Select either **All Lines** or **Selected Lines**, and then choose the **OK** button.
6. In the list of vendors that appears, select the vendor that you want to buy all the items from, and then choose the **OK** button.

A purchase invoice is created that contains one, more than one, or all the lines on the sales invoice.

7. Proceed to process the purchase invoice, for example, by editing or adding purchase invoice lines. For more information, see [Record Purchases](#).

Posting Purchases

3/31/2019 • 2 minutes to read

In the **Posting group** on a purchase document, you can choose between the following posting functions:

- **Post**
- **Preview Posting**
- **Post and Print**
- **Test Report**
- **Post Batch**

When you have completed all the lines and entered all the information on the purchase order, you can post it, that is, create a receipt and an invoice.

When a purchase order is posted, the vendor's account, the general ledger, and the item ledger entries are updated.

For each purchase order, a purchase entry is created in the **G/L Entry** table. An entry is also created in the vendor's account in the **Vendor Ledger Entry** table and a G/L entry is created in the relevant payables account. In addition, posting the order may result in a VAT entry and a G/L entry for the discount amount. Whether an entry for the discount is posted depends on the contents of the **Discount Posting** field on the **Purchases & Payables Setup** page.

For each purchase order line, an item ledger entry will be created in the **Item Ledger Entry** table (if the purchase lines contain item numbers) or a G/L entry will be created in the **G/L Entry** table (if the purchase lines contain a G/L account). In addition, purchase orders are always recorded in the **Purch. Recpt. Header** and **Purch. Inv. Header** tables.

Before you start to post, you can print a test report that contains all the information in the purchase order and indicates any errors there. To print the report, choose **Posting**, and then choose **Test Report**.

IMPORTANT

When you post an order, you can create both a receipt and an invoice. These can be done simultaneously or independently. You can also create a partial receipt and a partial invoice by completing the **Qty. to Receive** and **Qty. to Invoice** fields on the individual purchase order lines before you post. Note that you cannot create an invoice for something that has not been received. That is, before you can invoice, you must have recorded a receipt, or you must choose to receive and invoice at the same time.

You can either post, or post and print. If you choose to post and print, a report is printed when the order is posted. You can also choose the **Post Batch** function, which lets you post several orders at the same time.

When the posting is completed, the posted purchase lines are removed from the order. A message tells you when the posting is completed. After this, you will be able to see the posted entries in the various pages that contain posted entries, such as the **Vendor Ledger Entries**, **G/L Entries**, **Item Ledger Entries**, **Purchase Receipts**, and **Posted Purchase Invoices** pages.

Correct or Cancel Unpaid Purchase Invoices

3/31/2019 • 2 minutes to read

You can correct or cancel a posted purchase invoice. This is useful if you want to correct a typing mistake, or if you want to change the purchase early in the order process.

If you have already paid for products on the posted purchase invoice, you cannot correct or cancel it from the posted purchase invoice itself. Instead, you must manually create a purchase credit memo to reverse the purchase, optionally managed with a purchase return order. For more information, see [Process Purchase Returns or Cancellations](#).

On the **Posted Purchase Invoice** page, you can choose the **Correct** button or the **Cancel** button. When you correct or cancel a posted purchase invoice, the corrective purchase credit memo is applied to all general ledger and inventory ledger entries that were created when the initial purchase invoice was posted. This reverses the posted purchase invoice in your financial records and leaves the corrective posted purchase credit memo for your audit trail. In the following the use of **Correct** and **Cancel** is described.

To correct a posted purchase invoice

1. Choose the  icon, enter **Posted Purchase Invoices**, and then choose the related link.
2. Select the posted purchase invoice that you want to correct.

NOTE

If the **Canceled** check box is selected, then you cannot correct the posted purchase invoice because it has already been corrected or canceled.

3. On the **Posted Purchase Invoice** page, choose **Correct**.

A new purchase invoice with the same information is created where you can make the correction. For more information, see [Record Purchases](#). The **Canceled** field on the initial posted purchase invoice is changed to **Yes**.

A purchase credit memo is automatically created and posted to void the initial posted purchase invoice.

4. Choose **Show Corrective Credit Memo** to view the posted purchase credit memo that voids the initial posted purchase invoice.

To cancel a posted purchase invoice

1. Choose the  icon, enter **Posted Purchase Invoices**, and then choose the related link.
2. Select the posted purchase invoice that you want to cancel.

NOTE

If the **Canceled** check box is selected, then you cannot cancel the posted purchase invoice because it has already been canceled or corrected.

3. On the **Posted Purchase Invoice** page, choose **Cancel**.

A purchase credit memo is automatically created and posted to void the initial posted purchase invoice. The **Canceled** field on the initial posted purchase invoice is changed to **Yes**.

4. Choose **Show Corrective Credit Memo** to view the posted purchase credit memo that voids the initial posted purchase invoice.

Combine Receipts on a Single Invoice

3/31/2019 • 2 minutes to read

If you want to invoice more than one purchase receipt at a time, you can use the **Combine Receipts** function.

Before you can create a combined purchase receipt, more than one receipt from the same vendor in the same currency must be posted. In other words, you must have filled in two or more purchase orders and posted them as received, but not invoiced.

When purchase receipts are combined on an invoice and posted, then a posted purchase invoice is created for the invoiced lines. The **Quantity Invoiced** field on the originating purchase order, or blanket purchase order, is updated based on the invoiced quantity. However, this original purchase document is not deleted, even if it has been fully received and invoiced, and you must therefore delete the purchase document.

To combine receipts

1. Choose the  icon, enter **Purchase Invoices**, and then choose the related link.
2. Choose the **New** action. For more information, see [Record Purchases](#).
3. On the **Lines** FastTab, choose the **Get Receipt Lines** action.
4. Select multiple receipt lines that you want to include in the invoice.

If an incorrect receipt line was selected or you want to start over, you can just delete the lines on the purchase invoice and then use the **Get Receipt Lines** function again.

5. To post the invoice, choose the **Post** action.

To remove open purchase orders after combined receipt posting

1. Choose the  icon, enter **Delete Invoiced Purchase Orders**, and select the related link.
2. Fill in the fields as necessary. Hover over a field to read a short description..
3. Choose the **OK** button.

Alternatively, delete the individual orders manually.

Repeat steps 1 through 3 for any other affected documents, such as blanket purchase orders.

Process Purchase Returns or Cancellations

3/31/2019 • 13 minutes to read

If you want to return items to your vendor or cancel services that you have purchased, then you can create and post a purchase credit memo that specifies the requested change with regard to the original purchase invoice. To include the correct purchase invoice information, you can create the purchase credit memo directly from the posted purchase invoice or you can create a new purchase credit memo with copied invoice information.

If you need more control of the purchase return process, such as warehouse documents for the item handling or better overview when shipping back items from multiple purchase documents with one purchase return, then you can create purchase return orders. A purchase return order automatically issues the related purchase credit memo. For more information, see [To create a purchase return order based on one or more a posted purchase documents](#).

NOTE

If a posted purchase invoice has not yet been paid, then you can use the **Correct** or **Cancel** functions on the posted purchase invoice to automatically reverse the involved transactions. These functions only work for unpaid invoices, and they do not support partial returns or cancellations. For more information, see [Correct or Cancel Unpaid Purchase Invoices](#).

Typically, you create a purchase credit memo or purchase return order in reaction to a credit memo sent to you by a vendor. The purchase credit memo or purchase return order functions as your internal documentation of the credit memo process for accounting purposes or to control the shipping of the involved items.

The change may relate to all the products on the original purchase invoice or only to some of the products. Accordingly, you can partially return received items or demand partial reimbursement of received services. In that case, you must edit the information on the purchase credit memo or purchase return order.

In addition to the original posted purchase invoice, you can apply the purchase credit memo or purchase return order to other purchase documents, for example another posted purchase invoice because you are also returning items delivered with that invoice.

The credit memo posting will also revert any item charges that were assigned to the posted document, so that the item's value entries are the same as before the item charge was assigned.

Inventory Costing

To preserve correct inventory valuation, you typically want to pick return items from inventory at the unit cost that they were purchased at, not at their current unit cost. This is referred to as exact cost reversing.

Two functions exist to assign exact cost reversing automatically.

FUNCTION	DESCRIPTION
Get Posted Document Lines to Reverse function on the Purchase Return Order page	Copies lines of one or more posted documents to be reversed into the purchase return order. For more information, see To create a purchase return order based on one or more posted purchase documents .

FUNCTION	DESCRIPTION
Copy Document function in the Purchase Credit Memo and Purchase Return Order pages	<p>Copies both the header and lines of one posted document to be reversed.</p> <p>Requires that the Exact Cost Reversing Mandatory check box is selected on the Purchases & Payables Setup page.</p>

To assign exact cost reversing manually, you must choose the **Appl.-from Item Entry** field on any type of return document line, and then select the number of the original purchase entry. This links the purchase credit memo or purchase return order to the original purchase sales entry and ensures that the item is valued at the original unit cost.

For more information, see [Design Details: Inventory Costing](#).

To create a purchase credit memo from a posted purchase invoice

1. Choose the  icon, enter **Posted Purchase Invoices**, and then choose the related link.
2. On the **Posted Purchase Invoices** page, select the posted purchase invoice that you want to reverse, and then choose the **Create Corrective Credit Memo** action.

Most fields on the purchase credit memo header are filled with the information from the posted purchase invoice. You can edit all the fields, for example with new information that reflects the return agreement.

3. Edit information on the lines according to the agreement, such as the number of items returned or the amount to be reimbursement.
4. Choose the **Apply Entries** action.
5. On the **Apply Vendor Entries** page, select the line with the posted purchase document that you want to apply the purchase credit memo to, and then choose the **Applies-to ID** action. The number of the purchase credit memo is inserted in the **Applies-to ID** field.

6. In the **Amount to Apply** field, enter the amount that you want to apply if smaller than the original amount.

At the bottom of the **Apply Vendor Entries** page, you can see the total amount to apply to reverse all involved entries, namely when the value in the **Balance** field is zero.

7. Choose the **OK** button. When you post the purchase credit memo, it will be applied to the specified posted purchase documents.

When you have created or edited the needed purchase credit memo lines and the single or multiple applications are specified, you can proceed to post the purchase credit memo.

8. Choose the **Post** action.

The posted purchase invoices that you apply the credit memo to are now reversed. If you have already paid the original invoice, the vendor should now refund the payment to you. If the credit memo is only for part of the product on the original invoice, you may only pay the remaining amount on the original purchase invoice to close it.

The purchase credit memo is removed and replaced with a new document in the list of posted purchase credit memos.

To create a purchase credit memo by copying a posted purchase invoice

1. Choose the  icon, enter **Purchase Credit Memos**, and then choose the related link.
2. Choose the **New** action to open a new empty purchase credit memo.
3. In the **Vendor** field, enter the name of an existing vendor.
4. Choose the **Copy Document** action.
5. On the **Copy Purchase Document** page, in the **Document Type** field, select **Posted Invoice**.
6. Choose the **Document No.** field to open the **Posted Purchase Invoices** page, and then select the posted purchase invoice that contains lines that you want to reverse.
7. Select the **Recalculate Lines** check box if you want the copied posted purchase invoice lines to be updated with any changes in item price and unit cost since the invoice was posted.
8. Choose the **OK** button. The copied invoice lines are inserted in the purchase credit memo.
9. Complete the purchase credit memo as explained in [To create a purchase credit memo from a posted purchase invoice](#).

To create a purchase return order based on one or more posted purchase documents

1. Choose the  icon, enter **Purchase Return Orders**, and then choose the related link.
2. Choose the **New** action.
3. Fill in the fields on the **General** FastTab as necessary.
4. On the **Lines** FastTab, fill the lines manually, or copy information from other documents to fill the lines automatically:
 - Use the **Get Posted Document Lines to Reverse** function to copy one or more posted document lines from one or more posted documents. This function always exactly reverses the costs from the posted document line. This function is described in the following steps.
 - Use the **Copy Document** function to copy an existing document to the return order. Use this function to copy the entire document. It can be either a posted document or a document that is not yet posted. This function only enables exact cost reversing when the **Exact Cost Reversing Mandatory** check box is selected on the **Sales and Receivables Setup** page.
5. Choose the **Get Posted Document Lines to Reverse** action.
6. At the top of the **Posted Purchase Document Lines** page, select the **Show Reversible Lines Only** check box if you want to see only lines that have quantities that have not yet been returned. For example, if a posted purchase invoice quantity has already been returned, you may not want to include that quantity on a new purchase return document.

NOTE

This field only works for posted receipts and posted invoice lines, not for posted return or posted credit memo lines.

At the left side of the page, the different document types are listed, and the number in brackets shows the number of documents available of each document type.

7. In the **Document Type Filter** field, select the type of posted document lines you would like to use.
8. Select the lines that you would like to copy to the new document.

NOTE

If you use Ctrl+A to select all lines, all lines within the filter you have set are copied, but the **Show Reversible Quantity Only** filter is ignored. For example, suppose you have filtered the lines to a particular document number with two lines, one of which has already been returned. Even if the **Show Reversible Quantity Only** field is selected, if you press Ctrl+A to copy all lines, both lines are copied, instead of only the one that has not yet been reversed.

9. Choose the **OK** button to copy the lines to the new document.

The following processes occur:

- For posted document lines of the type **Item**, a new document line is created that is a copy of the posted document line, with the quantity that has not yet been reversed. The **Appl.-to Item Entry** field is filled in as appropriate with the number of the item ledger entry of the posted document line.
- For posted document lines that are not of the type **Item**, such as item charges, a new document line is created that is a copy of the original posted document line.
- Calculates the **Unit Cost (LCY)** field on the new line from the costs on the corresponding item ledger entries.
- If the copied document is a posted shipment, posted receipt, posted return receipt, or posted return shipment, the unit price is calculated automatically from the item card.
- If the copied document is a posted invoice or credit memo, the unit price, invoice discounts, and line discounts from the posted document line are copied.
- If the posted document line contains item tracking lines, the **Appl.-to Item Entry** field on the item tracking lines is filled with the appropriate item ledger entry numbers from the posted item tracking lines.

When you copy from a posted invoice or posted credit memo, the program copies any relevant invoice discounts and line discounts as valid at the time of posting that document from the posted document line to the new document line. Be aware, however, that if the **Calc. Inv. Discount** option is activated on the **Purchases & Payables Setup** page, then the invoice discount will be newly calculated when you post the new document line. The line amount for the new line may therefore be different than the line amount for the posted document line, depending on the new calculation of the invoice discount.

NOTE

If part of the quantity of the posted document line has already been reversed or sold or consumed, a line is created for only the quantity that remains in inventory or that has not been returned. If the full quantity of the posted document line has already been reversed, a new document line is not created.

If the flow of goods in the posted document is the same as the flow of goods in the new document, a copy of the original posted document line in the new document is created. The **Appl.-from Item Entry** field is not filled in because, in this case, exact cost reversing is not possible. For example, if you use the **Get Posted Document Lines to Reverse** function to get a posted purchase credit memo line for a new purchase credit memo, only the original posted credit memo line is copied to the new credit memo.

10. On the **Purchase Return Order** page, in the **Return Reason Code** field on each line, select the reason for the return.

11. Choose the **Post** action.

To create a replacement purchase order from a purchase return order

You may agree with your vendor that they compensate you for a purchased item by replacing the item. The replacement item can be the same or it can be different. This situation could occur if the vendor mistakenly shipped the wrong item.

1. On the **Purchase Return Order** page for an active return process, on an empty line, make a negative entry for the replacement item by inserting a negative amount in the **Quantity** field.
2. Choose the **Move Negative Lines** action.
3. On the **Move Negative Purchase Lines** page, fill in the fields as necessary.
4. Choose the **OK** button. The negative line is deleted from the purchase return order, and a new purchase order is created. For more information, see [Record Purchases](#).

To create a purchase allowance

If you receive items from your vendor that are not what you wanted, for example, if they are slightly damaged, the wrong color or the wrong size, the vendor may offer you a purchase allowance.

You can post this reduced purchase cost as an item charge on a credit memo or return order and link it to the posted receipt. The following describes it for a purchase return order, but the same steps apply to a purchase credit memo.

1. Choose the  icon, enter **Purchase Credit Memos**, and then choose the related link.
2. Choose the **New** action to open a new empty purchase credit memo.
3. Fill in the credit memo header with information about the vendor who sent you the purchase allowance.
4. On the **Lines** FastTab, in the **Type** field, select **Charge (Item)**.
5. In the **No.** field, select the appropriate item charge value.

You may want to create a special item charge number to cover purchase allowances.

6. In the **Quantity** field, enter **1**.
7. In the **Direct Unit Cost** field, enter the amount of the purchase allowance.
8. Assign the purchase allowance as an item charge to the items in the posted receipt. For more information, see [Use Item Charges to Account for Additional Trade Costs](#). When you have assigned the allowance, return to the **Purchase Credit Memo** page.

When you post the purchase return order, the purchase allowance is added to the relevant purchase entry amount. In this way, you can maintain accurate inventory valuation.

To combine return shipments

If you want to return items covered by different purchase return orders to the same vendor, then you can use the **Combine Return Shipments** function.

When you ship the items, you post the related purchase return orders as shipped and this creates posted purchase return shipments.

When you are ready to invoice these items, instead of invoicing each purchase return order separately, you can create a purchase credit memo and automatically copy the posted purchase return shipment lines to this document. Then you can post the purchase credit memo and conveniently invoice all the open purchase return orders at the same time.

When return shipments are combined on a credit memo and posted, then a posted purchase credit memo is created for the invoiced lines. The **Quantity Invoiced** field on the originating purchase return order is updated based on the invoiced quantity. However, this original purchase return order is not deleted, even if it has been fully

received and invoiced, and you must therefore delete the purchase return order manually.

NOTE

The following procedure assumes that there are several purchase return orders for the vendor, and that they have been posted as shipped.

1. Choose the  icon, enter **Purchase Credit Memos**, and then choose the related link.
2. Choose the **New** action.
3. On the **General** FastTab, fill in the fields as necessary.
4. Choose the **Get Return Shipment Lines** action.
5. Select multiple return shipment lines that you want to include in the invoice.

If an incorrect return shipment line was selected or you want to start over, you can just delete the lines on the purchase credit memo and then use the **Get Return Shipment Lines** function again.

6. Choose the **Post** action.

To remove open purchase return orders after combined return shipment posting

1. Choose the  icon, enter **Delete Invoiced Purchase Return Orders**, and then choose the related link.
2. Fill in the fields as necessary, and then choose the **OK** button.
3. Alternatively, delete the individual purchase return orders manually.

Receive and Convert Electronic Documents

3/31/2019 • 3 minutes to read

The generic version of Business Central supports receiving electronic invoices and credit memos in the PEPPOL format, which is supported by the largest providers of document exchange services. To receive an invoice from a vendor as an electronic PEPPOL document, you process the document in the Incoming Documents page to convert it to a purchase invoice or general journal line in Business Central.

In addition to receiving electronic documents directly from trading partners, you can receive electronic documents from an OCR service that has turned your PDF or image files into electronic documents.

Before you can receive electronic documents through the document exchange service, you must set up various master data, such as company information, vendors, items, and units of measure. These are used to identify the business partners and items when converting data in elements in the incoming document file to fields in Business Central. For more information, see [Set Up a Document Exchange Service](#).

Before you can receive electronic documents through the OCR service, you must set up and enable the preconfigured service connection. For more information, see [Set Up Incoming Documents](#).

The traffic of electronic documents in and out of Business Central is managed by the Job Queue feature. Before you can receive electronic documents, the relevant job queue must be started.

You can either start the conversion of electronic documents manually, as described in this procedure, or you can enable a workflow to convert electronic documents automatically when they are received. The generic version of Business Central includes a workflow template, *From Incoming Electronic through OCR to Open Purchase Invoice Workflow*, which is ready to be copied to a workflow and enabled. For more information, see [Workflow](#).

NOTE

When you convert electronic documents received from the OCR service to documents or journal lines in Business Central, multiple lines on the source document will be summed on one line. The single line will be of type G/L Account and the **Description** and (G/L account) **No.** fields will be empty. The value in the **Amount** field will equal the total amount excluding VAT of all lines in the source document.

To make sure that the **Description** and **No.** fields are filled, you can choose the **Map Text to Account** button on the **Incoming Documents** page to define that a certain invoice text is always mapped to a certain debit or credit account in the general ledger. Going forward, the **Description** field on document or journal lines created from an electronic document for that vendor or customer will be filled with the text in question and the (G/L account) **No.** field with the account in question.

Instead of mapping to a G/L account, you can also map to a bank account. This is practical, for example, for electronic documents for expenses that are already paid where you want to create a general journal line that is ready to post to a bank account.

The following procedure describes how to receive a vendor invoice and convert it to a purchase invoice in Business Central. The procedure is the same when you convert a vendor invoice to a general journal line.

To receive and convert an electronic invoice to a purchase invoice

1. Choose the  icon, enter **Incoming Documents**, and then choose the related link.
2. Select the line for the incoming document record that represents a new incoming electronic invoice, and then, on the **Home** tab, in the **Manage** group, choose **Edit**.

On the **Incoming Document Card** page, the related XML file is attached, and most of the fields are

prefilled with information from the electronic invoice. For more information, see [Create Incoming Document Records](#).

3. In the **Data Exchange Type** field, choose **PEPPOL - Invoice** or **OCR – Invoice** depending on the source of the electronic document.
4. To map text on the vendor invoice to a specific debit account, on the **Actions** tab, in the **General** group, choose **Map Text to Account**, and then fill the **Text-to-Account Mapping Worksheet** page.
5. On the **Actions** tab, in the **General** group, choose **Create Document**.

A purchase invoice will be created in Business Central based on the information in the electronic document.

Any validation errors, typically related to wrong or missing master data in Business Central will be shown on the **Error Messages** FastTab.

Date Calculation for Purchases

3/31/2019 • 2 minutes to read

Business Central automatically calculates the date on which you must order an item to have it in inventory on a certain date. This is the date on which you can expect items ordered on a particular date to be available for picking.

If you specify a requested receipt date on a purchase order header, then the calculated order date is the date on which the order must be placed to receive the items on the date that you requested. Then, the date on which the items are available for picking is calculated and entered in the **Expected Receipt Date** field.

If you do not specify a requested receipt date, then the order date on the line is used as the starting point for calculating the date on which you can expect to receive the items and the date on which the items are available for picking.

Calculating with a Requested Receipt Date

If there is a requested receipt date on the purchase order line, then that date is used as the starting point for the following calculations.

- requested receipt date - lead time calculation = order date
- requested receipt date + inbound whse. handling time + safety lead time = expected receipt date

If you entered a requested receipt date on the purchase order header, then that date is copied to the corresponding field on all the lines. You can change this date on any of the lines, or you can remove the date on the line.

Calculating without a Requested Delivery Date

If you enter a purchase order line without a requested delivery date, then the **Order Date** field on the line is filled with the date in the **Order Date** field on the purchase order header. This is either the date that you entered or the work date. The following dates are then calculated for the purchase order line, with the order date as the starting point.

- order date + lead time calculation = planned receipt date
- planned receipt date + inbound whse. handling time + safety lead time = expected receipt date

If you change the order date on the line, such as when items are not available at your vendor until a later date, then the relevant dates on the line are automatically recalculated.

If you change the order date on the header, then that date is copied to the **Order Date** field on all the lines, and all the related date fields are then recalculated.

Merge Duplicate Records

3/31/2019 • 4 minutes to read

As different users create new customer, vendor, or contact cards over time, or the new records are created automatically during migration, a customer, vendor, or contact may be represented in the system with more than one record. In this case, you can use the **Merge Duplicate** page from the card of the record that you want to keep. The page gives you an overview of duplicated field values and provides functions to select which values to keep or discard when merging two records into one.

NOTE

Only users with the MERGE DUPLICATES permission set can use this functionality.

TIP

The **Merge Duplicate** page shows all fields where the values are different for the two records being compared. Therefore, a duplicate is indicated by the page showing very few fields. Whereas, if the page shows many fields, then the suspected record is probably not a duplicate.

The following procedure is based on a customer card. The steps are similar for a vendor and contact cards.

1. Choose the  icon, enter **Customers**, and then choose the related link.
2. Select the customer that you know or suspect that a duplicate record exists for, and then choose the **Edit** action.
3. On the **Customer Card** page, choose the **Merge With** action.
4. On the **Merge Duplicate** page, in the **Merge With** field, select the customer that you believe is a duplicate of the one you have opened, indicated in the **Current** field.

The **Fields** FastTab lists fields where the values are different for the two customers. This means that if the selected customer is really a duplicate, then only very few fields should be listed, such as typing errors and other data entry mistakes.

The **Related Tables** FastTab lists tables where there are fields with a relation to both customers. The **Current Count** and **Duplicate Count** fields show the number of fields in related tables where the **No.** value of both the current and the duplicate customer is used. On the **Merge Duplicate** page, this section is informational only, however, if merge conflicts exist, you will resolve them on the **Merge Duplicate Conflicts** page. See steps 8 through 12.

5. For each field where you want to use another value than the current one, select the **Override** check box. The value in the **Alternate Value** field will then be transferred to the current record when you complete the process.
6. When you have finished selecting which values to keep or override, choose the **Merge** action.

The system checks if the merge of values for the duplicate customer into the current customer causes any conflicts. A conflict exists if a value in at least one primary-key field is the same for both customers while the value in the **No.** field is different for the two customers.

7. If no conflicts are found, choose the **Yes** button in the confirmation message box.

The duplicate customer is renamed so that all usage of its **No.** value in all fields with relations to the customer table will be replaced with the **No.** value of the current customer.

8. If conflicts exist, choose the **Resolve (xx) conflicts before merge.** action on the **Conflicts** FastTab, which will appear if conflicts exist.
9. On the **Merge Duplicate Conflicts** page, select the line for a related table with a conflict, and then choose the **View Details** action.

The **Merge Duplicate** page now shows the fields in the selected table that cause a merge conflict between the two customer records. Notice in both the summarized values in the **Current** and **Conflicts With** fields and on the lines that at least one primary-key field is the same for both customers and the value of the **No.** field is different for the two customers.

10. If you do not want to keep the duplicate customer record, choose the **Remove Duplicate** action, and then choose the **Close** button.

Identical field values, other than the value in the **No.** field, are removed from the duplicate record and inserted on the current record.

11. If you want to keep the duplicate customer record after the merge, choose the **Rename Duplicate.**
12. On lines, not for the **No.** field, where the field has the same value on both records, change the value in the **Alternate Value** field, and then choose the **Close** button.

The conflicting field value is updated on the duplicate record so that it can be merged with the current record. The duplicate record continues to exist after the merge.

13. Repeat steps 8 through 12 until all conflicts are resolved. The **Conflicts** FastTab disappears.
14. On the **Merge Duplicate** page, choose the **Merge** action again, and then select the **Yes** button in the confirmation message box.

NOTE

For contacts, you can use functionality to find duplicate contacts before you use the **Merge Duplicate** page. For more information, see [Searching for Duplicate Contacts](#).

Inventory

5/13/2019 • 3 minutes to read

For each physical product that you trade in, you must create an item card of type **Inventory**. Items that you offer to customers but do not keep in inventory you can register as catalog items, which you can convert to inventory items when necessary. You can increase or decrease the quantity of an item in inventory by posting directly to the item ledger entries, for example, after a physical count or if you do not record purchases.

Inventory increases and decreases are naturally also recorded when you post purchase and sales documents respectively. For more information, see [Record Purchases](#), [Sell Products](#), and [Invoice Sales](#). Transfers between locations changes inventory quantities across your company's warehouses.

To increase your overview of items and to help you find them, you can categorize items and give them attributes to search and sort by.

NOTE

The physical handling of items is referred to as warehouse activities. For more information, see [Warehouse Management](#).

Inventory Reconciliation

When you post inventory transactions, such as sales shipments, purchase invoices, or inventory adjustments, the changed item costs are recorded in item value entries. To reflect this change of inventory value in your financial books, the inventory costs are automatically posted to the related inventory accounts in the general ledger. For each inventory transaction that you post, the appropriate values are posted to the inventory account, adjustment account, and COGS account in the general ledger. For more information, see [Reconcile Inventory Costs with the General Ledger](#).

Even though inventory costs are automatically posted to the general ledger, it is still necessary to ensure that the costs of goods are forwarded to the related outbound sales transaction, especially in situations where you sell goods before you invoice the purchase of those goods. This is referred to as cost adjustment. Item costs are automatically adjusted when you post item transactions, but you can also adjust item costs manually. For more information, see [Adjust Item Costs](#).

TO	SEE
Create item cards for inventory items that you trade in.	Register New Items

Register New Items

3/31/2019 • 4 minutes to read

Items, among other products, are the basis of your business, the goods or services that you trade in. Each item must be registered as an item card.

Item cards hold the information that is required to buy, store, sell, deliver, and account for items.

The item card can be of type **Inventory**, **Service**, or **Non-Inventory** to specify if the item is a physical inventory unit, a labor time unit, or a physical unit that is not tracked in inventory. For more information, see [About Item Types](#).

An item can be structured as a parent item with underlying child items in a bill of materials (BOM). In Business Central, a bill of material can be either an assembly BOM or a production BOM, depending on its use. For more information, see [Work with Bills of Material](#).

If you purchase the same item from more than one vendor, you can connect those vendors to the item card. The vendors will then appear on the **Item Vendor Catalog** page, so that you can easily select an alternate vendor.

Items that you offer to your customers but you do not want manage in your system until you start selling them can be set up as catalog items. Catalog items are not to be mistaken with regular items of type **Non-Inventory**. For more information, see [Work with Catalog Items](#).

NOTE

If item templates exist for different item types, then a page appears when you create a new item card from where you can select an appropriate template. If only one item template exists, then new item cards always use that template.

To create a new item card

1. Choose the  icon, enter **Items**, and then choose the related link.
2. On the **Items** page, choose the **New** action.

If only one item template exists, then a new item card opens with some fields filled with information from the template.

3. On the **Select a template for a new item** page, choose the template that you want to use for the new item card.
4. Choose the **OK** button. A new item card opens with some fields filled with information from the template.
5. Proceed to fill or change fields on the item card as necessary. Hover over a field to read a short description.

NOTE

In the **Costing Method** field, you set up how the item's unit cost is calculated by making assumptions about the flow of physical items through your company. Five costing methods are available, depending on the type of item. For more information, see [Design Details: Costing Methods](#).

If you select **Average**, then the item's unit cost is calculated as the average unit cost at each point in time after a purchase. Inventory is valued with the assumption that all inventories are sold simultaneously. With this setting, you can choose the **Unit Cost** field to view, on the **Average Cost Calc. Overview** page, the history of transactions that the average cost is calculated from.

On the **Price and Posting** FastTab, you can view special prices or discounts that you grant for the item if certain criteria are met, such as customer, minimum order quantity, or ending date. Each row represents a special price or line discount. Each column represents a criterion that must apply to warrant the special price that you enter in the **Unit Price** field, or the line discount that you enter in the **Line Discount %** field. For more information, see [Record Sales Price, Discount, and Payment Agreements](#).

The item is now registered, and the item card is ready to be used on purchase and sales documents.

If you want to use this item card as a template when you create new item cards, you can save it as a template. For more information, see the following section.

To save the item card as a template

1. On the **Item Card** page, choose the **Save as Template** action. The **Item Template** page opens showing the item card as a template.
2. Fill in the fields as necessary. Hover over a field to read a short description.
3. To reuse dimensions in templates, choose the **Dimensions** action. The **Dimension Templates** page opens showing any dimension codes that are set up for the item.
4. Edit or enter dimension codes that will apply to new item cards created by using the template.
5. When you have completed the new item template, choose the **OK** button.

The item template is added to the list of item templates, so that you can use it to create new item cards.

To set up multiple vendors for an item

If you purchase the same item from more than one vendor, you must enter information about each vendor of the item, such as prices, lead time, discounts, and so on.

1. Choose the  icon, enter **Items**, and then choose the related link.
2. Select the relevant item, and then choose the **Edit** action.
3. Choose the **Vendors** action.
4. Choose the **Vendor No.** field, and then select the vendor that you want to set up for the item.
5. Optionally, fill in the remaining fields.
6. Repeat steps 2 through 5 for each vendor that you want to buy the item from.

The vendors will now appear on the **Item Vendor Catalog** page, which you open from the item card, so that you can easily select an alternate vendor.

Work with Bills of Material

3/31/2019 • 6 minutes to read

You use bills of materials (BOMs) to structure parent items that must be assembled or produced by resources or machine centers from components. An assembly BOM can also be used to sell a parent item as a kit consisting of its components.

Assembly BOMs or Production BOMs

You use assembly orders for making end items from components in a simple process that can be performed by one or more basic resources, which are not machine or work centers, or without any resources. For example, an assembly process could be to pick two wine bottles and one coffee sack and then pack them as a gift item.

An assembly BOM is the master data that defines which component items go into an assembled end item and which resources are used to assemble the assembly item. When you enter an assembly item and a quantity in the header of a new assembly order, then the assembly order lines are automatically filled according to the assembly BOM with one assembly order line per component or resource. For more information, see [Assembly Management](#).

Assembly BOMs are described in this topic.

You use production orders for making end items from components in a complex process that requires a production routing and work or machine centers, which represent production capacities. For example, a production process could be to cut steel plates in one operation, weld them in the next operation, and paint the end item in the last operation. For more information, see [Manufacturing](#).

A production BOM is the master data that defines a production item and the components that go into it. For assembly items, the production BOM must be certified and assigned to the production item before it can be used in a production order. When you enter the production item on a production order line, either manually or by refreshing the order, then the production BOM content becomes the production order components. For more information, see [Create Production BOMs](#).

The concept of resources in production is much more advanced than in assembly management. Work centers and machine centers function as resources, and production steps are represented by operations that are assigned to resources in production routings. For more information, see [Create Routings](#).

Both assembly orders and production orders may be linked directly to sales orders. However, you can only use assembly orders to customize the end item directly for a customer request with the sales order.

To create an assembly BOM

To define a parent item that consists of other items, and potentially of resources required to put the parent together, you must create an assembly BOM.

Assembly BOMs usually contain items but can also contain one or more resources that are required to put the assembly item together.

Assembly BOMs can have multiple levels, which means that a component on the assembly BOM can be an assembly item itself. In that case, the **Assembly BOM** field on the assembly BOM line contains **Yes**.

Special requirements apply to items on assembly BOMs with regards to availability. For more information, see [To see the availability of an item by its use in assembly BOMs](#).

There are two parts to creating an assembly BOM:

- Setting up a new item
- Defining the BOM structure of the assembly item.

1. Set up a new item. For more information, see [Register New Items](#).

Proceed to enter components or resources on the assembly BOM.

2. On the **Item Card** page for an assembly item, choose the **Assembly** action, and then choose the **Assembly BOM** action.
3. On the **Assembly BOM** page, fill in the fields as necessary. Hover over a field to read a short description.

To view the components of an assembly item indented according to the BOM structure

From the **Assembly BOM** page, you can open a separate page that shows the components and any resources indented according to their BOM position under the assembly item.

1. Choose the  icon, enter **Items**, and then choose the related link.
2. Open the card for an assembly item. (The **Assembly BOM** field on the **Items** page contains **Yes**.)
3. On the **Item Card** page, choose the **Assembly** action, and then choose the **Assembly BOM** action.
4. On the **Assembly BOM** page, choose the **Show BOM** action.

To replace the assembly item with its components on document lines

From any sales and purchase document that contains an assembly item, you can use a special function to replace the line for the assembly item with new lines for its components. This function is useful, for example, if you want to sell the components as a kit that represents the assembly item.

Caution: When you have used the **Explode BOM** function, you cannot easily undo it. You must delete the sales order lines representing the components and then reenter a sales order line for the assembly item.

The following procedure is based on a sales invoice. The same steps apply to other sales documents and to all purchase documents.

1. In the top right corner, choose the **Search for Page or Report** icon, enter **Sales Invoices**, and then choose the related link.
2. Open a sales invoice that contains a line for an assembly item.
3. Choose the line for an assembly item, and then **Explode BOM** line action.

All fields on the sales invoice line for the assembly item are cleared except for the **Item** and **Description** fields. Complete sales invoice lines are inserted for the components and possible resources that comprise the assembly item.

Note: The Explode BOM function is also available on the **Assembly BOM** page.

To calculate the standard cost of an assembly item

You calculate the unit cost of an assembly item by rolling up the unit cost of each component and resource in the item's assembly BOM.

You can also calculate and update the standard cost for one or many items on the **Standard Cost Worksheet** page. For more information, see [Update Standard Costs](#).

The unit cost of an assembly BOM always equals the total of the unit costs of its components, including other assembly BOMs, and any resources.

1. In the top right corner, choose the **Search for Page or Report** icon, enter **Items**, and then choose the related link.
2. Open the card for an assembly item. (The **Assembly BOM** field on the **Items** page contains **Yes**.)
3. On the **Item Card** page, choose the **Assembly** action, and then choose the **Assembly BOM** action.
4. On the **Assembly BOM** page, choose the **Calc. Standard Cost** action.
5. Select one of the following options, and then choose the **OK** button.

OPTION	DESCRIPTION
Top Level	Calculates the assembly item's standard cost as the total cost of all purchased or assembled items on that assembly BOM regardless of any underlying assembly BOMs.
All Levels	Calculates the assembly's item standard cost as the sum of: 1) The calculated cost of all underlying assembly BOMs on the assembly BOM. 2) The cost of all purchased items on the assembly BOM.

The costs of the items that make up the assembly BOM are copied from the component item cards. The cost of each item is multiplied by the quantity, and the total cost is shown in the **Unit Cost** field on the item card.

Categorize Items

3/31/2019 • 2 minutes to read

To maintain an overview of your items and to help you sort and find items, it is useful to organize your items in item categories.

To find items by characteristics, you can assign item attributes to items and also to item categories. For more information, see [Work with Item Attributes](#).

To create an item category

1. Choose the  icon, enter **Item Categories**, and then choose the related link.
2. On the **Item Categories** page, choose the **New** action.
3. On the **Item Category Card** page, on the **General** FastTab, fill in the fields as necessary. Hover over a field to read a short description.
4. On the **Attributes** FastTab, specify any item attributes for the item category. For more information, see [To assign item attributes to item categories](#).

NOTE

If the item category has a parent item category, as indicated by the **Parent Category** field, then any item attributes that are assigned to that parent item category are prefilled on the **Attributes** FastTab.

NOTE

Item attributes that you assign to an item category will automatically apply to the item that the item category is assigned to.

To assign an item category to an item

1. Choose the  icon, enter **Items**, and then choose the related link.
2. Open the card for the item that you want to assign to an item category.
3. Choose the lookup button in the **Item Category Code** field and select an existing item category. Alternatively, choose the **New** action to first create a new item category as explained in [To create an item category](#).

Work with Item Attributes

3/31/2019 • 4 minutes to read

When customers inquire about an item, either in correspondence or in an integrated web shop, they may ask or search according to characteristics, such as height and model year. To provide this customer service, you can assign item attribute values of different types to your items, which can then be used when searching for items.

You can also assign item attributes to item categories, which then apply to the items that use the item categories. For more information, see [Categorize Item](#).

TIP

If you attach pictures to items, the Image Analyzer extension can detect attributes in the image, and suggest the attributes so you can decide whether to assign them. The extension is ready to go. You just need to enable it. For more information, see [The Image Analyzer Extension](#).

To create item attributes

1. Choose the  icon, enter **Item Attributes**, and then choose the related link.
2. On the **Item Attributes** page, choose the **New** action.
3. On the **Item Attribute** page, fill in the fields as necessary. Hover over a field to read a short description.

NOTE

If you select **Option** in the **Type** field, then you can choose the **Item Attribute Values** action to create values for the item attribute. For more information, see [To create values for item attributes of type Option](#).

To create values for item attributes of type Option

1. Choose the  icon, enter **Item Attributes**, and then choose the related link.
2. On the **Item Attributes** page, select an item attribute of type **Option** that you want to create values for, and then choose the **Item Attribute Values** action.
3. On the **Item Attribute Values** page, fill in the fields as necessary. Hover over a field to read a short description.

To assign item attributes to items

1. Choose the  icon, enter **Items**, and then choose the related link.
2. On the **Items** page, select the item that you want to assign item attributes to, and then choose the **Attributes** action.
3. On the **Item Attribute Values** page, choose the **New** action.
4. Choose the lookup button in the **Attribute** field and select an existing item attribute. Alternatively, choose the **New** action to first create a new item attribute as explained in [To create item attributes](#).
5. In the **Value** field, enter the item attribute value, such as "2010" for the **Model Year** attribute.
6. For item attributes of type **Option**, choose the lookup button in the **Value** field and select an item attribute value. Alternatively, choose the **New** action to first create a new item attribute value as explained in [To create values for item attributes of type Option](#).

7. Repeat steps 4 through 6 for all item attributes that you want to assign to the item.

To assign item attributes to item categories

1. Choose the  icon, enter **Item Categories**, and then choose the related link.
2. On the **Item Categories** page, select the item category that you want to assign item attributes to, and then choose the **Edit** action.
3. On the **Item Category Card** page, on the **Attributes** FastTab, choose the **New** action.
4. Choose the lookup button in the **Attribute** field and select an existing item attribute. Alternatively, choose the **New** action to first create a new item attribute as explained in [To create item attributes](#).
5. In the **Default Value** field, choose the lookup button and select an item attribute value.
6. Repeat steps 4 and 5 for all item attributes that you want to assign to the item category.

NOTE

Item attributes for parent item categories will be inherited to child item categories. This is indicated by the **Inherited From** field on the **Attributes** FastTab. For more information, see [Categorize Items](#).

To filter by item attributes

1. Choose the  icon, enter **Items**, and then choose the related link.
2. On the **Items** page, choose the **Filter by Attributes** action.
3. On the **Filter Items by Attribute** page, choose the lookup button in the **Attribute** field and select an item attribute.
4. In the **Value** field, choose the lookup button and select an attribute value to filter items by.

NOTE

You can only select values directly for item attributes that have fixed values, such as Color. For item attributes that have variable values, such as Width, you must specify the item attribute value by first selecting a condition. See step 5.

5. In the **Value** field for a variable item attribute, choose the lookup button.
6. On the **Specify Filter Value** page, in the **Condition** field, choose the drop-down arrow and select a condition.
7. In the **Value** field, enter an attribute value to filter items by.

Example: To filter on items where the material description begins with "blue", fill in the fields as follows:
Attribute field: Material Description, **Condition** field: Begins With, **Value** field: blue.

8. Choose the **OK** button.

The items on the **Items** page are filtered by the specified item attribute values.

Work with Catalog Items

3/31/2019 • 3 minutes to read

You can offer certain items to your customers for their convenience, which you do not want to manage in your system until you start selling them. When you want to start managing such items in your system, you can convert them to normal item cards in two ways.

- From a catalog item card, create a new item card based on a template.
- From a sales order line of type **Item** with an empty **No** field, select a catalog item. An item card is then automatically created for the catalog item.

NOTE

You cannot select a catalog item from the **Sales Invoice** page.

You can select a catalog item from the **Sales Quote** page, but the catalog item will not be converted to a normal item when you use the **Make Order** function.

A catalog item typically has the item number of the vendor who supplies it. To enable conversion of a catalog item card to a normal item card, you must first set up how vendor item numbering is converted to your own item numbering.

IMPORTANT

Catalog items are not to be mistaken with non-inventory items, which are regular items that are given the type **Non-Inventory** to keep them out of availability and costing calculations, for example, because they are only used internally and have a low cost. For more information, see [About Item Types](#).

To create a catalog item

Catalog item cards have much less information than normal item cards because you only use them to offer on quotes and in other ways. For that reason, they must be converted to normal item cards before you can post sales transactions for them.

1. Choose the  icon, enter **Catalog Items**, and then choose the related link.
2. Choose the **New** action.
3. Fill in the fields as necessary. Hover over a field to read a short description.

To set up how catalog item numbers are converted to your own numbering

To enable conversion of a catalog item card to a normal item card, you must first set up how the vendor's item numbering is converted to your own item number format.

1. Choose the  icon, enter **Catalog Item Setup**, and then choose the related link.
2. Fill in the fields as necessary.

To convert a catalog item to a normal item

1. Choose the  icon, enter **Catalog Items**, and then choose the related link.
2. Open the card for a catalog item that you want to convert to a normal item.
3. On the **Catalog Item Card** page, choose the **Create Item** action.

A new item card prefilled with information from the catalog item and a relevant item template is created. You can then fill or edit fields on the new item card as necessary. For more information, see [Register New Items](#).

To sell a catalog item, and convert it to a normal item

1. Choose the  icon, enter **Sales Orders**, and then choose the related link.
2. Choose the **New** action. Fill in the fields on the **General** FastTab as for any sales order. For more information, see [Sell Products](#).
3. On a new sales line, in the **Type** field, select **Item**, but leave the **No.** field empty.
4. Choose the **Line** action, and then choose the **Select Catalog Items** action.

The catalog item is converted to a normal item. A new item card prefilled with information from the catalog item and a relevant item template is created.

5. On the **Catalog Items** page, select the catalog item that you want to sell, and then choose the **OK** button.
6. When the sales order is complete, choose the **Post** action.

You can then fill or edit fields on the new item card as necessary. For more information, see [Register New Items](#).

NOTE

An Item cross reference record is automatically created for the vendor of the item between the vendor's item number and your new item number. For more information, see [Use Item Cross References](#).

[Create Special Orders](#)

[Inventory](#)

[Working with Business Central](#)

Count Inventory Using Documents

3/31/2019 • 11 minutes to read

You can take a physical inventory of your items by using physical inventory order and physical inventory recording documents. The **Physical Inventory Order** page is used to organize the complete inventory counting project, for example one per location. The **Physical Inventory Recording** page is used by to communicate and capture the actual counting of items. You can create multiple recordings for one order, for example to distribute groups of items to different employees.

The **Physical Inventory Recording** report can be printed from each recording and contains empty quantity fields for entering the counted inventory. When a user is done counting, and the quantities are entered on the **Physical Inventory Recording** page, you choose the **Finish** action. This transfers the quantities to the related lines on the **Physical Inventory Order** page. Functionality ensures that no item count can be recorded twice.

NOTE

This procedure describes how to perform a physical inventory using documents, a method that provides more control and supports distributing the counting to multiple employees. You can also perform the task by using journals, the **Phys. Inventory Journals** and **Whse. Phys. Inventory Journals** pages. For more information, see [Count, Adjust, and Reclassify Inventory Using Journals](#).

Note that if you use the Bins or Zones functionality, then you cannot use physical inventory orders. In stead, use **Whse. Phys. Inventory Journal** page to count your warehouse entries before synchronizing them with item ledger entries.

Counting inventory by using documents consist of the following overall steps:

1. Create a physical inventory order with expected item quantities prefilled.
2. Generate one or more physical inventory recordings from the order.
3. Enter the counted item quantities on the recordings, as captured on print-outs, for example, and set it to **Finished**.
4. Complete and post the physical inventory order.

To create a physical inventory order

A physical inventory order is a complete document that consists of a physical inventory order header and some physical inventory order lines. The information on a physical inventory header describes how to take the physical inventory. The physical inventory order lines contain the information about the items and their locations.

To create the physical inventory order lines, you typically use the **Calculate Lines** function to reflect the current inventory as lines on the order. Alternatively, you can use the **Copy Document** function to fill the lines with the content of another open or posted physical inventory order. The following procedure only describes how to use the **Calculate Lines** function.

1. Choose the  icon, enter **Physical Inventory Orders**, and then choose the related link.
2. Choose the **New** action.
3. Fill in the required fields on the **General** FastTab. Hover over a field to read a short description.
4. Choose the **Calculate Lines** action.
5. Select options as necessary.

6. Set filters, for example, to only include a subset of items to be counted with the first recording.

TIP

To plan for multiple employees to count the inventory, it is advisable to set different filters each time you use the **Calculate Lines** action to only fill the order with the subset of inventory items that one user will be recording. Then as you generate multiple physical inventory recordings for multiple employees, you minimize the risk of counting items twice. For more information, see the "To create a physical inventory recording" section.

7. Choose the **OK** button.

A line for each item that exists on the chosen location and per the set filters and options is inserted on the order. For items that are set up for item tracking, the **Use Item Tracking** check box is selected, and information about the expected quantity of serial and lot numbers is available by choosing the **Lines** action and then **Item Tracking Lines**. For more information, see the "Handling Item Tracking when Counting Inventory" section.

You can now proceed to create one or more recordings, which are instructions to the employees who perform the actual counting.

To create a physical inventory recording

For each physical inventory order, you can create one or more physical inventory recording documents on which employees enter the counted quantities, either manually or through an integrated scanning device.

By default, a recording is created for all the lines on the related physical inventory order. To avoid that two employees count the same items in case of distributed counting, it is advisable to gradually fill the physical inventory order by setting filters on the **Calculate Lines** batch job (see the "To create a physical inventory order" section) and then create the physical inventory recording while selecting the **Only Lines Not in Recordings** check box. This settings makes sure that each new recording that you create only contains different items than the ones on other recordings.

In case of manual counting, you can print a list, the **Phys. Invt. Recording** report, which has an empty column to write the counted quantities in. When counting is completed, you enter the recorded quantities on the related lines on the **Phys. Inventory Recording** page. Lastly, you transfer the recorded quantities to the related physical inventory order by setting the status to **Finished**.

1. On a **Physical Inventory Order** page that contains lines for the items to be counted in one recording, choose the **Make New Recording** action.
2. Select options and set filters as necessary.
3. Choose the **OK** button.

A physical inventory recording document is created.

4. For every set of items to be counted, load them on the related physical inventory order and repeat steps 1 through 3 with the **Only Lines Not in Recordings** check box selected.
5. Choose the **Recordings** action to open the **Phys. Inventory Recording List** page.
6. Open the relevant recording.
7. On the **General** FastTab, fill in the fields as necessary.
8. For items that use item tracking, create an additional line for each lot number or serial number code by choosing the **Functions** action, and then the **Copy Line** action. For more information, see the "Handling Item Tracking when Counting Inventory" section.

9. Choose the **Print** action to prepare the physical document that employees will use to write down the counted quantities.

To finish a physical Inventory recording

When employees have counted the inventory quantities, you must prepare to record them in the system.

1. From the **Phys. Inventory Recording List** page, select the physical inventory recording that you want to finish, and then choose the **Edit** action.
2. On the **Lines** FastTab, fill the actual counted quantity in the **Quantity** field for each line.
3. For items with serial or lot numbers (the **Use Item Tracking** check box is selected), enter the counted quantities on the dedicated lines for the item's serial and lot numbers respectively question. For more information, see the "Handling Item Tracking when Counting Inventory" section.
4. Select the **Recorded** check box on each line.
5. When you have entered all data for a physical inventory recording, choose the **Finish** action. Note that all lines must have the **Recorded** checkbox selected.

NOTE

When you finish a physical inventory recording, each line is transferred to the line on the related physical inventory order that matches it exactly. To match, the values in the **Item No.**, **Variant Code**, **Location Code**, and **Bin Code** fields must be the same on the recording and the order lines.

If no matching physical inventory order line exists, and if the **Allow Recording Without Order** checkbox is selected, then a new line is inserted automatically and the **Recorded Without Order** checkbox on the related physical inventory order line is selected. Otherwise, an error message is displayed and the process is canceled.

If more than one physical inventory recording lines match a physical inventory order line, then a message is displayed and the process is canceled. If, for some reason, two identical physical inventory lines end up on the physical inventory order, you can use a function to resolve it. For more information, see the "To find duplicate physical inventory order lines" section.

To complete a physical inventory order

When you have finished a physical inventory recording, the **Qty. Recorder (Base)** field on the related physical inventory order is updated with the counted (recorded) values, and the **On Recording** check box is selected. If a counted value is different from the expected, then that difference is shown in the **Pos Qty. (Base)** and **Neg Qty. (Base)** field respectively.

To see expected quantities and any recorded differences for items with item tracking, choose the **Lines** action, and then choose the **Item Tracking Lines** action to select various views for serial and lot numbers involved in the physical inventory count.

You can also choose the **Phys. Inventory Order Diff.** action to view any differences between the expected quantity and the counted quantity.

To find duplicate physical inventory order lines

1. Choose the  icon, enter **Physical Inventory Orders**, and then choose the related link.
2. Open the physical inventory order that you want to view duplicate lines for.
3. Choose the **Show Duplicate Lines** action.

Any duplicate physical inventory order lines are displayed so that you can delete them and keep only one line with a unique set of values in the **Item No.**, **Variant Code**, **Location Code**, and **Bin Code** fields.

To post a physical inventory order

After completing a physical inventory order and changing its status to **Finished**, you can post it. You can only set the status of a physical inventory order to **Finished** if the following are true:

- All related physical inventory recordings have a status of **Finished**.
- Each physical inventory order line has been counted by at least one inventory recording line.
- The **In Recording Lines** and the **Qty. Exp. Calculated** check boxes have been selected for all of the physical inventory order lines.

1. Choose the  icon, enter **Physical Inventory Orders**, and then choose the related link.
2. Select the physical inventory order that you want to complete, and then choose the **Edit** action.

On the **Physical Inventory Order** page, you view the quantity recorded in the **Qty. Recorded (Base)** field.

3. Choose the **Finish** action.

The value in the **Status** field is changed to **Finished**, and you can now only change the order by first choosing the **Reopen** action.

4. To post the order, choose the **Post** action, and then choose the **OK** button.

The involved item ledger entries are updated along with any related item tracking entries.

To view posted physical inventory orders

After posting, the physical inventory order will be deleted and you can view and evaluate the document as a posted physical inventory order including its physical inventory recordings and any comments made.

1. Choose the  icon, enter **Posted Phys. Invt. Orders**, and then choose the related link.
2. On the **Posted Phys. Invt. Orders** page, select the posted inventory order that you want to view, and then choose the **View** action.
3. To view a list of related physical inventory recordings, choose the **Recordings** action.

Handling Item Tracking when Counting Inventory

Item tracking pertains to the serial or lot numbers that are assigned to items. When counting an item that is stored in inventory as, for example, 10 different lot numbers, the employee must be able to record which and how many units of each lot number are on inventory. For more information about item tracking functionality, see [Work with Serial and Lot Numbers](#).

The **Use Item Tracking** check box on physical inventory order lines is automatically selected if an item tracking code is set up for the item, but you can also select or deselect it manually.

Example - Prepare a Physical Inventory Recording for an Item-Tracked Item

Consider a physical inventory for Item A, which is stored in inventory as ten different serial numbers.

1. On the recording line for the item, select the **Use Item Tracking** check box.
2. Choose the **Serial No.** field, select the first serial number that exists in inventory for the item, and then choose the **OK** button.

Proceed to copy the line for the first item-tracked item to insert additional lines corresponding to the number of serial numbers that are stored in inventory.

3. Choose the **Functions** action, and then the **Copy Line** action.
4. On the **Copy Phys. Invt. Rec. Line** page, enter 9 in the **No. of Copies** field, and then choose the **OK** button.

5. On the first of the copy lines, select the **Serial No.** field and select the next serial number for the item.
6. Repeat step 5 for the remaining eight serial numbers, taking care to not select the same one twice.
7. Choose the **Print** action to prepare the print-out that employees will use to write down the counted items and serial/lot numbers.

Notice that the **Phys. Invt. Recording** report contains ten lines for Item A, one for each serial number.

Example - Record and Post Counted Lot Number Differences

A lot-tracked item is stored in inventory with the "LOT" number series.

Expected Inventory:

LOT NO.	QUANTITY
LOT1001	80
LOT1003	30
LOT1006	10
Total	120

Recorded Quantities:

LOT NO.	QUANTITY
LOT1001	80
LOT0002	12
LOT1003	20
LOT1006	10
Total	112

Quantities to Post:

LOT NO.	EXPECTED QUANTITY	RECORDED QUANTITY	QUANTITY TO POST
LOT1001	80	80	0
LOT1002	0	12	+12
LOT1003	30	20	-10
LOT1006	10	0	-10
Total	120	112	-8

On the **Physical Inventory Order** page, the **Neg. Qty. (Base)** field will contain 8. For the order line in question, the **Phys. Invt. Item Track. List** page will contain the positive or negative quantities for the individual lot numbers.

Count, Adjust, and Reclassify Inventory Using Journals

3/31/2019 • 16 minutes to read

At least once every fiscal year you must take a physical inventory, that is, count all the items on inventory, to see if the quantity registered in the database is the same as the actual physical quantity in the warehouses. When the actual physical quantity is known, it must be posted to the general ledger as a part of period-end valuation of inventory.

Although you count all items in inventory at least once a year, you may have decided to count some items more often, perhaps because they are more valuable, or because they are very fast movers and a large part of your business. For this purpose, you can assign special counting periods to those items. For more information, see [To perform cycle counting](#).

If you need to adjust recorded inventory quantities, in connection with counting or for other purposes, you can use an item journal to change the inventory ledger entries directly without posting business transactions. Alternatively, you can adjust for a single item on the item card.

If you need to change attributes on item ledger entries, you can use the item reclassification journal. Typical attributes to reclassify include dimensions and sales campaign codes, but you also perform "system transfers" by reclassifying bin and location codes. Special steps apply when you want to reclassify serial or lot numbers and their expiration dates. For more information, see [Work with Serial and Lot Numbers](#).

NOTE

In advanced warehouse configurations, items are registered in bins as warehouse entries, not as item ledger entries. Therefore, you perform counting, adjusting, and reclassifying in special warehouse journals that support bins. Then, you use special functions to synchronize the new or changed warehouse entries with their related item ledger entries to reflect the changes in inventory quantities and values. This is described in specific procedures below where relevant.

To perform a physical inventory

You must take a physical inventory, that is, count the actual items on hand, to check if the quantity registered is the same as the physical quantity in stock at the end of a fiscal year, if not more often. If there are differences, you must post them to the item accounts before you do the inventory valuation.

NOTE

This procedure describes how to perform a physical inventory using a journal, the **Phys. Inventory Journal** page. You can also perform the task using documents, the **Physical Inventory Order** and **Physical Inventory Recording** pages, which provide more control and support distributing the counting to multiple employees. For more information, see [Count Inventory Using Documents](#).

Note that the document-based functionality cannot be used to count items in bins, warehouse entries.

Apart from the physical counting task, the complete process involves the following three tasks:

- Calculate the expected inventory.
- Print the report to be used when counting.

- Enter and post the actual counted inventory.

You can perform the physical inventory in either of the following ways depending on your warehouse setup. For more information, see [Setting Up Warehouse Management](#).

- If your location is not using directed put-away and pick (basic warehouse configuration), you use the **Phys. Inventory Journal** page in the **Inventory** menu, and the procedure is much the same as when you conduct a physical inventory without cycle counting.
- If your location is using directed put-away and pick (advanced warehouse configuration), you first use the **Whse. Phys. Invt. Journal** page, and then you use the **Item Journal** page to run the **Calculate Whse. Adjustment** function.

To calculate the expected inventory in basic warehouse configurations

1. Choose the  icon, enter **Phys. Inventory Journals**, and then choose the related link.
2. Choose the **Calculate Inventory** action.
3. On the **Calculate Inventory** page, specify the conditions to use to create the journal lines, such as whether to include items that have zero recorded inventory.
4. Set filters if you only want to calculate inventory for certain items, bins, locations, or dimensions.
5. Choose the **OK** button.

NOTE

The item entries are processed according to the information that you specified, and lines are created in the physical inventory journal. Notice that the **Qty. (Phys. Inventory)** field is automatically filled in with the same quantity as the **Qty. (Calculated)** field. With this feature, it is not necessary for you to enter the counted inventory on hand for items that are the same as the calculated quantity. However, if the quantity counted differs from what is entered in the **Qty. (Calculated)** field, you must overwrite it with the quantity actually counted.

To calculate the expected inventory in advanced warehouse configurations

1. Choose the  icon, enter **Item Journal**, and choose the related link.
2. Choose the **Calculate Whse. Adjustment** action.
3. Fill in the batch job request page with the numbers of the items you want to count and with your location.
4. Choose the **OK** button, and post the adjustments if any.

If you do not do this before you perform the warehouse physical inventory, the results you post to the physical inventory journal and item ledger in the second part of the process will be the physical inventory results combined with other warehouse adjustments for the items that were counted.

5. Choose the  icon, enter **Whse. Phys. Invt. Journal**, and choose the related link.
6. Choose the **Calculate Inventory** action. The **Whse. Calculate Inventory** batch job request page opens.
7. Set the filters to limit the items that will be counted in the journal, and then choose the **OK** button.

The program creates a line for each bin that fulfills the filter requirements. You can at this point still delete some of the lines, but if you want to post the results as a physical inventory, you must count the item in all the bins that contain it.

If you only have time to count the item in some bins and not others, you can discover discrepancies, register them, and later post them in the item journal using the **Calculate Whse. Adjustment** function.

8. Choose the  icon, enter **Whse. Phys. Inventory List**, and choose the related link.
9. Open the report request page and print the lists on which you want employees to record the quantity of

items that they count in each bin.

10. When the counting is done, enter the counted quantities in the **Qty. (Phys. Inventory)** field in the warehouse physical inventory journal.

NOTE

In the warehouse physical inventory journal, **Qty. (Calculated)** field is filled in automatically on the basis of warehouse bin records and copies these quantities are copied to the **Qty. (Physical)** field on each line. If the quantity counted by the warehouse employee differs from what the program has entered in the Qty. (Physical) field, you must enter the quantity actually counted.

11. When you have entered all the counted quantities, choose the **Register** action.

When you register the journal, the program creates two warehouse entries in the warehouse register for every line that was counted and registered:

- If the calculated and the physical quantities differ, a negative or positive quantity is registered for the bin, and a balancing quantity is posted to the adjustment bin of the location.
- If the quantity calculated is equal to the physical quantity, the program registers an entry of 0 for both the bin and the adjustment bin. The entries are the record that on the registering date, a warehouse physical inventory was performed, and there was no discrepancy in inventory for the item.

When you register the warehouse physical inventory, you are not posting to the item ledger, the physical inventory ledger, or the value ledger, but the records are there for immediate reconciliation whenever necessary. If you like to keep precise records of what is happening in the warehouse, however, and you counted all of the bins where the items were registered, you should immediately post the warehouse results as an inventory physical inventory. For more information, see [To enter and post the actual counted inventory in advanced warehouse configurations](#).

To print the report to be used when counting

1. On the **Phys. Inventory Journal** page containing the calculated expected inventory, Choose the **Print** action.
2. On the **Phys. Inventory List** page, specify if the report should show the calculated quantity and if the report should list inventory items by serial/lot numbers.
3. Set filters if you only want to print the report for certain items, bins, locations, or dimensions.
4. Choose the **Print** button.

Employees can now proceed to count inventory and record any discrepancies on the printed report.

To enter and post the actual counted inventory in basic warehouse configurations

1. On each line on the **Phys. Inventory Journal** page where the actual inventory on hand, as determined by the physical count, differs from the calculated quantity, enter the actual inventory on hand in the **Qty. (Phys. Inventory)** field.

The related fields are updated accordingly.

NOTE

If the physical count reveals differences that are caused by items posted with incorrect location codes, do not enter the differences in the physical inventory journal. Instead, use the reclassification journal or a transfer order to redirect the items to the correct locations. For more information, see [Item Reclass. Journal](#) or [Create Transfer Orders](#).

2. To adjust the calculated quantities to the actual counted quantities, choose the **Post** action.

Both item ledger entries and physical inventory ledger entries are created. Open the item card to view the resulting physical inventory ledger entries.

3. Choose the  icon, enter **Items**, and then choose the related link.
4. To verify the inventory counting, open the item card in question, and then, choose the **Phys. Inventory ledger Entries** action.

To enter and post the actual counted inventory in advanced warehouse configurations

1. Choose the  icon, enter **Item Journal**, and choose the related link.
2. Choose the **Calculate Whse. Adjustment** action.
3. Select the same items that you counted in the cycle counting physical inventory you just performed, and any other items that require adjustment, and then choose the **OK** button.

The **Inventory Journal** page opens and lines are created for these items. Note that the net quantities that you just counted and registered bin by bin are now ready to be consolidated and synchronized as item ledger entries.

4. Post the journal without changing any quantities.

The quantities in the item ledger (item entries) and the quantities in the warehouse (warehouse entries) are now once again the same for these items, and the program has updated the last counting date of the item or stockkeeping unit.

To perform cycle counting

Although you count all items in inventory at least once a year, you may have decided to count some items more often, perhaps because they are more valuable, or because they are very fast movers and a large part of your business. For this purpose, you can assign special counting periods to those items.

You can perform the cycle counting in either of the following ways depending on your warehouse setup. For more information, see [Setting Up Warehouse Management](#).

- If your location is not using directed put-away and pick (basic warehouse configuration), you use the **Phys. Inventory Journal** page in the **Inventory** menu, and the procedure is much the same as when you conduct a physical inventory without cycle counting.
- If your location is using directed put-away and pick (advanced warehouse configuration), you first use the **Whse. Phys. Invt. Journal** page, and then you use the **Item Journal** page to run the **Calculate Whse. Adjustment** function.

To set up counting periods

A physical inventory is typically taken at some recurring interval, for example monthly, quarterly, or annually. You can set up whatever inventory counting periods necessary.

You set up the inventory counting periods that you want to use and then assign one to each item. When you perform a physical inventory and use the **Calculate Counting Period** in the physical inventory journal, lines for the items are created automatically.

1. Choose the  icon, enter **Phys. Invt. Counting Periods**, and then choose the related link.
2. Fill in the fields as necessary. Hover over a field to read a short description.

To assign a counting period to an item

1. Choose the  icon, enter **Items**, and then choose the related link.
2. Select the item to which you want to assign a counting period.
3. In the **Phys Invt Counting Period Code** field, select the appropriate counting period.

4. Choose the **Yes** button to change the code and calculate the first counting period for the item. The next time you choose to calculate a counting period in the physical inventory journal, the item appears as a line on the **Phys. Invt. Item Selection** page. You can then begin to count the item on a periodic basis.

To initiate a count based on counting periods in basic warehouse configurations

1. Choose the  icon, enter **Phys. Inventory Journal**, and then choose the related link.
2. Choose the **Calculate Counting Period** action.

The **Phys. Invt. Item Selection** page opens showing the items that have counting periods assigned and need to be counted according to their counting periods.

3. Perform the physical inventory. For more information, see [To perform a physical inventory](#).

To initiate a count based on counting periods in advanced warehouse configurations

1. Choose the  icon, enter **Whse. Phys. Invt. Journal**, and choose the related link.
2. Choose the **Calculate Counting Period** action.

The **Phys. Invt. Item Selection** page opens showing the items that have counting periods assigned and need to be counted according to their counting periods.

3. Perform the physical inventory. For more information, see [To perform a physical inventory](#).

NOTE

You must count the item in all the bins that contain the particular item. If you delete some of the bin lines that the program has retrieved for counting on the **Whse. Phys. Inventory** page, then you will not be counting all the items in the warehouse. If you later post such incomplete results in the Phys. Inventory Journal, the amounts posted will be incorrect.

To adjust the inventory of one item

After you have made a physical count of an item in your inventory area, you can use the **Adjust Inventory** function to record the actual inventory quantity.

1. Choose the  icon, enter **Items**, and then choose the related link.
2. Select the item for which you want to adjust inventory, and then choose the **Adjust Inventory** action.
3. In the **New Inventory** field, enter the inventory quantity that you want to record for the item.
4. Choose the **OK** button.

The item's inventory is now adjusted. The new quantity is shown in the **Current Inventory** field on the **Adjust Inventory** page and in the **Inventory** field on the **Item Card** page.

You can also use the **Adjust Inventory** function as a simple way to place purchased items on inventory if you do not use purchase invoices or orders to record your purchases. For more information, see [Record Purchases](#).

NOTE

After you have adjusted inventory, you must update it with the current, calculated value. For more information, see [Revalue Inventory](#).

To adjust the inventory quantity of multiple items in basic warehouse configurations

On the **Item Journal** page, you can post item transaction directly to adjust inventory in connection with purchases, sales, and positive or negative adjustments without using documents.

If you often use the item journal to post the same or similar journal lines, for example, in connection with material consumption, you can use the **Standard Item Journal** page to make this recurring work easier. For more information, see [Working with Standard Journals](#).

1. Choose the  icon, enter **Item Journals**, and then choose the related link.
2. Fill in the fields as necessary. Hover over a field to read a short description.
3. Choose the **Post** action to make the inventory adjustments.

NOTE

After you have adjusted inventory, you must update it with the current, calculated value. For more information, see [Revalue Inventory](#).

To adjust bin quantities in advanced warehouse configurations

If your location uses directed put-away and pick, use the **Whse. Item Journal** to post, outside the context of the physical inventory, all positive and negative adjustments in item quantity that you know are real gains, such as items previously posted as missing that show up unexpectedly, or real losses, such as breakage.

Unlike posting adjustments in the inventory item journal, using the warehouse item journal gives you an additional level of adjustment that makes your quantity records even more precise at all times. The warehouse thus always has a complete record of how many items are on hand and where they are stored, but each adjustment registration is not posted immediately to the item ledger. In the registering process, credits or debits are made to the real bin with the quantity adjustment and a counterbalancing entry is made in an adjustment bin, a virtual bin with no real items. This bin is defined in the **Inv. Adjustment Bin Code** on the location card.

1. Choose the  icon, enter **Whse. Item Journal**, and then choose the related link.
2. Fill in the header information.
3. Fill in the **Item No.** field on the line.
4. Enter the bin in which you are putting the extra items or where you have found items to be missing.
5. Fill in the quantity that you observe as a discrepancy in the **Quantity** field. If you have found extra items, enter a positive quantity. If items are missing, enter a negative quantity.
6. Choose the **Register** action.

To synchronize the adjusted warehouse entries with the related item ledger entries

At appropriate intervals as defined by company policy, you must post the warehouse adjustment bin records in the item ledger. Some companies find it appropriate to post adjustments to the item ledger every day, while others may find it adequate to reconcile less frequently.

1. Choose the  icon, enter **Item Journal**, and then choose the related link.
2. Fill in the fields on each journal line.
3. Choose the **Calculate Whse. Adjustment** action, and fill in the filters as appropriate in the batch job request page. The adjustments are calculated only for the entries in the adjustment bin that meet filter requirements.
4. On the **Options** FastTab, fill in the **Document No.** field with a number that you enter manually. Because no number series has been set up for this batch job, use the number scheme set up by the warehouse, or enter the date followed by your initials.
5. Choose the **OK** button. The positive and negative adjustments are totaled for each item and lines are created in the item journal for any items where the sum is a positive or negative quantity.
6. Post the journal lines to enter the quantity differences in the item ledger. The inventory in the warehouse bins now corresponds precisely to the inventory in the item ledger.

To reclassify an item's lot number

If you need to change attributes on item ledger entries, you can use the item reclassification journal. Typical attributes to reclassify include dimensions and sales campaign codes, but you also perform "system transfers" by reclassifying bin and location codes.

Special steps apply when you want to reclassify serial or lot numbers and their expiration dates. For more information, see [Work with Serial and Lot Numbers](#).

The following example is based on a location code. The steps are similar for other types of item attributes.

1. Choose the  icon, enter **Item Reclass. Journals**, and then choose the related link.
2. On the **Item Reclass. Journal** page, fill in the fields as necessary.
3. In the **Location Code** field, enter the item's current location code.
4. In the **New Location Code** field, enter the item's new location code.
5. Choose the **Post** action.

For information about transferring items with full control of quantities shipped and received, see [Transfer Inventory Between Locations](#).

View the Availability of Items

6/6/2019 • 7 minutes to read

From the context of a business task, you can get advanced information about when and where an item is available, such as when talking to a customer about a delivery date.

You can view the availability of all items per location, and you can view the availability of each item by event, by period, or by location. An event is any scheduled item transaction, such as a sales shipment or an inbound transfer receipt.

NOTE

Availability views by location require that you maintain inventory at more than one location. For more information, see [Set Up Locations](#).

If you use warehousing functionality, availability varies depending on allocations at the bin level when warehouse activities such as picks and movements occur and when the inventory reservation system imposes restrictions to comply with. A rather complex algorithm verifies that all conditions are met before allocating quantities to picks for outbound flows. For more information see [Design Details: Availability in the Warehouse](#).

In Business Central, availability figures are typically shown in two different fields, each with a different definition:

- The **Quantity on Hand** field, in some places named **Inventory**, shows the actual quantity today according to posted item ledger entries.
- The **Projected Available Balance** field is calculated and shows the quantity on hand plus scheduled receipts minus gross requirements. (In Business Central, scheduled receipts include quantities on purchase orders and inbound transfer orders. Gross requirements include quantities on sales orders and outbound transfer orders.)

TIP

The projected available balance is especially relevant to view in the **Item Availability by Periods** and **Item Availability by Event** pages as they contain the date dimension.

NOTE

The following procedures describe how to view advanced availability information from the items list and item card. You can also access the information from sales document lines, for the item on the line. For more information, see [Sell Products](#).

To view the availability of an item according to when it will be received or shipped

You view the availability of an item according to scheduled item transactions on the **Availability by Event** page.

1. Choose the  icon, enter **Items**, and then choose the related link.
2. Open the card of an item that you want to view availability for.
3. Choose the **Item Availability by** action, and then choose the **Event** action.

The **Item Availability by Event** page shows how the inventory quantity of the item will develop over

time according to scheduled shipment and receipt events. The page gives a condensed view that shows one line of accumulated information per time interval in which inventory quantities change. Time intervals where no events occurred are not shown. You can expand each line to show details about the event or events that caused the accumulated quantity on the line.

4. Choose the value in the **Projected Available Balance** field to view the item ledger entries or open documents that make up the value.

To view the availability of an item in different periods

You view the availability of an item over time for specified time periods on the **Item Availability by Periods** page.

1. Choose the  icon, enter **Items**, and then choose the related link.
2. Open the card of an item that you want to view availability for.
3. Choose the **Item Availability by** action, and then choose the **Period** action.

The **Item Availability by Periods** page shows how the inventory quantity of the item will develop over time, shown for a period that you select, such as Day, Week, or Quarter.

4. Choose the value in the **Projected Available Balance** field to view the item ledger entries or open documents that make up the value.

To view the availability of an item at the locations where it is stored

You view the availability of an item at the different places where it is stored on the **Item Availability by Location** page.

1. Choose the  icon, enter **Items**, and then choose the related link.
2. Open the card of an item that you want to view availability for.
3. Choose the **Item Availability by** action, and then choose the **Location** action.

The **Item Availability by Location** page shows how the inventory quantity of the item will develop in the future, shown for each location where it is stored.

4. Choose the value in the **Qty. on Hand** field to view the item ledger entries that make up the value.
5. Choose the value in the **Projected Available Balance** field to view the item ledger entries or open documents that make up the value.

To view the availability of all items by the location where they are stored

You view the availability of all your items across all your locations on the **Items by Location** page.

1. Choose the  icon, enter **Items**, and then choose the related link.
2. Choose the **Items by Location** action.

The **Items by Location** page shows for all your items how many are available at each location.

3. Choose the value in the **Qty. on Hand** field to view the item ledger entries that make up the value.

To view the availability of an item by its use in assembly or production BOMs

If an item exists in assembly or production BOMs, either as a parent item or as a component, then you can view how many units of its are required on the **Item Availability by BOM Level** page. The page shows how many units of a parent you can make based on the availability of child items on underlying lines. Any item that has an assembly or production BOM is shown on the page as a collapsible line. You can expand this line to see the underlying components and lower-level subassemblies with their own BOMs.

You can use the page to find out whether you can fulfill a sales order for an item on a specified date by looking at its current availability and the quantities that can be supplied by its components. You can also use the page to identify bottlenecks in related BOMs.

On each line on the page for both parent items and child items, the following key fields specify the availability figures. You can use these figures to promise how many units of a parent you can supply if you start the related assembly process.

FIELD	DESCRIPTION
Able to Make Parent	Shows how many units of any subassembly in the top item you can make. The field specifies how many immediate parent units you can assemble. The value is based on availability of the item on the line.
Able to Make Top Item	Shows how many units of the top item you can make. The field specifies how many units of the top-line BOM item you can assemble. The value is based on availability of the item on the line.

Item Availability by BOM Level Page

The **Item Availability by BOM Level** page shows information for the item on the card or document line that the page is opened for. The item is always shown on the top line. You can view information for other items or for all items by changing the value in the **Item Filter** field.

NOTE

By default, availability figures on the lines show the total availability of all items under the top item. These figures are displayed in the **Available Quantity** field, and the focus is on the top item. However, information about how many subassemblies you can make may be skewed. To get a true indication of how many of the shown subassemblies you can make, you must clear the **Show Total Availability** check box and then see the figure in the **Able to Make Parent** field.

The **Bottleneck** field specifies which item in the BOM structure restricts you from making a larger quantity than the quantity that is shown in the **Able to Make Top Item** field. For example, the bottleneck item can be a purchased component with an expected receipt date that is too late to make additional units of the top item by the date in the **Needed by Date** field.

Assembly Availability Page

The **Assembly Availability** page shows detailed availability information for the assembly item. It opens:

- Automatically from a sales order line in assemble-to-order scenarios when you enter a quantity that causes a component availability issue.
- Automatically from an assembly order header when you enter a value in the Quantity field that causes a component availability issue.
- Manually when you open it from an assembly order. On the Actions tab, in the Functions group, click Show Availability.

The **Details** FastTab shows detailed availability information for the assembly item, including how many of the

assembly order quantity can be assembled by the due date based on availability of the required components. This is shown in the **Able to Assemble** field on the **Details** FastTab.

The value in the **Able to Assemble** field is shown in red font if the quantity is lower than the quantity in the **Remaining Quantity** field, indicating that there are not enough components available to assemble the full quantity.

The **Lines** FastTab shows detailed availability information for the assembly components.

If one or more assembly components are not available, then this is reflected in the **Able to Assemble** field on the line in question as a quantity less than the quantity in the **Remaining Quantity** field on the **Details** FastTab.

Transfer Inventory Between Locations

3/31/2019 • 2 minutes to read

You can transfer inventory items between locations by creating transfer orders. Alternatively, you can use the item reclassification journal.

With transfer orders, you ship the outbound transfer from one location and receive the inbound transfer at the other location. This allows you to manage the involved warehouse activities and provides more certainty that inventory quantities are updated correctly.

With the reclassification journal, you simply fill in the **Location Code** and the **New Location Code** fields. When you post the journal, the item ledger entries are adjusted at the locations in question. With this method, warehouse activities are not managed.

NOTE

If you have items recorded in your inventory without a location code, for example from a time when you only had one warehouse, then you cannot transfer those items using transfer orders. Instead, you must use the reclassification journal to reclassify the items from a blank location code to an actual location code. For more information, see step 3 in [To transfer items with the item reclassification journal](#).

To transfer items, locations and transfer routes must be set up. For more information, see [Set Up Locations](#).

To transfer items with a transfer order

1. Choose the  icon, enter **Transfer orders**, and then choose the related link.
2. On the **Transfer Order** page, fill in the fields as necessary. Hover over a field to read a short description.

NOTE

If you have filled in the **In-Transit Code**, **Shipping Agent Code**, and **Shipping Agent Service** fields on the **Trans. Route Spec.** page when you set up the transfer route, then the corresponding fields on the transfer order are filled in automatically.

When you fill in the **Shipping Agent Service** field, the receipt date at the transfer-to location is calculated by adding the shipping time of the shipping agent service to the shipment date.

As a warehouse worker at the transfer-from location, proceed to ship the items.

3. Choose the **Post** action, choose the **Ship** option, and then choose the **OK** button.

The items are now in transit between the specified locations, according to the specifies transfer route.

As a warehouse worker at the transfer-from location, proceed to receive the items.

4. Choose the **Post** action, choose the **Receive** option, and then choose the **OK** button.

To transfer items with the item reclassification journal

1. Choose the  icon, enter **Item Reclass. Journals**, and then choose the related link.
2. On the **Item Reclass. Journal** page, fill in the fields as necessary. Hover over a field to read a short

description.

3. In the **Location Code** field, enter the location where the items are currently stored.

NOTE

To transfer items that have no location code, leave the **Location Code** field blank.

4. In the **New Location Code** field, enter the location that you want to transfer the items to.
5. Choose the **Post** action.

Reserve Items

3/31/2019 • 4 minutes to read

You can reserve items for sales orders, purchase orders, service orders, assembly orders, and production orders. You can reserve items on inventory or inbound on open document or journal lines. You perform the work on the **Reservation** page.

Each line on the **Reservation** page, which you open to reserve items, displays information about one type of line (sales, purchase, journal) or inventory entry. The lines describe how many items are available to be reserved from each type of line or entry.

To reserve items for sales

The following describes how to reserve items from a sales order. The steps are similar for purchase, service, and assembly orders.

1. Choose the  icon, enter **Sales Orders**, and then choose the related link.
2. On a sales order, on the **Lines** FastTab, choose the **Reserve** action. The **Reservation** page opens.
3. Select the line that you want to reserve the items from.
4. Choose one of the following actions.

FUNCTION	DESCRIPTION
Auto Reserve	To automatically reserve items on the Reservation page.
Reserve from Current Line	To reserve the items from the document on the line you have selected.
Cancel Reservation from Current Line	To cancel reservation of the items from the document on the line you have selected.

NOTE

If item tracking lines exist for the sales order, the reservation system will take you through special steps. For more information, see [To reserve a specific serial or lot number](#).

To reserve an item for a production order line

You can reserve items for production orders. You have to distinguish between production order lines, meaning the parent item, and production order components.

In the following procedure, a firm planned production order is used.

1. Choose the  icon, enter **Firm Planned Prod. Order**, and then choose the related link.
2. Open the firm planned production order you want to reserve parent items for.
3. Select the relevant production order line.
4. On the **Lines** FastTab, choose the **Reserve** action.
5. On the **Reservation** page, select the **Sales Line, Order** line, and then choose the **Reserve from Current Line**

action.

The quantity you entered in the firm planned production order line is now reserved.

To reserve items for production order components

You can reserve items for production orders. You have to distinguish between production order lines, meaning the parent item, and production order components.

In the following procedure, a firm planned production order is used.

1. Choose the  icon, enter **Firm Planned Prod. Order**, and then choose the related link.
2. Open the firm planned production order you want to reserve component items for.
3. Select the relevant production order line.
4. On the **Lines** FastTab, choose **Line**, and then choose **Components**.
5. Select the relevant component line.
6. Choose On the **Lines** FastTab, choose the **Reserve** action.
7. On the **Reservation** page, select a line, and then choose the **Reserve from Current Line** action.

The quantity you entered in the firm planned production component line is now reserved.

To change a reservation

Sometimes, you may want to change an item reservation.

1. From the document line that you have reserved from, on the **Lines** FastTab, choose the **Reserve** action.
2. On the **Reservation** page, choose the **Reservation Entries** action.
3. The **Reservation Entries** page, update the **Quantity** field on the line you want to change.
4. Confirm the subsequent message, by choosing the **OK** button.

To cancel a reservation

Sometimes, you may want to cancel an item reservation.

1. From the document line that you want to cancel a reservation from, on the **Lines** FastTab, choose the **Reserve** action.
2. On the **Reservation** page, choose **Reservation Entries** action.
3. On the **Reservation Entries** page, choose the **Cancel Reservation** action.
4. Confirm the subsequent message, by choosing the **OK** button.

To reserve a specific serial or lot number

From outbound documents for item-tracked items, such as sales orders or production component lists, you can reserve specific serial or lot numbers. This may be relevant, for example, if you need production components from a specific lot to ensure consistency with earlier production batches, or because a customer has requested a specific serial number. For more information, see [Work with Serial and Lot Numbers](#).

This is referred to as a specific reservation, because you reserve from the quantity of Item X that belongs to Lot X. If you simply reserve from quantities of Item X, then it is a normal, non-specific, reservation. For more information, see [Design Details - Item Tracking and Reservations](#).

The following procedure is based on a sales order.

1. Choose the  icon, enter **Sales Orders**, and then select the related link.
2. Create a sales order line for an item-tracked item.

3. Assign serial and lot numbers to the sales order line. For more information, see [Work with Serial and Lot Numbers](#).
4. On the sales order line, choose the **Reserve** action.
5. Choose the **Yes** button to reserve specific serial or lot numbers.
6. In the **Item Tracking List** page, select the serial and lot number combination that you have just assigned.
7. Choose the **OK** button to open the **Reservation** page showing only supply with the specified item tracking number. If there are any non-specific reservations on any of the item tracking numbers that you have specified for this line, you are informed of the quantity that has already been reserved.
8. Choose either the **Auto Reserve** or the **Reserve from Current Line** action to create the reservation on the specific item tracking numbers.

Work with Serial and Lot Numbers

3/31/2019 • 17 minutes to read

You can assign serial numbers and lot numbers to any outbound or inbound document, and its posted item tracking entries are displayed in the related item ledger entries. You perform the work on the **Item Tracking Lines** page, which you can open from an inbound or outbound document.

The matrix of quantity fields at the top of the **Item Tracking Lines** page displays the quantities and sums of item tracking numbers being defined on the lines. The quantities must correspond to those of the document line, which is indicated by 0 in the **Undefined** fields.

As a performance measure, the program collects the availability information on the **Item Tracking Lines** page only once, when you open the page. This means that the program does not update the availability information during the time that you have the page open, even if changes occur in inventory or on other documents during that time.

Items with serial or lot numbers can be traced both backwards and forward in the supply chain. This is useful for general quality assurance and for product recalls. For more information, see [Trace Item-Tracked Items](#).

About Picking Serial or Lot Numbers in the Warehouse

Outbound handling of serial or lot numbers is a frequent task in different warehouse processes.

In some processes, the inventory items do not carry serial or lot numbers, and the warehouse worker must assign new during the outbound handling, typically from a predefined number series.

In simple processes, the inventory items already carry serial or lot numbers, for example assigned during the put-away, and these numbers are automatically transferred through all outbound warehouse activities without interaction by warehouse workers.

In special situations for serial- or lot-numbered inventory, specific serial or lot numbers are defined on the source document, such as a sales order, which the warehouse worker must respect during the outbound warehouse handling. This may be because the customer requested a specific lot during the order process. When the inventory pick or warehouse pick document is created from an outbound source document where serial or lot numbers are already defined, then all fields on the **Item Tracking Lines** page under the inventory pick are locked for writing, except the **Qty. to Handle** field. In that case, the inventory pick lines specify the item tracking numbers on individual take and place lines. The quantity is already split into unique serial or lot number combinations because the sales order specifies the item tracking numbers to ship.

Item Tracking Availability

When you work with serial and lot numbers, Business Central calculates availability information for lot and serial numbers and shows it in the various item tracking pages. This lets you see how much of a lot or serial number is currently being used on other documents. This reduces errors and uncertainty caused by double allocations.

On the **Item Tracking Lines** page, a warning icon is shown in the **Availability, Lot No.** or **Availability, Serial No.** field if some or all of the quantity you have selected is already being used in other documents or if the lot or serial number is not available.

On the **Lot No./Serial No.-List** page, the **Lot No./Serial No.-Availability** page, and the **Item Tracking - Select Entries** page, information is displayed about how much quantity of an item is being used. This includes the following information.

FIELD	DESCRIPTION
Total Quantity	The total number of item currently in inventory
Total Requested Quantity	The total number of items that are requested that will be used in this and other documents
Current Pending Quantity	The number of items that are requested that will be used on the current document but that is not yet committed to the database
Current Requested Quantity	The number of items that are requested that will be used on the current document
Total Available Quantity	The total number of items in inventory, minus the quantity of the item that are requested on this and other documents (total requested quantity), and minus the quantity that is requested but not yet committed on this document (current pending quantity)

If you work on the **Item Tracking Lines** page for a long period of time or if there is a great deal of activity with the item you are working with, then you can choose the **Refresh Availability** action. In addition, the availability of the item is automatically rechecked when you close the page to confirm that there are no availability problems.

To set up item tracking codes

An item tracking code reflects the different considerations a company has regarding the use of serial and lot numbers for items moving through the inventory.

1. Choose the  icon, enter **Item Tracking Codes**, and then choose the related link.
2. Choose the **New** action.
3. Fill in the fields as necessary. Hover over a field to read a short description.
4. On the **Serial No.** and the **Lot No.** FastTabs, define policies of item tracking by serial and lot numbers respectively.

NOTE

If you want to track specific items or specific lots throughout their lifetime, you must choose the **SN Specific Tracking** and **Lot Specific Tracking** fields, respectively. As a result, when handling an outbound unit of an item with this item tracking code, you must always specify which existing serial number or which existing lot number to handle. This means that when selling a unit of the item, it must be applied against a specific pool of serial numbers or a specific lot number in inventory. Or in other words, a serial number or lot number assigned to the item when entering into inventory must follow that item type out of inventory.

As this particular setup field covers all possible transactions with the item, the individual inbound/outbound fields will also be selected. However, the individual inbound/outbound fields have nothing to do with application across inventory - they merely define your company's work flow concerning when to assign item tracking numbers.

To set up expiration rules for serial or lot numbers

For some items you might want to set up specific expiration dates and rules in the item tracking code. This functionality allows you to keep track of when specific serial numbers and lot numbers expire.

1. Select an existing item tracking code, and then choose the **Edit** action.

- On the **Misc.** FastTab, select the following check boxes.

FIELD	DESCRIPTION
Strict Expiration Posting	Specifies that an expiration date assigned to the item tracking number as it entered inventory must be respected when it exits inventory.
Man. Expir. Date Entry Reqd.	Specifies that you must manually enter an expiration date on the item tracking line.
Ignore Expiration Dates	Specifies that you do not want to calculate expiration dates.

To set up warranties for serial or lot numbers

For some items, you might want to set up specific warranties in the item tracking code. This functionality allows you to keep track of when the warranties on specific serial or lot numbers in your inventory will run out.

- Choose the , enter **Item Tracking Codes**, and then choose the related link.
- Select an existing item tracking code, and then choose the **Edit** action.
- On the **Misc.** FastTab, fill in the **Warranty Date Formula** field, and then select the check box as follows.

FIELD	DESCRIPTION
Warranty Date Formula	Specifies the last day of warranty for the item.
Man. Warranty Date Entry Reqd.	Specifies that you must manually enter a warranty date on the item tracking line.

To record serial or lot number information

If you need to link special information to a specific item tracking number, for example, for quality assurance, you can do so in a serial or lot number information card.

- Open a document that has serial or lot numbers assigned.
- Open the **Item Tracking Lines** page for the document.
- Choose, for example, the **Serial No. Information Card** action.

The **Serial No.** and **Lot No.** fields are prefilled from the item tracking line.

- Enter a short piece of information in the **Description** field, for example about the condition of the item.
- Choose the **Comment** action to create a separate comment record.
- Select the **Blocked** check box to exclude the serial or lot number from any transactions.

To modify existing serial or lot number information

- Choose the , enter **Items**, and then choose the related link.
- Select an item that has an item tracking code and has serial or lot number information.
- From the **Item Card** page, choose the **Entries** action, and then choose **Ledger Entries**.
- Choose the **Lot No.** or **Serial No.** field. If information exists for the item tracking number, then the **Lot No. Information List** or **Serial No. Information List** page opens.

5. Select a card, and then choose the **Lot No./Serial No. Information Card** action.
6. Modify the short description text, the comment record, or the **Blocked** field.

You cannot modify the serial or lot numbers or quantities. To do so, you must reclassify the item ledger entry in question. For more information, see [To reclassify lot or serial numbers](#).

To assign serial or lot numbers during an inbound transaction

Companies may want to keep track of items from the moment they enter the company. In this situation, the purchase order is often the central document, although item tracking may be handled from any inbound document and its posted entries displayed in the related item ledger entries.

The exact rules for handling item tracking numbers across your company are governed by the setup on the **Item Tracking Code Card** page.

NOTE

To use item tracking numbers in warehouse activities, the **Lot Warehouse Tracking** and **SN Warehouse Tracking** setup fields must be selected, as they define the special principles in handling serial and lot numbers in warehouse activities.

1. Choose the  icon, enter **Purchase Orders**, and then choose the related link.
2. Select the relevant document line and on the **Lines** FastTab, choose the **Line** action, and then choose the **Item Tracking Lines** action.

You can assign serial or lot numbers in the following ways:

- Automatically, by choosing **Assign Serial No.** or **Assign Lot No.** to assign serial/lot numbers from predefined number series.
 - Automatically, by choosing **Create Customized SN** to assign serial/lot numbers based on number series you define specifically for the arrived items.
 - Manually, by entering serial or lot numbers directly, for example, the vendor's numbers.
 - Manually, by assigning a specific number to each item unit.
3. To assign automatically, choose the **Create Customized SN** action.
 4. In the **Customized SN** field, enter the starting number of a descriptive serial number series, for example **S/N-Vend0001**.
 5. In the **Increment** field, enter 1 to define that each sequential number increases by one.

The **Quantity to Create** field contains the line quantity by default, but you can modify it.

6. Select the **Create New Lot No.** check box to organize the new serial numbers in a distinct lot.
7. Choose the **OK** button.

A lot number with individual serial numbers is created according to the item quantity of the document line, starting from **S/N-Vend0001**.

The matrix of quantity fields in the header displays dynamically the quantities and sums of the item tracking numbers you define on the page. The quantities must correspond to those of the document line, which is signified by 0 in the **Undefined** fields.

When the document is posted, the item tracking entries are carried to the associated item ledger entries.

To assign a serial or lot number during an outbound transaction

There are two ways to add serial and lot numbers to outbound transactions:

- Selecting from existing serial or lot numbers. This applies when item tracking numbers have already been assigned during an inbound transaction. For more information, see [To select from existing serial numbers and lot numbers](#).
- Assigning new serial or lot numbers during outbound transactions. This applies when item tracking numbers are not assigned to items until they are sold and ready to be shipped.

The different rules for item tracking numbers are set up on the **Item Tracking Code Card** page.

NOTE

To assign item tracking numbers in warehouse activities, the **SN Warehouse Tracking** and **Lot Warehouse Tracking** check boxes must be selected on the item's item tracking code card.

1. Select the relevant document and, on the **Lines** FastTab, choose the **Order** action, and then choose the **Item Tracking Lines** action.

You can assign item tracking numbers in the following ways:

- Automatically, from predefined number series: Choose the **Assign Serial No.** or **Assign Lot No.** action.
- Automatically, based on parameters you define specifically for the outbound item: Choose the **Create Customized SN** action.
- Manually, by entering serial or lot numbers, without using a number series.

2. For this procedure, assign a serial number automatically by choosing **Assign Serial No.**

The **Quantity to Create** field contains the line quantity by default, but you can modify it.

3. Select the **Create New Lot No.** field to organize the new serial numbers in a distinct lot.
4. Choose the **OK** button to create a lot number and new individual serial numbers according to the quantity to handle on the related document line.

The matrix of quantity fields at the top displays dynamically the quantities and sums of the item tracking numbers that you define on the page. The quantities must correspond to those of the document line, which is signified by **0** in the **Undefined** fields.

When the document is posted, the item tracking entries are carried to the associated item ledger entries.

To select from existing serial or lot numbers

When you are working with items that require item tracking and you are creating outbound transactions, where the items go out of inventory, you typically need to select the lot or serial numbers from those that already exist in inventory.

The exact rules for handling item tracking numbers across your company are governed by the setup of the **Item Tracking Code** table.

NOTE

To handle item tracking numbers in warehouse activities, the item must be set up with SN/Lot Warehouse Tracking, as this dictates the special principles governing serial and lot numbers in the warehouse.

1. From any outbound document, select the line that you want to select serial or lot numbers for.

2. On the **Lines** FastTab, choose the **Actions** action, choose the **Line** or the **Item** action, and then choose the **Item Tracking Lines** action.
3. On the **Item Tracking Lines** page, you have three options for specifying lot or serial number:
 - Select the **Lot No.** or **Serial No.** field, and then select a number from the **Item Tracking Summary** page.
 - Choose the **Select Entries** action. The **Select Entries** page shows all lot or serial numbers along with availability information.
4. In the **Selected Quantity** field, enter the quantity of each lot or serial number that you would like to use.
5. Choose the **OK** button, and the selected item tracking information is transferred to the **Item Tracking Lines** page.
6. Type or scan in the item tracking number.

The matrix of quantity fields in the header dynamically displays the quantities and sums of the item tracking numbers you define on the page. The quantities must correspond to those of the document line, which is signified by **0** in the **Undefined** fields.

When you post the document line, the item tracking information is transferred to the associated item ledger entries.

To handle serial and lot numbers on transfer orders

Procedures for handling serial and lot numbers that are being transferred between different locations are similar to those applied when items are sold and purchased.

However, the transfer order is unique in that shipment and receipt are both done from the same transfer line and, therefore, use the same instance of the **Item Tracking Lines** page. This means that item tracking numbers shipped from one location must be received unchanged at the other location.

The exact rules for handling item tracking numbers across your company are governed by the setup of the **Item Tracking Code** table.

1. Choose the  icon, enter **Transfer Orders**, and then choose the related link.
2. Open the transfer order you want to process. On the **Lines** FastTab, choose the **Line** action, choose the **Item Tracking Lines** action, and then choose the **Shipment** action.
3. On the **Item Tracking Lines** page, assign or select serial or lot numbers as for any other outbound item transaction.

When handling serial and lot numbers for transfer items, the items typically have numbers already assigned to them. Therefore, the process typically consists of selecting from existing serial or lot numbers.

4. Post the transfer order, first ship and then receive, to record that the items are transferred carrying their item tracking entries.

During the transfer, the **Item Tracking Lines** page remains locked for writing.

To handle serial and lot numbers when getting receipt lines from a purchase invoice

When you use functionality to get posted receipt or shipment lines from related invoices or credit memos, then any item tracking lines on the warehouse documents are transferred automatically, however, they are processed in a special way.

The functionality supports the following inbound processes:

- **Get Receipt Lines** - from a purchase invoice.
- **Get Return Shipment Lines** - from a purchase credit memo.

The functionality supports the following outbound processes:

- **Get Shipment Lines** - from a sales invoice or combined shipments.
- **Get Return Receipt Lines** - from a sales credit memo.

In these situations, the existing item tracking lines are copied automatically to the invoice or credit memo, but the **Item Tracking Lines** page does not permit changes to the serial or lot numbers. Only the quantities can be changed.

1. Choose the  icon, enter **Purchase Invoices**, and then select the related link.
2. Open a purchase invoice for items that are purchase with serial or lot numbers.
3. From a purchase invoice line, on the **Lines** FastTab, choose the **Get Receipt Lines** action.
4. On the **Get Receipt Lines** page, select a receipt lines that has item tracking lines, and then choose the **OK** button.

The source document is copied to the purchase invoice as a new line, and its item tracking lines are copied to the underlying **Item Tracking Lines** page.

5. In the purchase invoice, select the transferred receipt line.
6. On the **Lines** FastTab, choose the **Line** action, and then choose the **Item Tracking Lines** action to see the transferred item tracking lines.

The contents of the **Serial No.** and **Lot No.** fields are not editable. However, you can delete complete lines or change the quantities to match changes being made on the source line.

To reclassify serial or lot numbers

Reclassifying item tracking for an item means changing a lot or serial number to a new lot or serial number or changing the expiration date to a new expiration date. If you are working with lots, you can also merge multiple lots into one. You perform these tasks using the item reclassification journal.

1. Choose the  icon, enter **Item Reclass. Journal**, and then choose the related link.
2. Fill in the line with the relevant information. For more information, see [Count Inventory Using Documents](#) or [Count, Adjust, and Reclassify Inventory Using Journals](#).
3. Choose the **Item Tracking Lines** action.
4. In the **Serial No.** or **Lot No.** field, select the current serial or lot number.
5. If you want to enter a new item tracking number, enter it in the **New Serial No.** or **New Lot No.** field. If you want, you can merge one or more lots to one new or existing lot.

NOTE

Be aware that when you reclassify expiration dates, then the items with the earliest expiration dates for outbound transactions are suggested first. For more information, see [Picking by FEFO](#).

6. If you would like to enter a new expiration date for the serial or lot number, enter it in the **New Expiration Date** field.

IMPORTANT

If you are reclassifying a lot to the same lot number but with a different expiration date, you must reclassify the entire lot, using one item reclassification journal line. If you are reclassifying more than one lot to one new lot number, meaning that you are merging more than one lot into one new lot, you must enter the same new expiration date for all the lots. If you are reclassifying one existing lot to a second existing lot that has a different expiration date, you must use the expiration date from the second lot. If you leave the **New Expiration Date** field blank, the lot or serial number will be reclassified with a blank expiration date.

7. If you have existing information on the old serial or lot number, you can copy it to the new serial or lot number.
 - a. On the **Item Tracking Lines** page, choose the **New Serial No. Information** action or the **New Lot No. Information** action.
 - b. To copy information from the old lot or serial number, choose the **Copy Info** action.
 - c. In the information list page, select the lot or serial number that you would like to copy from, and choose the **OK** button.
8. If you want to modify the existing information for the lot or serial number, you can record lot or serial information.
9. Post the journal to link the renewed item tracking numbers or expiration dates to the associated item ledger entry

Use Item Cross References

3/31/2019 • 2 minutes to read

If you set up a cross reference between the item description that you use for an item and the description that the vendor of that item uses, then the vendor's item description is automatically inserted on purchase documents for the vendor when you fill in the **Cross-Reference No.** field. The same functionality applies for customer item numbers on sales documents.

The following procedures describe how to use item cross references on the purchase side. The steps are similar for the sales side.

To set up an item cross reference to a vendor's item description

1. Choose the  icon, enter **Items**, and then choose the related link.
2. Open the card for an item for which you want to create a cross reference to the item description that the vendor uses for that item.
3. Choose the **Cross References** action.
4. On a new line on the **Item Cross-Reference Entries** page, fill in the fields as necessary. Hover over a field to read a short description..

To enter a vendor's item description on a purchase order

1. Choose the  icon, enter **Purchase Orders**, and then choose the related link.
2. Create a purchase order for the vendor that you set up an item cross reference for in the previous procedure.
3. Create a purchase line for the item that you set up an item cross reference for in the previous procedure.
4. In the **Cross-Reference No.** field, select the item cross reference that you have created, and then choose the **OK** button.

The **Description** field on the line is overwritten with the vendor's item description, as set up on the item cross-reference entry.

Trace Item-Tracked Items

3/31/2019 • 3 minutes to read

You can see where an item-tracked item was used, including how and when it was received or produced, transferred, sold, consumed, or returned. You can also find all current instances of a specific serial or lot number in the database. You do this by using the Item Tracing and the Navigate features.

These features can be particularly useful in quality control when you need to find out which customers received products with a particular lot number or when you need to find out which lot a defective component came from.

On the **Item Tracing** page, you can trace forwards and backwards in a sequence of posted inventory transactions for the serial or lot number.

On the **Navigate** page, you cannot see the sequence of transactions, but you can see all records of the serial or lot number, both posted entries and open records.

The two features can be used in combination by transferring a traced serial or lot number to the **Navigate** page to finish a complete trace scenario. For more information, see [Walkthrough: Tracing Serial-Lot Numbers](#).

To trace item-tracked items

1. Choose the  icon, enter **Item Tracing**, and then choose the related link.
2. In the filter fields at the top of the page, enter the specific item numbers or a filter on the item numbers that you would like to trace.
3. In the **Show Components** field, select whether you would like to also see where the components for the items came from. Your options in this field are as follows.

FIELD	DESCRIPTION
No	Select this option if you do not want to see any components.
Item-tracked Only	Select this option if you want to see only components that have lot or serial numbers.
All	Select this option if you want to see all components.

4. In the **Trace Method** field, select the method you would like to use for tracing the item. The options are as follows

FIELD	DESCRIPTION
Usage->Origin	This method traces the item starting from where it was used to where it came from. For instance, if a manufactured item was sold to a customer, the Item Tracing page shows this with the sales shipment line first, which you can then expand to see from which production order it came.

FIELD	DESCRIPTION
Origin->Usage	This method traces the item starting from where it came into inventory to where it was used. For instance, if a manufactured item was sold to a customer, the Item Tracing page shows this with the finished production order first, which you can then expand to see sale shipment lines where the item was used.

5. Choose the **Trace** action to run the trace.

NOTE

If you have received the same lot on more transactions, then the **Item Tracing** page may not show all transactions. Only applied transactions are shown.

NOTE

If additional transaction history under an item tracing line has already been traced by another line above it, then the **Already Traced** check box is selected. To provide a simpler view, such underlying lines are not shown.

To find the item tracing lines where the transaction history has already been traced, choose the **Go to Already Traced** button. The item tracing line in question is selected, and all underlying lines are expanded.

To find item-tracked items with Navigate

1. Choose the  icon, enter **Navigate**, and then select the related link.
2. On the **Item Tracking** FastTab, in the **Serial No.** and **Lot No.** fields, enter the item tracking numbers that you want to trace.
3. Choose the **Find** action to find all instances of the serial or lot number in the database.

Block Items from Sales or Purchasing

5/22/2019 • 2 minutes to read

You can block an item from being entered on sales or purchase lines, and you can block it from being posted in any transaction.

The following table illustrates what occurs when items are blocked.

OPTION	DESCRIPTION
Sales Blocked	You cannot enter the item in a sales document or in a sales item journal.
Purchasing Blocked	You cannot enter the item in a purchase document, in a purchase item journal, or in purchase planning processes.
Blocked	You cannot use the item for any item transaction.

NOTE

Blocked items can be returned. This means that none of the above settings apply when the item is used on return orders and credit memos.

To block an item from being entered on sales lines

1. Choose the  icon, enter **Items**, and then choose the related link.
2. Select the item that you want to block, and then select the **Sales Blocked** check box.

If you try to enter the item on a sales document or journal line, you will now get an error message that the item is blocked.

To block an item from being entered on purchase lines

1. Choose the  icon, enter **Items**, and then choose the related link.
2. Select the item that you want to block, and then select the **Purchasing Blocked** check box.

If you try to enter the item on a purchase document or journal line, you will now get an error message that the item is blocked.

To block an item from being posted

1. Choose the  icon, enter **Items**, and then choose the related link.
2. Select the item that you want to block, and then select the **Blocked** check box.

If you try to post any type of transaction for the item, you will now get an error message that the item is blocked.

Work with Responsibility Centers

3/31/2019 • 3 minutes to read

Responsibility centers provide the ability to handle administrative centers. A responsibility center can be a cost center, a profit center, an investment center, or other company-defined administrative center. Examples of responsibility centers are a sales office, a purchasing department for several locations, and a plant planning office. Using this functionality, for example, companies can set up user-specific views of sales and purchase documents related exclusively to a particular responsibility center.

Using multiple locations together with responsibility centers provides the ability to manage business operations in the most flexible, yet optimal way.

Multiple locations allows companies to manage their inventory in multiple locations using one database. Two concepts, locations and stockkeeping units, are the cornerstones of this granule. A location is defined as a place that handles physical placement and quantities of items. The concept is broad enough to include locations such as plants or production facilities as well as distribution centers, warehouses, showrooms and service vehicles. A stockkeeping unit is defined as an item at a specific location and/or as a variant. Using stockkeeping units, companies with multiple locations are able to add replenishment information, addresses, and some financial posting information at the location level. As a result, they have the ability to replenish variants of the same item for each location as well as to order items for each location on the basis of location-specific replenishment information.

Responsibility centers extends the multiple locations functionality by providing users the ability to handle administrative centers. A responsibility center can be a cost center, a profit center, an investment center, or other company-defined administrative center. Examples of responsibility centers are a sales office, a purchasing department for several locations, and a plant planning office. Using this functionality, for example, companies can set up user-specific views of sales and purchase documents related exclusively to a particular responsibility center.

To set up a responsibility center

1. Choose the  icon, enter **Responsibility Centers**, and then choose the related link.
2. Choose the **New** action.
3. Fill in the fields as necessary. Hover over a field to read a short description.

If you are using responsibility centers to administer your company, it can be useful to have a default responsibility center for your company.

4. Choose the  icon, enter **Company Information**, and then choose the related link.
5. In the **Responsibility Center** field, enter a responsibility center code.

This code will be used on all purchase, sales, or service documents, if the user, customer, or vendor has no default responsibility center. On any sales, purchase, or service document, you can enter another responsibility center than the default.

NOTE

When you enter a responsibility center code on a document, it affects the address, dimensions, and prices on the document.

To assign responsibility centers to users

You can set up users so that in their daily routines the program retrieves only the documents relevant for their particular work areas. Users are usually associated with one responsibility center and work only with documents related to specific application areas at that particular center.

To set this up, you assign responsibility centers to users in three functional areas: Purchases, Sales, and Service Management.

1. Choose the  icon, enter **User Setup**, and then choose the related link.
2. On the **User Setup** page, select the user you want to assign a responsibility center to. If the user not is on the list, you must enter a user ID in the **User ID** field.
3. In the **Sales Resp. Ctr. Filter** field, enter the responsibility center where the user will have tasks related to sales.
4. In the **Purchase Resp. Ctr. Filter** field, enter the responsibility center where the user will have tasks related to purchasing.
5. In the **Service Resp. Ctr. Filter** field, enter the responsibility center where the user will have tasks related to service management.

NOTE

Users will still be able to view all posted documents and ledger entries, not just those related to their own responsibility center.

Project Management

3/31/2019 • 2 minutes to read

In Business Central, you can perform common project management tasks, such as configuring a job and scheduling a resource, as well as providing the information needed to manage budgets and monitor progress. You can track machine and employee hours on the project by using time sheets. As a project manager, you have a good overview, not only of individual jobs, but also of the allocation of employees, machinery and other resources being used in all projects.

Before you can use Business Central to manage projects, you must set up resources, time sheets, and jobs. For more information, see [Setting Up Project Management](#).

The following table describes a sequence of tasks, with links to the topics that describe them.

TO	SEE
Create jobs, assign job tasks, and prepare job planning lines.	Create Jobs
Allocate resources to jobs and manage resource prices.	Use Resources for Jobs
Create a time sheet with integrated job task and planning lines and post time sheet lines to a job journal.	Use Time Sheets for Jobs
Budget for resources to be used in jobs and compare actual item and resource usage to budgeted usage to improve the quality and cost efficiency of future projects.	Manage Job Budgets
Review and record usage on various parts of your job, which is automatically updated as you modify and transfer information from job planning lines to job journals or job invoices for posting.	Record Usage for Jobs
Purchase supplies for a job, either on purchase orders or invoices, and record item and time usage.	Manage Job Supplies
Learn about WIP (Work in Process), a feature that ensures correct financial statements and enables you to estimate the financial value of jobs that are ongoing.	Understanding WIP Methods
Post the consumption of materials, resources, and other expenses of job work in process (WIP) to monitor its financial value and to maintain correct financial statements even though you post job expenses before invoicing the job.	Monitor Job Progress and Performance
Record job costs for resource usage, materials, and job-related purchases on an on-going basis and invoice the customer, either when the job is finished or according to an invoicing schedule.	Invoice Jobs

Get started with projects

Project management is complicated enough in itself, and learning how to create jobs and managing work in

process in a new tool can be another complication. To help you get started with project management in Business Central, you can see [a video about creating jobs](#) on the Business Central YouTube channel.

Create Jobs

3/31/2019 • 3 minutes to read

When you start a new project, you must create a job card with integrated job tasks and job planning lines, structured in two layers.

The first layer consists of job tasks. You must create at least one job task per job because all posting refers to a job task. Having at least one job task in your job enables you to set up job planning lines and to post consumption to the job.

The second layer consists of job planning lines, which specify the detailed use of resources, items and various general ledger expenses.

The layer structure enables you to divide the job into smaller tasks, and therefore use more specific details in budgeting, quotes, and registration. In addition, it gives you insight into how a job is progressing. For example, you can track whether you are meeting designated milestones or if you are on target to meet budget expectations.

TIP

Choose the **New Job** action on the **Project Manager** Role Center to launch an assisted setup guide that takes you through the steps of creating a job with integrated tasks and planning lines. The following procedure describes how to perform the steps manually. For an example of how to create a job manually, see [Video: How to create a job in Dynamics 365 Business Central](#).

To create a job card

You create a job card and then create job task lines and job planning lines for it.

1. Choose the  icon, enter **Jobs**, and then choose the related link.
2. Choose the **New** action, and then fill in the fields as necessary. Hover over a field to read a short description.
3. To specify the job with information on other jobs, choose the **Copy Job** action, fill in the fields as necessary, and then choose the **OK** button.

NOTE

If you are using time sheets with your job, you must also designate a person responsible. This person can approve time sheets for the employee tasks associated with the job. For more information, see [Set Up Timesheets](#).

To create tasks for a job

A key part of creating a job is to specify the various tasks involved in the job. You do this by adding new lines on the **Tasks** FastTab on the **Job Card** page, one task per line. Every job must have at least one task.

1. Choose the  icon, enter **Jobs**, and then choose the related link.
2. Open the job card for a relevant job.
3. On the **Tasks** FastTab, fill in the fields as necessary on a new line.
4. To indent tasks and create a hierarchy, Choose the **Tasks** action, the then choose **Indent Job Tasks** action.
5. Repeat steps 3 and 4 for all the tasks that you need for the job.
6. To specify the job tasks with information on other job tasks, choose the **Copy Job Tasks from** action, fill in the

fields as necessary, and then choose the **OK** button.

To create planning lines for a job

You can refine your new job tasks on job planning lines. A planning line can be used to capture any information that you want to track for a job. You can use planning lines to add information such as what resources are required or to capture what items are needed to perform the job. For example, if you have a task to obtain customer approval of a job, you can associate that task with planning lines for items such as meeting with the customer and assigning a resource.

A job planning line can have one of the following types.

TYPE	DESCRIPTION
Budget	Provides estimated usage and costs for the job, typically in a time and materials type project. Planning lines of this type cannot be invoiced.
Billable	Provides estimated invoicing to the customer, typically in a fixed price project.
Both Budget and Billable	Provides budgeted usage equal to what you want to invoice.

Note. As you enter information on job planning lines, cost information is automatically filled in. For example, the cost, price, and discount for resources and items are initially based on the information that is defined on the resource and item cards.

1. Choose the  icon, enter **Jobs**, and then choose the related link.
2. Open a relevant job card.
3. Select a job task for which the **Job Task Type** field contains **Posting**, and then choose the **Job Planning Lines** action.
4. On the **Job Planning Lines** page, on a new line, fill in the fields as necessary.
5. Repeat steps 3 and 4 for all planning lines that you need for the job task.

Use Resources for Jobs

3/31/2019 • 2 minutes to read

You record the usage of resources in the job journal to keep track of costs, prices, and the work types that are linked to jobs. For more information, see [Record Usage for Jobs](#).

You can also post the usage of a resource in a resource journal. Entries posted in a resource journal have no effect on the general ledger.

To assign resources to jobs

You assign resources to jobs by creating job planning lines for the job. For more information, see [Create Jobs](#).

To record resource usage for a job

1. Choose the  icon, enter **Job Journals**, and then choose the related link.
2. Open a relevant job journal batch, and then fill in the fields as necessary. Hover over a field to read a short description.
3. When the journal is complete, choose the **Post** action.

To adjust resource prices

If you want to change costs or prices for a large number of resources, you can use a batch job.

1. Choose the  icon, enter **Adjust Resource Costs/Prices**, and then choose the related link.
2. Fill in the fields on a line as necessary, and then choose the **OK** button.

NOTE

This batch job does not create or adjust alternate costs or prices for resources. It only changes the contents of the field on the resource card for the **Adjust Field** field that you selected in the batch job. The adjustment will take effect immediately for resources, so check your adjustment factors before you run the batch job.

To get resource price change suggestions based on existing alternate prices

If you have already set up alternate resource price for some resources, you can use a batch job to set up multiple alternate resource prices.

1. Choose the  icon, enter **Resource Price Changes**, and then choose the related link.
2. Choose the **Suggest Res. Price Chg. (Price)** action, and then fill in the fields as necessary.
3. Choose the **OK** button.
4. When the batch job is finished, the **Resource Price Changes** page shows the results of the batch job.

To get resource price change suggestions based on standard prices

If you want to set up multiple alternate resource prices based on the standard prices on the resource cards, you can use a batch job.

1. Choose the  icon, enter **Resource Price Changes**, and then choose the related link.

2. Choose the **Suggest Res. Price Chg. (Res.)** action, and then fill in the fields as necessary.
3. Choose the **OK** button.
4. When the batch job is finished, open the **Resource Price Changes** page to see the results of the batch job.

To get resource price change suggestions based on alternate prices

If you have already set up alternate resource price for some resources, you can use a batch job to set up multiple alternate resource prices.

1. Choose the  icon, enter **Suggest Res. Price Chg. (Price)**, and then choose the related link.
2. Fill in the fields as necessary.
3. Choose the **OK** button.
4. When the batch job is finished, open the **Resource Price Changes** page to see the results of the batch job.

[Working with Business Central](#)

Use Time Sheets for Jobs

3/31/2019 • 7 minutes to read

You use the **Create Time Sheets** batch job to set up time sheets for a specified number of time periods or weeks. You must have permissions to be able to create time sheets.

You can copy and use your job planning lines in a time sheet. In that way, you must only enter the information in one place and the line information is always correct.

After you have approved time sheet entries for a job, you can post them to the relevant job journal or resource journal.

Before you can use time sheets, you must set up general information and specify an administrator and one or more approvers of time sheets. For more information, see [Set Up Time Sheets](#).

To create a time sheet

You can use the **Create Time Sheets** batch job to set up time sheets for a specified number of time periods or weeks. Then, the time sheet owner can open it and record time that has been spent on a task.

1. Choose the  icon, enter **Time Sheets**, and then choose the related link.
2. On the **Time Sheet List** page, choose the **Create Time Sheets** action.
3. Fill in the fields as necessary. Hover over a field to read a short description.

NOTE

The **Use Time Sheet** and **Time Sheet Owner User ID** fields must be filled in on the card for the resource of the time sheet.

1. Choose the **OK** button.

You can view the time sheets that you have created on the **Time Sheet list** page.

To copy job planning lines to a time sheet

The following procedure describes how to quickly add job planning lines to a time sheet.

1. Choose the  icon, enter **Time Sheets**, and then choose the related link.
2. On the **Time Sheet List** page, select a time sheet for the relevant time period, and then choose the **Edit Time Sheet** action.
3. Choose the **Create lines from job planning** action. Any job planning lines in the time sheet time period are copied to the time sheet for the person or machine in the **Resource No.** field on the time sheet.

To define work types and add one to a time sheet

You can define the work type for all time sheet lines for jobs. In this way, you can add information that you need to bill the customer for different types of work.

1. Choose the  icon, enter **Time Sheets**, and then choose the related link.
2. Open the relevant time sheet.
3. Choose the **Description** field.
4. On the **Time Sheet Line Job Detail** page, choose the **Work Type Code** field, and select a work type from the

list, such as **Miles**.

5. If no work types exist, chose the **New** action.
6. On the **Work Types** page, fill in the fields as necessary.
7. Repeat step 4 to assign the new work type to the time sheet.

To reuse time sheet lines in other time sheets

If your time sheet information remains the same from time period to time period, you can save time by copying the lines from the previous time period. Then, you just enter your time usage for the new period.

1. Choose the  icon, enter **Time Sheets**, and then choose the related link.
2. Open the time sheet for a period later than the period for an existing time sheet with lines.
3. Choose the **Copy Lines from Previous Time Sheet** action.

The lines are copied, including details such as type and description. For example, if the line is related to a job, the **Job No.** is copied. All copied lines have the status **Open**. You can now modify the lines as needed.

To fill in a time sheet lines and submit for approval

Time sheet registration is tracked in hours, the standard base unit of measure for resources. By default, a time sheet shows the common work days of Monday through Friday.

1. Choose the  icon, enter **Time Sheets**, and then choose the related link.
2. Select a time sheet for the relevant time period, and then choose the **Edit Time Sheet** action.
3. Fill in the fields on a line as necessary. Enter the number of hours used by the resource on each day of the week.

TIP

You can review the sum of time sheet hours that you have entered in the **Actual/Budgeted Summary** FactBox.

4. Repeat step 3 for other work types that the resource performs.
5. Choose the **Submit** action, and then choose the **All open lines** action to submit all lines or the **Selected lines only** action to submit only the lines that are selected on the **Time Sheet** page.

NOTE

You can only submit time sheet lines for which you have entered time.

6. To modify information on a line that has been set to **Submitted**, select the line, and then choose the **Reopen** action.

NOTE

A manager may reject a time sheet line that is submitted for approval. If a line has a status of **Rejected**, you can make changes to the line, and then choose **Submit** again.

7. Choose the **OK** button.

To approve or reject a time sheet

A time sheet must be submitted for approval before it can be used. You can approve and reject individual lines on a time sheet or send them back to the submitter for additional action. A time sheet can be approved in two ways:

- A time sheet administrator can approve any time sheet.
- The person who is specified in the **Time Sheet Approver User ID** field on a resource card can approve that resource's time sheets. For more information, see [Set Up Time Sheets](#).

1. Choose the  icon, enter **Manager Time Sheets**, and then choose the related link.
2. Select a time sheet from the list.
3. On the **Time Sheet** page, choose the **Approve** action, and then choose the **All submitted lines** action to approve all lines or the **Selected lines only** action to approve only the lines that are selected on the **Time Sheet** page.
4. Choose the **OK** button.
5. Alternatively, choose the **Reject** action and follow steps 4 through 5.

TIP

Use the **Time Sheet Status** and **Actual/Budgeted Summary** FactBoxes to get an overview of time sheet information.

After you have approved or rejected a time sheet, it cannot be modified unless it is first reopened. The following procedure explains how to reopen an approved or rejected time sheet.

To reopen a time sheet

1. Choose the  icon, enter **Manager Time Sheets** or **Time Sheets**, and then choose the related link.
2. Open a time sheet from the list.

NOTE

You can only reopen lines that have the status **Approved**. You cannot reopen lines that have the status **Rejected**. You cannot reopen a time sheet if it has been posted.

3. On the **Time Sheet** page, choose the **Reopen** action, and then choose the **All submitted lines** action to reopen all lines or the **Selected lines only** action to reopen only the lines that are selected on the **Time Sheet** page.
4. Choose the **OK** button. The status of the time sheets line or lines is changes to **Submitted**.

To post time sheet lines in a resource journal

After you have approved time sheet entries for a resource, you can post them to the relevant resource journal.

1. Choose the  icon, enter **Resource Journal**, and then choose the related link.
2. Choose the **Suggest Lines from Time Sheets** action.
3. Fill in the fields as necessary.
4. Choose the **OK** button. Entries for usage are created in the resource journal, where you can modify the information as needed.
5. Choose the **Post** action.
6. To verify the posting, choose the **Ledger Entries** action. The **Resource Ledger Entries** page opens showing the result of posting the resource journal.

To post time sheet lines in a job journal

After you have approved time sheet entries for a job, you can post them to the relevant job journal.

1. Choose the  icon, enter **Job Journal**, and then choose the related link.
2. Choose the **Suggest Lines from Time Sheets** action.
3. Fill in the fields as necessary.
4. Choose the **OK** button. Entries for usage are created in the job journal, where you can modify the information as needed.

NOTE

Information about work type and whether the work is chargeable is copied from the time sheet line. If needed, you can reduce the quantity of hours and do a partial posting. If you reduce the quantity, then the next time that you choose the **Suggest Lines From Time Sheets** action, the line that is created will contain the remaining quantity of hours.

5. Choose the **Post** action.
6. To verify the posting, choose the **Ledger Entries** action. The **Job Ledger Entries** page opens showing the result of posting the resource journal.

To archive time sheets

After you have posted time sheets, you can archive them for future reference. All time sheets lines must be posted before a time sheet can be archived.

NOTE

When you archive a time sheet, it is removed from the lists in both the **Time Sheets** page and the **Manager Time Sheets** page.

1. Choose the  icon, enter **Move Time Sheets to Archive**, and then choose the related link.
2. Fill in the fields as necessary, and then choose the **OK** button.
3. To review archived time sheets, choose the  icon, enter **Time Sheet Archives** or **Manager Time Sheet Archives**, and then choose the related link.

Manage Job Budgets

3/31/2019 • 2 minutes to read

You can set up a budget for each job. The budget is used to plan the resources that you allocate to a job. The budget can be either general with few entries or it can contain more entries that are divided into activity levels. You can then compare the budgeted amounts with the actual usage as recorded in the job journal. By monitoring differences between actual usage and budgeted usage, you can control an ongoing project and improve the quality of future jobs by reducing the risk of underestimating costs.

The following procedure describes how to estimate budgeted costs during planning. For information about recording budgeted versus actual job prices and costs, see [Record Usage for Jobs](#).

To estimate the budgeted costs for a job

When a customer wants to know the price of a job that will be invoiced based on usage, you must have to determine the budgeted costs for the job. You use the **Job Task Lines** page to do this.

1. Choose the  icon, enter **Jobs**, and then choose the related link.
2. Open a relevant job.
3. Select a task line of type Posting, and then choose the **Job Planning Lines** action.
4. On a new line, fill in the fields as necessary. Hover over a field to read a short description.

For the **Line Type** field, refer to the following information.

LINE TYPE	DESCRIPTION
Both Budget and Billable	The cost and price amounts entered on the planning line are the budgeted costs for the particular planning line. The price amount will be invoiced.
Budget	The customer is not charged for usage. Usage is not transferred to an invoice, but will still be used in the calculation of WIP.
Billable	The customer is charged for usage. Usage is transferred to the invoice, based on the quantity specified in the Qty. to Transfer to Invoice field.

NOTE

The **Planned Delivery Date** field for the planning line contains the date when usage related to the planning line is expected to be completed. It is also the date when the planning line may be transferred to a sales invoice and posted.

On the underlying job task on the **Job Card** page, the **Start Date** and **End Date** fields respectively contain the value of the **Planned Delivery Date** field on the earliest and latest job planning lines in the related **Job Planning Lines** page.

NOTE

When you fill in the **Quantity** field, all total price and total cost information will be calculated and filled in for that planning line. You can edit them at any time.

On the **Job Card** page, you can now see a summary of the total budgeted costs, budgeted price, billable cost and billable price for each task.

For information about recording budgeted versus actual job prices and costs, see [Record Usage for Jobs](#).

Record Usage for Jobs

3/31/2019 • 4 minutes to read

On the **Job Planning Lines** page, you can review and record usage on various parts of your job, which is automatically updated as you modify and transfer information between jobs and job journals or job invoices. This requires that you have set up a job so that the **Apply Usage Link by Default** is turned on. For more information, see [Set Up Jobs](#).

For example, for planning lines of type **Budget**, you can enter the quantity of a resource, and indicate what quantity to transfer to the job journal. If the type of the planning line is **Billable**, you can enter the quantity of the resource, and indicate what quantity to transfer to an invoice. By comparing the quantity that has been transferred to the journal or invoice with the remaining quantity, you can quickly review usage information.

The following procedures describe how to record actual (billable) or budgeted job prices and costs. For information about estimating budgeted values during planning, see [Manage Job Budgets](#).

To record usage for a job planning line of type Budget

1. Choose the  icon, enter **Jobs**, and then choose the related link.
2. Select the relevant job, and then choose the **Job Planning Lines** action.
3. Select a job planning line of type **Budget** or **Both Budget and Billable** for which you want to record usage.
4. In the **Qty. To Transfer to Journal** field, enter the number that you want to transfer. The default quantity is the value that you enter in the **Quantity** field.

The **Remaining Quantity** field shows the quantity that remains to complete the job and be transferred to the journal.

5. Choose the **Create Job Journal Lines** action.
6. On the **Job Transfer Job Planning Line** page, fill in the fields as necessary, and then choose the **OK** button. Hover over a field to read a short description.
7. Choose the **Open Job Journal** action.
8. On the **Job Journal** page, select the relevant line and then choose the **Post** action.
9. On the **Job Planning Lines** page, review the recorded usage by observing the **Quantity**, **Remaining Quantity**, and **Qty. To Transfer to Journal** fields.
10. Repeat steps 3 through 8 to record additional usage.

To record usage for a job planning line of type Billable

In the next task, you also record usage, but for a job planning line of type **Billable**. Typically, in this case, you invoice your usage, but you can also transfer it to a journal. However, when you do that, a job planning line of type **Budget** is created to match the billable line. For more information, see [Manage Job Budgets](#).

1. Choose the  icon, enter **Jobs**, and then choose the related link.
2. Select the relevant job, and then choose the **Job Planning Lines** action.

3. Select a job planning line of type **Billable** for which you want to record usage.
4. In the **Qty. To Transfer to Invoice** field, enter the number that you want to transfer. The default quantity is the value that you enter in the **Quantity** field.

The **Quantity to Invoice** field shows the quantity that remains to complete the job and be invoiced.
5. Choose the **Create Sales Invoice** action.
6. On the **Job Transfer to Sales Invoice** page, fill in the fields as necessary, and then choose the **OK** button.
7. On the **Job Planning Lines** page, select the relevant line, and then choose the **Post** action.
8. Review the recorded usage by observing the **Quantity, Quantity to Invoice, Qty. To Transfer to Invoice** fields, and, if the sales invoice is posted, the **Qty. Invoiced** fields.
9. Repeat steps 3 through 8 to record additional usage.
10. To review a related posted sales invoice, choose the **Sales Invoices/Credit Memos** action.
11. On the **Job Invoices** page, select the relevant invoice, and then choose the **Open Sales Invoice/Credit Memo** action.

To create job journal lines from job planning lines

When you are ready to post financial information for jobs, you must create job journal lines that you can post.

1. Choose the  icon, enter **Jobs**, and then choose the related link.
2. Select a relevant open job, and then choose the **Job Planning Lines** action.
3. On the **Job Planning Lines** page, on a relevant job planning line, in the **Qty. to Transfer to Journal** field, enter the quantity that you want to transfer to a job journal.
4. Choose the **Create Job Journal Lines** action.
5. On the **Job Transfer Job Planning Line** page, fill in the fields as necessary.
6. Choose the **OK** button. Job journal lines are created.
7. To verify the transfer, open the relevant job journal batch and check the entries.
8. When the job journal lines are complete, choose the **Post** action.

To create job journal lines manually

1. Choose the  icon, enter **Job Journals**, and then choose the related link.
2. In the **Batch Name** field, choose a relevant job journal batch.
3. On a new line, enter document number, job number, job task number, type, and the quantity of the type being consumed.
4. When the job journal lines are complete, choose the **Post** action.

To review planning lines for a job ledger entry

After you have posted job journal lines, you can see the planning lines that are associated with the job journal entries that have been posted.

NOTE

This requires that the **Apply Usage Link by Default** check box has been selected for the job, or is the default setting for all jobs in your organization. For more information, see [Set Up Jobs](#).

1. Choose the  icon, enter **Job Journals**, and then choose the related link.

2. Select a relevant job journal, and then choose the **Ledger Entries** action.
3. On the **Job Ledger Entries** page, choose **Show Linked Job Planning Lines** action.

Manage Job Supplies

3/31/2019 • 2 minutes to read

Managing project supplies of items, services, and expenses is an integral and critical aspect of the execution of all jobs. You can use inventory quantities or make job-specific purchases using purchase orders or purchase invoices. For example, a service job on a computer requires a new disk. You create a purchase invoice to buy a new disk and record the job that it will be used on.

If the purchase process does not require that the physical transaction be recorded separately, then a purchase may be processed on the **Job G/L Journal** page. For more information, see [Record Usage for Jobs](#).

To purchase items or services for a job

The following procedure shows how to use a purchase invoice to purchase products for a job. The same steps apply when using a purchase order.

1. Choose the  icon, enter **Purchase Invoices**, and then choose the related link.
2. Choose the **New** action and fill in the fields as necessary. For more information, see [Record Purchases](#).
3. In the **Job No.** and **Job Task No.** fields, select the information of the job that you want to purchase items or services for. Use the **Choose Columns** function if the field is not visible. For more information, see [Personalizing Your Workspace](#).

The value that you select in the **Job Line Type** field defines whether a planning line is created when you post the usage of the item. If the field contains **Billable**, then job planning lines that are ready to be invoiced to the customer are created. For more information, see [Invoice Jobs](#).

4. Choose the **Post** action.

To view the value of purchases for a job

1. Choose the  icon, enter **Jobs**, and then choose the related link.
2. Open a relevant job card.

On the **Tasks** FastTab, the **Outstanding Orders** field shows the total outstanding amount, in local currency, of inventory items and services on purchase documents for the job task line.

The **Amt. Rec. Not Invoiced** field shows the value of items delivered on purchase documents, but not yet invoiced.

3. Choose either of the fields to open the **Purchase Lines** page where you can review information about the related purchase document lines, including which items or services have been received.

To post a job-related expense

If you incur extraordinary or one-time job expenses, you can use the **Job G/L Journal** page to post them directly to the relevant job account.

1. Choose the  icon, enter **Job G/L Journals**, and then choose the related link.
2. Create a new line and enter information about the expense, including information in the **Job No.** and **Job Task No** fields.
3. When the journal is complete, choose the **Post** action.

Understanding WIP Methods

3/31/2019 • 2 minutes to read

Business Central supports the following methods of calculating and recording the value of work in process.

WIP METHOD	CALCULATION FORMULA	CALCULATION DESCRIPTION
<p>Cost Value</p>	<p>Recognized Revenue = Billable Invoiced Price</p> <p>Estimated Total Costs = Billable Total Price x Budget Cost Ratio</p> <p>WIP Costs = (Percentage of Completion - Invoiced %) x Estimated Total Costs</p> <p>Percentage of Completion = Usage Total Costs / Budget Total Costs Invoiced % = Billable Invoiced Price</p> <p>Billable Total Price Recognized Costs = Usage Total Costs - WIP</p>	<p>Cost value calculations start by calculating the value of what has been provided by taking a proportion of the estimated total costs based on percentage of completion. Invoiced costs are subtracted by taking a proportion of the estimated total costs based on the invoiced percentage.</p> <p>This calculation requires that the billable total price, budget total price, and budget total costs be correctly entered for the whole job.</p>
<p>Cost of Sales</p>	<p>Recognized Revenue = Billable Invoiced Price</p> <p>Recognized Costs = Budget Total Cost x Invoiced Percentage</p> <p>Invoiced % = Billable Invoiced Price / Billable Total Price</p> <p>(Invoiced % exists as column on job task lines)</p> <p>WIP Costs = Usage Total Costs – Recognized Costs</p>	<p>Cost of sales calculations begin by calculating the recognized costs. Costs are recognized proportionally based on budget total costs.</p> <p>This calculation requires that the billable total price and budget total costs be correctly entered for the whole job.</p>
<p>Sales Value</p>	<p>Recognized Costs = Usage Total Costs</p> <p>Recognized Revenue = Usage Total Price x Expected invoicing ratio</p> <p>Cost Recovery % = Billable Total Price / Budget Total Price</p> <p>WIP Sales = Recognized Sales - Billable Invoiced Price</p>	<p>Sales value calculations recognize revenue proportionally based on usage total costs and the expected cost recovery ratio.</p> <p>This calculation requires that the billable total price and budget total price be correctly entered for the whole job.</p>

WIP METHOD	CALCULATION FORMULA	CALCULATION DESCRIPTION
Percentage of Completion	<p>Recognized Costs = Usage Total Costs</p> <p>Recognized Revenue = Billable Total Price x Percentage of Completion</p> <p>Percentage of Completion = Usage Total Costs / Budget Total Costs (Referred to as "Cost Completion %" on job task lines)</p> <p>WIP Sales = Recognized Sales - Billable Invoiced Price</p>	<p>Percentage of completion calculations recognize revenue proportionally based on the percentage of completion, that is, usage total costs vs. budget costs.</p> <p>This calculation requires that the billable total price and budget total costs be correctly entered for the whole job.</p>
Completed Contract	<p>WIP Amount = WIP Cost Amount = Usage (Total Cost)</p> <p>WIP Sales Amount = Billable (Invoiced Price)</p>	<p>Completed contract does not recognize revenue and costs until the job is complete. You may want to do this when there is high uncertainty around the estimates of costs and revenue for the job.</p> <p>All usage is posted to the WIP Costs account (asset) and all invoiced sales are posted to the WIP Invoiced Sales account (liability) until the job is complete.</p>

Monitor Job Progress and Performance

3/31/2019 • 4 minutes to read

As a job progresses, materials, resources, and other expenses are consumed and must be posted to the job. Work in Process (WIP) is a feature that enables you to estimate the financial value of jobs in the general ledger while the jobs are ongoing. In many cases, you might post expenses for a job before invoicing a job. When only expenses have been posted, your financial statement will be inaccurate. For more information, see [Understanding WIP Methods](#).

To track the value in the general ledger, you can calculate WIP and post the value to the general ledger.

You can calculate WIP based on the following:

- Cost Value
- Sales Value
- Recognizable Cost
- Percentage of Completion
- Completed Contract

If you want to view the result using a different method, you can change the method and calculate WIP again. There is no limit to the number of times that you calculate WIP. WIP is only calculated, it does not get posted to the general ledger. After you have calculated WIP, you can post to the general ledger.

To create a job WIP method

You can create a job WIP method that reflects the needs of your organization. After you have created it, you can set it as the default job WIP calculation method that will be used in your organization.

NOTE

After you have used your new method to create WIP entries, you cannot delete the method or modify it.

1. Choose the  icon, enter **Job WIP Methods**, and then choose the related link.
2. Choose the **New** action, and then fill in the fields as necessary. Hover over a field to read a short description.
3. Close the page.
4. To make this new method the default, choose the  icon, enter **Jobs Setup**, and then choose the related link.
5. In the **Default WIP Method** field, choose the method from the list.

To define a WIP method for a job

When you create a new job, you must specify which job WIP method that applies. In some cases, which Job WIP method that you can use has been set up for you as a default.

1. Choose the  icon, enter **Jobs**, and then choose the related link.
2. Choose the **New** action. For more information, see [Create Jobs](#).
3. On the **Job Card** page, in the **WIP Method** field, select a WIP method from the list. If a default method has been defined, you can select another option if needed.

To calculate WIP

You can determine the WIP amount that is to be posted to balance sheet accounts for the period end reporting. You use the **Job Calculate WIP** batch job to do this.

1. Choose the  icon, enter **Job Calculate WIP**, and then choose the related link.
2. Choose the **Calculate WIP** action.
3. On the **Job Calculate WIP** page, fill in the fields as necessary.
4. Choose the **OK** button.

NOTE

The batch job only calculates the WIP. It is not posted to the general ledger. To do so, you must run the **Post WIP to G/L** batch job when you have calculated the WIP. For more information, see the following procedure.

To post WIP

When you have calculated WIP, you can post it to balance sheet accounts for the period end reporting. You use the **Job Post WIP to G/L** batch job to do this.

1. Choose the  icon, enter **Job Post WIP to G/L**, and then choose the related link.
2. On the **Job Post WIP to G/L** page, fill in the fields as necessary.
3. Choose the **OK** button.

To view job usage estimates and post updates

You can view job usage up to the completion of a project in one step. To do so, you use the **Job Calc. Remaining Usage** batch job for all the tasks up to and including the end of a job.

This lets you track and compare your original estimates against actual results and make modifications or new entries as needed. For example, you may have estimated that a job required 10 hours, and to date, it has taken 15 hours. You can add the extra five hours to the existing journal line or create a new journal line to report these five hours as overtime, which is another work type. The appropriate cost and price are calculated, and you can then post to the journal.

NOTE

Item entries create item ledger entries and reduce the inventory quantity. The **Post Inventory Cost to G/L** batch job transfers the cost from inventory to the general ledger. Resource entries create resource ledger entries.

1. Choose the  icon, enter **Job Journals**, and then choose the related link.
2. Select a relevant job journal, and then choose the **Calc. Remaining Usage** action.
3. On the **Job Calc. Remaining Usage** page, enter the document number and posting date that is to be inserted in the journal, and then choose the **OK** button.
4. Update the journal with any modifications that may be needed.
5. Choose the **Post**.

To view job ledger entries

All job-related entries are recorded in job registers and are numbered sequentially, starting with 1. From the job register, you can get an overview of all job ledger entries.

1. Choose the  icon, enter **Job Registers**, and then choose the related link.
2. Select a relevant register, and then choose **Job Ledger** action.

On the **Job Ledger Entries** page you can review the entries that are associated with any job.

Invoice Jobs

3/31/2019 • 3 minutes to read

During the project, job costs from resource usage, materials, and job-related purchases can accumulate. As the job progresses, these transactions get posted to the job journal. It is important that all costs get recorded in the job journal before you invoice the customer.

You can invoice the whole job from the **Job Task Lines** page or only invoice selected billable lines from the **Planning Lines** page. Invoicing can be done after the job is finished or at certain intervals during the job's progress based on an invoicing schedule.

NOTE

If you select **Billable** in the **Job Line Type** field on the purchase documents for job-related purchases, then job planning lines that are ready to be invoiced to the customer are created. For more information, see [Manage Project Supplies](#).

To create and post a job sales invoice

You can create an invoice for a job or for one or more job tasks for a customer when either the work to be invoiced is complete or the date for invoicing based on an invoicing schedule has been reached.

From the **Jobs** page, you can invoice a customer by selecting the job, and then choosing the **Create Job Sales Invoice** action. The following procedure shows how to use a batch job to invoice multiple jobs.

1. Choose the  icon, enter **Job Create Sales Invoice**, and then choose the related link.
2. Fill in the fields as necessary. Hover over a field to read a short description.
3. Set filters if you want to limit the jobs that the batch job will process.
4. Choose the **OK** button to create the invoices.

To create multiple job sales invoices from job planning lines

You can create an invoice from a job planning lines, and indicate at that time the quantity of the item, resource, or general ledger account that you want to invoice.

1. Choose the  icon, enter **Jobs**, and then choose the related link.
2. Open a relevant job.
3. Select a job task for which the **Job Task Type** field contains **Posting**, and then choose the **Job Planning Lines** action.
4. On a job planning line, in the **Qty. To Transfer to Invoice** field, enter the quantity of the item, resource, general ledger account type that you want to invoice.
5. Choose the **Create Sales Invoice** action.
6. On the **Job Create Sales Invoice** page, enter the posting date and whether you want to create a new invoice or append this invoice to an existing one.
7. Choose the **OK** button.

On the job planning line, in the **Qty. Transferred to Invoice** field, you can see the quantity.

8. On the **Job Planning Lines** page, choose the **Sales Invoices/Credit Memos** action.

The **Sales Invoice** page opens, showing the quantity that you have transferred to the invoice.

9. Make any additional changes, and then choose the **Post** action.

NOTE

The above procedure is similar for creating, reviewing, and posting a job-related sales credit memo.

To calculate and post job completion entries

When you have completed all activities for a job, including usage posting and invoicing, you must update the job to have a **Status** of **Completed**. Then, you must reverse any WIP that has been posted to the general ledger.

1. Choose the  icon, enter **Jobs**, and then choose the related link.
2. Select an open job, and then choose the **Edit** action.
3. In the **Status** field, select **Completed**.
4. Follow the assistance steps to calculate and post WIP. Alternatively, follows steps 5 and 6 to do so manually.
5. Choose the **Calculate WIP** action.
6. On the **Job Calculate WIP** page, fill in the fields as necessary.

The job WIP entries created by running the batch job will have the **Job Complete** check box selected to show that they are completion entries.

7. Choose the **Job Post WIP to G/L** action.
8. On the **Job Post WIP to G/L** page, fill in the fields as necessary.

The job WIP general ledger entries created by running the batch job will have the **Job Complete** check box selected to show they are completion entries.

Fixed Assets

3/31/2019 • 2 minutes to read

The Fixed Assets functionality in Business Central provides an overview of your fixed assets and ensures correct periodic depreciation. It also enables you to keep track of your maintenance costs, manage insurance policies, post fixed asset transactions, and generate various reports and statistics.

For each fixed asset, you must set up a card containing information about the asset. You can set up buildings or production equipment as a main asset with a component list, and you can group them in various ways, such as by class, department, or location. Then you can begin to acquire, maintain, and sell the fixed assets. You can also set up budgeted assets. This makes it possible to include any anticipated acquisitions and sales in reports.

To keep track of fixed asset depreciations as well as other financial transactions related to fixed assets, you set up one or more depreciation books for each fixed asset in your company. Depreciation is done by running a report to calculate periodic depreciation and fill in a journal with the resulting entries, ready to be posted. Business Central supports several depreciation methods. For more information, see [Depreciation Methods](#). You can set up multiple depreciation books per fixed asset for different purposes, such as one for tax reporting and another for internal reporting.

For each asset, you can record maintenance costs and the next service date. Keeping track of maintenance expenses can be important for budgeting purposes and for making decisions about whether to replace a fixed asset.

Each fixed asset can be attached to one or more insurance policies. You can therefore easily verify that insurance policy amounts are in accordance with the value of the assets that are linked to the policy. This also makes it easy to monitor annual insurance premiums.

NOTE

You can record fixed asset transactions on the **Fixed Asset G/L Journal** page or on the **Fixed Asset Journal** page, depending on whether the transactions are for financial reporting or for internal management. Help for Fixed Assets only describes how to use the **Fixed Asset G/L Journal** page. For more information, see [Set Up Fixed Asset Depreciation](#).

Before you can begin to manage fixed assets, you must set up default values, fixed asset accounting, posting groups, allocation keys, journals, and posting types. For more information, see [Setting Up Fixed Assets](#).

The following table describes a sequence of tasks, with links to the topics that describe them.

TO	SEE
Create fixed assets, assign depreciation methods, post acquisitions, salvage values, and print fixed asset lists.	Acquire Fixed Assets
Record service visits, post maintenance costs, and monitor maintenance costs.	Maintain Fixed Assets
Update insurance information, post acquisition costs to insurance policies, modify insurance coverage, view insurance statistics, and list insurance policies.	Insure Fixed Assets

TO	SEE
Reclassify fixed assets, transfer fixed assets to different locations, split up or combine assets.	Transfer, Split, or Combine Fixed Assets
Adjust values of fixed assets, post appreciation, and post write-down transactions.	Revalue Fixed Assets
Calculate depreciation, post depreciation, and analyze depreciation in fixed assets reports.	Depreciate or Amortize Fixed Assets
Post disposal transactions, view disposal ledger entries, and post partial disposals.	Dispose of or Retire Fixed Assets
Manage fixed asset budgets, budget acquisition costs, budget disposals of fixed assets, and budget depreciation.	Manage Budgets for Fixed Assets

Acquire Fixed Assets

3/31/2019 • 5 minutes to read

For each fixed asset, you must set up a card containing information about the asset. You can set up buildings or production equipment as a main asset with a component list, and you can group them in various ways, such as by class, department, or location. A depreciation book must be set up and assigned to each fixed asset before you can acquire it.

When a fixed asset is set up and a depreciation book assigned, you must acquire the fixed asset. To acquire a fixed asset, you record its acquisition cost in the relevant G/L account, bank account, or vendor by posting an acquisition transaction from the **Fixed Asset G/L Journal** page. You can use the **Assisted Fixed Asset Acquisition** page to create and post the required general journal lines automatically.

The salvage value is the residual value of a fixed asset when it can no longer be used. You can post the salvage value at the same time as you post the acquisition cost. For more information, see [Depreciate or Amortize Fixed Assets](#).

Indexation is used to adjust values for general price-level changes. The **Index Fixed Assets** batch job can be used to calculate the acquisition costs at replacement costs.

To create a fixed asset and acquire it automatically

The following procedure describes how to create a fixed asset and then acquire it by using the **Assisted Fixed Asset Acquisition** page to create and post the required fixed asset G/L journal lines. You can also create and post the journal lines manually. For more information, see [To post a fixed asset acquisition manually with the fixed asset G/L journal](#).

1. Choose the  icon, enter **Fixed Assets**, and then choose the related link.
2. Choose the **New** action, and then fill in the fields on the **General** FastTab as necessary. Hover over a field to read a short description.
3. On the **Depreciation Book** FastTab, fill in the fields as necessary. This step assigns a depreciation book to the fixed asset.
4. If you need to assign more than one depreciation book to the fixed asset, choose the **Add More Depreciation Books** action. For more information, see [To assign a depreciation book to a fixed asset](#).

When all fields required to acquire a fixed asset are filled in, the **You are ready to acquire the fixed asset. Acquire** notification appears at the top of the page.

5. Choose the **Acquire** action in the notification.
6. Follow the steps on the **Assisted Fixed Asset Acquisition** page to complete the automatic acquisition of the fixed asset.

NOTE

You can also post acquisition cost as credits. In that case, remember that the value in the **Acquisition Cost Incl. VAT** field must be with a minus sign to indicate a credit.

When you choose **Finish**, the **Book Value** field on the **Fixed Asset Card** page is filled, indicating that the fixed asset has been acquired at the specified acquisition cost.

To set up a component list for a main asset

You can group your fixed assets into main assets and their components. For example, you may have a production machine that consists of many parts that you want to group in this manner.

Both the main asset and all its components must be set up as individual fixed asset cards. After you have set up a component list, Business Central automatically fills in the **Main Assets/Component** and **Components of Main Asset** fields on the fixed asset cards.

1. Choose the  icon, enter **Fixed Assets**, and then choose the related link.
2. Select the fixed asset that is the main asset, and then choose the **Main Asset Components** action.
3. On the **Main Asset Components** page, choose the **FA No.** field, and then select the fixed asset that you want to add as a component of the main asset.
4. Close the page.
5. Repeat steps 3 and 4 for each component asset that you want to add.
6. Choose the  icon, enter **Fixed Asset Setup**, and then choose the related link.
7. Select the **Allow Posting to Main Assets** check box.

To post a fixed asset acquisition manually with the fixed asset G/L journal

The following procedure describes how to acquire a fixed asset manually by creating and posting lines on the **Fixed Asset G/L Journal** page. You can also acquire a fixed asset automatically by using the **Assisted Fixed Asset Acquisition** page. For more information, see step 5 in [To create a fixed asset and acquire it automatically](#).

NOTE

You can also post acquisition cost as credits. In that case, remember that the value in the **Amount** field must be with a minus sign to indicate a credit.

1. Choose the  icon, enter **FA G/L Journals**, and then choose the related link.
2. On the **Fixed Asset G/L Journal** page, in the **FA Posting Type** field, select **Acquisition Cost**.
3. Fill in the remaining fields as necessary.
4. Choose the **Post** action.

TIP

If you fill in the **Insurance No.** field in the fixed asset G/L journal when you post an acquisition cost, then Business Central will also post the acquisition cost of the fixed asset to the insurance coverage ledger. For more information, see [Insure Fixed Assets](#).

To cancel an acquisition cost posting for one fixed asset

If you make an error when posting an acquisition cost, you can remove the entry with the **Cancel FA Entries** batch job and then post the correct acquisition entry. The erroneous entries are transferred to the **FA Error Ledger Entries** page.

For example, if you post an acquisition with the wrong date, you must correct it as soon as possible because the fixed asset posting date is used in many critical calculations.

IMPORTANT

You cannot use the **Reverse Transactions** function for fixed asset entries.

1. Choose the  icon, enter **Cancel FA Entries**, and then choose the related link.
2. Fill in the fields as necessary. Hover over a field to read a short description.
3. Choose the **OK** button to run the batch job.
4. When the incorrect entry or entries are canceled, proceed to post the correct acquisition cost.

To cancel ledger entries for multiple fixed assets at a time, use the **Cancel FA Ledger Entries** batch job.

To post the salvage value together with the acquisition cost

You can post the salvage value together with the acquisition cost from a fixed asset G/L journal.

1. Choose the  icon, enter **Cancel FA Entries**, and then choose the related link.
2. Create the acquisition journal line. For more information, see [To post a fixed asset acquisition manually with the fixed asset G/L journal](#).
3. In the **Salvage Value** field on the journal line, enter the salvage value amount as a credit (with a minus sign).
4. Choose the **Post** action.

NOTE

The **Salvage Value** posting type is an option on the **Fixed Asset Journal** page only. It is not available on the **Fixed Asset G/L Journal** page because salvage value is never posted to the general ledger.

Maintain Fixed Assets

3/31/2019 • 3 minutes to read

Maintenance expenses are routine periodic costs undertaken to preserve the value of fixed assets. Unlike capital improvements, they do not increase values.

You can record and maintain an up-to-date file on maintenance and service of your fixed assets to have complete maintenance records on a fixed asset easily accessible. Each time a fixed asset is sent to service, you record all relevant information such as date of service, vendor number and service agent's phone number. Maintenance registration is recorded for each fixed asset from the relevant fixed asset card.

Indexation is used to adjust values for general price-level changes. The **Index Fixed Assets** batch job can be used to recalculate the maintenance costs.

To record maintenance work on a fixed asset

Every time maintenance has been performed, such as a service visit, you can record it for the relevant fixed asset on the **Maintenance Registrations** page.

1. Choose the  icon, enter **Fixed Assets**, and then choose the related link.
2. Select the fixed asset that you want to record maintenance for, and then choose the **Maintenance Registration** action.
3. On the **Maintenance Registration** page, fill in the fields as necessary. Hover over a field to read a short description.

To post maintenance costs from a fixed asset G/L journal

1. Choose the  icon, enter **Depreciation Book List**, and then choose the related link.
2. Select the depreciation book that is assigned to the fixed asset, and then choose the **Edit** action.
3. On the **Depreciation Book Card** page, make sure the **Maintenance** check box is not selected. This ensures that maintenance costs are not posted to the general ledger.
4. Choose the  icon, enter **FA G/L Journals**, and then choose the related link.
5. Create an initial journal line and fill in the fields as necessary.
6. In the **FA Posting Type** field, select **Maintenance**.
7. Choose the **Insert FA Bal. Account** action. A second journal line is created for the balancing account that is set up for maintenance posting.

NOTE

Step 7 only works if you have set up the following: On the **FA Posting Group Card** page for the posting group of the fixed asset, the **Maintenance Account** field contains the general ledger debit account and the **Maintenance Bal. Account** field contains the general ledger account to which you want to post balancing entries for appreciation. For more information, see [To set up fixed asset posting groups](#).

8. Choose the **Post** action.

To follow up on fixed assets service visits

You can print the **Maintenance - Next Service** report to see which assets you have scheduled a service visit for. You can also use this report when you are updating the **Next Service Date** field on fixed asset cards.

1. Choose the  icon, enter **Maintenance Next Service**, and then choose the related link.
2. Fill in the **Starting Date** and **Ending Date** fields.
3. Choose the **Print** or **Preview** button.

To monitor maintenance costs

You can view the maintenance costs when you look at the statistics of a fixed asset.

1. Choose the  icon, enter **Fixed Assets**, and then choose the related link.
2. Select the fixed asset you want to view maintenance costs for, and then choose the **Depreciation Books** action.
3. On the **FA Depreciation Books** page, select the relevant fixed asset depreciation book, and then choose the **Statistics** action.
4. On the **Fixed Asset Statistics** page, choose the **Maintenance** field.

The **Maintenance Ledger Entries** page opens showing the entries that make up the amount in the **Maintenance** field.

To view or print maintenance costs for multiple fixed assets

In the **Maintenance - Analysis** report, you can select to see maintenance based on one, two, or three maintenance codes for a specified date or period. You can see the total of all selected assets or a total for each asset.

1. Choose the  icon, enter **Maintenance Analysis**, and then choose the related link.
2. Fill in the fields as necessary.
3. Choose the **Print** or **Preview** button.

To view maintenance ledger entries

You can also study maintenance costs by viewing the maintenance ledger entries.

1. Choose the  icon, enter **Fixed Assets**, and then choose the related link.
2. Select the fixed asset that you want to view ledger entries for, and then choose the **Depreciation Books** action.
3. On the **FA Depreciation Books** page, select the relevant fixed asset depreciation book, and then choose the **Maintenance Ledger Entries** action.

To view or print maintenance ledger entries for multiple fixed assets

In the **Maintenance - Details** report, you can view or print maintenance ledger entries for one or many fixed assets.

1. Choose the  icon, enter **Maintenance Details**, and then choose the related link.
2. Fill in the fields as necessary.
3. Choose the **Print** or **Preview** button.

Getting Started

Working with Business Central

Insure Fixed Assets

3/31/2019 • 5 minutes to read

An insurance policy for a fixed asset is represented by an insurance card. You can assign one fixed asset to one insurance policy or multiple fixed assets to one insurance policy.

You assign a fixed asset to an insurance policy by posting to the insurance coverage ledger from the **Insurance Journal** page.

In addition, you can assign a fixed asset to an insurance policy and create coverage ledger entries when you post its acquisition cost. You do this by posting an acquisition cost from the fixed asset journal with the **Insurance No.** field filled in. The **Automatic Insurance Posting** check box on the **Fixed Asset Setup** page must be selected. For more information, see [To post a fixed asset acquisition manually with the fixed asset G/L journal](#).

If the **Automatic Insurance Posting** check box on the **Fixed Asset Setup** page is not selected, then posting acquisitions from the fixed asset journal will create lines on the **Insurance Journal** page, which you must then post manually.

WARNING

If you do not select the **Automatic Insurance Posting** check box on the **Fixed Asset Setup** page, then your insurance journal should be based on a journal template without a number series. This is because the inserted document numbers from the fixed asset journal line will otherwise conflict with the number series of the insurance journal. For more information about journal templates and batches, see [Set Up General Fixed Assets Information](#).

After you have assigned a fixed asset to an insurance policy, the **Insured** check box is selected on the fixed asset card. When you sell the fixed asset, the check box is automatically deselected.

To create or modify an insurance card

An insurance policy for a fixed asset must be represented by an insurance card.

When you receive information about changes in the coverage amount, you must enter the new information on the **Insurance Card** page to ensure that you analyze insurance policy coverage correctly.

1. Choose the  icon, enter **Insurance**, and then choose the related link.
2. Choose the **New** action to create a new card for an insurance policy. Hover over a field to read a short description.
3. Alternatively, select the insurance policy that you want to change, and then choose the **Edit** action.

To assign a fixed asset to an insurance policy by posting from the insurance journal

You assign a fixed asset to an insurance policy by posting to the insurance coverage ledger.

The following procedure explains how to create an insurance journal line manually. If the **Automatic Insurance Posting** check box is selected on the **FA Setup** page, then insurance journal lines are automatically created when you post acquisition costs. In that case, all you have to do is to post the journal.

1. Choose the  icon, enter **Insurance Journals**, and then choose the related link.
2. Open the relevant journal, and fill in the journal lines as necessary.

3. To assign multiple fixed assets to one insurance policy, create journal lines with the same value in the **Insurance No.** field and different values in the **FA No.** field.
4. Choose the **Post** action.

NOTE

The entries from an insurance journal are only posted to the insurance coverage ledger.

To update the insurance value of a fixed asset

You can use the **Index Insurance** batch job to update the value of the fixed assets that are covered.

1. Choose the  icon, enter **Index Insurance**, and then choose the related link.
2. Fill in the fields as necessary.

NOTE

In the **Index Figure** field, you enter a decrease of 5%, for example, as 95, whereas you enter an increase of 2% as 102.

3. Choose the **OK** button.

The batch job calculates the new amount as a percentage of the total value insured, as stated on the **Insurance Statistics** page, and then creates a line in the insurance journal.

4. Choose the  icon, enter **Insurance Journals**, and then choose the related link.
5. Open the relevant insurance journal, review the created values, and then post them to the insurance coverage ledger.

To monitor insurance coverage

Business Central provides dedicated reports and statistics pages for use in analyzing insurance policies and whether your fixed assets are over- or under-insured.

Overview of Insurance Policies

To get an overview of your insurance policies, preview or print the **Insurance - List** report. The report shows all the policies and the most important fields from the insurance cards.

Insurance Coverage

To see which insurance policies cover each asset and by which amount, you can preview or print the **Insurance - Tot. Value Insured** report.

Over/Under Coverage

You can check if fixed assets are over- or under-insured in the following ways:

- The **Insurance Statistics** page. A positive amount in the **Over/Under Insured** field means that the fixed asset is over-insured. A negative amount means that it is underinsured.
- The **Fixed Asset Statistics** page. Choose the **Total Value Insured** field to view the **Ins. Coverage Ledger Entries** page.
- The **Over/Under Coverage** report.
- The **Insurance Analysis** report.

Uninsured Fixed Assets

To check if you have forgotten to assign a fixed asset to an insurance policy, you can print or preview the **Insurance - Uninsured FAs** report. This report displays fixed assets for which amounts have not been posted to the insurance coverage ledger.

To view insurance coverage ledger entries

You can view the entries that you have made in the insurance coverage ledger.

1. Choose the  icon, enter **Insurance**, and then choose the related link.
2. Select the relevant insurance policy, and then choose the **Coverage Ledger Entries** action.

To view the total insurance value of fixed assets

A dedicated matrix page shows the insurance values that are registered for each insurance policy for each fixed asset as a result of insurance-related amounts that you have posted.

1. Choose the  icon, enter **Insurance**, and then choose the related link.
2. Select the relevant insurance policy, and then choose the **Total Value Insures per FA** action.
3. Fill in the fields as necessary.
4. Choose the **Show Matrix** action.
5. To see the underlying insurance coverage ledger entries, choose a value in the matrix.

To correct insurance coverage entries

If a fixed asset has been attached to the wrong insurance policy, you can correct it by creating two reclassification entries from the insurance journal.

1. Choose the  icon, enter **Insurance Journals**, and then choose the related link.
2. Create one journal line for the fixed asset and the correct insurance policy where the value in the **Amount** field is positive.
3. Create another journal line for the fixed asset and the incorrect insurance policy where the value in the **Amount** field is negative.
4. Choose the **Post** action.

The fixed asset will be detached from the incorrect insurance policy, on the second line, and attached to the correct insurance policy, on the first line.

Transfer, Split, or Combine Fixed Assets

3/31/2019 • 3 minutes to read

You use the fixed asset reclassification journal to transfer, split up, and combine fixed assets. You view or print the results of fixed asset reclassification with the **Fixed Asset-Book Value 02** report.

To transfer a fixed asset to a different department

You may need to transfer a fixed asset to a different department when, for example, you place an asset in the production department while it is under construction and then move it to the administration department when it is finished.

1. Set up a new fixed asset. Enter the new department in the **Department Code** field.
2. Assign a fixed asset depreciation book to the new fixed asset. For more information, see [Acquire Fixed Assets](#).
3. Choose the  icon, enter **FA Reclass. Journals**, and then choose the related link.
4. Create a reclassification journal where the **FA No.** field contains the original fixed asset, and the **New FA No.** field contains the new fixed asset to be moved.
5. Choose the **Reclassify** action.

Two lines are now created in the fixed asset G/L journal using the template and batch that you have specified on the **FA Journal Setup** page for the specified depreciation book. For more information, see [Set Up Fixed Asset Depreciation](#).

6. Choose the  icon, enter **FA G/L Journals**, and then choose the related link.
7. On the **Fixed Asset G/L Journal** page, choose the **Post** action to post the reclassification that you performed in steps 4 and 5.

If you have posted an acquisition cost for one asset, you can use the fixed asset reclassification journal to split the acquisition cost among several assets.

To split a fixed asset into three fixed assets

You can split one fixed asset into multiple fixed assets, for example when you need to distribute a fixed asset onto three different departments. In that case, you can move, for example, 25 percent of the acquisition cost and depreciation for the original fixed asset to the second fixed asset and 45 percent to the third asset. The remaining 30 percent will remain on the original fixed asset.

1. Set up two new fixed assets. Enter the new department in the **Department Code** field.
2. Assign fixed asset depreciation books to the new fixed assets. For more information, see [Acquire Fixed Assets](#).
3. Choose the  icon, enter **FA Reclass. Journals**, and then choose the related link.
4. Create two reclassification journal lines, one for each new fixed asset.
5. On the first line, enter the second fixed asset in the **New FA No.** field and 25 in the **Reclassify Acq. Cost %** field.

6. On the second line, enter the third fixed asset in the **New FA No.** field and 40 in the **Reclassify Acq. Cost %** field.
7. On both lines, select the **Reclassify Acquisition Cost** and **Reclassify Depreciation** check boxes.
8. Choose the **Reclassify** action.

Two lines are now created in the fixed asset G/L journal using the template and batch that you have specified on the **FA Journal Setup** page for the specified depreciation book. For more information, see [Set Up Fixed Asset Depreciation](#).

9. Choose the  icon, enter **FA G/L Journals**, and then choose the related link.
10. On the **Fixed Asset G/L Journal** page, choose the **Post** action to post the reclassification that you performed in steps 4 through 8.

To combine two fixed assets into one

You can combine multiple fixed assets into one fixed asset, for example when you move distributed fixed assets into one department. If you have posted acquisition costs and depreciation for the fixed asset to be moved, those values will be combined in the single fixed asset.

1. Choose the  icon, enter **FA Recl. Journals**, and then choose the related link.
2. Create a reclassification journal where the **FA No.** field contains the fixed asset to be moved/combined, and the **New FA No.** field contains the fixed asset that it will be combined with.
3. Leave the **Reclassify Acq. Cost %** field empty to move/combine the entire acquisition cost.
4. Select the **Reclassify Acquisition Cost** and **Reclassify Depreciation** check boxes.
5. On the **Actions** tab, choose **Reclassify**.

Two lines are now created in the fixed asset G/L journal using the template and batch that you have specified on the **FA Journal Setup** page for the specified depreciation book. For more information, see [Set Up Fixed Asset Depreciation](#).

6. Choose the  icon, enter **FA G/L Journals**, and then choose the related link.
7. On the **Fixed Asset G/L Journal** page, choose the **Post** action to post the reclassification that you performed in steps 2 through 5.

To view changed depreciation book values due to fixed asset reclassification

1. Choose the  icon, enter **FA Book Value 02**, and then choose the related link.
2. Fill in the fields as necessary.
3. Choose the **Print** or **Preview** button.

Revalue Fixed Assets

3/31/2019 • 5 minutes to read

Revaluation of fixed assets can consist of appreciations, write-downs, or general value adjustments.

When the value of a fixed asset has increased, you post a journal line with a higher amount, an appreciation, to the depreciation book. The new amount is recorded as an appreciation according to the fixed asset posting setup.

When the value of a fixed asset has decreased, you post a journal line with a lower amount, a write-down, to the depreciation book. The new amount is recorded as a write-down according to the fixed asset posting setup.

Indexation is used to adjust multiple fixed asset values, for example per general price changes. The **Index Fixed Assets** batch job can be used to change various amounts, such as write-down and appreciation amounts.

To post an appreciation from the fixed asset G/L journal

1. Choose the  icon, enter **FA G/L Journals**, and then choose the related link.
2. Create an initial journal line and fill in the fields as necessary.
3. In the **FA Posting Type** field, select **Revaluation**.
4. Choose the **Insert FA Bal. Account** action. A second journal line is created for the balancing account that is set up for appreciation posting.

NOTE

Step 4 only works if you have set up the following: On the **FA Posting Group Card** page for the posting group of the fixed asset, the **Appreciation Account** field contains the general ledger debit account and the **Appreciation Bal. Account** field contains the general ledger account to which you want to post balancing entries for appreciation. For more information, see [To set up fixed asset posting groups](#).

5. Choose the **Post** action.

To post a write-down from the fixed asset G/L journal

1. Choose the  icon, enter **FA G/L Journals**, and then choose the related link.
2. Create an initial journal line, and fill in the fields as necessary.
3. In the **FA Posting Type** field, select **Write-Down**.
4. Choose the **Insert FA Bal. Account** action. A second journal line is created for the balancing account that is set up for write-down posting.

NOTE

Step 4 only works if you have set up the following: On the **FA Posting Group Card** page for the posting group of the fixed asset, the **Write-Down Account** field contains the general ledger credit account and the **Write-Down Expense Account** field contains the general ledger debit account to which you want to post balancing entries for write-downs. For more information, see [To set up fixed asset posting groups](#).

5. Choose the **Post** action.

To perform general revaluation of fixed assets

Indexation is used to adjust multiple fixed asset values, for example per general price changes. The **Index Fixed Assets** batch job can be used to change various amounts, such as write-down and appreciation amounts. The **Allow Indexation** check box on the **Depreciation Book** page must be selected.

1. Choose the , enter **Index Fixed Assets**, and then choose the related link.
2. Fill in the fields as necessary.
3. Choose the **OK** button.

Revaluation lines are created per your settings in step 2. The lines are created in either the fixed asset journal or the fixed asset G/L journal, depending on your template and batch setup on the **FA Journal Setup** page. For more information, see [Set Up General Fixed Asset Information](#).

4. Choose the , enter **FA G/L Journals**, and then choose the related link.
5. Select the journal with the fixed assets that you want to revalue, and then choose the **Ledger Entries** action.
6. Check the created entries, and then choose the **Post** action to post the journal.

TIP

If the index figures are for simulation purposes only, you can create a special depreciation book to store them in. Then these entries will not affect any of the other depreciation books.

To post additional acquisition costs

You post additional acquisition cost for a fixed asset in the same way as you post the original acquisition cost: from a purchase invoice or from a fixed asset journal. For more information, see [Acquire Fixed Assets](#).

If depreciation has already been calculated for the fixed asset, select the **Depr. Acquisition Cost** check box to have the additional acquisition cost less the salvage value depreciated in proportion to the amount by which the previously acquired fixed asset has already been depreciated. This ensures that the depreciation period is not changed.

The depreciation percentage is calculated as:

$$P = (\text{total depreciation} \times 100) / \text{depreciable basis}$$

$$\text{Depreciation amount} = (P/100) \times (\text{extra acquisition cost} - \text{salvage value})$$

Remember to select the **Depr. until FA Posting Date** check box on the invoice, the fixed asset G/L journal, or the fixed asset journal lines to ensure that depreciation is calculated from the last fixed asset posting date to the posting date of the additional acquisition cost.

Example - Posting Additional Acquisition Costs

A machine is purchased on August 1, 2000. The acquisition cost is 4,800. The depreciation method is straight-line over four years.

On August 31, 2000, the **Calculate Depreciation** batch job is run. Depreciation is calculated as:

$$\text{book value} \times \text{number of depreciation days} / \text{total number of depreciation days} = 4800 \times 30 / 1440 = 100$$

On September 15, 2000, an invoice is posted for painting the machine. The invoice amount is 480.

If you selected the **Depr. until FA Posting Date** check box on the invoice before posting, the following calculation is made:

15 days of depreciation (from 09/01/00 to 09/15/00) is calculated as:

$$\text{book value} \times \text{number of depreciation days} / \text{remaining number of depreciation days} = (4800 - 100) \times 15 / 1410 = 50$$

If you selected the **Depr. Acquisition Cost** check box on the invoice before posting, the following calculation is made:

$$\text{The additional acquisition cost is depreciated by } ((150 \times 100) / 4800) / 100 \times 480 = 15$$

The depreciable basis is now $5280 = (4800 + 480)$, and the accumulated depreciation is $165 = (100 + 50 + 15)$, corresponding to 45 days of depreciation of the total acquisition cost. This means that the asset will be totally depreciated within the estimated lifetime of four years.

When the **Calculate Depreciation** batch job is run on 09/30/00, the following calculation is made:

$$\text{Remaining depreciable life is 3 years, 10 months and 15 days} = 1395 \text{ days}$$

$$\text{Book value is } (5280 - 165) = 5115$$

$$\text{Depreciation amount for September 2000: } 5115 \times 15 / 1395 = 55.00$$

$$\text{Total of depreciation} = 165 + 55 = 220$$

If you did not select the **Depr. until FA Posting Date** check box, the asset would lose 15 days of depreciation because the **Calculate Depreciation** batch job run on 09/30/00 would calculate depreciation from 09/15/00 to 09/30/00. This means that when the **Calculate Depreciation** batch job is run on 09/30/00, the calculation is as follows:

$$\text{Remaining life time is 3 years, 10 months and 15 days} = 1395 \text{ days}$$

$$\text{Book value is } (4800 + 480 - 100 - 15) = 5165$$

$$\text{Depreciation amount for September 2000: } 5165 \times 15 / 1395 = 55.54$$

$$\text{Total of depreciation} = 100 + 15 + 55.54 = 170.54$$

Depreciate or Amortize Fixed Assets

3/31/2019 • 4 minutes to read

Depreciation is used to allocate the cost of fixed assets, such as machinery and equipment, over their depreciable life. For each fixed asset, you must define how it will be depreciated.

There are two ways to post depreciation:

- Automatically, by running the **Calculate Depreciation** batch job.
- Manually, by using the fixed asset G/L journal.

Business Central can calculate daily depreciation, which allows you to calculate depreciation for any period. You can therefore analyze current operating results on, for example, a monthly, quarterly, or annual basis. The calculation uses a standard year of 360 days and a standard month of 30 days. For more information, see [Depreciation Methods](#).

If several departments use a fixed asset, periodic depreciation can be automatically allocated to these departments according to a user-defined allocation table.

You can cancel incorrect depreciation entries by using the **Cancel FA Ledger Entries** batch job. Afterward, you can post the correct amount by running the **Calculate Depreciation** batch job again. The errors you correct are posted as fixed asset error ledger entries.

Indexation is used to adjust values for general price-level changes. You can use the **Index Fixed Assets** batch job to recalculate the depreciation amounts.

To calculate depreciation automatically

Once a month, or whenever you choose, you can run the **Calculate Depreciation** batch job. The batch job ignores fixed assets that have been sold, are blocked or inactive, or use the manual depreciation method.

1. Choose the  icon, enter **Calculate Depreciation**, and then choose the related link.
2. Fill in the fields as necessary. Hover over a field to read a short description.
3. Choose the **OK** button.

The batch job calculates the depreciation and creates lines in the fixed asset G/L journal.

4. Choose the  icon, enter **FA G/L Journals**, and then choose the related link.

On the **Fixed Asset G/L Journal** page, in the **No. of Depreciation Days** field you can see how many days of depreciation have been calculated.

5. Choose the **Post** action.

To post depreciation manually from the fixed asset G/L journal

1. Choose the  icon, enter **Fixed Asset G/L Journal**, and then choose the related link.
2. Create an initial journal line and fill in the fields as necessary.
3. In the **FA Posting Type** field, select **Depreciation**.
4. Choose the **Insert FA Bal. Account** action. A second journal line is created for the balancing account that is set up for depreciation posting. For more information, see [To set up fixed asset posting groups](#).
5. On the **Home** tab, choose **Post** to post the journal.

If you have set up fixed asset allocation keys to allocate amounts to different departments or projects, the amounts are allocated during posting. For more information, see [Set Up General Fixed Assets Information](#).

To calculate allocations in the fixed asset G/L journal

If a fixed asset is used by several departments, periodic depreciation can be automatically allocated to these departments according to a user-defined allocation table.

1. Choose the  icon, enter **Fixed Asset G/L Journal**, and then choose the related link.
2. Create an initial line and fill in the fields as necessary.
3. In the **FA Posting Type** field, select **Allocation**.
4. Choose the **Insert FA Bal. Account** action. A second journal line is created for the balancing account that is set up for allocation posting.
5. On the **Home** tab, choose **Post** to post the journal.

Use duplication lists to prepare to post to multiple depreciation books

When you fill in journal lines to post to a depreciation book, you can duplicate the lines in a separate journal so you can post to a different depreciation book. For more information, see [To post entries to different depreciation books](#).

1. Choose the  icon, enter **Depreciation Books**, and then choose the related link.
2. Open the depreciation book, and then select the **Part of Duplication List** check box.

IMPORTANT

If you have selected the **Use Duplication List** field, do not use number series on the journal. The reason is that the number series for the fixed asset G/L journal does not the number series for the fixed asset journal.

To post entries to different depreciation books

1. Choose the  icon, enter **Fixed Asset G/L Journal**, and then choose the related link.
2. In the journal that you want to post depreciation with, select the **Use Duplication List** check box.
3. Fill in the remaining fields as necessary.
4. Choose the **Post** action.
5. Choose the  icon, enter **FA Journals**, and then choose the related link.

NOTE

The **Fixed Asset Journal** page contains new lines for different depreciation books according to the duplication list.

6. Review or edit the lines, and then choose the **Post** action.

NOTE

Another way to duplicate an entry in a separate book is to enter a depreciation book code in the **Duplicate in Depreciation Book** field when you fill in a journal line.

You can copy entries from one depreciation book to another by using the **Copy Depreciation Book** batch job. The batch job creates journal lines in the journal batch that you have specified on the **FA Journal Setup** page for

the depreciation book that you want to copy to. For more information, see the following procedure.

To copy fixed asset ledger entries between depreciation books

1. Choose the  icon, enter **Depreciation Books**, and then choose the related link.
2. Open the relevant depreciation book card, and then choose the **Copy Depreciation Book** action.
3. On the **Copy Depreciation Book** page, fill in the fields as necessary.
4. Choose the **OK** button.

The copied lines are created in either the fixed asset G/L journal or the fixed asset journal, depending on whether the depreciation book that you are copying has integration to the general ledger.

Dispose of or Retire Fixed Assets

3/31/2019 • 2 minutes to read

When you sell or otherwise dispose of a fixed asset, the disposal value must be posted to calculate and record the gain or loss. A disposal entry must be the last entry posted for a fixed asset. For partially disposed fixed assets, you can post more than one disposal entry. The total of all posted disposal amounts must be a credit amount.

NOTE

If you trade-in a fixed asset for another one, you must record both the sale of the old asset (disposal) and the purchase of the new one (acquisition). For more information, see [Acquire Fixed Assets](#).

To post a disposal from the fixed asset G/L journal

1. Choose the  icon, enter **FA G/L Journals**, and then choose the related link.
2. Create an initial journal line and fill in the fields as necessary. Hover over a field to read a short description.
3. In the **FA Posting Type** field, select **Disposal**.
4. Choose the **Insert FA Bal. Account** action. A second journal line is created for the balancing account that is set up for disposal posting.

NOTE

Step 4 only works if you have set up the following: On the **FA Posting Group Card** page for the posting group of the fixed asset, the **Disposal Account** field contains the general ledger debit account and the **Disposal Bal. Account** field contains the general ledger account to which you want to post balancing entries for appreciation. For more information, see [To set up fixed asset posting groups](#).

5. Choose the **Post** action.

If you sell or dispose of part of a fixed asset, you must split up the asset before you can record the disposal transaction. For more information, see [Transfer, Split, or Combine Fixed Assets](#).

To view disposal ledger entries

When you sell or dispose of a fixed asset, the disposal value is posted to the general ledger where you can view the result.

1. Choose the  icon, enter **Fixed Assets**, and then choose the related link.
2. Select the fixed asset that you want to view entries for, and then choose the **Depreciation Books** action.
3. Select the depreciation book that you want to view entries for, and then choose the **Ledger Entries** action.
4. Select a line with **Disposal** in the **FA Posting Category** field, and then choose the **Navigate** action.
5. On the **Navigate** page, select the general ledger entry line, and then choose the **Show** action.

The **General Ledger Entries** page opens where you can see the entries that the disposal posting resulted in.

Manage Budgets for Fixed Assets

6/6/2019 • 2 minutes to read

You can set up budgeted fixed assets. For example, this lets you include anticipated acquisitions and sales in reports.

To prepare your budgeted income statement, budgeted balance sheet, and cash budget, you need information about future investments, disposals and depreciation of fixed assets. You can get this information from the **Fixed Asset - Projected Value** report. Before you print this report, you must prepare the budget.

To budget the acquisition cost of a fixed asset

To prepare a budget, you have to set up fixed asset cards for fixed assets that you intend to buy in the future. The budget fixed assets are set up as ordinary fixed assets, but it must be set up to not post to the general ledger.

When you post the acquisition cost, you enter the number of the budgeted fixed asset in the **Budgeted FA No.** field. This will post an acquisition cost with an opposite sign for the budgeted asset. This means that the total acquisition cost on the budgeted asset is the difference between the budgeted and the actual acquisition cost.

1. Choose the  icon, enter **Fixed Assets**, and then choose the related link.
2. Choose the **New** action to create a new fixed asset card for the budgeted fixed asset.
3. Select the **Budgeted Asset** check box to prevent posting to the general ledger.
4. Fill in the remaining fields, assign a depreciation book, and then post the first acquisition cost with the budgeted fixed asset entered in the **Budgeted FA No.** field on the journal line. For more information, see [Acquire Fixed Assets](#).

To budget the disposal of a fixed asset

If you plan to sell assets within the budget period, you can enter information about sales price and sales date.

1. Choose the  icon, enter **Fixed Assets**, and then choose the related link.
2. Select the fixed asset to be disposed of, and then choose the **Depreciation Books** action.
3. On the **FA Depreciation Books** page, fill in the **Projected Disposal Date** and **Projected Proceeds on Disposal** fields. Hover over a field to read a short description.

To view projected disposal values

To see the projected disposal values and have the gain and loss calculated, you can use the **FA Projected Value** report.

1. Choose the  icon, enter **FA Projected Value**, and then choose the related link.
2. Fill in the fields as necessary.
3. Choose the **Print** or **Preview** button.

To budget depreciation

You can use the **Fixed Asset - Projected Value** report to calculate future depreciation. The report shows the book value and accumulated depreciation at the start of the selected period, changes during the period, and the book value and accumulated depreciation at the end of the selected period.

1. Choose the  icon, enter **Fixed Asset Projected Value**, and then choose the related link.

2. Fill in the fields as necessary.
3. To see total values for all assets, clear the **Print per Fixed Asset** check box.
4. Leave the **Fixed Asset** FastTab blank to have all assets included. In the **Budgeted Asset** field, enter **No** to exclude budgeted assets or **Yes** to see budgeted assets only.
5. Choose the **Print** or **Preview** button.

Managing Relationships

5/2/2019 • 2 minutes to read

The relationship management features of Business Central help you manage and support your sales efforts. With these features, you have access to complete and accurate information so you can focus your interactions on preferred customer/contact segments.

Good sales and marketing practices are all about how to make the best decisions at the right time. Business Central provides a precise and timely overview of your contact information so that you can serve your prospective customers more efficiently and increase customer satisfaction.

The following table describes a sequence of tasks, with links to the topics that describe them.

TO	SEE
Define default settings for the use of contacts and interactions and set up number series.	Setting Up Relationship Management
Define the external entities that you have business relations with, such as customers, prospective customers, vendors, lawyers, and consultants, either as Person type or Company type.	Managing Contacts
Manage all types of communications between your company and your contacts, such as by email, letter, telephone, meetings.	Managing Interactions
Define segments to select a group of contacts according to specific criteria, such as the industry that the contacts belong to.	Managing Segments
Process incoming leads by creating opportunities and associating them to salespeople so that you can keep track of potential sales.	Managing Sales Opportunities
Create marketing plans to identify, attract, and retain customers.	Managing Marketing Campaigns
Use Dynamics 365 for Sales for customer engagement and enjoy seamless integration in the lead-to-cash process by using Business Central for backend activities such as processing orders, managing inventory, and doing your finances.	Integrating with Dynamics 365 for Sales

Setting Up Relationship Management

5/2/2019 • 4 minutes to read

Before you get started working with your contacts and marketing interests, there are a few decisions and steps that you should take to set up how the marketing area manages certain aspects of your contacts. For example, you can decide whether to synchronize the contact card with the customer card, vendor card, and bank account card, how number series are defined, or what the standard salutation should be when writing to your contacts.

Managing your contacts and having a strategy in place to identify, attract, and retain customers will help optimize your business and increase customer satisfaction. Using a good contact management system will also help you create and maintain relationships with your customers. Communication is the key to these relationships. Being able to tailor communication with potential and existing customers, vendors, and business partners according to their needs, is necessary for companies to succeed. Establishing a strategy and defining how your company uses contact information is a primary step. This information will be viewed by many different groups in your company, so having a good system in place will help everyone be more productive.

You set up the marketing and contact management from the **Marketing Setup** page. To open the **Marketing Setup** page, choose the  icon, enter **Marketing Setup**, and then choose the related link.

Automatically Copying Specific Information from Contact Companies to Contact Persons

Some information about contact companies is identical to the information about the contact persons working within these companies, for example, the address details. In the **Inheritance** section of the **Marketing Setup** page, you can set the application to automatically copy specific fields from the contact company card to the contact person card each time you create a contact person for a contact company. For example, you can select to copy the salesperson code, address details (address, address 2, city, post code, and county), communication details (fax number, telex answer back, and phone number), and more.

When you modify one of these fields on the contact company card, the program will automatically modify the field on the contact person card (unless you have manually modified the field on the contact person card).

For more information, see [Create Contact Persons](#).

Using Predefined Defaults on New Contacts

You can decide that the application automatically assigns a specific language code, territory code, salesperson code, and country/region code as defaults to each new contact you create. You can also enter a default sales cycle code that the program automatically assigns to each new opportunity you create.

The inheritance of fields overwrites the default values you have set up. For example, if you have set up English as the default language, but the contact company's language is German, the program will automatically assign German as the language code for the contact persons recorded for that company.

Automatically Recording Interactions

Business Central can automatically record sales and purchase documents as interactions (for example, orders, invoices, receipts, and so on), as well as emails, phone calls, and cover sheets.

For more information, see [Automatically Record Interactions with Contacts](#).

Synchronizing Contacts with Customers and More

In order to synchronize the contact card with the customer card, the vendor card and the bank account card, you must select a business relation code for customers, vendors, and bank accounts. For example, you can only link a contact with an existing customer if you have selected a business relation code for customers on the **Marketing Setup** page.

For more information, see [Synchronizing Contacts with Customers, Vendors and Bank Accounts](marketing-synchronize-contacts-customers-vendors-bank-accounts/Synchronizing Contacts With Customers, Vendors, and Bank Accounts).

Assigning a Number Series to Contacts and Opportunities

You can set up a number series for contacts and opportunities. If you have set up a number series for contacts, when you create a contact, and press Enter in the No. field on the contact card, the program automatically enters the next available contact number.

For more information about number series, see [Create Number Series](#).

Searching for Duplicate Contacts when Contacts are Created

You can choose to have the program automatically search for duplicates each time you create a contact company, or you can choose to search manually after you have created contacts. You can also choose to have the program update the search strings automatically each time you modify contact information or create a contact. You can decide the search hit percentage, that is, the percentage of identical strings two contacts must have for the program to consider them as duplicates.

See Also

[Managing Contacts](#)

[Working with Business Central](#)

Managing Contacts

5/2/2019 • 2 minutes to read

Different groups at your company will have business relationships with various companies. For example, a salesperson might regularly meet prospective customers and at the end of the week record the results of these visits.

All of the external entities that you have business relationships with (for example, customers, prospective customers, vendors, lawyers, and consultants) should be recorded as contacts. Having this data recorded in one central location ensures every group in your company can view and use the information efficiently.

Communication with your contacts will be more successful if all details are readily available. For example, a marketing person might like to know what other products a specific customer has purchased before attempting to interest them in a new product.

The following table describes a sequence of tasks, with links to the topics that describe them.

TO	SEE
Set up contact management prior to creating contacts.	Set Up Contacts
Create a contact card for each new person or company that you interact with, such as a customer or vendor.	Create Contacts
Set up profile questionnaires that you want to use when entering information about your contacts' profiles.	Use Profile Questionnaires to Classify Business Contacts

Set Up Contacts

3/31/2019 • 8 minutes to read

When creating contacts, you can enter specific information, such as the industry that the contact belong to and your business relationship with the contacts.

Before you create contacts and record details about your business relationships, you must set up the different codes that you will use to assign this information to your contact companies and people. Codes can be set up for mailing groups, industry groups, business relationships, Web sources, organizational levels and job responsibilities. You can set these up by choosing the **New** action as you look up to the lists from the contact card.

By having this information set up, creating contacts is much more organized and being able to find all contacts based on a certain group will be more efficient. Every group at your company will be able to find the is information making communication with the contacts more successful.

To assign industry groups to a contact

You use industry groups to indicate the type of industry to which your contacts belong, for example, the retail industry or the automobile industry.

NOTE

This is only possible for contacts of type **Company**.

The industry group code defines the type or category of the group, such as ADVERT for advertising, or PRESS, for TV and radio. You can have several industry group codes. To define the industry groups, you use the **Industry Groups** page.

1. Open the relevant contact card.
2. Choose the **Company** action, and then the **Industry Groups** action. The **Contact Industry Groups** page opens.
3. In the **Industry Groups Code** field, select the industry groups you want to assign.

Repeat these steps to assign as many industry groups as you want. You can also assign industry groups from the contact list by following the same procedure.

The number of industry groups that you have assigned to the contact is displayed in the **No. of Industry Groups** field in the **Segmentation** section on the **Contact Card** page.

After you have assigned industry groups to your contacts, you can use this information to select contacts for your segments. For more information, see [Add Contacts to Segments](#).

To assign mailing groups to a contact

You can use mailing groups to identify groups of contacts that you want to receive the same information. For example, you can set up a mailing group for the contacts that you want to send a notification of an office move, or another group for sending holiday gifts.

The mailing group code defines the type or category of the group, such as MOVE for office move, or GIFT for holiday gift. You can have several industry group codes. To define the industry groups, you use the **Mailing**

Groups page.

1. Open the relevant contact card.
2. Choose the **Mailing Groups** action. The **Contact Mailing Groups** page opens.
3. In the **Mailing Groups Code** field, select the mailing group that you want to assign.

Repeat these steps to assign as many mailing groups as you want. You can also assign mailing groups from the contact list by following the same procedure.

The number of mailing groups you have assigned to the contact is displayed in the **No. of Mailing Groups** field in the **Segmentation** section on the **Contact Card** page.

After you have assigned mailing groups to your contacts, you can use this information to select contacts for your segments. For more information, see [Add Contacts to Segments](#).

To define a contact's alternate address

You can assign an alternate address where your contact sometimes wants to receive mail and information, for example, their summer cottage. You can also assign one or several date ranges to each alternate address you have entered for your contacts to specify when each address is valid.

1. Open the relevant contact card.
2. Choose the **Alternative Address** action, and then choose the **Card** action.

To define that the alternate address applies in a specific period, choose the **Date Range** action instead.

3. On the **Contact Alt. Address List** page, enter a new alternate address and fill in the fields on the **Contact Alternative Address** page.

Repeat these steps to assign as many alternate addresses as you want. For each alternate address you may want to specify one or several date ranges.

To assign job responsibilities to a contact

You can add information about the job responsibilities of contact persons to indicate what the contact person is responsible for within their company, for example, IT, management, or production. You can use this information when entering information about your contacts.

NOTE

This is only possible for contacts of type **Person**.

The job responsibility code defines the type or category of the job, such as **MARKETING** or **PURCHASE**. You can have several job responsibility codes. To define the job responsibility, you use the **Job Responsibilities** page.

1. Open the relevant contact card.
2. Choose the **Person** action, and then choose the **Job Responsibilities** action. The **Contact Job Responsibilities** page opens.
3. In the **Job Responsibility Code** field, select the job responsibility that you want to assign.

Repeat these steps to assign as many job responsibilities as you want. You can also assign job responsibilities from the contact list by following the same procedure.

The number of job responsibilities you have assigned to the contact is displayed in the **No. of Job Responsibilities** field in the **Segmentation** section on the **Contact** page.

After you have assigned job responsibilities to your contacts, you can use this information to select contacts for your segments. For more information, see [Add Contacts to Segments](#).

To assign organizational levels to a contact

You can use organizational levels on your contacts to specify which position they have in the company, for example, top management. You can use this information when entering information about your contacts.

NOTE

This is only possible for contacts of type **Person**.

The organizational level code defines the type or category of the organizational level, such a CEO or CFO. You can have several organizational level codes. To define the organizational level, you use the **Organizational Levels** page.

1. Open the relevant contact card.
2. In the **Organizational Levels** field, select the code you want to assign.

After you have assigned organizational levels to your contacts, you can use this information to create segments.

After you have assigned job responsibilities to your contacts, you can use this information to select contacts for your segments. For more information, see [Add Contacts to Segments](#).

To assign web sources to a contact

You can use web sources with your contact companies to identify, for example, search engines and web sites, on the Internet that you want to use to search for information about the contacts. When assigning web sources, you specify which search engine and search word the application will use to find the requested information.

NOTE

This is only possible for contacts of type **Company**.

When assigning web sources, you specify which search engine and search word that the application will use to find the requested information.

1. Open the relevant contact card.
2. Choose the **Company** action, and then choose the **Web Sources** action. The **Contact Web Sources** page opens.
3. In the **Web Source Code** field, choose the web source you want to assign.
4. In the **Search Word** field, enter the search word that you want to use to find the information.

Repeat these steps to assign as many web sources as you want.

To assign business relations to a contact

You can use business relations to indicate the business relationship you have with your contacts, for example, a prospect, bank, consultant, service supplier, and so on.

NOTE

This is only possible for contacts of type **Company**.

1. Open the relevant contact card.
2. Choose the **Company** action, and then the **Business Relations** action.
3. On the **Contact Business Relations** page, in the **Business Relation Code** field, select the business relation you want to assign.

Repeat these steps to assign as many business relations as you want.

The number of business relations you have assigned to the contact is displayed in the **No. of Business Relations** field in the **Segmentation** section on the **Contact** page.

After you have assigned business relations to your contacts, you can use this information to select contacts for your segments. For more information, see [Add Contacts to Segments](#).

Automatically Copying Specific Information from Contact Companies to Contact Persons

Some information about contact companies is identical to the information about the contact persons working within these companies, for example, the address details. On the **Inheritance** FastTab on the **Marketing Setup** page, you can specify which fields on the contact card for a company is copied to the contact card for a person each time you create a contact person for the contact company.

When you modify one of these fields on the contact company card, the same fields on the contact person card are updated, unless you have manually modified the field on the contact person card.

For more information, see [Create Contacts](#).

Using Predefined Defaults on New Contacts

You can decide that the application automatically assigns a specific language code, territory code, salesperson code, and country/region code as defaults to each new contact you create. You can also enter a default sales cycle code that the program automatically assigns to each new opportunity you create. You set this up on the **Defaults** FastTab on the **Marketing Setup** page.

The inheritance of fields overwrites the default values you have set up. For example, if you have set up English as the default language, but the contact company's language is German, the program will automatically assign German as the language code for the contact persons recorded for that company.

Synchronizing Contacts with Customers, Vendors, and Bank Accounts

In order to synchronize the contact card with a linked customer, vendor, or bank account card, you must fill in the relevant field in the **Bus. Relation Code for** section on the **Interactions** FastTab on the **Marketing Setup** page.

For more information, see [Synchronizing contacts with customers, vendors, and bank accounts](#).

Searching for Duplicate Contacts

You can choose to have the program automatically search for duplicates each time you create a contacts, or you can choose to search manually after you have created contacts. You can also choose to have the program update the search strings automatically each time you modify contact information or create a contact. You can decide the search hit percentage, that is, the percentage of identical strings two contacts must have for the program to consider them as duplicates. You set this up on the **Duplicates** FastTab on the **Marketing Setup** page.

When you have found a duplicate contact, you can use the **Merge Duplicate** page to merge it into an existing contact record that you want to keep. For more information, see [Merge Duplicate Records](#).

Create Contacts

3/31/2019 • 6 minutes to read

You regularly meet persons from other companies that may develop into business relationships, such as a customer relation. When such a new contact is made, as much information as possible must be recorded on a contact card so that communication can continue.

Person or Company

You can decide to set up a contact as a person or a company, typically depending on whether you know the name of the contact person at the time of creation. You do this when you fill in the **Type** field on the **Contact Card** page. You can also maintain contact cards for both a company and one or more persons working in the company. This happens automatically when you fill in the **Company Name** field on a contact card of type **Person**.

Functionality is the same for both types, except that the options for additional information changes depending on the type. For example, you can only assign job responsibilities to a person and industry group to a company. This is indicated in the UI by garying out the fields and actions that do not apply. You can change the value of the **Type** field later, or you can use the fields on the **Inheritance** FastTab on the **Marketing Setup** page to control which data is shared between a person and the person's related company. For more information, see [Setting Up Contacts](#).

To create a contact manually

1. Choose the  icon, enter **Contacts**, and then choose the related link.
2. Choose the **New** action.
3. In the **No.** field, enter a number for the contact.

Alternatively, if you have set up a number series for contacts on the **Marketing Setup** page, you can press the Enter key to insert the next available contact number.

4. Fill in the remaining fields as required. Hover over a field to read a short description.

To create a contact from a customer, vendor, or bank account

If you have customers, vendors, and bank accounts that you want to create contact cards for, you can use the **Create Contacts from** batch jobs to create contacts on the basis of the existing data. When you create a contact this way, the contact information is afterwards synchronized with the related customer, vendor, or bank account information. For more information, see [Synchronizing Contacts with Customers, Vendors, and Bank Accounts](#).

NOTE

Before you can create contacts based on existing data, you must specify a business relation code for customers, vendors, or bank accounts on the **Interactions** FastTab on the **Marketing Setup** page. For more information, see [Setting up Contacts](#).

1. Choose the  icon, enter one of the following, depending what you want to create contacts from, and then choose the related link.
 - **Create Contacts from Customers**
 - **Create Contacts from Vendors**
 - **Create Contacts from Bank Accounts**

2. On the request page that opens, in the **Customer, Vendor, or Bank Account** section, set filters if you want to create contacts from specific customers, vendors, or bank accounts.
3. Choose the **OK** button to start creating contacts.

The next contact numbers in the number series are assigned to the new contacts. The business relations that are specified on the **Marketing Setup** page is assigned to the newly created contacts.

TIP

You can also do this the other way around, namely by creating a customer, vendor, or bank account from a contact. For more information, see [To create a contact as a customer, vendor, or bank account](#)

Synchronizing Contacts with Customers, Vendors, and Bank Accounts

If some of your contacts are also customers, vendors, or bank accounts, you can synchronize the contact information with the related customer, vendor, or bank account.

The following benefits exist when a contact is synchronized with a customer, vendor, bank account.

- You only have to update information in one place. For example, if you modify the phone number on the contact, the phone number is automatically updated with the same modification on the customer, the vendor, or the bank account.
- If you have specified a number series for contacts, when you create a customer card, a vendor card, or a bank account card, a contact card is automatically created for the customer, vendor or bank account.
- You can create sales quotes and orders and purchase quotes and orders from the contact.
- You can have your interactions recorded when you perform actions, such as printing orders, blanket orders, creating sales service orders, sending e-mails, and so on.
- If you delete a contact linked to a customer, vendor, or bank account, only the contact is removed. The customer, vendor, or bank account remains.
- If you delete a customer, vendor, bank account that is linked to a contact, the contact remains.

NOTE

Certain details, such as invoicing and posting details, do not appear on the contact card. Therefore, you may want to add them manually on the customer card, vendor card, or bank account card when you create contacts as customers, vendors or bank accounts.

Synchronization of common data between contacts and the related customers, vendors, or bank accounts is enabled in three ways:

- When you link contacts with existing customers, vendors, or bank accounts from the contact card. See [To link a contact to an existing customer, vendor, or bank account](#).
- When you create customers, vendors, or bank accounts from contacts. See [To create a contact from a customer, vendor, or bank account](#).
- When you create contacts as customers, vendors, or bank accounts. See [To create a contact as a customer, vendor, or bank account](#).

To link a contact to an existing customer, vendor, or bank account

If you have a contact and either a customer, vendor, or bank account for the same company, you can link the two entities so that common data is synchronized.

1. Open the contact that you want to link.

2. Choose the **Link with existing** action, and then choose the **Customer, Vendor,** or **Bank** action.
3. On the page that opens, select the customer, vendor, or bank account to link to.
4. In the **Current Master Fields** field, specify whose fields to prioritize in case of conflicting information in fields common to the contact and customer, vendor, or account. For example, if the salesperson code is different on the contact card than on the customer card, you can choose to keep the one on the contact card by selecting **Contact**.
5. Choose the **OK** button.

To create a contact as a customer, vendor, or bank account

If you have a customer, vendor, or bank account for the company that you want to create a contact for, you can use the **Create as** function. When you create a contact this way, the contact information is afterwards synchronized with the related customer, vendor, or bank account information. For more information, see [Synchronizing Contacts with Customers, Vendors, and Bank Accounts](#).

NOTE

Before you can create customers, vendors, or bank accounts from contacts, you must specify a business relation code for customers, vendors, or bank accounts on the **Interactions** FastTab on the **Marketing Setup** page. For more information, see [Setting up Contacts](#).

1. Choose the  icon, enter **Contacts**, and then choose the related link.
2. Select the contact you want to create as a customer, vendor, or bank account.
3. Choose the **Create As** action, and then choose either **Customer, Vendor,** or **Bank**.
4. Choose the **OK** button.

The contact information is transferred from the contact card to a new customer, vendor, or bank account card. You may want to add specific information to each of the cards, such as invoicing and payment details. For more information, see, for example, [Register New Customers](#).

Use Profile Questionnaires to Classify Business Contacts

3/31/2019 • 2 minutes to read

You can set up profile questionnaires that you want to use when entering information about your contacts' profiles. Within each questionnaire, you can set up the different questions you intend to ask your contacts.

You can also run the questionnaire to answer some of the questions based on contact, customer, or vendor data automatically.

To add a profile questionnaire

1. Choose the  icon, enter **Questionnaire Setup**, and then choose the related link.
2. On the **Home** tab, in the **New** group, choose **New**.
3. Fill in the fields as necessary. Hover over a field to read a short description.

To add questions to a profile questionnaire

1. Choose the relevant profile questionnaire, and then on the **Home** tab, in the **Process** group, choose **Edit Questionnaire Setup**.
2. On the first empty line, in the **Type** field, choose **Question** and type your question in the **Description** field. Fill in the other fields on this line.
3. On the next empty line, in the **Type** field, choose **Answer** and type your answer in the **Description** field.
4. In the **Priority** field, select the priority. In the **From Value** and **To Value** fields, define a point range. Contacts that receive points within the defined range will get the answer.

Repeat these steps to enter all the questions and answers within the profile questionnaire.

After you have created a questionnaire, you must create contact ratings to classify your contacts. You can also set up questions that are rated automatically based on information in the contact card.

NOTE

If you enter a question that is automatically answered, choose **Line**, and then choose **Question Details**, to enter the criteria to automatically answer the question.

The Automatic Classification of Contacts

You can automatically classify your contacts according to customer, vendor, and contact information, by setting up automatically answered profile questions on the **Profile Questionnaire Setup** page.

NOTE

Only contacts that are recorded as customers can be assigned a classification based on customer data and only contacts that are recorded as vendors can be assigned a classification based on vendor data. The automatic classification is not updated automatically. Consequently, you may want to update the profile questionnaires, after you have updated the customer, vendor or contact data they are based on.

After you have set up automatically answered profile questions, if you assign the profile questionnaire containing

these questions to a contact, Business Central will automatically assign the right answers for the contact.

Example

You can classify your contacts according to how much they bought from you:

ANSWER	APPLIES TO
A	contacts who bought for 500,000 LCY or more
B	contacts who bought for 100,000 up to 499,999 LCY
C	contacts who bought for 99,999 LCY or less

To do this, fill on the **Profile Questionnaire Setup** page as follows:

TYPE	DESCRIPTION	AUTOMATIC CLASSIFICATION	FROM VALUE	TO VALUE
Question	ABC Classification	Click to insert a check mark		
Answer	A		500,000	
Answer	B		100,000	499,999
Answer	C			99,999

Then fill on the **Profile Question Details** page as follows:

FIELD	VALUE
Customer Classification Field	Sales (LCY)
Classification Method	Defined Value

When you assign the profile questionnaire containing this question to a contact, the program automatically enters the relevant answer for this contact on the profile lines of the contact card.

[Creating Contacts](#)

Merge Duplicate Records

3/31/2019 • 4 minutes to read

As different users create new customer, vendor, or contact cards over time, or the new records are created automatically during migration, a customer, vendor, or contact may be represented in the system with more than one record. In this case, you can use the **Merge Duplicate** page from the card of the record that you want to keep. The page gives you an overview of duplicated field values and provides functions to select which values to keep or discard when merging two records into one.

NOTE

Only users with the MERGE DUPLICATES permission set can use this functionality.

TIP

The **Merge Duplicate** page shows all fields where the values are different for the two records being compared. Therefore, a duplicate is indicated by the page showing very few fields. Whereas, if the page shows many fields, then the suspected record is probably not a duplicate.

The following procedure is based on a customer card. The steps are similar for a vendor and contact cards.

1. Choose the  icon, enter **Customers**, and then choose the related link.
2. Select the customer that you know or suspect that a duplicate record exists for, and then choose the **Edit** action.
3. On the **Customer Card** page, choose the **Merge With** action.
4. On the **Merge Duplicate** page, in the **Merge With** field, select the customer that you believe is a duplicate of the one you have opened, indicated in the **Current** field.

The **Fields** FastTab lists fields where the values are different for the two customers. This means that if the selected customer is really a duplicate, then only very few fields should be listed, such as typing errors and other data entry mistakes.

The **Related Tables** FastTab lists tables where there are fields with a relation to both customers. The **Current Count** and **Duplicate Count** fields show the number of fields in related tables where the **No.** value of both the current and the duplicate customer is used. On the **Merge Duplicate** page, this section is informational only, however, if merge conflicts exist, you will resolve them on the **Merge Duplicate Conflicts** page. See steps 8 through 12.

5. For each field where you want to use another value than the current one, select the **Override** check box. The value in the **Alternate Value** field will then be transferred to the current record when you complete the process.
6. When you have finished selecting which values to keep or override, choose the **Merge** action.

The system checks if the merge of values for the duplicate customer into the current customer causes any conflicts. A conflict exists if a value in at least one primary-key field is the same for both customers while the value in the **No** field is different for the two customers.

7. If no conflicts are found, choose the **Yes** button in the confirmation message box.

The duplicate customer is renamed so that all usage of its **No.** value in all fields with relations to the customer table will be replaced with the **No.** value of the current customer.

8. If conflicts exist, choose the **Resolve (xx) conflicts before merge.** action on the **Conflicts** FastTab, which will appear if conflicts exist.
9. On the **Merge Duplicate Conflicts** page, select the line for a related table with a conflict, and then choose the **View Details** action.

The **Merge Duplicate** page now shows the fields in the selected table that cause a merge conflict between the two customer records. Notice in both the summarized values in the **Current** and **Conflicts With** fields and on the lines that at least one primary-key field is the same for both customers and the value of the **No.** field is different for the two customers.

10. If you do not want to keep the duplicate customer record, choose the **Remove Duplicate** action, and then choose the **Close** button.

Identical field values, other than the value in the **No.** field, are removed from the duplicate record and inserted on the current record.

11. If you want to keep the duplicate customer record after the merge, choose the **Rename Duplicate.**
12. On lines, not for the **No.** field, where the field has the same value on both records, change the value in the **Alternate Value** field, and then choose the **Close** button.

The conflicting field value is updated on the duplicate record so that it can be merged with the current record. The duplicate record continues to exist after the merge.

13. Repeat steps 8 through 12 until all conflicts are resolved. The **Conflicts** FastTab disappears.
14. On the **Merge Duplicate** page, choose the **Merge** action again, and then select the **Yes** button in the confirmation message box.

NOTE

For contacts, you can use functionality to find duplicate contacts before you use the **Merge Duplicate** page. For more information, see [Searching for Duplicate Contacts](#).

Managing Segments

5/2/2019 • 2 minutes to read

You create segments to select a group of contacts according to specific criteria. For example, a segment could be the industry that the contacts belong to or your business relationship with the contacts. You can create a segment to select the contacts you want to target with a campaign.

There are two main tasks in creating a segment:

- Enter general information about the segment. Before you can select the contacts within the segment, you must first create the segment.
- Select the contacts to be included within the segment.

The following table describes a sequence of tasks, with links to the topics that describe them.

TO	SEE
Create segments which allow you to select a group of contacts. For example, direct mail.	Create Segments
Manage the contacts that are assigned to segments.	Add Contacts to Segments

Create Segments

3/31/2019 • 2 minutes to read

You can create segments to select a group of contacts, for example, if you want to create an interaction involving several contacts, such as direct mail.

To create a segment

1. Choose the  icon, enter **Segments**, and then choose the related link.
2. Choose the **New** action.
3. In the **General** section, in the **No.** field, enter a number for the segment.

Alternatively, if you have set up number series for segments on the **Marketing Setup** page, you can press Enter to select the next available segment number.

4. Fill in the other fields on the header.

You can now add contacts to the segment. For more information, see [Add Contacts to Segments](#).

Add Contacts to Segments

3/31/2019 • 2 minutes to read

After you have created a segment and entered basic information about it, you may want to add contacts to the segment. You can do this by filling in the lines on the **Segment** page manually, but it is easier and faster to use the **Add Contacts** action.

To add a contact to a segment

1. Choose the  icon, enter **Segments**, and then choose the related link.
2. Select the segment, and then choose the **Add Contacts** action. The **Add Contacts** batch job page opens.
3. In the **Contact** section, set filters to specify the information by which you want to select contacts.

To enter additional filters, repeat this procedure on each of the remaining sections, and then choose the **OK** button.

If you have added contacts by mistake and want to go back one step, then choose the **Go Back** action.

To refine the number of contacts

After you have selected the contacts within a segment, you may decide to remove some but keep others. You can manually remove contacts from the lines on the **Segment** page, but it is easier and faster to use the **Refine Contacts** action.

1. Open the segment.
2. Choose **Contacts**, and then choose the **Refine Contacts** action. The **Remove Contacts - Refine** page opens.
3. In the **Contact** section, enter filters to specify the information that you want to use to select the contacts to be removed from the segment.
4. Add additional filters as needed, and then choose the **OK** button.

You can refine a segment as many times as you want. If you have refined the segment by mistake and want to go one step back, choose the **Go Back**.

To see a list of the segment criteria that you have used, in the **General** section, choose the **No. of Criteria Actions** field.

To reduce the number of contacts

After you have selected the contacts within a segment, you may want to remove some of them. You can do this by manually removing them from the lines in the Segment page, but it is easier and faster to use the Reduce Contacts function to specify which contacts to remove, and to use the Refine Contacts function to specify which contacts to keep.

1. Open the segment.
2. Choose **Contacts**, and then choose the **Reduce Contacts** action. The **Remove Contacts - Reduce** page opens.
3. In the **Contact** section, enter filters to specify the information that you want to use to select the contacts to be removed from the segment.
4. Add additional filters as needed, and then choose the **OK** button.

You can reduce a segment as many times as you want. If you have refined the segment by mistake and want to

go one step back, then choose the **Go Back** action.

Manage Interactions for Segments

5/2/2019 • 2 minutes to read

The **Segment** page is a type of worksheet where you can:

- Create segments.
- Save the segmentation criteria you have used to select contacts.
- Log the segment and record interactions involving the contacts within the segment.

Segmenting

There are several ways to create segments:

- You can manually enter the contacts you want to include in the segment in the segment lines.
- You can select contacts.
- You can reuse a logged segment as the basis to create a new one.
- You can reuse saved segmentation criteria.

Interactions

On the **Segment** page, you can create interactions for several contacts simultaneously. For example, you can merge a segment with a Microsoft Word document, so that you can send a letter to all the contacts in the segment.

You can specify information about the interaction for the segment on the **Segment** header. For example, you can decide which interaction template you want to use for all the contacts, specify a description, a correspondence type, and so on. However, you can modify this information in the segment line for each particular contact, for example, by specifying another description for one contact. If you are merging a segment with a Microsoft Word document, you can personalize the document to be sent for one or several of the contacts within the segment, for example, by adding individualized comments to the document.

Logging

On the **Segment** page, when you choose **Log**, the application records the interactions on the **Interaction Log Entry** page, and logs the segment. After you have logged the segment, you can only find it on the **Logged Segments** page.

On the **Logged Segments** page, you can decide to create a follow-up segment containing the same contacts as the segment you have logged.

[Working with Business Central](#)

Managing Interactions

5/2/2019 • 2 minutes to read

In Business Central, interactions are all types of communications between your company and your contacts. For example, communications can be email, letter, telephone, meetings, and so on.

You can record all the interactions that you have with your contacts in order to keep track of the sales and marketing efforts you have directed at your contacts and to improve your future business interactions with them.

The following table describes a sequence of tasks, with links to the topics that describe them.

TO	SEE
Set up your system to record interactions.	Set Up Contacts
Create interactions to record all the interactions and communications you have with your contacts and segments, such as emailing.	Create Interactions on Contacts and Segments
Set up your system to automatically record interactions for sales, purchase, and service documents, such as when a document is created, posted, or printed.	Automatically Record Interactions with Contacts

Record Interactions With Contacts

5/2/2019 • 2 minutes to read

Setting up your application to record interactions consists of these tasks:

- Setting up interaction templates
- Creating interactions on contacts or segments
- View and manage recorded interactions

Setting up Interaction Templates

Before you can create and record interactions, you must set up interaction templates. When creating interactions, you must specify the interaction templates they are based on. An interaction template is a model that defines the basic characteristics of an interaction. You set up an interaction template on the **Interaction Templates** page.

After you have entered information about the interaction template, you can create an attachment, for example, a Microsoft Word document. Repeat the steps to set up as many interaction templates as you want.

Creating Interactions

There are two ways of recording interactions:

- You can manually create interactions that are linked to a single contact or to a segment. For more information, see [Create Interactions on Contacts and Segments](#).
- You can automatically record interactions when you perform actions in the application, for example, when you print an invoice, or quote. For more information, see [Automatically Record Interactions with Contacts](#).

Viewing and Managing Recorded Interactions

You can view all the recorded interactions that have not been deleted on the **Interaction Log Entries** page. You can open this page by:

- Using the **Search for Page or Report** icon to search on **Interaction Log Entries**.
- Choosing the **Interaction Log Entries** action on a contact or segment. The **Interaction Log Entry** page contains the interactions you create manually and the interactions that the application records automatically.

In this page, you can:

- View the status of interactions.
- Mark interactions as canceled.

You can delete interaction log entries that have been canceled. To delete interaction log entries, choose the  icon, enter **Delete Canceled Interaction Log Entries**, and then choose the related link, and then fill in the information.

Create Interactions on Contacts and Segments

3/31/2019 • 2 minutes to read

You can create interactions to record all the interactions and communications you have with your contacts and segments, for example, direct mail.

Before you create interactions, you must set up interaction templates. For more information, see [Set Up Interaction Templates](#).

To create an interaction

1. Open the contact, salesperson, or interaction log entry.
2. Choose the **Create Interaction** action.
3. Fill in the fields, and then choose the **OK** button.

NOTE

If you need to perform another task before finishing the interaction, you can choose **Cancel** and then finish the interaction at a later time. This postpones the interaction.

To finish and delete postponed interactions

1. Open the contact, salesperson, or interaction log entry.
2. Choose **Postponed Interactions**.
3. Select the interaction you want to finish, and then choose the **Resume** action.

To create an interaction on a segment

1. Choose the  icon, enter **Segments**, and then choose the related link.
2. In the **Segment page**, in the **Interaction** section, fill in the fields to specify which interaction you want to assign to the segment.

After you have assigned an interaction to the segment, you can personalize the interaction for each particular contact within the segment, for example, by selecting another interaction template on the lines on the **Segment** page.

3. To log the segment and interactions, choose the **Log** action. The **Log Segment** page opens.
4. If you want to create a new segment containing the same contacts, select the **Create Follow-up Segment** check box. To create a follow-up segment, you must have specified number series for segments on the **Marketing Setup** page.

An interaction is recorded for each contact within the segment in the **Interaction Log Entry** table, and the segment is logged. Logged segments can be found on the **Logged Segment** page.

If you have selected the **Create Follow-up Segment** check box, a new segment is created that contains the same contacts as the segment you have just logged.

Recording Interactions with Contacts Automatically

3/31/2019 • 2 minutes to read

You can set up the application to automatically record interactions for sales, purchase and service documents, cover sheets, e-mails, phone calls, such as:

- Print sales or purchase quotes, orders, invoices, credit memos, cover sheets.
- Create sales service orders.
- Post sales service orders.
- Send e-mails to your contacts.
- Call your contacts, if you have a TAPI-compliant telephone and the correct installation.

To set up the automatic recording of these interactions, you specify interaction templates for these documents and actions by using the **Interaction Template Setup** page.

To open the **Interaction Template Setup** page, choose the  icon, enter **Interaction Template Setup**, and then choose the related link.

Managing Sales Opportunities

5/2/2019 • 2 minutes to read

Any incoming lead can be considered a sales opportunity. You can create opportunities and associate them to a salesperson so that you can keep track of potential sales.

Before you can start using opportunity management, you must set up sales cycles and sales cycle stages. As you create opportunities, you should provide information about the contact, salesperson, sales cycle, and dates, as well as your estimates for the sales value of the opportunity and your estimation of the chances of its success.

The following table describes a sequence of tasks, with links to the topics that describe them.

TO	SEE
Set up the sales cycles that you usually follow, and the different stages within each opportunity sales cycle.	Set Up Opportunity Sales Cycles and Cycle Stages
Create sales opportunities that you have from your contacts.	Create Opportunities
Move a sales opportunity through the sales cycle to completion.	Process Sales Opportunities

Set Up Opportunity Sales Cycles and Cycle Stages

3/31/2019 • 3 minutes to read

Before you can start using sales opportunities, you must set up sales cycles and sales cycle stages. A sales cycle is made up of a series of stages that go from the initial contact to the closing of a sale. Each stage can have certain requirements that must be met, such as requiring a sales quote, before an opportunity can go to the next stage. You can also specify whether a stage can be skipped. You can setup as many sales cycles as you need, and you can set up as many sales cycle stages as necessary within a sales cycle.

Implementing opportunity sales cycles involves setting up the sales cycle, defining the different stages of the cycle, and then assigning the cycle to opportunities. Assigning the relevant activity or tasks to the opportunity may also be part of setting up a sales cycle.

This topic also describes how to set up tasks and activities, and how to assign tasks to activities. For more information, see [To set up activities with tasks](#).

To set up opportunity sales cycle codes

1. Choose the  icon, enter **Sales Cycles**, and then choose the related link. The **Sales Cycles** page opens, and lists all the existing sales cycles.
2. Choose the **New** action, and fill in the fields as necessary. Hover over a field to read a short description.

Repeat these steps to set up as many sales cycles as you want. After you have set up opportunity sales cycles, you may want to set up the different stages within each cycle.

To define opportunity sales cycle stages

1. On the **Sales Cycles** page, select the opportunity sales cycle for which you want to set up stages, and then choose the **Stages** action. The **Sales Cycle Stages** page opens.
2. Choose the **New** action to enter a new stage in the sales cycle.

Repeat these steps to set up as many stages as you want within the sales cycle.

To assign stage cycles to opportunities

After you add the opportunities stage cycle, you can start to add sales opportunities, and then assign the stage cycle to opportunities by setting the **Sales Cycle Code** field. For more information, see [Create Sales Opportunities](#).

To set up activities with tasks

You can combine multiple task, for example tasks that each represent a step, in activities. Activity tasks are related to each other by a date formula. You can assign activities to opportunities, salespeople, or contacts.

1. Choose the  icon, enter **Activities**, and then choose the related link.
2. Choose the **New** action, and fill in the fields as necessary.
3. On the **Lines** FastTab, fill in the fields as necessary to define one or more tasks in the activity.

To assign tasks or activities of tasks to opportunities

When you have set up a task, you can assign it to a sales opportunity and thereby assign the activity that the task

belongs to.

NOTE

This procedure describes how to assign activity tasks to opportunities. the steps are similar when you assign tasks to salespeople and contacts.

1. Choose the  icon, enter **Opportunities**, and then choose the related link.
2. Select an opportunity, and then choose the **Tasks** action.
3. On the **Task List** page, choose the **Create Task** action.
4. The **Create Task** page, fill in the fields as necessary.
Notice in the **Opportunity** field, that it is automatically assigned to the opportunity in question.
5. Choose the **OK** button.
6. On the **Task List** page, select the new task, and then choose the **Assign Activities** action.
7. On the **Assign Activity** page, fill in the fields as necessary, and then choose the **OK** button.

Create Sales Opportunities

3/31/2019 • 2 minutes to read

You can create opportunities for the sales opportunities you have on your contacts. All opportunities must be assigned to a salesperson or purchaser and must have a contact.

You can create opportunities from the **Opportunity List** page. But you typically will create opportunities from the specific contact or salespeople.

Before you can create opportunities, you must set up opportunity sales cycles. For more information see [Set Up Opportunity Sales Cycles and Stages](#).

To create an opportunity from a salesperson

1. Choose the  icon, enter **Salespeople**, and then choose the related link.
2. Select the salesperson from the list for whom you want to create an opportunity.
3. Choose the **Opportunities** action, and then choose **List**.
4. Choose **New**, and then fill in the fields as relevant. Hover over a field to read a short description.

To create an opportunity from a contact

1. Choose the  icon, enter **Contacts**, and then choose the related link.
2. Select the contact from the list for whom you want to create an opportunity.
3. Do one of the following:
 - Choose the **Create Opportunity** action.
 - Choose the **Opportunities** action, and then choose **New**.
4. Fill in the relevant fields.

[Creating and Managing Contacts](#)

[Working with Business Central](#)

Process Sales Opportunities

3/31/2019 • 3 minutes to read

After you create an opportunity, there are several features for managing the opportunity and moving it through to completion.

To view opportunities

The existing sale opportunities are available from the **Opportunity List** page. There are different ways to access this page for processing sales opportunities:

TO VIEW OPPORTUNITIES FOR	THEN
All salespeople and contacts	Choose the  icon, enter Opportunity List , and then choose the related link.
A specific sales person	Choose the  icon, enter Salespeople , and then choose the related link. Select the salesperson, choose the Opportunities action, and then choose the List action.
A specific contact	Choose the  icon, enter Contacts , and then choose the related link. Select the contact from the list, and then choose the Opportunities action.

Each of these tasks opens the **Opportunity List** page.

To close opportunities

You can close opportunities when the negotiations are over. When closing an opportunity, you can specify whether it was won or lost, and the reasons for closing it. To specify a reason, you must set up closed opportunity codes.

1. On the **Opportunity List** page, select the opportunity, and then choose the **Close** action. The **Close Opportunity** page opens.
2. Fill in the relevant fields, and then choose the **OK** button.

The **Close Opportunity Code** and **Date Closed** fields are required fields and must be filled in before you can choose the **OK** button.

In the **Close Opportunity Code** field, you can choose from one of the existing close opportunity codes or add a new code. To add a new code, from the drop-down list, choose **Select from full list**, and then choose **new**. On the new blank line, fill in the **Code**, **Type**, and **Description** fields, and then choose the **OK** button.

To create quotes for opportunities

You can create sales quotes for contacts that are not recorded as customers.

1. On the **Opportunity List** page, select the opportunity, and then choose the **Assign Sales Quote** action. The **Sales Quote** page opens.
2. Fill in the relevant fields.

To create sales orders for opportunities

You can make sales orders from the sales quotes that you have created for your opportunities. Before you can create sales orders for your contacts, you must create the contact as a customer. For more information, see [Create a Customer, Vendor, or Bank Account From a Contact](#).

1. On the **Opportunity List** page, find the opportunity that you have created a sales quote for.
2. Choose the **Assign Sales Quote** action. The **Sales Quote** page opens to show the sales quote that you have assigned to the opportunity.
3. Fill in the additional fields, and then choose the **Make Order** action.

When handling sales opportunities, you may need to create a quote for the contact that the opportunity is linked to.

To delete opportunities

You can delete opportunities, for example, after you have concluded a deal. However, you can only delete closed opportunities. There are two ways to delete closed opportunities. You can delete individual closed opportunities from the **Opportunity List** page or you can run the **Delete Closed Opportunities** batch job to delete multiple opportunities based on a specified criteria.

To delete closed opportunities from the **Opportunity List** page, select the opportunity, and then choose the **Delete** action.

To delete closed opportunities by using the **Delete Closed Opportunities** batch job, follow these steps:

1. Choose the  icon, enter **Delete Opportunities**, and then choose the related link.
2. In the **Opportunity** section, set up the filters that specify the closed opportunities to delete.
3. Choose the **OK** button.

After you have deleted an opportunity, it is removed it from the **Opportunity List** page.

To move an opportunity through sales cycle stages

If an opportunity follows a sales cycle, you can move it forward or back through the different stages, such as moving the next or previous stage, and even skipping a stage.

1. On the **Opportunity List** page, choose the **Update** action. The **Update Opportunity** opens,
2. Use the **Action Type** field to move the opportunity through the sales cycle stages:
 - **Next** moves the opportunity forward one stage.
 - **Skip** moves the opportunity forward one or several stages in the sales cycle, which you specify in the **Presentation** field. You can only skip stages that have been set up to allow skipping.
 - **Previous** moves the opportunity back one stage.
 - **Jump** moves the opportunity back one or several stages in the sales cycle, which you specify in the **Presentation** field.
 - **Update** enables you to change information (such as to modify your evaluation of their chances of success and estimated values) without moving to another stage.
3. Fill in the other fields as needed, and then choose the **OK** button.

Managing Marketing Campaigns

3/31/2019 • 2 minutes to read

Having a strong marketing plan in place enables you to identify, attract, and retain customers. A marketing plan consists of various campaigns and other interactions in connection with your sales and marketing activities. While planning a campaign, you need to decide which contacts to target, what type of campaign (such as trade show or direct mail), and what salespeople will perform each task.

Each campaign consists of various activities or tasks. You can combine multiple task, for example tasks that each represent a step, in activities. Activity tasks are related to each other by a date formula. Individual tasks can only be assigned to salespeople. Activities can be assigned to opportunities, salespeople, groups of sales people, and contacts. For more information, see [Set Up Opportunity Sales Cycles and Cycle Stages](#).

Defining individual campaigns

Before you can create a campaign, you must set up *campaign status codes*. Using these codes will help you manage your campaigns by assigning a status to the campaign. As you work through the stages of a campaign, you are able to see what step a campaign is at and what step comes next. You set up campaign status codes on the **Campaign Status** page.

You can create a campaign card for each campaign that you want to keep track of. You can also view these campaign cards to view general information about your campaigns. You can delete campaign entries, such as if the entry records an action that has been canceled. Only canceled campaign entries can be deleted.

Selecting the target audience

After you have created a campaign, you can start creating segments that specify the target audience of the campaign. For more information, see [Managing Segments](#).

Registering discount percentages

When you have set up your campaign, decided what segments you want the campaign to cover, and set the starting and ending dates, you register the discount percentage that the customer will receive on the individual items on the lines on the **Sales Line Discounts** page. You can also register the sales prices for the individual items on the lines on the **Sales Prices** page. You can access both pages from the campaign card.

When you have set up the sales prices/line discounts and the segments on the campaign card, you must activate them so that the campaign prices/discounts will be reflected on the lines.

NOTE

In order to activate the sales prices/line discounts, you must specify if the whole segment or only some contacts are targets of the campaign. If the sales prices/line discounts covers all the contacts in the segment, select the **Campaign Target** field on the **Campaign** FastTab of the **Segment** card.

If the sales prices/line discounts are not to be offered to all the contacts in the segment, you can clear the **Campaign Target** field for the relevant contacts. If you cannot see this field, you can add it to your view. For more information, see [Personalizing Your Workspace](#).

Conducting campaigns

As a campaign runs, all interactions with your contacts, or segment, are recorded so that you can get statistics and other information about the costs and success rates of the campaign.

Campaigns are conducted by salespeople, and you must create activities to represent each task and assign them to the relevant salespeople. For more information, see [Set Up Opportunity Sales Cycles and Cycle Stages](#).

Using Dynamics 365 for Sales from Business Central

6/13/2019 • 6 minutes to read

If you use Dynamics 365 for Sales for customer engagement, you can enjoy seamless integration in the lead-to-cash process by using Business Central for backend activities such as processing orders, managing inventory, and doing your finances.

Before you can use the integration capabilities, you must set up the connection and define users in Dynamics 365 for Sales. For more information, see [Integrating with Dynamics 365 for Sales](#).

NOTE

These steps describe the process of integrating online versions of Dynamics 365 for Sales and Business Central. For information about on-prem configuration, see [Preparing Dynamics 365 for Sales for Integration on-premises](#).

Integrating the applications lets you access data in Sales from Business Central, and in some cases the other way around. You can work with and synchronize data that both services have in common, such as customers, contacts, and sales information, and keep the data up to date in both applications.

For example, a sales person in Sales can use the price lists from Business Central when they create a sales order. When they add the item to the sales order line in Sales, they can see the inventory level (availability) of the item from Business Central.

Conversely, order processors in Business Central can handle sales orders that are automatically or manually transferred from sales. For example, they can create and post sales order lines for items or resources that were entered in Sales as write-in products. For more information, see [Handling Sales Order Data](#).

IMPORTANT

Business Central integrates only with Dynamics 365 for Sales. Other Dynamics 365 applications that change the standard workflow or data model in Sales, for example Project Service Automation, can break the integration between Business Central and Sales.

Coupling Records

The assisted setup guide lets you choose the data to synchronize. Later, you can also set up synchronization for specific records. This is referred to as *coupling*. For example, you can couple a specific account in Sales with a specific customer in Business Central. This section describes what to take into consideration when you couple records.

For example, if you want to see accounts in Sales as customers in Business Central, you must couple the two types of records. To do that, on the **Customers** list page in Business Central, use the **Set Up Coupling** action. Then specify which Business Central customers to match to which accounts in Sales.

You can also create (and couple) an account in Sales based on, for example, customer record in Business Central using **Create Account in Dynamics 365 for Sales**, or vice versa, using **Create Customer in Business Central**.

When you set up coupling between two records, you can also manually request current record, for example a customer, to be overwritten immediately by account data from Sales (or from Business Central) using **Synchronize Now** action. **Synchronize Now** action which will ask whether to overwrite Sales or Business Central record data.

In some cases you must couple certain sets of data before other sets of data, as shown in the following table.

DATA	WHAT TO COUPLE FIRST
Customers and accounts	Couple salespeople with Sales users
Items and resources	Couple units of measure with Sales unit groups
Items and resource prices	Couple customer price groups with Sales prices

NOTE

If your prices or customers use foreign currencies, make sure that you couple currencies to Sales transaction currencies.

In Sales, sales orders depend on information such as customers, units of measure, currencies, customer price groups, and items and/or resources. For the integration with sales orders to work you must couple customers, units of measure, currencies, customer price groups, and items and/or resources.

Fully Synchronizing Records

At the end of the assisted setup guide you can choose the **Run Full Synchronization** action to start synchronizing all Business Central records with all related records in Sales. On the **Dynamics 365 for Sales Full Synch Review** page, you choose the **Start** action. Full synchronization can take some time to complete, but you can continue to work in Business Central while it runs in the background.

To check the progress of individual jobs in a full synchronization, on the **Dynamics 365 for Sales Full Synch Review** page choose a record to view details. To update the status during synchronization, refresh the page.

From the **Microsoft Dynamics 365 Connection Setup** page, you can get details about full synchronization at any time. From here, you can also open the **Integration Table Mappings** page to see details about the tables in Business Central and Sales that must be synchronized.

Handling Sales Order Data

Sales orders that people submit in Dynamics 365 for Sales will be transferred to Business Central if you select the **Automatically Create Sales Orders** check box on the **Microsoft Dynamics 365 Connection Setup** page. Alternatively, you can manually convert submitted sales orders from Dynamics 365 for Sales by using the **Create in Business Central** action available on **Sales Orders - Dynamics 365 for Sales** page. On such sales orders, the **Name** field on the original order is transferred and mapped to the **External Document Number** field on the sales order in Business Central.

This can also work if the original sales order contains write-in products, meaning items or resources that are not registered in either app. In that case, you must fill in the **Write-in Product Type** and **Write-in Product No.** fields on the **Sales & Receivables Setup** page so that such non-registered product sales are mapped to a specified item/resource number for financial analysis.

If the description of the item on the original sales order is long, an additional sales order line of the type **Comment** is created to hold the full text on the sales order in Business Central.

Updates to sales order header fields, such as Last Shipment Date or Requested Delivery Date, that are mapped in SALESORDER-ORDER **Integration table mapping** are periodically synchronized to Dynamics 365 for Sales. Processes such as releasing a sales order and shipping or invoicing a sales order are posted to the sales order timeline in Dynamics 365 for Sales. For more information, see [Introduction to activity feeds](#).

Handling Sales Quotes Data

Sales quotes that are activated in Dynamics 365 for Sales will be transferred to Business Central if you select the **Automatically Process Quotes** check box on the **Microsoft Dynamics 365 Connection Setup** page. Alternatively, you can manually convert activated sales quotes from Dynamics 365 for Sales by using the **Process in Business Central** action on the **Sales Quotes - Dynamics 365 for Sales** page. On such sales quotes, the **Name** field on the original quote is transferred and mapped to the **External Document Number** field on the sales order in Business Central. Also **Effective To** field on quote is transferred and mapped to the **Quote Valid Until** field on sales quote in Business Central.

Sales quotes go through many revisions while they are being finalized. Both manual and automatic processing of sales quotes in Business Central ensures that previous versions of sales quotes are archived before processing new revisions of sales quotes from Dynamics 365 for Sales.

Handling Posted Sales Invoices, Customer Payments, and Statistics

After fulfilling a sales order, invoices will be created for it. When you invoice a sales order, you can transfer the posted sales invoice to Dynamics 365 for Sales if you select the **Create Invoice in Dynamics 365 for Sales** check box on the **Posted Sales Invoice** page. Posted invoices are transferred to Dynamics 365 for Sales with the status, **Billed**.

When the customer payment is received for the sales invoice in Business Central, the sales invoice status will be changed to **Paid** with the **Status Reason** field set to **Partial**, if partially paid, or **Complete** if completely paid, when you choose the **Update Account Statistics** action on the customer page in Business Central. The **Update Account Statistics** function will also refresh values, such as the **Balance** and **Total Sales** fields in the **Business Central Account Statistics** FactBox in Dynamics 365 for Sales. Alternatively, you can have the scheduled jobs, Customer Statistics and POSTEDSALESINV-INV automatically run both of these processes in the background.

Couple and Synchronize Records Manually

3/31/2019 • 2 minutes to read

This topic describes how to couple one or more records in Business Central with records in Dynamics 365 for Sales. Coupling records lets you view Dynamics 365 for Sales information from Business Central, and vice versa. The coupling also enables you to synchronize data between the records. You can couple existing records, or create and couple new records.

NOTE

Coupling and synchronizing data with Dynamics 365 for Sales is available only if your system administrator has created a connection between Business Central and Dynamics 365 for Sales. A quick way to check is to open the **Customer** card and look for the **Set Up Coupling** action. If the action is available, the apps are connected.

To couple a record

1. In Business Central, open the card for the record you want to couple. For example, the Customer or Contact card.

You can also just open the list page and select the record that you want to couple.

2. Choose the **Set Up Coupling** action.
3. Fill in the fields, and then choose **OK**.

To synchronize a single record

1. In Business Central, open the card for the record you want to couple. For example, the Customer or Contact card.
2. Choose the **Synchronize Now** action.
3. If a record can be synchronized either from Business Central to Dynamics 365 for Sales or from Dynamics 365 for Sales to Business Central, select the option that specifies the direction of data update, and then choose **OK**.

To synchronize multiple records

1. In Business Central, open the list page for the record, such as the Customers or Contacts list pages.
2. Select the records that you want to synchronize, and then choose the **Synchronize Now** action.
3. If records can be synchronized either from Business Central to Dynamics 365 for Sales or from Dynamics 365 for Sales to Business Central, select the option that specifies the direction of data update, and then choose **OK**.

See Also

[Using Dynamics 365 for Sales from Business Central](#)

View the Status of Synchronization Jobs

6/13/2019 • 2 minutes to read

Use the **Coupled Data Synchronization Errors** page to view the status of synchronization jobs that have been run for coupled records in a Dynamics 365 for Sales integration. This includes jobs that were run from the job queue and manual synchronization jobs that ran on records from Business Central. For example, viewing their status is helpful when troubleshooting because it gives you access to details about errors related to coupled records. Typically, these types of errors are caused by user actions, for example, when:

- Two people made a change to the same record in both business apps.
- Someone deleted a record in one of the apps, but not both.

NOTE

The **Coupled Data Synchronization Errors** page shows information about jobs related to coupled records. If you resolve all of the errors but records are still not synchronizing, it might have something to do with a setting for the integration. Typically, your administrator will need to resolve those types of errors.

To view and resolve synchronization errors for coupled records

1. Choose the  icon, enter **Coupled Data Synchronization Errors**, and then choose the related link.
2. The **Coupled Data Synchronization Errors** page shows issues that occurred when you synchronized coupled records. The following table includes actions that you can use to resolve issues one by one:

ACTION	DESCRIPTION
Remove Coupling	Uncouples the records and they will no longer synchronize. To resume synchronizing the records, you must couple them again.
Retry	For each record where an error is found, synchronization is skipped unless you fix the issue manually. Retry will include the record in the next synchronization.
Synchronize	The app will try to resolve a conflict where a record was changed in both business apps. You can choose the version of the record to use in both apps.
Restore Records and Delete Records	These are useful when a record was deleted in one of the apps. Delete Records deletes the record in the app where it still exists. Restore recreates the record in the app where it was deleted.

To view the synchronization log for a specific (manually synchronized) record

1. Open, for example, a customer, item or any other record that is synchronizing data between Business Central and Dynamics 365 for Sales.
2. Choose the **Synchronization Log** action to view the synchronization log for a selected record. For example, a specific customer you synchronized manually.

Using Dynamics 365 for Sales from Business Central

Manage Human Resources

3/31/2019 • 2 minutes to read

In Business Central, you can keep detailed records of your employees. You can register and maintain employee information, such as employment contracts, confidential information, qualifications, and employee contacts.

You can also register employee absences, which allows you to analyze registered absences as necessary.

To start using the Human Resources functionality, you must set up employees and other basic information. You can then associate various codes to an employee, which allows you to filter information for specific employees.

The following table describes a sequence of tasks, with links to the topics that describe them.

TO	SEE
Register new employees or edit records for existing employees, and attach related information, such as contracts and articles.	Register Employees
Record employees' absence and view absence statistics by various filters.	Manage Employee Absence

See Also

[Changing Which Features are Displayed](#)

Register Employees

3/31/2019 • 2 minutes to read

To use the Human Resources functionality, you must first register each employee by creating a card with all the core and related information.

You can modify an employee's details at any time. Keeping up-to-date records about your employees simplifies personnel tasks. For example, if an employee's address changes, you register this on the employee card.

The following procedures describe how to create an initial employee card and how to assign two types of employee details to an employee. In addition, you can assign various other related information, such as qualifications and causes of inactivity. You assign employee information either by choosing a field or an action on the **Employee Card** page.

NOTE

You can reimburse employees for their expenses during business activities. For this purpose, you must fill in the fields on the **Payments** FastTab on the **Employee Card** page. For more information, see [Record and Reimburse Employees' Expenses](#).

To set up an employee

1. Choose the  icon, enter **Employees**, and then choose the related link.
2. Choose the **New** action.
3. On the **Employee Card** page, fill in the fields as necessary. Hover over a field to read a short description.

To insert a picture of an employee

If you have a picture of an employee in .bmp format, you can insert it on the employee card.

1. Choose the  icon, enter **Employees**, and then choose the related link.
2. Open the card for the relevant employee.
3. In the **Employee Picture** FactBox, choose the drop-down button, and then choose **Import**.
4. On the **Select a picture to upload** page, choose the **Choose** button.
5. Select the file, and then choose **Open**.

The picture is inserted in the **Employee Picture** FactBox.

To register various information about an employee

On the employee card, you can set up information, such as union membership, relatives, and contracts for the employee. The following describes how to set up an alternate address. The steps are similar for all other information that you can set up from an employee card.

You can use alternate addresses to keep track of your employees' location, for example if they are stationed abroad, on a long business trip, or residing at a summer residence.

1. Choose the  icon, enter **Employees**, and then choose the related link.
2. Open the card for the relevant employee.
3. Choose the **Alternate Addresses** action.
4. **In the Alternate Address List** page, fill in the fields as necessary.

5. Repeat step 4 for each alternate address.

Manage Employee Absence

3/31/2019 • 2 minutes to read

To manage an employee's absence, you must record the absence on the **Absence Registration** page. It can then be viewed in different ways for analysis and reporting needs.

You can view employee absence in two different pages:

- The **Absence Registration** page, where you register all employee absences with a line for each absence.
- The **Employee Absences** page, where the absences for one employee only is shown. This is the information that you entered on the **Absence Registration** page, filtered by the particular employee.

To obtain meaningful statistics, you should always use the same unit of measure (hour or day) when registering employee absences.

To register employee absence

You can register employee absences on a daily basis or at some other interval that meets your organizational needs.

1. In the top right corner, choose the **Search for Page or Report** icon, enter **Absence Registration**, and then choose the related link.
2. Choose the **New** action.
3. Fill in a line for each employee absence you want to register.
4. Close the page.

TIP

To obtain meaningful statistics, always use the same unit of measure, hour or day, when registering employee absences.

To view an individual employee's absence

1. In the top right corner, choose the **Search for Page or Report** icon, enter **Employees**, and then choose the related link.
2. Select the relevant employee, and then choose the **Absences** action.

The **Employee Absences** page opens showing all the absences and the date on which they started and ended.

To view an employee's absence by categories

1. In the top right corner, choose the **Search for Page or Report** icon, enter **Employees**, and then choose the related link.
2. Select the relevant employee, and then choose the **Absences by Categories** action.
3. On the **Empl. Absences by categories** page, fill in the filter fields as necessary, and then choose the **Show Matrix** action.

The **Empl. Absences by Cat. Matrix** page opens showing all absences, broken down by causes of absence.

To view all employee absences by category

1. In the top right corner, choose the **Search for Page or Report** icon, enter **Absence Registration**, and then choose the related link.
2. On the **Absence Registration** page, choose the **Overview by Categories** action.
3. On the **Absence Overview by Categories** page, set a filter in the **Employee No. Filter** field to view employee absences for individual or a defined group of employees.
4. Choose the **Show Matrix** action.

The **Absence Overview by Categories Matrix** page opens showing all employees' absences broken down by the various causes of absence.

To view all employee absences by period

1. In the top right corner, choose the **Search for Page or Report** icon, enter **Absence Registration**, and then choose the related link. On the **Absence Registration** page, choose the **Overview by Periods** action.
2. On the **Absence Overview by Periods** page, set a filter in the **Cause of Absence Filter** field to view employee absences for specified causes of absence.
3. Choose the **Show Matrix** action.

The **Abs. Overview by Periods Matrix** page opens showing employee absences broken down by periods.

Planning

6/6/2019 • 2 minutes to read

The production operations required to transform inputs into finished goods must be planned daily or weekly depending on the volume and nature of the products. Business Central offers features to supply for anticipated and actual demand from sale, assembly, and production as well as features for distribution planning using stockkeeping units and location transfers.

NOTE

This topic mainly describes planning for companies involved in manufacturing or assembly management where the resulting supply orders can be either production, assembly, transfer, or purchase orders. The main interface for this planning work is the **Planning Worksheet** page.

Business Central also supports supply planning for wholesale companies where the resulting supply orders can only be transfer and purchase orders. The main interface for this planning work is the **Requisition Worksheet** page, which is described indirectly in this topic as most planning functionality applies to both worksheets.

Planning can be seen as the preparation of required supply orders in the purchasing, assembly, or manufacturing departments to fulfill sales or end-item demand. For more information, see [Purchasing](#), [Assembly Management](#), and [Manufacturing](#).

The following table describes a sequence of tasks, with links to the topics that describe them.

TO	SEE
Get a brief introduction to how the planning system can be used to detect and prioritize demand and suggest a balanced supply plan.	About Planning Functionality
Understand how all aspects of the planning system work and how to adjust the algorithms to meet planning requirements in different environments.	Design Details: Supply Planning
Learn how the planning logic differentiates between demand at locations according to the SKU setup and demand without location codes.	Planning With or Without Locations
Forecast demand presented by expected sales and production components.	Create a Demand Forecast
Create one-to-one production orders automatically from a sales order to cover the exact demand of that sales order line.	Create Production Orders from Sales Orders
Create a project production order directly from a multiline sales order representing a production project.	Plan Project Orders
Use the Order Planning page to manually plan for sales or production demand one production BOM level at a time.	Plan for New Demand Order by Order

TO	SEE
Use the Planning Worksheet page to run both the MPS and MRP options to automatically create either a high-level or detailed supply plan at all item levels.	Run Full Planning, MPS or MRP
Run the requisition worksheet to automatically create a detailed supply plan to cover demand for items that are replenished by purchase or transfer only.	Requisition Worksheet page
Initiate or update a production order as rough-scheduled operations in the master production schedule.	Replan or Refresh Production Orders Directly
Recalculate work or machine center calendars due to planning changes.	To calculate a work center calendar
Track the order demand (tracked quantity), forecast, blanket sales order, or planning parameter (untracked quantity) that has given rise to the planning line in question.	Track Relations Between Demand and Supply
View an item's projected available inventory by different views and see which gross requirements, planned order receipts, and other events influence it over time.	View the Availability of Items
Perform selected planning activities, such as changing or adding planning worksheet lines, in a graphical view of the supply plan.	Modify Planning Suggestions in a Graphical View

About Planning Functionality

3/31/2019 • 5 minutes to read

The planning system takes all demand and supply data into account, nets the results, and creates suggestions for balancing the supply to meet the demand.

For detailed information, see [Design Details: Supply Planning](#).

NOTE

For all the fields that are mentioned in this topic, read the tooltip to understand their function. Hover over a field to read a short description.

Demand and Supply

Planning has two elements: demand and supply. These must be held in balance to ensure that the demand is met in a timely and cost-efficient manner.

- Demand is the common term used for any kind of gross requirement such as a sales order, service order, component need from assembly or production orders, outbound transfer, blanket order or forecast. In addition to these, the program allows some other technical types of demand - such as a negative production or purchase order, negative inventory, and purchase return.
- Supply is the common word used for any kind of replenishment such as inventory, a purchase order, assembly order, production order, or inbound transfer. Correspondingly, there can be a negative sales or service order, negative component need or sales return – all of which in some way also represent supply.

Another goal of the planning system is to ensure that the inventory does not grow unnecessarily. In the case of decreasing demand, the planning system will suggest that you postpone, decrease in quantity, or cancel existing replenishment orders.

Planning Calculation

The planning system is driven by anticipated and actual customer demand, as well as inventory reordering parameters. Running the planning calculation will result in the program suggesting specific actions (Action Messages) to take concerning possible replenishment from vendors, transfers between warehouses, or production. If replenishment orders already exist, the suggested actions could be to increase or expedite the orders to meet the changes in demand.

The basis of the planning routine is in the gross-to-net calculation. Net requirements drive planned order releases, which are scheduled based on the routing information (manufactured items) or the item card lead time (purchased items). Planned order release quantities are based on the planning calculation, and are affected by the parameters set on the individual item cards.

Planning with Manual Transfer Orders

As you can see from the **Replenishment System** field on a SKU card, the planning system can be set up to create transfer orders to balance supply and demand across locations.

In addition to such automatic transfer orders, you may sometimes need to perform a general move of inventory quantities to another location, irrespective of existing demand. For this purpose you would manually create a transfer order for the quantity to move. To ensure that the planning system does not try to manipulate this manual

transfer order, you must set the **Planning Flexibility** on the transfer line(s) to None.

Contrarily, if you do want the planning system to adjust the transfer order quantities and dates to existing demand, you must set the **Planning Flexibility** field to the default value, Unlimited.

Planning Parameters

The planning parameters control when, how much, and how to replenish based on the various settings on the item card (or stockkeeping unit - SKU), and the manufacturing setup.

The following planning parameters exist on the item or SKU card:

- Dampener Period
- Dampener Quantity
- Reordering Policy
- Reorder Point
- Maximum Inventory
- Overflow Level
- Time Bucket
- Lot Accumulation Period
- Rescheduling Period
- Reorder Quantity
- Safety Lead Time
- Safety Stock Quantity
- Assembly Policy
- Manufacturing Policy

The following order modifiers exist on the item or SKU card:

- Minimum Order Quantity
- Maximum Order Quantity
- Order Multiple

Global planning setup fields on the **Manufacturing Setup** page include:

- Dynamic Low-Level Code
- Current Demand Forecast
- Use Forecast on Locations
- Default Safety Lead Time
- Blank Overflow Level
- Combined MPS/MRP Calculation
- Components at Location
- Default Dampener Period
- Default Dampener Quantity

For more information, see [Design Details: Planning Parameters](#)

Other Important Planning Fields

Planning Flexibility

On most supply orders, such as production orders, you can select **Unlimited** or **None** in the **Planning Flexibility** field on the lines.

This specifies whether the supply represented by the production order line is considered by the planning system when calculating action messages. If the field contains **Unlimited**, then the planning system includes the line when calculating action messages. If the field contains **None**, then the line is firm and unchangeable, and the planning system does not include the line when calculating action messages.

Warning

The **Warning** information field on the **Planning Worksheet** page informs you of any planning line created for an unusual situation with a text, which the user can choose to read additional information. The following warning types exist:

- Emergency
- Exception
- Attention
- Emergency

The emergency warning is displayed in two situations:

- The inventory is negative on the planning starting date.
- Back-dated supply or demand events exist.

If an item's inventory is negative on the planning starting date, the planning system suggests an emergency supply order for the negative quantity to arrive on the planning starting date. The warning text states the starting date and the quantity of the emergency order.

Any document lines with due dates before the planning starting date are consolidated into one emergency supply order for the item to arrive on the planning starting date.

Exception

The exception warning is displayed if the projected available inventory drops below the safety stock quantity.

The planning system will suggest a supply order to meet the demand on its due date. The warning text states the item's safety stock quantity and the date on which it is violated.

Violating the safety stock level is considered an exception because it should not occur if the reorder point has been set correctly.

NOTE

Supply on planning lines with Exception warnings is normally not modified according to planning parameters. Instead, the planning system only suggests a supply to cover the exact demand quantity. However, you can set the planning run up to respect certain planning parameters for planning lines with certain warnings. For more information, see "Respect Planning Parameters for Exception Warnings" in Calculate Plan - Plan. Wksh.

Attention

The attention warning is displayed in two situations:

- The planning starting date is earlier than the work date.
- The planning line suggests to change a released purchase or production order.

NOTE

In planning lines with warnings, the **Accept Action Message** field is not selected, because the planner is expected to further investigate these lines before carrying out the plan.

Subcontract Manufacturing

3/31/2019 • 6 minutes to read

Subcontracting selected operations to vendor is common in many manufacturing companies. Subcontracting can be a rare occurrence or can be an integral part of all production processes.

The program provides several tools for managing subcontract work:

- **Work Centers with assigned vendor:** This feature enables you to set up a work center that is associated with a vendor (subcontractor). This is called a subcontract work center. You can specify a subcontract work center on a routing operation, which allows you to easily process the subcontracted activity. In addition, the cost of the operation can be designated at the routing or the work center level.
- **Work Center cost based on units or time:** This feature enables you to specify whether costs associated with the work center are based on the production time or a flat charge per unit. Although subcontractors commonly use a flat charge per unit to charge for their services, the program can handle both options (production time and flat charge per unit).
- **Subcontracting Worksheet:** This feature allows you to find the production orders with material ready to send to a subcontractor and to automatically create purchase orders for subcontract operations from production order routings. Then the program automatically posts the purchase order charges to the production order during the posting of the purchase order. Only production orders with a status of released can be accessed and used from a subcontracting worksheet.

Subcontract Work Centers

Subcontract Work Centers are set up the same as regular work centers with additional information. They are assigned to routings in the same manner as other work centers.

Subcontract Work Center Fields

This **Subcontractor No.** field designates the work center as a subcontract work center. You can enter the number of a subcontractor who supplies the work center. This field can be used to administer work centers, which are not in-house but perform processing under contract.

If you subcontract with the vendor for a different rate for each process, then select the **Specific Unit Cost** field. This lets you set up a cost on each routing line and saves the time of re-entering each purchase order. The cost on the routing line is used in processing instead of the cost on the work center cost fields. Selecting the **Specific Unit Cost** field calculates costs for the vendor by the routing operation.

If you subcontract at a single rate per vendor, leave the **Specific Unit Cost** field blank. The costs will be set up by filling in **Direct Unit Cost**, **Indirect Cost %**, and **Overhead Rate** fields.

Routings that use Subcontract Work Centers

Subcontract work centers can be used for operations on routings in the same way as regular work centers.

You can set up a routing that uses an outside work center as a standard operational step. Alternatively, you can modify the routing for a particular production order to include an outside operation. This might be needed in an emergency such as a server not working correctly, or during a temporary period of higher demand, where the work generally performed in-house must be sent to a subcontractor.

For more information, see [Create Routings](#).

Calculate Subcontracting Worksheets and Create Subcontract Purchase

Orders

Once you have calculated the subcontracting worksheet, the relevant document, in this case a purchase order, is created.

The **Subcontracting Worksheet** page functions like the **Planning Worksheet** by calculating the needed supply, in this case purchase orders, which you review in the worksheet and then create with the **Carry Out Action Message** function.

NOTE

Only production orders with status **Released** can be accessed and used from a subcontracting worksheet.

To calculate the subcontracting worksheet

1. Choose the  icon, enter **Subcontracting Worksheet**, and then choose the related link.
2. To calculate the worksheet, choose the **Calculate Subcontracts** action.
3. On the **Calculate Subcontracts** page, set filters for the subcontracted operations, or the work centers where they are performed, to calculate only the relevant production orders.
4. Choose the **OK** button.

Review the lines on the **Subcontracting Worksheet** page. The information in this worksheet comes from the production order and production order routing lines and flows to the purchase order when that document is created. You can delete a row from the worksheet without affecting the original information, just as you can with the other worksheets. The information will reappear the next time you run the **Calculate Subcontracts** function.

To create the subcontract purchase order

1. Choose the  icon, enter **Subcontracting Worksheet**, and then choose the related link.
2. On the **Actions** tab, in the **Process** group, choose **Carry Out Action Message**.
3. Select the **Print Orders** field to print the purchase order as it is created.
4. Choose the **OK** button.

If all subcontracted operations are sent to the same vendor location, then only one purchase order is created.

The worksheet line that was turned into a purchase order is deleted from the worksheet. Once a purchase order is created, it will not appear in the worksheet again.

Posting Subcontract Purchase Orders

Once the Subcontractor Purchase Orders have been created, they can be posted. Receiving the order posts a Capacity Ledger Entry to the production order and invoicing the order posts the direct cost of the purchase order to the production order.

When the purchase is posted as received, then an output journal entry is automatically posted for the production order. This only applies if the subcontract operation is the last operation on the production order routing.

Caution

Posting output automatically for an ongoing production order when subcontracted items are received may not be desired. Reasons for this could be that the expected output quantity that is posted may be different from the actual quantity and that the posting date of the automatic output is misleading.

To avoid that the expected output of a production order is posted when subcontract purchases are received, make sure the subcontracted operation is not the last one. Alternatively, insert a new last operation for the final output quantity.

To post a subcontract purchase order

1. Choose the  icon, enter **Purchase Orders**, and then select the related link.
2. Open a purchase order that is created from the subcontracting worksheet.

On the purchase order lines, you see the same information that was in the worksheet. The **Prod. Order No.**, **Prod. Order Line No.**, **Operation No.**, and **Work Center No.** fields are filled in with the information from the source production order.

3. Choose the **Post** action.

When the purchase is posted as received, then an output journal entry is automatically posted for the production order. This only applies if the subcontract operation is the last operation on the production order routing.

Caution

Posting output automatically for an ongoing production order when subcontracted items are received may not be desired. Reasons for this could be that the expected output quantity that is posted may be different from the actual quantity and that the posting date of the automatic output is misleading.

To avoid that the expected output of a production order is posted when subcontract purchases are received, make sure the subcontracted operation is not the last one. Alternatively, insert a new last operation for the final output quantity.

When the purchase order is posted as invoiced, then the direct cost of the purchase order is posted to the production.

Planning With or Without Locations

3/31/2019 • 4 minutes to read

Concerning planning with or without location codes on demand lines, the planning system operates in a straight forward way when:

- demand lines always carry location codes and the system fully uses stockkeeping units, including the relevant location setup.
- demand lines never carry location codes and the system does not use SKUs or any location setup (see last scenario below).

However, if demand lines sometimes have location codes and other times do not, the planning system will follow certain rules depending on setup.

Demand at Location

When the planning system detects demand at a location (a line with a location code), it will behave in different ways depending on 3 critical setup values.

During a planning run, the system checks for the 3 setup values in sequence and plans accordingly:

1. Is there a check mark in the **Location Mandatory** field?

If yes, then:

2. Does SKU exist for the item?

If yes, then:

The item is planned according to planning parameters on the SKU card.

If no, then:

3. Does the **Components at Location** field contain the demanded location code?

If yes, then:

The item is planned according to planning parameters on the item card.

If no, then:

The item is planned according to: Reordering Policy = *Lot-for-Lot*, Include Inventory = *Yes*, all other planning parameters = *Empty*. (Items using reordering policy *Order* remain using *Order* as well as the other settings.)

NOTE

This minimal alternative only covers the exact demand. Any planning parameters defined are ignored.

See variations in the scenarios below.

Demand at "Blank Location"

Even if the **Location Mandatory** check box is selected, the system will allow demand lines to be created without a location code – also referred to as *BLANK* location. This is a deviation for the system because it has various setup

values tuned to dealing with locations (see above) and as a result, the planning engine will not create a planning line for such a demand line. If the **Location Mandatory** field is not selected but any of the location setup values exist, then that is also considered a deviation and the planning system will react by outputting the "minimal alternative":

The item is planned according to: Reordering Policy = *Lot-for-Lot* (*Order remains Order*), Include Inventory = *Yes*, all other planning parameters = *Empty*.

See variations in the setup scenarios below.

Setup 1:

- Location Mandatory = *Yes*
- SKU is set up for *RED*
- Component at Location = *BLUE*

Case 1.1: Demand is at *RED* location

The item is planned according to planning parameters on the SKU card (including possible transfer).

Case 1.2: Demand is at *BLUE* location

The item is planned according to planning parameters on the item card.

Case 1.3: Demand is at *GREEN* location

The item is planned according to: Reordering Policy = *Lot-for-Lot* (*Order remains Order*), Include Inventory = *Yes*, all other planning parameters = *Empty*.

Case 1.4: Demand is at *BLANK* location

The item is not planned because no location is defined on the demand line.

Setup 2:

- Location Mandatory = *Yes*
- No SKU exists
- Component at Location = *BLUE*

Case 2.1: Demand is at *RED* location

The item is planned according to: Reordering Policy = *Lot-for-Lot* (*Order remains Order*), Include Inventory = *Yes*, all other planning parameters = *Empty*.

Case 2.2: Demand is at *BLUE* location

The item is planned according to planning parameters on the item card.

Setup 3:

- Location Mandatory = *No*
- No SKU exists
- Component at Location = *BLUE*

Case 3.1: Demand is at *RED* location

The item is planned according to: Reordering Policy = *Lot-for-Lot* (*Order remains Order*), Include Inventory = *Yes*, all other planning parameters = *Empty*.

Case 3.2: Demand is at *BLUE* location

The item is planned according to planning parameters on the item card.

Case 3.3: Demand is at *BLANK* location

The item is planned according to: Reordering Policy = *Lot-for-Lot* (*Order remains Order*), Include Inventory = *Yes*, all other planning parameters = *Empty*.

Setup 4:

- Location Mandatory = *No*

- No SKU exists
- Component at Location = *BLANK*

Case 4.1: Demand is at *BLUE* location

The item is planned according to: Reordering Policy = *Lot-for-Lot* (*Order* remains *Order*), Include Inventory = *Yes*, all other planning parameters = *Empty*.

Case 4.2: Demand is at *BLANK* location

The item is planned according to planning parameters on the item card.

As you can see from the last scenario, the only way to get a correct result for a demand line without a location code is to disable all setup values relating to locations. Similarly, the only way to get stable planning results for demand at locations is to use stockkeeping units.

Therefore, if you often plan for demand at locations, it is strongly advised to use the Stockkeeping Units feature.

Create a Demand Forecast

3/31/2019 • 5 minutes to read

You can create sales and production forecasts with the **Demand Forecast** page.

Forecasting functionality is used to create anticipated demand; actual demand is created from sales and production orders. During creation of the Master Production Schedule (MPS), the forecast is netted against the sales and production orders. The *Component* option on the forecast determines which type of requirements to take into consideration in the netting process. If the forecast is for a sales item, only sales orders net the forecast. If it is for components, only dependent demand from production order components net the forecast.

Forecasting allows your company to create "what if" scenarios and efficiently and cost-effectively plan for and meet demand. Accurate forecasting can make a critical difference in customer satisfaction levels with regard to order promising dates and on-time delivery.

Sales Forecasts and Production Forecasts

The forecasting functionality in the program can be used to create sales or production forecasts, in combination or independently. For example, most make-to-order companies do not carry finished goods inventory, because each item is produced when it is ordered. Anticipating orders (sales forecasting) is critical for a reasonable turnaround time on the finished goods (production forecasting). As an example, component parts with lengthy delivery times, if not on order or on inventory, can delay production.

- The sales forecast is the sales department's best guess at what will be sold in the future, and is specified by item and by period. However, the sales forecast is not always adequate for production.
- The production forecast is the production planner's projection of how many end items and derived subassemblies to produce in specific periods to meet the forecasted sales.

In most cases, then, the production planner modifies the sales forecast to fit the conditions of production, yet still satisfies the sales forecast.

You create forecasts manually on the **Demand Forecast** page. Multiple forecasts can exist in the system, and are differentiated by name and type. Forecasts can be copied and edited as necessary. Note that only one forecast is valid for planning purposes at a time.

The forecast consists of a number of records each stating item number, forecast date, and forecasted quantity. The forecast of an item covers a period, which is defined by the forecast date and the forecast date of the next (later) forecast record. From a planning point of view, the forecasted quantity should be available at the start of the demand period.

You must designate a forecast as *Sales Item*, *Component*, or *Both*. The forecast type *Sales Item* is used for sales forecasting. The production forecast is created using the *Component* type. The forecast type *Both* is only used to give the planner an overview of both the sales forecast and the production forecast. With this option, the forecast entries are not editable. By designating these forecast types here, you can use the same worksheet to enter a sales forecast as you do a production forecast, and use the same sheet to view both forecasts simultaneously. Note that the system treats the different inputs (sales and production) differently when calculating planning, based on item, manufacturing, and production setup.

Component Forecast

The component forecast can be seen as an option forecast in relation to a parent item. This can, for example, be useful if the planner can estimate the demand for the component.

As the component forecast is designed to define options for a parent item, the component forecast should be equal or less than the sales item forecast quantity. If the component forecast is higher than the sales item forecast, the system treats the difference between these two types of forecast as independent demand.

Forecasting Periods

The forecast period is valid from its starting date until the date the next forecast starts. The time interval page gives you multiple choices to insert the demand at a specific date in a period. It is therefore recommended not to change the forecast period scope unless you want to move all forecast entries to the starting date of this period.

Forecast by Locations

It can be stated in the manufacturing setup if you want filter forecast according to location when calculating a plan. Note, though, that if location-based forecasts are viewed in isolation, the overall forecast may not be representative.

To create a demand forecast

1. Choose the  icon, enter **Demand Forecast**, and then choose the related link.
2. On the **General** FastTab, select a forecast in the **Demand Forecast Name** field. Multiple forecasts can exist and are differentiated by name and forecast type.
3. In the **Location Filter** field, select the location to which this forecast will apply.
4. In the **Forecast Type** field, select **Sales Item**, **Component**, or **Both**. If you select **Sales Item** or **Component**, then you can edit the quantity by period. If you select **Both**, then you cannot edit the quantity, but you can choose the drop-down arrow button and view the demand forecast entries.
5. Specify a **Date Filter** if you want to limit the amount of data displayed.
6. On the **Demand Forecast Matrix** FastTab, enter the forecasted quantities of **Sales Item** or **Component** forecast for the various periods.
7. On the **Matrix Options** FastTab, set the time interval in the **View by** field to change the period that is displayed in each column. You can select from the following intervals: **Day**, **Week**, **Month**, **Quarter**, **Year**, or the **Accounting Period**, as set up in Financial Management.

NOTE

You should consider which time interval that you want to use for future forecasts so that the time interval is consistent throughout. When you enter a forecast quantity, it is valid on the first day of the time interval that you select. For example, if you select a month, then you enter the forecast quantity on the first day of the month. If you select a quarter, then you enter the forecast quantity on the first day of the first month in the quarter.

8. In the **View as** field, select how the forecast quantities are shown for the time interval. If you select **Net Change**, then the net change in balance is displayed for the time interval. If you select **Balance at Date**, then the page displays the balance as of the last day in the time interval.

NOTE

You can also edit an existing forecast. On the **Demand Forecast Matrix** page, choose the **Copy Demand Forecast** action and populate the **Demand Forecast** page with an existing forecast. You can then edit quantities as appropriate.

Create Production Orders from Sales Orders

3/31/2019 • 2 minutes to read

You can create production orders for produced items directly from sales orders.

To create a production order from a sales order

1. Choose the  icon, enter **Sales Orders**, and then choose the related link.
2. Select the sales order you want to create a production order for.
3. Choose the **Planning** action. On the **Sales Order Planning** page, you can view the availability of the sales order item.
4. Choose the **Create Prod. Order** action.
5. Select the status and order type.
6. Choose the **Yes** button to create the production order.

You can also choose to make a project production order. For more information, see [Plan Project Orders](#).

Plan Project Orders

3/31/2019 • 2 minutes to read

This planning task starts from a sales order and uses the **Sales Order Planning** page. Once you have created a project production order, you can plan it further by using the **Order Planning** page.

To create a project production order

1. Choose the  icon, enter **Sales Orders**, and then choose the related link.
2. Select the sales order that represents the production project, and then choose the **Planning** action.
3. On the **Sales Order Planning** page, choose the **Create Prod. Order** action.
4. On the **Create Order from Sales** page, in the **Order Type** field, select **Project Order**.
5. Choose the **Yes** button.
6. Choose the  icon, enter **Production Orders**, and then choose the related link.
7. Open the production order just created.

Notice that the **Source Type** field of the production order contains **Sales Header** and the order has multiple lines, one for each sales line item that must be produced.

8. Choose the **Planning** action.
9. On the **Order Planning** page, choose the **Refresh** action to calculate new demand.

The order header line for the project order is displayed with all unfulfilled demand lines expanded under it. Although the production order contains lines for several produced items, the total demand for all production order lines is listed under one order header line on the **Order Planning** page, and the original customer name is displayed. You can now proceed to plan for the demand as described in [Plan for New Demand Order by Order](#).

NOTE

Demand lines in the project production order that have **Prod. Order** in their **Replenishment System** field represent underlying production orders. After you have generated these production orders, you must again calculate a plan on the **Order Planning** page to identify any unfulfilled component demand for them. In that case, they are displayed as demand lines under a normal production order header line, meaning, the project relation is no longer visible on the page. However, if you are using the Order Tracking feature, then you can look back and forth to all supply orders made under the original sales order.

Plan for New Demand Order by Order

3/31/2019 • 6 minutes to read

This planning task can be performed on the **Order Planning** page, which displays all new demand along with availability information and suggestions for supply. It provides the visibility and tools needed to effectively plan demand from sales lines and component lines and then create different types of supply orders directly.

You can enter the **Order Planning** page in two ways depending on your focus: From an order that you want to plan for specifically or in batch mode because you want to plan for all and any new demand.

To plan for new production order demand

1. Choose the  icon, enter **Planned Production Orders**, and then choose the related link. (You can perform these steps for planned, firm planned, or released production orders).
2. Open the production order you want to plan for, and then choose the **Planning** action.
3. On the **Order Planning** page, choose the **Calculate Plan** action.

The page displays planning lines according to the view filter **Production Demand**, meaning unfulfilled component lines of all existing production orders. Demand for only the one production order is not shown because it is necessary to plan for one production order with an overview of demand for potentially earlier components lines. Planning lines for the production order in context are expanded.

To plan for any new demand

1. Choose the  icon, enter **Order Planning**, and then choose the related link.
2. On the **Order Planning** page, choose the **Calculate Plan** action.
3. Choose the **Expand (+)** button in front of the date in the **Demand Date** field to see the underlying planning lines that represent demand lines with insufficient availability.
4. For each expanded planning line, that is, demand line, you can see values in information fields at the bottom of the page.

OPTION	DESCRIPTION
Qty. on Other Locations	Shows if the item exists on another location. You can then look up and select it.
Substitutes Exist	Shows if a substitute item is created for the item. You can then look up and select it. Note that this feature only applies to components, that is, from demand lines of type Production .
Quantity Available	Shows the total availability of the item, that is, the Projected Available Balance.
Earliest Date Available	Shows the arrival date of an inbound supply order that can cover the needed quantity on a date later than the demand date.

5. In the **Replenishment System** field, select which type of supply order to create.

The default value is that of the item card, or SKU card, but you can change it to one of three options:

OPTION	DESCRIPTION
Purchase	Creates a purchase order.
Transfer	Creates a transfer order.
Prod. Order	Creates a production order.

In the **Supply From** field you must select a value according to the selected replenishment system.

NOTE

If the field is not filled in, the system will display an error message when you use the **Make Supply Order** function, and no supply order will be created for the planning line in question. This, however, is not the case if the replenishment system is **Prod. Order**.

6. From the **Supply From** field, you can look up in the relevant list and select where the supply should come from:

- If replenishment system is **Purchase**, the look-up button in this field looks up on the **Item Vendor Catalog** page.
- If replenishment system is **Transfer**, the look-up button in this field looks up on the **Location List** page.

In case the item exists in another location, the **Qty. on Other Location** field at the bottom shows a value and you can then look up and select the location from which the item should be supplied when you make the transfer order.

If a substitute exists for the demanded item, the **Substitute Exists** field is set to **Yes**, and you can then look up to the **Item Substitution Entries** page and select the substitute.

7. Select the **Reserve** check box if you want to make a reservation between the supply order you are creating and the demand line that it is created for. It is empty by default.

NOTE

You can only select this check box if the item has **Optional** or **Always** in the **Reserve** field on its item card.

8. In the **Qty. to Order** field, you can enter the quantity that will go on the supply order you are creating. The default value is the same quantity as that in the **Needed Quantity** field. But you may decide to order more or less than this quantity based on your knowledge of the demand situation. If, for example, you see on the **Order Planning** page that several unrelated demand lines are for the same purchased item, and they are due around the same date, you can consolidate these by entering the total needed quantity in the **Qty. to Order** field of one line, and then delete the other, obsolete planning lines for that item.

9. In the **Due Date** and **Order Date** fields, you can enter the dates that should apply to the created supply orders.

These two fields are interrelated according to the **Default Safety Lead Time** field, which can be found on the **Manufacturing Setup** page. By default, the due date is the same as the demand date, but you can change this as you like.

NOTE

If you enter a date later than the demand date, you will receive a warning message.

To make supply orders

1. Choose the  icon, enter **Planned Production Orders**, and then choose the related link. You can perform these steps for a planned, firm planned, or released production order.
2. Open the production order you want to plan for, and then choose the **Planning** action.
3. Place the cursor on a relevant planning line, and then choose the **Make Orders** action.
4. On the **Make Supply Orders** page, on the **Order Planning** FastTab, in the **Make Orders for** field, select one of the following options.

OPTION	DESCRIPTION
The Active Line	Make a supply order only for the line where the cursor is placed.
The Active Order	Make supply orders for all lines in the order where the cursor is placed.
All Lines	Make supply orders for all lines on the Order Planning page.

5. On the **Options** FastTab, define what kind of supply orders, or requisition worksheet lines, should be made.

NOTE

The settings you last made on the **Make Supply Orders** page will be saved under your user ID so that they are the same the next time you use the page.

6. Choose the **OK** button to make the suggested supply orders or requisition worksheet lines.

You have now planned for the unfulfilled demand by making respective supply orders. Details about specific work flows when using the **Order Planning** page would depend on a company's internal policies.

When you have finished your planning work on the **Order Planning** page, for example defined an alternative way to supply the quantity, you can proceed to create supply orders for one or more of the planning lines.

NOTE

The supply orders you create may introduce new dependent demand, for example for underlying production orders, and you should therefore choose **Calculate Plan** again to find and resolve this before moving down the list.

Run Full Planning, MPS or MRP

3/31/2019 • 10 minutes to read

The terms "running the planning worksheet" or "running MRP" refer to the calculation of the master production schedule and material requirements based on actual and forecasted demand. The planning system can calculate either Master Planning Schedule (MPS) or Material Requirements Planning (MRP) on request, or it can calculate both at the same time.

- **MPS** is the calculation of a master production schedule based on actual demand and the demand forecast. The MPS calculation is used for end items that have a forecast or a sales order line. These items are called MPS items and are identified dynamically when the calculation starts.
- **MRP** is the calculation of material requirements based on actual demand for components and the demand forecast on the component level. MRP is calculated only for items that are not MPS items. The purpose of MRP is to provide time-phased formal plans, by item, to supply the appropriate item, at the appropriate time, in the appropriate location, in the appropriate quantity.

The planning algorithms used for both MPS and MRP are identical. The planning algorithms pertain to netting, reuse of existing replenishment orders, and action messages. The planning system process examines what is needed or will be needed (demand) and what is on-hand or expected (supply). When these quantities are netted against each other, Business Central provides action messages. Action messages are suggestions to create a new order, change an order (quantity or date), or cancel an order already on order. The term "order" includes purchase orders, assembly orders, production orders, and transfer orders.

Links created by the planning engine between demand and its related supply can be tracked on the **Order Tracking** page. For more information, see [Track Relations Between Demand and Supply](#).

Proper planning results depend on the set up done on item cards, assembly BOMs, production BOMs, and routings.

Methods for Generating a Plan

- **Calculate Regenerative Plan:** This function processes or regenerates the material plan. This process starts by deleting all planned supply orders that are currently loaded. All items in the database are replanned.
- **Calculate Net Change Plan:** This function processes a net change plan. Items are considered in net change planning from two types of changes:
 - **Demand/supply changes:** These include modifications to quantities on sales orders, demand forecasts, assembly orders, production orders, or purchase orders. An unplanned inventory level change is also considered a quantity change.
 - **Planning parameter changes:** These include changes in safety stock, reorder point, routing, bill of material, and changes to the time bucket or lead time calculation.
- **Get Action Messages:** This function serves as a short-term planning tool by issuing action messages to alert the user of any modifications made since the last regenerative or net change plan was calculated.

With each planned method, Business Central generates worksheet entries assuming infinite capacity. Work center and machine center capacity is not considered when you develop schedules.

IMPORTANT

The Calculate Regenerative Plan function is the most common process. The Calculate Plan and Carry out Action Messages functions, however, can be used to run the Calculate Net Change Plan process.

The Get Action Messages Plan function can be run between regenerative and net change planning runs to obtain an immediate view of the effect of schedule changes, but it is not intended as a replacement of full regenerative or net change planning processes.

To calculate the planning worksheet

1. Choose the  icon, enter **Planning Worksheets**, and then choose the related link.
2. Choose the **Calculate Regenerative Plan** action to open the **Calculate Plan** page.
3. On the **Options** FastTab, fill in the fields as described in the following table.

FIELD	DESCRIPTION
MPS	Select to initiate the calculation of a master production schedule. Items with open sales orders or demand forecasts are considered in this run.
MRP	Select to initiate the calculation of material requirements planning. Items with dependent requirements are considered in this run. Typically, MPS and MRP are run at the same time. To run MPS and MRP at the same time, the Combined MPS/MRP Calculation field must be selected on the Planning FastTab on the Manufacturing Setup page.
Starting Date	This date is used to evaluate inventory availability. If an item's on-hand quantity is below the reorder point, the system forward-schedules a replenishment order from this date. If an item is below its safety stock (as of the starting date), the system back-schedules a replenishment order due on the planning starting date.
Ending Date	<p>This is the ending date of the planning horizon. Neither demand nor supply is considered after this date. If the reorder cycle for an item extends beyond the ending date, the effective planning horizon for that item is equal to the order date + reorder cycle.</p> <p>The planning horizon is the time that the plan is extended to. If the horizon is too short, items with a longer lead time are not ordered on time. If the horizon is too long, too much time is spent reviewing and processing information that likely changes before it is needed. It is possible to set one planning horizon for production and a longer one for purchases, although it is not required. A planning horizon for purchases and production should be set to cover the cumulative lead time for components.</p>

FIELD	DESCRIPTION
Stop and Show First Error	Select if you want the planning run to stop as soon as it encounters an error. At the same time, a message is displayed with information about the first error. If an error exists, only the successful planning lines made before the error was encountered will be presented in the planning worksheet. If you do not select this field, the Calculate Plan batch job will continue until it has completed, that is, errors will not interrupt the batch job. If one or more errors exist, a message will display after completion with information about how many items are affected. The Planning Error Log page will then open to provide more details about the error and links to the affected item cards.
Use Forecast	Select a forecast that should be included as demand when you run the planning batch job. The default forecast is set up on the Planning FastTab on the Manufacturing Setup page.
Exclude Forecast Before	Define how much of the selected forecast to include in the planning run by entering a date before which forecast demand is not included, thus allowing you to exclude old information.
Respect Planning Parameters for Exception Warnings	By default, this field is selected. Supply on planning lines with warnings is normally not modified according to planning parameters. Instead, the planning system only suggests a supply to cover the exact demand quantity. However, you can define certain planning parameters for planning lines to be respected with certain warnings.

- On the **Item** FastTab, set filters to run the planning based on item, item description, or location.
- Choose the **OK** button. The batch job runs and then the planning worksheet is populated with the planning lines.

To perform action messages

- On the **Planning Worksheet** page, choose the **Carry Out Action Message** action.
- On the **Options** FastTab, specify how to create the supplies. Fill in the fields as described in the following table.

FIELD	DESCRIPTION
Production Order	Specify how you want to create production orders. You can do this directly from the planning line proposals. You can create either planned or firm planned production orders.
Assembly Order	Specify how you want to create assembly orders. You can do this directly from the planning line proposals.

FIELD	DESCRIPTION
Purchase Order	Specify how you want to create purchase orders. You can do this directly from the planning line proposals. If you chose to copy the planning line proposals for purchase orders to the requisition worksheet, select the template and worksheet name.
Transfer Order	Specify how you want to create transfer orders. You can do this directly from the planning line proposals. If you chose to copy the planning line proposals for transfer orders to the requisition worksheet, select the template and worksheet name.
Combine Transfer Orders	Select if you want to combine transfer orders.
Stop and Show First Error	Select if you want the Carry Out Action Msg. - Plan. batch job to stop as soon as it encounters an error. At the same time, a message is displayed with information about the first error. If an error exists, only the planning lines processed before the error was encountered will create supply orders.

3. On the **Planning Line** FastTab, you can set filters to limit the perform action messages.

4. Choose the **OK** button.

The batch job deletes the lines in the planning worksheet after it has performed the action message. The other lines remain in the planning worksheet until they are either accepted at a later date or else deleted. You can also delete the lines manually.

Action Messages

Action messages are issued by the order tracking system when balance is unattainable in the existing order network. They can be viewed as a suggestion for you to process changes that reestablish equilibrium between supply and demand.

The generation of action messages occurs one level at a time, for each item's low-level code. This makes sure that all items that experience or will experience changes in supply or demand are considered.

To avoid small, superfluous, or unimportant action messages, the user can establish dampeners, which serve to restrict the generation of action messages to only those changes that exceed the defined quantity or number of days.

After you have reviewed the action messages and determined whether to accept some or all of the suggested changes, select the **Accept Action Message** field, and then you are ready to update the schedules accordingly.

NOTE

An action message is a suggestion to create a new order, cancel an order, or change the quantity or date of an order. An order is a purchase order, transfer order, or production order.

In response to any supply/demand imbalances, the following action messages are generated.

ACTION MESSAGE	DESCRIPTION
New	If a demand cannot be fulfilled by suggesting action messages to Change Qty. , Reschedule , or Reschedule & Change Qty. on existing orders, the action message New is generated, which suggests a new order. In addition, the message New is generated if there are no existing supply orders in the reorder cycle of the item in question. This parameter determines the number of periods forward and backward in the availability profile when it searches for an order to reschedule.
Change Quantity	When demand that is tracked to a supply order experiences a quantity change, the action message Change Qty. is generated, which indicates that the related supply should be changed relative to the change in demand. If a new demand emerges, Business Central searches for the nearest existing unreserved supply order in the reorder cycle, and issues a change of action message for that order.
Reschedule	When a supply or demand order experiences a date modification causing an imbalance in the order network, the action message Reschedule is generated. If there is a one-to-one relationship between demand and supply, an action message is generated suggesting that the supply order be moved accordingly. If the supply-order covers demand from more than one sales order, the supply order is re-scheduled equal to the date of the first demand.
Resch. & Chg. Qty.	If both the dates and quantities of an order have been modified, you must change plans with regard to both circumstances. Action messaging gathers both actions in one message, Resched. and Chg. Qty. , to ensure that the order network returns to balance.
Cancel	If a demand, which has been covered on an order-to-order basis, is deleted, an action message is generated to cancel the related supply order. If the relationship is not order-to-order, an action message is generated to change in order to reduce the supply. If through other factors, such as inventory adjustments, a supply order is not required at the time the action messages are generated by the user, Business Central suggests an action message of Cancel in the worksheet.

Replan or Refresh Production Orders Directly

3/31/2019 • 3 minutes to read

The **Replan** function on production orders is typically used after you have added or changed components that constitute underlying production orders. The function calculates changes made to components and routings lines, and it includes items on lower production BOM levels for which it may generate new production orders.

Based on the changes you have made to the components and routing lines, the Replan function calculates and plans for any new demand for the production order.

The **Refresh** function on production orders is typically used after you have done one of the following:

- Created a production order header manually to calculate and create line data for the first time.
- Made changes to the production order header to recalculate all the line data.

The Refresh function calculates changes made to a production order header and does not involve production BOM levels. The function calculates and initiates the values of the component lines and routing lines based on the master data defined in the assigned production BOM and routing, according to the order quantity and due date on the production order's header.

You can either insert the production order lines manually or use the function that calculates the production order lines from the header.

NOTE

If you use the Refresh function to recalculate production order lines, the old production order lines are deleted and new lines are calculated.

To replan a production order

1. Choose the  icon, enter **Firm Planned Prod. Orders**, and then choose the related link.
2. Open the production order you want to replan.
3. On the **Lines** FastTab, choose the **Lines** action, and then choose the **Components** action.
4. Add a component, which is a produced item or subassembly.
5. From the production order, choose the **Replan** action.

On the **Replan Production Order** page, proceed to define how and what to replan.

6. In the **Scheduling Direction** field, select one of the following options.

OPTION	DESCRIPTION
Back	Calculates the operation sequence backwards from the earliest possible ending date, defined by due date and/or other scheduled orders, to the latest possible starting date. Note: This default option is relevant in the majority of situations.

OPTION	DESCRIPTION
Forward	Calculates the operation sequence forward from the earliest latest possible starting date, defined by due date and/or other scheduled orders, to the earliest possible ending date. Note: This option is only relevant for expedite orders.

7. In the **Plan** field, select whether to calculate production requirements for produced items on the production BOM, as follows.

OPTION	DESCRIPTION
No Levels	Do not consider lower level production. This only updates the item's schedule, like refresh.
One Level	Plan for first-level production demand. First-level production orders may be created.
All Levels	Plan for all-level production demand. All-level production orders may be created.

8. Select **One Level**, and choose the **OK** button to replan the production order, and calculate and create a new underlying production order for the introduced subassembly, if it is not fully available.

NOTE

Changes implemented with the **Replan** function are very likely to change the capacity need of the production order and you may therefore have to reschedule operations afterwards.

To refresh a production order

If you have amended production order lines, components, or routing lines, you must also refresh the information on the production order. In the following procedure, the components are calculated for a firm planned production order. The steps are similar for routing lines.

1. Choose the  icon, enter **Firm Planned Prod. Order**, and then choose the related link.
2. Choose the **New** action. For more information, see [Create Production orders](#).
3. Choose the **Refresh** action.
4. On the **Refresh Production Order** page, select one of the following options:

OPTION	DESCRIPTION	
Scheduling Direction	Forward	Scheduling starts from the starting date and proceeds forward to the finishing date. You must fill in the starting date to use this option.
	Backward	Scheduling starts from the ending date and proceeds backward to the starting date.

OPTION	DESCRIPTION	
Calculate	Lines	Select this field to calculate the production order lines.
	Routings	This field has no influence on calculating the production lines.
	Component Need	This field has no influence on calculating the production lines.
Warehouse	Create Inbound Request	This field has no influence on calculating the production lines.

5. Choose the **OK** button to confirm your selection. Now the production order lines are calculated.

NOTE

Calculating production order components deletes previous changes in the components.

Track Relations Between Demand and Supply

3/31/2019 • 2 minutes to read

From any supply or demand document in the so-called order network, you can track the order demand (tracked quantity), forecast, blanket sales order, or planning parameter (untracked quantity) that has given rise to the planning line in question.

The planning worksheets also offers supporting planning information about non-order entities to help the planner obtain an optimal supply plan. For more information, see [Untracked Planning Elements](#).

To track linked items

Order tracking shows how sales orders, production orders, and purchase orders are related to the manufacturing order through the planning and reservation systems.

The following describes how to track linked items on a firm planned production order. The steps are similar for all other order types, and from planning worksheet lines.

1. Choose the  icon, enter **Firm Planned Prod. Order**, and then choose the related link.
2. Open the relevant firm planned production order from the list.
3. On the **Lines** FastTab, choose the **Functions** action, and then choose the **Order Tracking** action.

The lines in the **Order Tracking** display the documents that are related to the current production order line.

Untracked Planning Elements

The **Untracked Planning Elements** page opens when you choose the **Untracked Qty.** field on the **order Planning** page. It serves two purposes:

1. To hold information about untracked quantities displayed when the user looks up from the Order Tracking page to see untracked quantities.
2. To hold warning messages displayed when the user chooses the **Warning** icon on the **Planning Worksheet** page.

The page contains entries which account for an untracked surplus quantity in order tracking network. These entries are generated during the planning run and explain where the untracked surplus quantity in the order tracking lines came from. This untracked surplus can come from:

- Production forecast
- Blanket orders
- Safety stock quantity
- Reorder point
- Maximum inventory
- Reorder quantity
- Maximum order quantity
- Minimum order quantity
- Order multiple
- Dampener (% of lot size)

Modify Planning Suggestions in a Graphical View

3/31/2019 • 7 minutes to read

A typical planning activity is to change or add planning worksheet lines to modify the suggested supply orders before you commit them by running the **Carry out Action Message** function. An alternative to doing this in the planning worksheet is to use a graphical view.

On the **Item Availability by Timeline** page, you can modify certain supply orders and suggestions by dragging elements on the x-axis to change quantity or dragging elements on the y-axis to change due date.

On the **Item Availability by Timeline** page and the **Planning Worksheet** page you can make the following changes:

- Modify a suggested supply order that only exists as a planning line.
- Modify an existing supply order that the planning system suggests to change.
- Create a new suggested supply order and modify it.

For more information about the planning line types that are shown, see the Description field on the **Event Changes** FastTab.

When you choose **Save Changes** on the **Item Availability by Timeline** page, the modifications that you have made are copied to the planning or requisition worksheet. You can now implement them using the **Carry Out Action Msg.-Plan.** function.

The following procedure shows how to modify supply suggestions by drag and drop. As an alternative, you can change the **Due Date** and **Quantity** fields on the **Event Changes** FastTab and immediately see the changes graphically on the **Timeline** FastTab on the **Planning Worksheet** page.

To modify suggested supply orders in the graphical view

1. Choose the  icon, enter **Item Availability by Timeline**, and then choose the related link.

The **Item Availability by Timeline** page opens with the item number, location, and variant of the item on the selected planning line prefilled in the **Options** FastTab. The **Timeline** FastTab shows a graphical representation of the item's projected inventory, including planning suggestions.

2. Make sure that the **Include Planning Suggestions** field is selected.
3. Find the suggested supply order that you want to modify. You can identify modifiable elements by the green circle and the disk icon. For more information about the different symbols, see [Symbols and Icons on the Timeline FastTab](#).
4. Place the pointer over the green circle until it enlarges and the pointer changes to Move shape (four arrows).
5. Press and hold the mouse button while you drag the pointer up or down to modify the quantity. Press and hold the mouse button while you drag the pointer left or right to modify the due date.
6. In addition to moving elements by drag and drop, you can modify planning suggestions by using a number of drop-down menu functions. Access the drop-down menu for the green circle of a suggested supply element and select one the following functions

FUNCTION	DESCRIPTION
<p>Create New Supply</p>	<p>Creates a new element point where you access the drop-down menu, which represents a new suggested supply order. It becomes a new line in the planning worksheet when you choose Save Changes.</p> <p>NOTE: If the Location Filter or Variant Filter fields on the Options FastTab are empty or have more than one filter value, then the new supply is created and later saved to the planning or requisition worksheet with the following codes:</p> <p>* If the filter field is empty, then the new supply is created without a location or variant code.</p> <p>* If more than one filter value is defined, then the new supply is created for the first filter value according to the sorting method.</p> <p>If you want another variant or location code, then you must manually change it on the new planning line.</p>
<p>Auto-Adjust Supply</p>	<p>Optimizes a new supply that you have created in the graph by making sure that it results in zero inventory before the next supply.</p>
<p>Delete Supply</p>	<p>Deletes the element in the Timeline FastTab and deletes the planning line when you choose Save Changes. The icon changes to a disk that has a red cross when the supply has been deleted.</p> <p>NOTE: You can only delete a supply of action message type New. After you choose Save Changes, you must manually delete the planning line in question in the planning or requisition worksheet.</p>

7. Choose the **Reload** action if you want to reset all the changes that you have made after you last opened the **Item Availability by Timeline** page or selected **Reload**.
8. When the elements are placed where you want them in the diagram, choose **Save Changes** to copy modified quantity and date changes to the planning or requisition lines that represent the graphical elements.

To implement the supply plan changes, you must follow the resulting action messages from the planning or requisition worksheet. For more information, see Carry Out Action Msg.-Plan..

Symbols and Icons on the Timeline FastTab

SYMBOL/ICON	DESCRIPTION
<p>Black cross</p>	<p>Orders (both supply and demand).</p> <ul style="list-style-type: none"> - Cannot be modified. - Visible when the Show Projected Inventory field is selected (orange graph).

SYMBOL/ICON	DESCRIPTION
Red circle	Existing supply orders that are not in planning suggestions. <ul style="list-style-type: none"> - Cannot be modified. - Visible when the Show Projected Inventory field is selected (orange graph).
Yellow star	Forecast demand. <ul style="list-style-type: none"> - Cannot be modified. - Visible when the Forecast Name field has a value. <p>When both the Show Projected Inventory and the Include Planning Suggestions fields are selected, then each yellow star has a linked counterpart in the opposite graph. This illustrates how a suggested supply fulfills the forecasted demand.</p>
Green circle with an icon shaped as a disk that has a red cross	Suggested supply order with action message <i>Cancel</i> . <ul style="list-style-type: none"> - Cannot be modified. - Visible when the Include Planning Suggestions field is selected (green graph).
Green circle with an icon shaped as a disk that has a star	Suggested supply orders with action message <i>New</i> . <ul style="list-style-type: none"> - Can be modified. - Visible when the Include Planning Suggestions field is selected (green graph).
Green circle with an icon shaped as a disk that has one or two arrows	Suggested supply orders with action message <i>Reschedule, Change Qty, or Resched. and Chg. Qty.</i> <ul style="list-style-type: none"> - Can be modified. - Visible when the Include Planning Suggestions field is selected (green graph). <p>The arrows reflect the direction of the planning suggestion. For example, a left arrow together with an up arrow reflects a <i>Resched. and Chg. Qty.</i> action message that consists of a backward rescheduling and a quantity increase.</p>

When you access the drop-down menu for the **Timeline** FastTab, the following functions appear depending what you choose

FUNCTION	DESCRIPTION
----------	-------------

FUNCTION	DESCRIPTION
<p>Create New Supply</p>	<p>Creates a new element on the point where you access the drop-down menu, which represents a new suggested supply order. It becomes a new line in the planning worksheet when you choose Save Changes on the Process tab.</p> <p>Any filter values that are defined in the Location Filter or Variant Filter fields on the Options FastTab will be applied to the new supply order. Note: If the filter fields are empty or have more than one filter value, then the new supply order is created by using the following codes:</p> <ul style="list-style-type: none"> • If the filter field is empty, then the new supply is created without a location or variant code. • If more than one filter value is defined, then the new supply is created by using the first filter value according to the sorting order. <p>If you want another variant or location code in the new supply order, then you must manually change it on the new planning line.</p>
<p>Auto-Adjust Supply</p>	<p>Optimizes a new supply that you have created in the graph by making sure that it creates zero inventory before the next supply.</p>
<p>Delete Supply</p>	<p>Deletes the element in the Timeline FastTab and deletes the planning line when you choose Save Changes on the Process tab. The icon changes to a disk that has a red cross when the supply has been deleted. Note: You can only delete a supply of action message type <i>New</i>. After you choose Save Changes on the Process tab, you must manually delete the planning line in question in the planning or requisition worksheet.</p>
<p>Show Document</p>	<p>Opens the order, planning line, or forecast that the element represents.</p>
<p>Zoom Out (Ctrl++)</p>	<p>Makes the scale of the x-axis larger, so that fewer days are shown. Note: You can also do this by pressing Ctrl + scroll mouse wheel.</p>
<p>Zoom In (Ctrl+-)</p>	<p>Makes the scale of the x-axis smaller, so that more days are shown. Note: You can also do this by pressing Ctrl + scroll mouse wheel.</p>
<p>Reset Zoom (Ctrl+0)</p>	<p>Reverts the scale of the x-axis to what was used before you zoomed.</p>

In addition to the keyboard actions that were mentioned earlier, you can also use the following keyboard actions in the **TimeLine** FastTab.

KEYBOARD ACTION	DESCRIPTION
<p>Ctrl + scroll mouse wheel</p>	<p>Changes the scale of the x-axis.</p>
<p>Select an element, then press Shift+Arrow</p>	<p>Moves the element in the direction of the arrow stroke.</p>

KEYBOARD ACTION	DESCRIPTION
Tab	Moves to the next element.
Shift+Tab	Moves to the previous element.
While moving an element, press Esc.	Cancels the move. Note: Does not work if you have released the mouse button.

Assembly Management

3/31/2019 • 3 minutes to read

To support companies that supply products to their customers by combining components in simple processes without the need of manufacturing functionality, Business Central includes features to assemble items that integrate with existing features, such as sales, planning, reservations, and warehousing.

An assembly item is defined as a sellable item that contains an assembly BOM. For more information, see [Work with Bills of Material](#).

Assembly orders are internal orders, just like production orders, that are used to manage the assembly process and to connect the sales requirements with the involved warehouse activities. Assembly orders differ from other order types because they involve both output and consumption when posting. The assembly order header behaves similarly to a sales order line, and the assembly order lines behave similarly to consumption journal lines.

To support a just-in-time inventory strategy and the ability to customize products to customer requests, assembly orders may be automatically created and linked as soon as the sales order line is created. The link between the sales demand and the assembly supply enables sales order processors to customize the assembly item on the fly, promise delivery dates according to component availability, and to post output and shipment of the assembled item directly from their sales order interface. For more information, see [Sell Items Assembled to Order](#).

On one sales order line, you can sell a quantity that is available and must be picked from stock together with a quantity that must be assembled to the order. Certain rules exist to govern the distribution of such quantities to ensure that assemble-to-order quantities take priority over inventory quantities in partial shipping. For more information, see the "Combination Scenarios" section in [Understanding Assemble to Order and Assemble to Stock](#).

Special functionality exists to govern the shipping of assemble-to-order quantities. When an assemble-to-order quantity is ready to be shipped, the warehouse worker in charge posts an inventory pick for the sales order line(s) in question. This, in turn, creates an inventory movement for the components, posts the assembly output, and the sales order shipment. For more information, see the "Handling Assemble-to-Order Items in Inventory Picks" section in [Pick Items with Inventory Picks](#).

The following table describes a sequence of tasks, with links to the topics that describe them.

Understanding Assemble to Order and Assemble to Stock

3/31/2019 • 5 minutes to read

Assembly items can be supplied in the following two processes:

- Assemble to order.
- Assemble to stock.

Assemble to Order

You typically use *assemble to order* for items that you do not want to stock because you expect to customize them to customer requests or because you want to minimize the inventory carrying cost. The supporting functionality includes:

- Ability to customize assembly items when taking a sales order.
- Overview of availability of the assembly item and its components.
- Ability to reserve assembly components immediately to guarantee order fulfillment.
- Function to determine profitability of the customized order by rolling up price and cost.
- Integration to the warehouse to make assembly and shipping easier.
- Ability to assemble to order at the point of making a sales quote or a blanket sales order.
- Ability to combine inventory quantities with assemble-to-order quantities.

In the assemble-to-order process, the item is assembled in response to a sales order and with a one-to-one link between the assembly order and the sales order.

When you enter an assemble-to-order item on a sales line, an assembly order is automatically created with a header that is based on the sales line and with lines that are based on the item's assembly BOM multiplied by the order quantity. You can use the **Assemble-to-Order Lines** page to see the linked assembly order lines to support you in customizing the assembly item and in a delivery date that is based on component availability information. For more information, see [Sell Items Assembled to Order](#).

NOTE

Although it is not part of the default process, you can sell inventory quantities with the assemble-to-order quantities. For more information, see [Sell Inventory Items in Assemble-to-Order Flows](#).

To enable this process, the **Assembly Policy** field on the item card must be **Assemble-to-Order**.

Assemble to Stock

You typically use *assemble to stock* for items that you want to assemble ahead of sales, such as to prepare for a kit campaign, and keep in stock until they are ordered. These items are usually standard items such as packaged kits that you do not offer to customize to customer requests.

In the assemble-to-stock process, the item is assembled without an immediate sales demand and is stocked in the warehouse as an inventory item for later sale or consumption as a subassembly. For more information, see [Assemble Items](#). From this point, the item is picked and processed as a single item and is treated like a finished production item.

When you enter an assemble-to-stock item on a sales line, the line like any other item sold from inventory. For example, availability is checked for the assembly item only.

NOTE

Although it is not part of the default process, you can assemble an item to order even if it is set up to be assembled to stock. For more information, see [Sell Assemble-to-Order Items and Inventory Items Together](#).

To enable this process, the **Assembly Policy** field on the item card must be **Assemble-to-Stock**.

Combination Scenarios

A general principle in Assembly Management is that when combined on a sales order line, assemble-to-order quantities must be shipped before inventory quantities.

If an assembly order is linked to a sales order line, then the value in the **Qty. to Assemble to Order** field on the sales order line is copied to the **Quantity to Assemble** field, via the **Quantity** field on the assembly order header. For more information, see [Sell Items Assembled to Order](#).

In addition, the value in the **Quantity to Assemble** field is related to the **Qty. to Ship** field on the sales order line, and this relation manages the shipping of assemble-to-order quantities, both partially and completely. This is true both when the full sales line quantity is assembled to order and in combination scenarios where one part of the sales line quantity is assembled to order and another part is shipped from inventory. However, in the combination scenario, you have additional flexibility when shipping partially in that you can modify the **Quantity to Assemble** field, within predefined rules, to specify how many units to ship partially from inventory and how many to ship partially by assembling to order.

If the full sales line quantity must be assembled to order and shipped, then the value in the **Qty. to Ship** field is copied to **Quantity to Assemble** field on the linked assembly order when you change the quantity to ship. This ensures that the quantity being shipped is fully supplied by the assemble-to-order quantity.

However, in combination scenarios, the full value in the **Qty. to Ship** is not copied to the **Quantity to Assemble** field on the assembly order header. Instead, a default value is inserted in the **Quantity to Assemble** field that is calculated from the **Qty. to Ship** field according to a predefined rule that ensures shipment of assemble-to-order quantities first.

If you want to deviate from this default, for example because you only want to assemble more or less of the quantity in the **Qty. to Ship** field, then you can modify the **Quantity to Assemble** field, but only within predefined rules, as illustrated below

An example why you would want to modify the quantity to assemble is that you want to partially post shipment of inventory quantities before the assembly output can be shipped.

The following explains the rules that define the minimum and maximum values that you can enter manually in the **Quantity to Assemble** to deviate from the default value in a combination scenario. The table shows a combination scenario where the **Qty. to Ship** field on the linked sales order line is changed from 7 to 4, and the **Quantity to Assemble** is therefore defaulted to 4.

	SALES ORDER LINE	ASSEMBLY ORDER HHEADER						
	Quantity	Qty. to Ship	Qty. to Assemble to Order	Quantity Shipped	Quantity	Quantity to Assemble	Assembled Quantity	Remaining Quantity

	SALES ORDER LINE	ASSEMBLY ORDER HHEADER						
Initial	10	7	7	0	7	7	0	7
Change		4				4 (inserted by default)		

Based on the above situation, you can only modify the **Quantity to Assemble** field as follows:

- The minimum quantity that you can enter is 1. This is because you must at least assemble one unit to be able to sell the four units, assuming that the remaining three are available in the inventory.
- The maximum quantity that you can enter is 4. This is to ensure that you do not assemble more of this assemble-to-order item than what is needed on the sale.

Quote an Assemble-to-Order Sale

3/31/2019 • 2 minutes to read

You can use assembly management to customize an assembly item to a customer's request during the sales process. For more information, see [Sell Items Assembled to Order](#).

As when you sell any other type of item, you can also create a sales quote for a customized assembly item before converting it to a sales order. This process involves several extra steps when you compare it to creating a regular sales quote, and it uses a variation of a linked assembly order, which is an assembly quote.

NOTE

Like all types of quotes, the quantities on assembly quotes are not used in availability, planning, or reservations.

To create a sales quote for an assemble-to-order item

1. Choose the  icon, enter **Sales Quote**, and then choose the related link.
2. Create a sales quote line with one line for an assembly item. For more information, see [Make Sales Quotes](#).
3. In the **Qty. to Assemble to Order** field, enter the full quantity.

NOTE

You should not quote a partial quantity. Therefore, you must enter the same quantity that you entered in the **Quantity** field on the sales quote line.

4. On the **Lines** FastTab, choose **Line**, choose **Assemble to Order**, and then choose **Assemble-to-Order Lines**. Alternatively, choose the **Qty. to Assemble to Order** field on the line.
5. On the **Assemble-to-Order Lines** page, review or modify the assembly order lines according to the quote that the customer is requesting. If you want to view more information, choose the **Show Document** action to open the complete blanket quote order. You cannot change the contents of most fields, and you cannot post.
6. When you have adjusted the assembly order lines according to the quote, close the **Assemble-to-Order Lines** page to return to the **Sales Quote** page.
7. If the customer accepts the quote, then create a sales order for the quoted assembly item. For more information, see [Make Sales Quotes](#). The linked assembly quote and any customizations are linked to that new sales order to prepare for assembly of the item or items to be sold.

Assemble Items

3/31/2019 • 4 minutes to read

If the **Replenishment System** field on the item card contains **Assembly**, then the default method of supplying the item is to assemble it from defined components and potentially by a defined resource.

The components and resources that go into this kind of an assembly item must be defined in an assembly BOM. For more information, see [Work with Bills of Material](#).

Assembly items can be set up for two different assembly processes:

- Assemble to stock.
- Assemble to order.

You typically use **Assemble to Stock** for items that you want to assemble ahead of sales, such as to prepare for a kit campaign, and keep in stock until they are ordered. These items are usually standard items such as packaged kits that you do not offer to customize to customer requests.

You typically use **Assemble to Order** for items that you do not want to stock because you expect to customize them to customer requests or because you want to minimize the inventory carrying cost by supplying them just in time. For more information, see [Sell Items Assembled to Order](#).

For more information about how to set up an assembly item, see [Understanding Assemble to Order and Assemble to Stock](#).

These setup options are default settings that manage how sales and assembly order lines are initially processed. You can depart from these defaults and supply the assembly item in the most optimal way when processing a sale. For more information, see [Sell Inventory Items in Assemble-to-Order Flows](#) and [Sell Assemble-to-Order Items and Inventory Items Together](#).

NOTE

Assembly components are handled in a special way in basic warehouse configurations. For more information, see the "Handling Assemble-to-Order Items in Inventory Picks" section in [Pick Items with Inventory Picks](#).

In this procedure, you create and process an assembly order for items that are assembled to stock, which means without a linked sales order. The steps include initiating the assembly order, handling potential component availability issues, and partially posting assembly item output.

To assemble an item

1. Choose the  icon, enter **Assembly Orders**, and then choose the related link.
2. Choose the **New** action. The **New Assembly Order** page opens.
3. Fill in the fields as necessary. Hover over a field to read a short description.
4. In the **Item No.** field, select the assembly item that you want to process. The field is filtered to show only items that are set up for assembly, which means that they have assembly BOMs assigned.
5. In the **Quantity** field, enter how many units of the item that you want assembled.

NOTE

If one or more components are not available to fulfill the entered assembly item quantity on the defined due date, then the **Assembly Availability** page automatically opens to provide detailed information about how many assembly items can be assembled based on component availability. For more information, see [View the Availability of Items](#). When you close the page, the assembly order is created with availability alerts on the affected component lines.

The assembly order lines are automatically filled with the contents of the assembly BOM and with line quantities according to the assembly order header.

NOTE

If the **Assembly Availability** page opened when you filled in the assembly order header, then each affected assembly order line contains a **Yes** in the **Avail. Warning** field with a link to detailed availability information. For more information, see [Check Availability](#). You can resolve a component availability issue by postponing the starting date, replacing the component with another item, or selecting an available substitution if one is defined.

6. In the **Quantity to Assemble** field, enter how many units of the assembly item that you want to post as output the next time that you post the assembly order. This quantity can be lower than the value in the **Quantity** field to reflect a partial output posting.

NOTE

To make sure that component consumption posting matches the assembly item output posting, the quantity fields in the assembly order lines automatically adjust to the value that you enter in the **Quantity to Assemble** field.

7. On assembly order lines of type **Item** or **Resource**, in the **Quantity to Consume** field, specify how many units you want to post as consumed the next time that you post the assembly order.
8. When you are ready to partially or fully post, choose the **Post** action.

NOTE

If warnings are still present in any of the assembly order lines, then the posting is blocked. A message about which component or components are not in inventory is displayed.

After posting succeeds, the assembly item is posted as output to the location code and potential bin code that are defined on the assembly order. For manually created assembly orders, the location may be copied from the **Default Location for Orders** setup field. For assemble-to-order flows, the location code may be copied from the sales order line.

Sell Items Assembled to Order

3/31/2019 • 3 minutes to read

If the **Assembly Policy** field on the item card of an assembly item is **Assemble-to-Order**, then the item is not expected to be in inventory, and it must be assembled specifically to a sales order. When you enter the item on a sales order line, then an assembly order is automatically created and linked to the sales order.

NOTE

If some assemble-to-order items are already in inventory, then you can deduct that quantity from the assembly order and reserve it from inventory. For more information, see [Sell Inventory Items in Assemble-to-Order Flows](#).

In this procedure, you process the sale of an item that will be assembled according to specifications that are requested by the customer. The steps include initiating the sales order line, customizing the assembly item by editing its components and resources, checking availability to establish a delivery date, and releasing the sales order to be assembled and immediately shipped.

NOTE

The following procedure does not include the standard sales order steps before the step where you enter the assemble-to-order item on a sales order line.

To sell an item that is assembled to order

1. Choose the  icon, enter **Sales Orders**, and then choose the related link.
2. Create a sales order. For more information, see [Sell Products](#).
3. In the **No.** field, enter an item that is set up to be assembled to order.
4. In the **Location Code** field, define which location the item will be sold from. The assembly process will occur at that location.
5. In the **Quantity** field, enter how many units to sell.

NOTE

If one or more components of the requested assembly item quantity are not available, then a detailed availability warning page opens. For more information, see [Assembly Availability](#).

An assembly order is now automatically created and linked to the sales order line. The due date of this assembly order is synchronized with the shipment date of the sales order line.

The quantity to sell is copied to the **Qty. to Assemble to Order** field, which indicates that the item setup expects the full quantity on the sales line to be assembled to the order. You can decrease the quantity to assemble to order, such as if you know that some items are already available. For more information, see [Sell Inventory Items in Assemble-to-Order Flows](#).

6. To reflect that the customer wants an additional item in a kit, on the **Lines** FastTab, choose the **Line** action, choose the **Assemble to Order** action, and then choose the **Assemble-to-Order Lines** action to view and change the standard assembly components. Alternatively, choose the **Qty. to Assemble to Order**

field.

7. On the **Assemble-to-Order Lines** page, create a new line of type **Item** for the requested additional kit content. The line represents an additional assembly component.

You could also customize the order by increasing the quantity of one standard item in the kit. You can do this by increasing the value in the **Quantity Per** field on the specific assembly order line.

NOTE

The **Assemble-to-Order Lines** page only contains the basic fields that a salesperson is expected to use to customize the component list, add item tracking numbers, or to solve component availability issues. To see more assembly order information, such as the assembly order starting date, choose the **Show Documents** action. This opens a full view of the assembly order that is linked to the sales order line. You cannot change the contents of most fields on the assembly order header, and you cannot post assembly output from it because you must use shipment posting of the sales order line.

On the header of linked assembly orders, only the **Starting Date** field can be changed to enable assembly workers to specify a date that is earlier than the due date when they will start the process. All fields on the lines of the linked assembly order can be changed so that warehouse workers can enter consumption figures during the process.

8. Review or react to component availability issues. For example, select an available substitute item or establish a later due date.
9. Close the **Assemble-to-Order Lines** page. The linked assembly order is now ready to start to assemble the customized items by the due date.
10. On the sales order, choose the **Release** action to notify the assembly department that the assembly process can start.
11. In the assembly department, perform the steps of assembling the items that are sold in this procedure. For more information, see [Assemble Items](#).

[Design Details: Warehouse Management](#)

[Working with Business Central](#)

Sell Inventory Items in Assemble-to-Order Flows

3/31/2019 • 3 minutes to read

If the **Assembly Policy** field on the item card of an assembly item contains **Assemble-to-Order**, then the default sales order process assumes that the item is not in inventory and must be assembled for that specific sales order. Therefore, a linked assembly order is automatically created when you add the item to a sales order line. For more information, see [Sell Items Assembled to Order](#). However, if a part of the sales order quantity is already available in inventory, then you can decrease the assembly order quantity by changing the **Qty. to Assemble to Order** field on the sales order line.

This scenario is rare because assemble-to-order items are expected to always be customized, and the chance that they are in inventory in the configuration that is requested by another customer is low. However, if a company does have assemble-to-order quantities in inventory because of returns or order cancellations, then these quantities should be picked and sold before new ones are assembled.

NOTE

No functionality exists on sales orders that automatically alerts or helps you deduct assembly order quantities that are already available. Instead, you must monitor availability information, such as in the **Sales Line Details** FactBox.

Similar functionality is available when you are selling assembly items from inventory and a part or all of the quantity is unavailable and can be supplied by an assembly order. For more information, see [Sell Assemble-to-Order Items and Inventory Items Together](#).

NOTE

Certain rules apply to the **Qty. to Ship** field on sales order lines that contain a combination of assemble-to-order quantities and inventory quantities. For more information, see the Combination Scenarios section in [Understanding Assemble to Order and Assemble to Stock](#).

In this procedure, you replace assemble-to-order quantities with inventory quantities on a sales order line. The steps include detecting that availability exists, deducting that quantity from the linked assembly order, and then reserving the inventory quantity to make sure that it is picked and shipped for the order.

To sell inventory items in assemble-to-order flows

1. Choose the  icon, enter **Sales Orders**, and then choose the related link.
2. Create a sales order. For more information, see [Sell Products](#).
3. On a sales order line for an assemble-to-order item, in the **Quantity** field, enter the demanded quantity.
4. In the **Sales Line Details** FactBox, determine if all or some of the demanded quantity is available.
5. In the **Qty. to Assemble to Order** field, deduct the available quantity so that only the unavailable quantity is assembled to the order. The **Reserved Quantity** field is decreased accordingly to reflect that the order-to-order link, or reservation, only applies to the quantity to be assembled.
6. On the **Lines** FastTab, choose **Functions**, and then choose the **Reserve** action.
7. On the **Reservation** page, select the item ledger entry line or lines that contain the available quantities, choose the **Reserve from Current Line** action, and then choose the **OK** button.

On the **Sales Order** page, the **Reserved Quantity** field now shows that the whole order line quantity is reserved. The **Qty. to Assemble to Order** field still reflects the subquantity that has to be assembled.

8. Release the sales order for picking of the inventory items and for assembly of the unavailable items. For more information, see [Assemble Items](#).

Caution

The **Bin Code** field on the sales order may be prefilled according to the **Assemble-to-Order Shpt. Bin Code** or the **From-Assembly Bin Code** field on the location card. In that case, the **Bin Code** field on the sales order line may be incorrect in this combination of assemble-to-order and assemble-to-stock quantities. It is a good idea to look in the **Bin Code** field and ensure that the placement works for all quantities. Alternatively, enter the two different quantities on separate sales order lines.

Sell Assemble-to-Order Items and Inventory Items Together

3/31/2019 • 2 minutes to read

If the **Assembly Policy** field on the item card of an assembly item contains **Assemble-to-Stock**, then the default sales order process assumes that the item is already assembled and can be picked from inventory, if it is available. Therefore, no assembly order is automatically created and linked to the sales order line. However, if a part (or all) of the quantity is not available, then you have the flexibility to create an assembly order for the remaining quantity by filling in the **Qty. to Assemble to Order** field on the sales order line. In this manner, you can assemble the item to order although it is set up to be assembled to stock by default.

Similar flexibility exists when you are selling items to be assembled to the order and a part of the quantity is in inventory, which you want to deduct from the assembly order. For more information, see [Sell Inventory Items in Assemble-to-Order Flows](#).

NOTE

Certain rules apply to the **Qty. to Ship** field on sales order lines that contain a combination of assemble-to-order quantities and inventory quantities. For more information, see the Combination Scenarios section in [Understanding Assemble to Order and Assemble to Stock](#).

NOTE

The following procedure does not include the standard sales order steps that you need to follow before you create an assembly order for unavailable quantities.

To sell assemble-to-order items and inventory items together

1. On a sales order line for an item that is set up to be assembled to stock, enter a quantity in the **Quantity** field that exceeds inventory. The **Check Availability** page appears. For more information, see [View the Availability of Items](#).
2. Note the **Total Quantity** field (a negative value), which you will enter in the next step.
3. In the **Qty. to Assemble to Order** field, enter the value from the previous step.
4. Perform any changes to the assembly components. For more information, see [Sell Items Assembled to Order](#).
5. Proceed to release the sales order, to prepare it for picking of the inventory items and for assembly of the unavailable items. For more information about these standard assembly steps, see [Assemble Items](#).

Caution

The **Bin Code** field on the sales order may be prefilled according to the **Assemble-to-Order Shpt. Bin Code** field or the **From-Assembly Bin Code** field on the location card. In that case, the **Bin Code** field on the sales order line may be incorrect in this combination of assemble-to-order and assemble-to-stock quantities. It is a good idea to examine the **Bin Code** field and make sure that the placement works for all quantities. Alternatively, enter the two different quantities on separate sales order lines.

Create Blanket Assembly Orders

3/31/2019 • 2 minutes to read

You can use assembly management to customize an assembly item to a customer's request during the sales process. For more information, see [Sell Items Assembled to Order](#).

As with any other type of item, you can also create blanket sales orders for customized assembly items before periodically making the actual sales orders according to the blanket order agreement. This process involves several extra steps when you compare it to creating a regular blanket sales order, and it uses a variation of a linked assembly order, which is a blanket assembly order.

NOTE

Like all blanket orders, quantities on assembly blanket orders are only forecasts and are not operational until they are converted to actual assembly orders. Therefore, order functionality, such as availability calculation, reservation, and item tracking, is not active on blanket assembly orders.

To create a blanket assembly order for an assemble-to-order item

1. Choose the  icon, enter **Blanket Sales Orders**, and then choose the related link.
2. Create a new blanket sales order with one line for an assembly item. For more information, see [Create Blanket Sales Orders](#).
3. In the **Qty. to Assemble to Order** field on the blanket assembly order line, enter the full quantity.

NOTE

You should not create blanket order agreements for a partial quantity. Therefore, you must enter the same quantity that you entered in the **Quantity** field on the blanket sales order line.

4. Choose the **Assemble to Order** action, and then choose the **Assemble-to-Order Lines** action. Alternatively, choose the **Qty. to Assemble to Order** field on the line.
5. On the **Assemble-to-Order Lines** page, review or modify the assembly order lines according to the blanket order agreement that you have made with the customer. If you want to view more information, choose the **Show Document** action to open the complete blanket assembly order. You cannot change the contents of most fields, and you cannot post.
6. When you have adjusted the assembly order lines according to the blanket order agreement, close the **Assemble-to-Order Lines** page to return to the **Blanket Sales Order** page.
7. When the customer requests to create a sales order based on the agreed blanket sales order, create a sales order for the agreed assembly item or items. For more information, see [Create Blanket Sales Orders](#).

The linked blanket assembly order and any customizations are linked to that new sales order to prepare for assembly of the item or items to be sold.

Undo Assembly Posting

3/31/2019 • 3 minutes to read

Sometimes you may need to undo a posted assembly order, for example when the order was posted with mistakes that must be corrected, or because it should not have been posted in the first place and must be rolled back.

When you undo a posted assembly order, a set of corrective item ledger entries is created to reverse the original entries. Each positive output entry for the assembly item is reversed by a negative output entry. Each negative consumption entry for an assembly component is reversed by a positive consumption entry. Fixed cost application is automatically created between the corrective and original entries to ensure exact cost reversal.

When you undo a fully posted assembly order, then you can choose to recreate the assembly order to its original state, for example to make corrections before reposting it. Alternatively, you can choose to not recreate the assembly order.

When you undo a partially posted assembly order, then all affected quantity fields, such as the **Assembled Quantity**, **Consumed Quantity**, and **Remaining Quantity** fields are restored to the values they had before the posting in question.

To recreate or restore assembly orders, the following conditions must apply to the assembly item that was output in the original posting:

- It must still be in inventory, that is, it is not sold or otherwise consumed by outbound transactions.
- It must not be reserved.
- It must exist in the bin that it was output to.

In addition, existing assembly orders can only be restored if the number of lines and the sequence of lines on the original assembly order are not changed.

TIP

To solve conflicts due to line changes, you can manually revert the changes on the lines in question before undoing the related posted assembly order. Alternatively, you can post the assembly order fully and then select to recreate it when undoing the posting.

The following procedure describes how to undo posted assembly orders where the items were assembled to stock. If you want to undo posted assembly orders where the items were assembled to a sales order, then you must use the **Undo Shipment** function on the posted shipment that relates to the posted assembly order. For more information, see [Reverse Postings](#). The undoing of the posted assembly order then happens automatically in the same way as described in this topic.

To undo posting of an assembly order

1. To undo a fully or partially posted assembly order, Choose the  icon, enter **Posted Assembly Orders**, and choose the related link.

The **Posted Assembly Orders** page opens showing one or more posted assembly orders that are posted from the assembly order in question. Each partial posting creates a separate posted assembly order.

2. Open the posted assembly order that you want to undo, and then choose the **Undo Assembly** action.

If the posted assembly order that you want to undo relates to a fully posted assembly order that is now

deleted, then you have the option to recreate it, typically because you want to reprocess it.

3. If you want to recreate the assembly order, choose the **Yes** button. To undo the posting without recreating the related assembly order, choose the **No** button.

The **Reversed** field on the assembly order header changes to **Yes**. The assembly order posting is now reversed, and you can proceed to process the entire assembly order if you chose to recreate it or the open assembly order that you have restored to its original state.

NOTE

To restore quantities from multiple partial postings in an assembly order, you must undo all the posted assembly orders in question by following steps 1 through 3 above for each posted assembly order.

Work with Bills of Material

3/31/2019 • 6 minutes to read

You use bills of materials (BOMs) to structure parent items that must be assembled or produced by resources or machine centers from components. An assembly BOM can also be used to sell a parent item as a kit consisting of its components.

Assembly BOMs or Production BOMs

You use assembly orders for making end items from components in a simple process that can be performed by one or more basic resources, which are not machine or work centers, or without any resources. For example, an assembly process could be to pick two wine bottles and one coffee sack and then pack them as a gift item.

An assembly BOM is the master data that defines which component items go into an assembled end item and which resources are used to assemble the assembly item. When you enter an assembly item and a quantity in the header of a new assembly order, then the assembly order lines are automatically filled according to the assembly BOM with one assembly order line per component or resource. For more information, see [Assembly Management](#).

Assembly BOMs are described in this topic.

You use production orders for making end items from components in a complex process that requires a production routing and work or machine centers, which represent production capacities. For example, a production process could be to cut steel plates in one operation, weld them in the next operation, and paint the end item in the last operation. For more information, see [Manufacturing](#).

A production BOM is the master data that defines a production item and the components that go into it. For assembly items, the production BOM must be certified and assigned to the production item before it can be used in a production order. When you enter the production item on a production order line, either manually or by refreshing the order, then the production BOM content becomes the production order components. For more information, see [Create Production BOMs](#).

The concept of resources in production is much more advanced than in assembly management. Work centers and machine centers function as resources, and production steps are represented by operations that are assigned to resources in production routings. For more information, see [Create Routings](#).

Both assembly orders and production orders may be linked directly to sales orders. However, you can only use assembly orders to customize the end item directly for a customer request with the sales order.

To create an assembly BOM

To define a parent item that consists of other items, and potentially of resources required to put the parent together, you must create an assembly BOM.

Assembly BOMs usually contain items but can also contain one or more resources that are required to put the assembly item together.

Assembly BOMs can have multiple levels, which means that a component on the assembly BOM can be an assembly item itself. In that case, the **Assembly BOM** field on the assembly BOM line contains **Yes**.

Special requirements apply to items on assembly BOMs with regards to availability. For more information, see [To see the availability of an item by its use in assembly BOMs](#).

There are two parts to creating an assembly BOM:

- Setting up a new item
- Defining the BOM structure of the assembly item.

1. Set up a new item. For more information, see [Register New Items](#).

Proceed to enter components or resources on the assembly BOM.

2. On the **Item Card** page for an assembly item, choose the **Assembly** action, and then choose the **Assembly BOM** action.
3. On the **Assembly BOM** page, fill in the fields as necessary. Hover over a field to read a short description.

To view the components of an assembly item indented according to the BOM structure

From the **Assembly BOM** page, you can open a separate page that shows the components and any resources indented according to their BOM position under the assembly item.

1. Choose the  icon, enter **Items**, and then choose the related link.
2. Open the card for an assembly item. (The **Assembly BOM** field on the **Items** page contains **Yes**.)
3. On the **Item Card** page, choose the **Assembly** action, and then choose the **Assembly BOM** action.
4. On the **Assembly BOM** page, choose the **Show BOM** action.

To replace the assembly item with its components on document lines

From any sales and purchase document that contains an assembly item, you can use a special function to replace the line for the assembly item with new lines for its components. This function is useful, for example, if you want to sell the components as a kit that represents the assembly item.

Caution: When you have used the **Explode BOM** function, you cannot easily undo it. You must delete the sales order lines representing the components and then reenter a sales order line for the assembly item.

The following procedure is based on a sales invoice. The same steps apply to other sales documents and to all purchase documents.

1. In the top right corner, choose the **Search for Page or Report** icon, enter **Sales Invoices**, and then choose the related link.
2. Open a sales invoice that contains a line for an assembly item.
3. Choose the line for an assembly item, and then **Explode BOM** line action.

All fields on the sales invoice line for the assembly item are cleared except for the **Item** and **Description** fields. Complete sales invoice lines are inserted for the components and possible resources that comprise the assembly item.

Note: The Explode BOM function is also available on the **Assembly BOM** page.

To calculate the standard cost of an assembly item

You calculate the unit cost of an assembly item by rolling up the unit cost of each component and resource in the item's assembly BOM.

You can also calculate and update the standard cost for one or many items on the **Standard Cost Worksheet** page. For more information, see [Update Standard Costs](#).

The unit cost of an assembly BOM always equals the total of the unit costs of its components, including other assembly BOMs, and any resources.

1. In the top right corner, choose the **Search for Page or Report** icon, enter **Items**, and then choose the related link.
2. Open the card for an assembly item. (The **Assembly BOM** field on the **Items** page contains **Yes**.)
3. On the **Item Card** page, choose the **Assembly** action, and then choose the **Assembly BOM** action.
4. On the **Assembly BOM** page, choose the **Calc. Standard Cost** action.
5. Select one of the following options, and then choose the **OK** button.

OPTION	DESCRIPTION
Top Level	Calculates the assembly item's standard cost as the total cost of all purchased or assembled items on that assembly BOM regardless of any underlying assembly BOMs.
All Levels	Calculates the assembly's item standard cost as the sum of: 1) The calculated cost of all underlying assembly BOMs on the assembly BOM. 2) The cost of all purchased items on the assembly BOM.

The costs of the items that make up the assembly BOM are copied from the component item cards. The cost of each item is multiplied by the quantity, and the total cost is shown in the **Unit Cost** field on the item card.

Design Details: Assembly Order Posting

3/31/2019 • 5 minutes to read

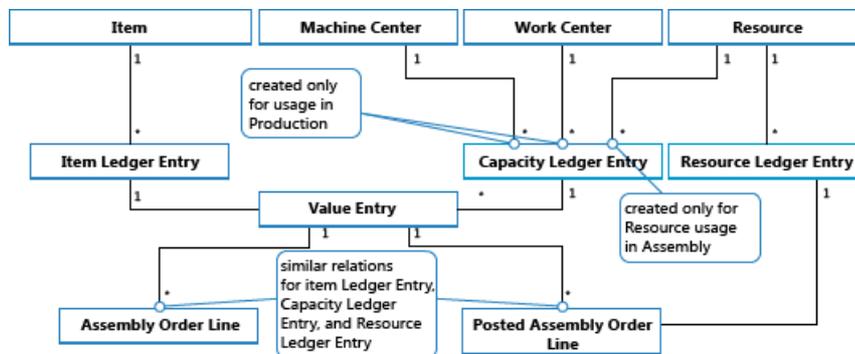

Assembly order posting is based on the same principles as when posting the similar activities of sales orders and production consumption/output. However, the principles are combined in that assembly orders have their own posting UI, like that for sales orders, while the actual entry posting happens in the background as direct item and resource journal postings, like that for production consumption, output, and capacity.

Similarly to production order posting, the consumed components and the used resources are converted and output as the assembly item when the assembly order is posted. For more information, see [Design Details: Production Order Posting](#). However, the cost flow for assembly orders is less complex, especially because assembly cost posting only occurs once and therefore does not generate work-in-process inventory.

The following journal postings occur during assembly order posting:

- The item journal posts positive item ledger entries, representing output of the assembly item, from the assembly order header
- The item journal posts negative item ledger entries, representing consumption of assembly components, from the assembly order lines.
- The resource journal posts usage of assembly resources (time units), from the assembly order lines.
- The capacity journal posts value entries relating to the resource usage, from the assembly order lines.

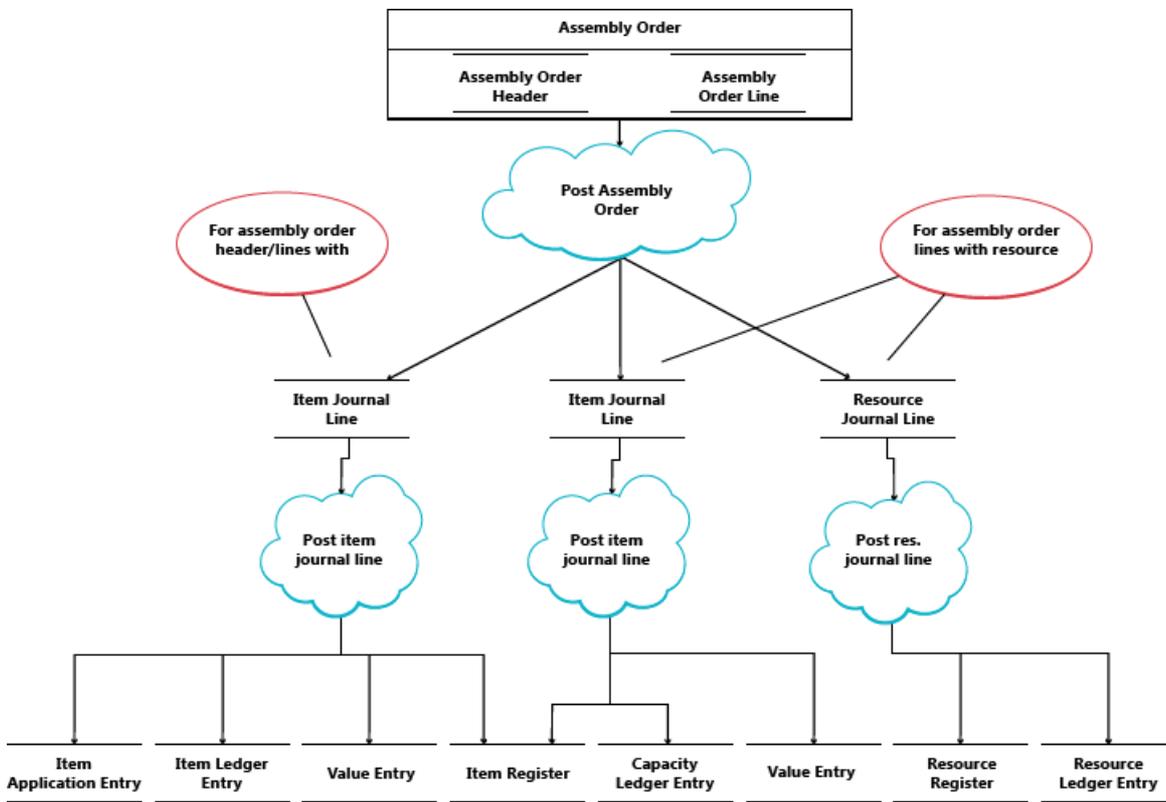

The following diagram shows the structure of item and resource ledger entries that result from assembly order posting.

NOTE

Machine and work centers are included to illustrate that capacity ledger entries are created from both production and assembly.

The following diagram shows how assembly data flows into ledger entries during posting:

Posting Sequence

The posting of an assembly order occurs in the following order:

1. The assembly order lines are posted.
2. The assembly order header is posted.

The following table outlines the sequence of actions.

ACTION	DESCRIPTION
Initialize Posting	<ol style="list-style-type: none"> 1. Make preliminary checks. 2. Add posting number and modify the assembly order header. 3. Release the assembly order.

ACTION	DESCRIPTION
Post	<ol style="list-style-type: none"> 1. Create the posted assembly order header. 2. Copy comment lines. 3. Post assembly order lines (consumption): <ol style="list-style-type: none"> a. Create a status page to calculate assembly consumption. b. Get the remaining quantity on which the item journal line will be based. c. Reset the consumed and remaining quantities. d. For assembly order lines of type Item: <ol style="list-style-type: none"> a. Populate fields on the item journal line. b. Transfer reservations to the item journal line. c. Post the item journal line to create the item ledger entries. d. Create warehouse journal lines and post them. e. For assembly order lines of type Resource: <ol style="list-style-type: none"> a. Populate fields on the item journal line. b. Post the item journal line. This creates capacity ledger entries. c. Create and post resource journal line. f. Transfer field values from the assembly order line into a newly created posted assembly order line. 4. Post the assembly order header (output): <ol style="list-style-type: none"> a. Populate fields on the item journal line. b. Transfer reservations to the item journal line. c. Post the item journal line to create the item ledger entries. d. Create warehouse journal lines and post them. e. Reset the assembly quantities and remaining quantities.

IMPORTANT

Unlike for production output, which is posted at expected cost, assembly output is posted at actual cost.

Cost Adjustment

Once an assembly order is posted, meaning that components (material) and resources are assembled into a new item, then it should be possible to determine the actual cost of that assembly item, and the actual inventory cost of the components involved. This is achieved by forwarding costs from the posted entries of the source (the components and resources) to the posted entries of the destination (the assembly item). The forwarding of costs is done by calculating and generating new entries, called adjustment entries that become associated with the destination entries.

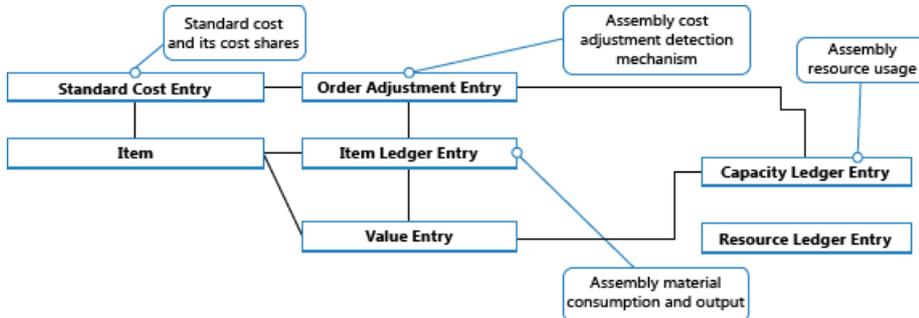

The assembly costs to be forwarded are detected with the Order Level detection mechanism. For information about other adjustment detection mechanisms, see [Design Details: Cost Adjustment](#).

Detecting the Adjustment

The order Level detection function is used in conversion scenarios, production and assembly. The function works as follows:

- Cost adjustment is detected by marking the order whenever a material/resource is posted as consumed/used.
- Cost is forwarding by applying the costs from material/resource to the output entries associated with the same order.

The following graphic shows the adjustment entry structure and how assembly costs are adjusted.

Performing the Adjustment

The spreading of detected adjustments from material and resource costs onto the assembly output entries is performed by the **Adjust Cost – Item Entries** batch job. It contains the Make Multilevel Adjustment function, which consists of the following two elements:

- Make Assembly Order Adjustment – which forwards cost from material and resource usage to the assembly output entry. Lines 5 and 6 in the algorithm below are responsible for that.
- Make Single Level Adjustments – which forwards costs for individual items using their costing method. Lines 9 and 10 in the algorithm below are responsible for that.

```

Make MultiLevel Adjustment
1.   While not Done do
2.     case TRUE of
3.       LevelExceeded:
4.         Done := TRUE;
5.       Assembly To Adjust Exists(TempOrderAdjmtEntry):
6.         Make Assembly Order Adjustments(TempOrderAdjmtEntry);
7.       WIP To Adjust Exists(TempProdOrderLine):
8.         Make WIP Adjustments(TempProdOrderLine);
9.       Inventory To Adjust Exist(TempItem):
10.        Make Single Level Adjustments(TempItem);
11.      ELSE
12.        Done := TRUE;
13.    end case

```

NOTE

The Make WIP Adjustments element, in lines 7 and 8, is responsible for forwarding production material and capacity usage to the output of unfinished production orders. This is not used when adjusting assembly order costs as the concept of WIP does not apply to assembly.

For information about how costs from assembly and production are posted to the general ledger, see [Design Details: Inventory Posting](#).

Assembly Costs are Always Actual

The concept of work in process (WIP) does not apply in assembly order posting. Assembly costs are only posted as actual cost, never as expected cost. For more information, see [Design Details: Expected Cost Posting](#).

This is enabled by the following data structure.

- In the **Type** field on item journal lines, in the **Capacity Ledger Entry** and **Value Entry** tables, *Resource* is used

to identify assembly resource entries.

- In the **Item Ledger Entry Type** field on item journal lines, in the **Capacity Ledger Entry** and **Value Entry** tables, *Assembly Output* and *Assembly Consumption* are used to identify the output assembly item entries and the consumed assembly component entries respectively.

In addition, posting group fields on the assembly order header and assembly order lines are populated by default as follows.

ENTITY	TYPE	POSTING GROUP	GEN. PROD. POSTING GROUP
Assembly Order Header	Item	Inventory Posting Group	Gen. Prod. Posting Group
Assembly Order Line	Item	Inventory Posting Group	Gen. Prod. Posting Group
Assembly Order Line	Resource		Gen. Prod. Posting Group

Accordingly, only actual costs are posted to the general ledger, and no interim accounts are populated from assembly order posting. For more information, see [Design Details: Accounts in the General Ledger](#)

Assemble to Order

The item ledger entry that results from posting an assemble-to-order sale is fixed applied to the related item ledger entry for the assembly output. Accordingly, the cost of an assemble-to-order sale is derived from the assembly order that it was linked to.

Item ledger entries of type Sale that result from posting assemble-to-order quantities are marked with **Yes** in the **Assemble to Order** field.

Posting sales order lines where a part is inventory quantity and another part is assemble-to-order quantity results in separate item ledger entries, one for the inventory quantity and one for the assemble-to-order quantity.

Manufacturing

3/31/2019 • 2 minutes to read

NOTE

Functionality described in this topic and sub topics is only visible in the user interface if you have the **Premium** experience. For more information, see [Changing Which Features are Displayed](#).

When demand is planned for and the materials have been issued according to production BOMs, then the actual production operations can start and be executed in the sequence defined by the production order routing.

An important part of executing production, from a system point of view, is to post production output to the database to report progress and to update inventory with the finished items. Output posting can be done manually, by filling and posting journal lines after production operations. Or, it can be done automatically with the use of backward flushing. In that case material consumption is automatically posted along with output when the production order changes to finished.

As an alternative to the batch journal for output posting for multiple production orders, you can use the **Production Journal** page to post consumption and/or output for one production order line.

Before you can begin to produce items, you must make various setup, such as work centers, routings, and production BOMs. For more information, see [Setting Up Manufacturing](#).

The following table describes a sequence of tasks, with links to the topics that describe them.

About Production Orders

3/31/2019 • 13 minutes to read

Production orders are used to manage the conversion of purchased materials into manufactured items. Production orders route work through various work or machine centers on the shop floor.

Before proceeding with production, most companies perform supply planning, typically once a week, to calculate how many production orders and purchase orders to execute to fulfill that week's sales demand. Purchase orders supply the components that are required according to the production BOM to produce the end items.

Production orders are the central components of the program's manufacturing functionality and they contain the following information:

- Products planned for manufacturing
- Materials required for the planned production orders
- Products that have just been manufactured
- Materials that have already been selected
- Products that have been manufactured in the past
- Materials that were used in previous manufacturing operations

Production orders are the starting points for:

- Planning future manufacturing
- Controlling current manufacturing
- Tracking of finished manufacturing

Production Order Creation

Production orders can be created on an order-by-order basis manually from the **Production Order** page, or generated from the **Sales Order Planning** or **Order Planning** pages. Multiple orders are created from the **Planning Worksheet** page.

Production orders are created using information from:

- Items
- Production BOMs
- Routings
- Machine centers
- Work centers

Limitations on Production Order Creation

Production orders are automatically reserved and tracked to their source when:

- Created from the **Planning Worksheet**
- Created with the Order function on the **Sales Order Planning** page
- Created from the **Order Planning** page
- Using the **Replan** function on production orders

For more information, see [Track Relations Between Demand and Supply](#).

Production orders created through other means are not automatically reserved and tracked.

Production Order Status

The production order status controls how the production order behaves within the program. The form and content of the production are dictated by the order's status. The production orders are displayed in different pages according to their status. You cannot change the status of a production order manually; you must use the **Change Status** function.

Simulated Production Order

The Simulated Production Order is unique based on the following characteristics:

- As its name implies, it is a simulation and its main purpose is for quoting and costing - such as when the Research and Development department wants to get a cost estimate on a proposed item. A simulated production order serves as an example of a production order.
- It does not influence the planning of orders. Planning (MPS and MRP) neither considers nor is affected by simulated production orders. Also, a simulated production order cannot be used as a template because it disappears when you change its status.

Planned Production Order

The Planned Production Order is unique because of the following characteristics:

- You can automatically create a planned production order from a sales order.
- Planned production orders are like released production orders and provide input to capacity requirements planning by showing the total capacity requirements by work center or machine center.
- A planned production order represents the best estimate of the future load for the work center or machine center load based on available information. Typically, they are generated from planning, but can also be created manually. Because they are erased during subsequent planning generations, manual creation is not practical.
- Their generation in planning results in a suggested "planned order release" that includes quantity, release date, and due date. The planning system logic is based on the replenishment system, reorder policies, and order modifiers that it encounters in the net requirements planning process.
- To view their impact, look at the load for each work center or machine center on the planned production order's routing.

Firm Planned Production Order

The Firm Planned Production Order is unique because of the following characteristics:

- You can automatically create a firm planned production order from a sales order.
- A firm planned production order acts as a placeholder in the planning schedule for some future job released to the floor.
- A firm planned production order can be generated from planning or created manually or from sales orders. They are not erased during subsequent planning.
- Their generation in planning results in a suggested "planned order release" that includes: quantity, release date, and due date. The planning system logic is based on the replenishment system, reorder policies, and order modifiers that it encounters in the net requirements planning process.
- To view their impact, look at the load for each work center or machine center on the firm planned production order's routing.

Released Production Order

The Released Production Order is unique based on the following characteristics:

- You can automatically create a released production order from a sales order.
- When a production order has been released, it does not necessarily mean that materials have been picked or the job has physically moved to its first operation.

- In a MTO (Make-to-Order) environment, it is not unusual to create a released production order immediately after the entry of the sales order.
- Actual material consumption and product output can be recorded manually with a released production order. In addition, automatic flushing of consumption and product output only occurs for released production orders.

Finished Production Order

The Finished Production Order is unique based on the following characteristics:

- A finished production order is typically one that has been manufactured.
- Finishing the production order is an important task in completing the costing lifecycle of the item that is being produced. By finishing a production order, costing can be adjusted and reconciled.
- Finished production orders are used for statistical reporting and to support the ability to track back to other orders (sales, production, and purchase, for example). The ability to track back to a finished production order allows you to review the detailed history.
- Finished production orders can never be changed.

Production Order Execution

Once a production order has been created and scheduled, it has to be released to the shop floor to be executed. During execution of the order, you record:

- Materials picked or consumed
- How much time was spent working on the order
- Quantity of the parent item produced

This information can be recorded manually or through automatic reporting, according to the items setup in the Flushing Method field.

Material Consumption

The program offers a variety of options for how a manufacturing company might want to record material consumption. For example, material consumption may be recorded manually, which might be desirable if there are frequent component substitutions or greater than expected scrap.

Consumption of materials may be processed through the consumption journal, but also may be recorded automatically by the program, known as automatic reporting. The reporting methods are:

- Manual
- Forward
- Backward

Manual consumption reporting uses the consumption journal to specify material picking.

Forward consumption reporting assumes the expected quantity of all materials for the entire order is consumed at the release of a production order, unless using routing link codes. When using routing link codes, the material consumed after the start of the operational step is recorded in the Output Journal. To forward flush the entire production order, you need to do two things:

- All items in the top-level production BOM need to have forward flushing selected on their respective item card.
- All routing link codes on the production BOM must be removed.

Backward consumption reporting records the actual quantity of all material picked or consumed when the status of a production order is changed to *Finished*, unless using routing link codes. When using routing link codes, the material is consumed after a quantity of the parent item is recorded for the operational step in the Output Journal.

When the Production Order is refreshed, the flushing method is copied from the item card. Because the flushing method for each production order component controls how and when the consumption is recorded, it is important

to note that you can change flushing method for specific items directly on the Production Order.

Automatic Consumption Posting (Flushing)

The advantage of automatic flushing is that it greatly reduces data entry. With the ability to automatically flush an operation, the entire consumption and output recording process can be automated. The disadvantage of using automatic flushing is that you may not be accurately recording, or even aware of, scrap. The Automatic Reporting methods are:

- Forward Flush the Entire Order
- Forward Flushing by Operation
- Back Flushing by Operation
- Back Flushing the Entire Order

Automatic Reporting - Forward Flush the Entire Order

If you forward flush the production order at the start of the job, the behavior of the program is very similar to a manual consumption. The major difference is that consumption happens automatically.

- The entire contents of the production BOM are consumed and deducted from inventory at the time the released production order is refreshed.
- The consumption quantity is the quantity per assembly stated on the production BOM, multiplied by the number of parent items you are building.
- There is no need to record any information in the consumption journal if all of the items are to be flushed.
- When consuming items from inventory, it does not matter when output journal entries are made, because the output journal has no effect on this mode of consumption posting.
- No routing link codes can be set.

Forward flushing an entire order is suited in production environments with:

- A low number of defects
- A low number of operations
- High component consumption in early operations

Automatic Reporting - Forward Flushing by Operation

Flushing by operation allows you to deduct inventory during a specific operation in the routing of the parent item. Material is tied to the routing using routing link codes, which correspond to routing link codes applied to components in the production BOM.

The flush takes place when the operation that has the same routing link code is started. Started means that some activity is recorded in the output journal for that operation. And that activity might just be that a setup time is entered.

The amount of the flush is for the quantity per assembly stated on the production BOM multiplied by the number of parent items being built (expected quantity).

This technique is best employed when there are many operations and certain components are not needed until late in the assembly sequence. In fact, a Just-in-Time (JIT) setup might not even have the items on hand when the RPO is begun.

Material can be consumed during operations by using routing link codes. Some components may not be used until final assembly operations and should not be withdrawn from stock until that time.

Automatic Reporting - Back Flushing by Operation

Back flushing by operation records consumption after the operation is posted in the output journal.

The advantage of this method is that the number of parent parts finished in the operation is known.

Material in the production BOM is linked to the routing records using routing link codes. The back flush takes

place when an operation with a particular routing link code is posted with a finished quantity.

The amount of the flush is for the quantity per assembly stated on the production BOM multiplied by the number of parent items that were posted as output quantity at that operation. This might be different from the expected quantity.

Automatic Reporting - Back Flushing the Entire Order

This reporting method does not consider routing link codes.

No components are picked until the released production order status is changed to *Finished*. The amount of the flush is the quantity per assembly stated on the production BOM multiplied by the number of parent items that were finished and placed into inventory.

Backward flushing the entire production order requires the same setup as for forward flushing: The reporting method must be set to backward on each item card for all items within the parent BOM to be reported. In addition, all routing link codes must be removed from the production BOM.

Production Output

The program provides you with the capability to track how much time is spent working on a production order, in addition to recording the quantity produced. This information can help you more accurately determine the costs of production. Also, manufacturers using a standard costing system may want to record actual information in order to help them develop better standards.

Output may be processed through the output journal, but also may be recorded automatically by the program. The program copies the flushing method from the machine center or work center card to the production order routing when refreshing. As with material consumption, there are three reporting methods for output:

- Manual
- Forward
- Backward

Manual method uses the Output Journal to specify time consumed and quantity produced.

Forward method records the expected output (and time), which is automatically recorded at the release of a Production Order. Routing link codes are not a factor in the forward flushing of the output.

Backward method records the expected output (and time), which is automatically recorded at the finish of a Production Order. Routing link codes are not a factor in the back flushing of the output.

Posting Consumption and Output

You can use any combination of automatic flushing and manually recorded information for both consumption and output. For example, you may want to automatically forward flush components, but still use the Consumption Journal to record scrap. Similarly, you may want to automatically record output, but use the Output Journal to record scrap of the parent item or additional time spent on the order.

Finally, if you enter consumption and output manually, you need to determine the sequence in which you are going to record this information. You can record consumption first and use a shortcut method to enter the information, which is based on expected quantity of output. Or, you can enter output first, using the **Explode Routing** function. You would then record consumption based on actual quantity of output.

Production Journal

The Production Journal combines the functions of the Consumption Journal and Output Journals into one journal, which is accessed directly from the Released Production Order.

The purpose of the Production Journal is to provide a single interface for you to register consumption and output from a Production Order.

The Production Journal has a simple view and provides you with the ability to:

- Easily record output and consumption related to a Production Order
- Relate the components to operations
- Relate actual operation data with the standard estimates on the Production Order routing and component lines
- Post and print an overview of registered operation data for the Production Order

The Production Journal performs many of the same functions as the Consumption and Output journals. Dimensions, Item Tracking, and Bin Contents are handled in the same way as on the Consumption and Output journals.

However, the Production Journal differs from the Consumption and Output journals in the following ways:

- It is called directly from a released production order line and preset with the relevant data.
- It allows you to define which types of components to handle based on a flushing method filter on the journal.
- Quantities and times already posted for the order are displayed at the bottom of the journal as actual entries.
- Fields where data entry is irrelevant are blank and non-editable.
- The user can set up the way output quantities are preset in the journal - for example, that the last operation must have zero as Output Quantity.
- If you happen to exit the journal without posting your changes, a request message is displayed allowing you to stay in the journal.
- It displays operations and components together in a logical structure that provides an overview of the production process.

In the production journal, consumption quantities are posted as negative item ledger entries, output quantities are posted as positive ledger entries, and times spent are posted as capacity ledger entries.

Create Production Order Headers

3/31/2019 • 2 minutes to read

You can create a production order manually, and the first step is to create a production order header.

Production orders are typically created automatically by a planning function to fulfill a known demand. For more information, see [Planning](#).

In the following procedure, a firm planned production order is created. You can also create production orders with a different status.

To create a production order header

1. Choose the  icon, enter **Firm Planned Prod. Orders**, and then choose the related link.
2. Choose the **New** action.
3. In the **No.** field, insert the next number in the series.
4. In the **Source Type** field, select the source of the production order.

Here you can select to produce for a family of items. For more information, see [Work With Production Families](#).

5. In the **Source No.** field, select the item number, family, or sales header for which the production order is to be generated.
6. Fill in the **Quantity** and **Due Date** fields according to your specifications.

When production requirements change, such as components or operations, you can quickly replan the production order. For more information, see [Replan or Refresh Production Orders Directly](#).

Subcontract Manufacturing

3/31/2019 • 6 minutes to read

Subcontracting selected operations to vendor is common in many manufacturing companies. Subcontracting can be a rare occurrence or can be an integral part of all production processes.

The program provides several tools for managing subcontract work:

- **Work Centers with assigned vendor:** This feature enables you to set up a work center that is associated with a vendor (subcontractor). This is called a subcontract work center. You can specify a subcontract work center on a routing operation, which allows you to easily process the subcontracted activity. In addition, the cost of the operation can be designated at the routing or the work center level.
- **Work Center cost based on units or time:** This feature enables you to specify whether costs associated with the work center are based on the production time or a flat charge per unit. Although subcontractors commonly use a flat charge per unit to charge for their services, the program can handle both options (production time and flat charge per unit).
- **Subcontracting Worksheet:** This feature allows you to find the production orders with material ready to send to a subcontractor and to automatically create purchase orders for subcontract operations from production order routings. Then the program automatically posts the purchase order charges to the production order during the posting of the purchase order. Only production orders with a status of released can be accessed and used from a subcontracting worksheet.

Subcontract Work Centers

Subcontract Work Centers are set up the same as regular work centers with additional information. They are assigned to routings in the same manner as other work centers.

Subcontract Work Center Fields

This **Subcontractor No.** field designates the work center as a subcontract work center. You can enter the number of a subcontractor who supplies the work center. This field can be used to administer work centers, which are not in-house but perform processing under contract.

If you subcontract with the vendor for a different rate for each process, then select the **Specific Unit Cost** field. This lets you set up a cost on each routing line and saves the time of re-entering each purchase order. The cost on the routing line is used in processing instead of the cost on the work center cost fields. Selecting the **Specific Unit Cost** field calculates costs for the vendor by the routing operation.

If you subcontract at a single rate per vendor, leave the **Specific Unit Cost** field blank. The costs will be set up by filling in **Direct Unit Cost**, **Indirect Cost %**, and **Overhead Rate** fields.

Routings that use Subcontract Work Centers

Subcontract work centers can be used for operations on routings in the same way as regular work centers.

You can set up a routing that uses an outside work center as a standard operational step. Alternatively, you can modify the routing for a particular production order to include an outside operation. This might be needed in an emergency such as a server not working correctly, or during a temporary period of higher demand, where the work generally performed in-house must be sent to a subcontractor.

For more information, see [Create Routings](#).

Calculate Subcontracting Worksheets and Create Subcontract

Purchase Orders

Once you have calculated the subcontracting worksheet, the relevant document, in this case a purchase order, is created.

The **Subcontracting Worksheet** page functions like the **Planning Worksheet** by calculating the needed supply, in this case purchase orders, which you review in the worksheet and then create with the **Carry Out Action Message** function.

NOTE

Only production orders with status **Released** can be accessed and used from a subcontracting worksheet.

To calculate the subcontracting worksheet

1. Choose the  icon, enter **Subcontracting Worksheet**, and then choose the related link.
2. To calculate the worksheet, choose the **Calculate Subcontracts** action.
3. On the **Calculate Subcontracts** page, set filters for the subcontracted operations, or the work centers where they are performed, to calculate only the relevant production orders.
4. Choose the **OK** button.

Review the lines on the **Subcontracting Worksheet** page. The information in this worksheet comes from the production order and production order routing lines and flows to the purchase order when that document is created. You can delete a row from the worksheet without affecting the original information, just as you can with the other worksheets. The information will reappear the next time you run the **Calculate Subcontracts** function.

To create the subcontract purchase order

1. Choose the  icon, enter **Subcontracting Worksheet**, and then choose the related link.
2. On the **Actions** tab, in the **Process** group, choose **Carry Out Action Message**.
3. Select the **Print Orders** field to print the purchase order as it is created.
4. Choose the **OK** button.

If all subcontracted operations are sent to the same vendor location, then only one purchase order is created.

The worksheet line that was turned into a purchase order is deleted from the worksheet. Once a purchase order is created, it will not appear in the worksheet again.

Posting Subcontract Purchase Orders

Once the Subcontractor Purchase Orders have been created, they can be posted. Receiving the order posts a Capacity Ledger Entry to the production order and invoicing the order posts the direct cost of the purchase order to the production order.

When the purchase is posted as received, then an output journal entry is automatically posted for the production order. This only applies if the subcontract operation is the last operation on the production order routing.

Caution

Posting output automatically for an ongoing production order when subcontracted items are received may not be desired. Reasons for this could be that the expected output quantity that is posted may be different from the actual quantity and that the posting date of the automatic output is misleading.

To avoid that the expected output of a production order is posted when subcontract purchases are received, make sure the subcontracted operation is not the last one. Alternatively, insert a new last operation for the final output quantity.

To post a subcontract purchase order

1. Choose the  icon, enter **Purchase Orders**, and then select the related link.
2. Open a purchase order that is created from the subcontracting worksheet.

On the purchase order lines, you see the same information that was in the worksheet. The **Prod. Order No.**, **Prod. Order Line No.**, **Operation No.**, and **Work Center No.** fields are filled in with the information from the source production order.

3. Choose the **Post** action.

When the purchase is posted as received, then an output journal entry is automatically posted for the production order. This only applies if the subcontract operation is the last operation on the production order routing.

Caution

Posting output automatically for an ongoing production order when subcontracted items are received may not be desired. Reasons for this could be that the expected output quantity that is posted may be different from the actual quantity and that the posting date of the automatic output is misleading.

To avoid that the expected output of a production order is posted when subcontract purchases are received, make sure the subcontracted operation is not the last one. Alternatively, insert a new last operation for the final output quantity.

When the purchase order is posted as invoiced, then the direct cost of the purchase order is posted to the production.

Register Consumption and Output for One Released Production order line

3/31/2019 • 3 minutes to read

This execution task is performed on the **Production Journal** page. The journal combines the functions of the separate consumption journal and output journals into one journal. The combined journal is accessed directly from a released production order. Its main purpose is to manually post the consumption of components, the quantity of end items produced, and the time spent in operations. The values are posted to ledger entries under the released production order. Consumption quantities are posted as negative item ledger entries, output quantities are posted as positive ledger entries, and times spent are posted as capacity ledger entries. Such posted values can also be viewed at the bottom of the journal as actual quantities.

NOTE

Because consumption data is processed together with output data, this journal offers an opportunity to display linked components and operations in a logical process structure. Components are indented under their respective operation. This requires that you use routing link codes.

NOTE

Components without routing link codes are listed first in the journal.

To register consumption and output

1. Choose the  icon enter **Released Prod. Orders**, and then choose the related link.
2. Open a released production order line that is ready for registration, and then on the **Lines** FastTab, choose the **Line** action, and then choose the **Production Journal** action.

The **Production Journal** page opens showing journal lines for the production order line according to the **Prod. Order Component** and **Prod. Order Routing** pages. These lines originate from the production BOM and routing assigned to the item that is being produced. For more information, see [Create Production BOMs](#).

3. In the **Posting Date** field at the top of the journal, enter a posting date that applies to all lines. The work date is entered by default. The field is meant as a quick way to align posting dates on all lines, if relevant.

NOTE

Posting dates entered on individual lines will override this field.

4. In the **Flushing Method Filter** field at the top of the journal, you can choose to also view consumption and output that is posted automatically according to the flushing methods defined for the item and resource respectively.

On each type of line in the journal, only the relevant fields are shown. The rest are blank and write-protected.

When the journal is opened, it is preset with the quantities to be posted. If nothing is posted so far, all

quantity fields will show by default the expected quantities carried from the production order. If partial postings have been made, the quantity fields on the lines will show the remaining quantities. The quantities and times already posted for the order are displayed at the bottom of the journal as actual entries.

Concerning the quantities in the **Output Quantity** field, you have the option to set up which values to preset when the journal is first opened. This is done from the **Manufacturing Setup** page, **General** FastTab, in the **Preset Output Quantity** field.

5. Proceed to enter the relevant consumption and output quantities in the editable fields.

NOTE

Only the output quantity on the last journal line of entry type **Output** will adjust the inventory level when posting the journal. Therefore, do not to post the journal, with the expected output quantity preset on the last output line, until all end items are actually produced.

6. Select the **Finished** field of output lines to indicate that the operation is finished. This field is related to the **Routing Status** field on a production order routing line.
7. Choose the **Post** action to register the quantities you have entered and then close the journal.

If values remain to be posted, the journal will contain these remaining values next time it is opened. Posted values are shown as actual values in the bottom of the journal.

NOTE

If an item that is being consumed is blocked, the journal will not post consumption quantities for that item. If a machine or work center is blocked, the journal will not post output quantities or process times for the output line in question.

NOTE

If you close the journal without posting, the changes will be lost.

WARNING

The **Production Journal** page cannot be used by two users simultaneously. This means that if User 2 opens the page and enters data when User 1 is already working on the page, then User 2 may lose data when User 1 closes the page.

Batch Post Production Consumption

3/31/2019 • 2 minutes to read

If the flushing method is **Manual**, you must post the components manually, using a consumption journal.

You can also set the system up to automatically post (*flush*) components when you start or finish production orders. For more information, see [Enable Flushing of Components According to Operation Output](#).

To post consumption for one or more production order lines

1. Choose the  icon, enter **Consumption Journal**, and then choose the related link.
2. Fill in the fields with the production order data and the consumption data. Hover over a field to read a short description.

If the warehouse location where the components are stored is set up to use bins but does not require pick processing, assign a bin code to the journal line to indicate where the items should be taken from in the warehouse. For more information, see [Pick for Production or Assembly](#).

3. Choose the **Post** action to post the consumption. The related item ledger entries are reduced.

Batch Post Output and Run Times

3/31/2019 • 2 minutes to read

The output quantity represents the work progress in the form of the finished quantity.

NOTE

Only when you post output quantity on the last operation, the inventory is updated automatically.

To post output quantities for one or more production order lines

1. Choose the  icon, enter **Output Journal**, and then choose the related link.
2. Fill in the fields with the production order data and the output data. Hover over a field to read a short description.
3. If the operation has been completed, select the **Finished** field.

If the warehouse location where the items should be put away uses bins but does not require put-away processing, assign a bin code to the journal line to specify where the items should be placed in the warehouse. For more information, see [Put Away Production or Assembly Output](#).

4. Choose the **Post** act to post the operations. The output quantity will be posted. The item is now available for shipping.

To post run times for one or more production order lines

The run time represents work progress in the form of the necessary working time.

1. Choose the  icon, enter **Output Journal**, and then choose the related link.
2. Fill in the fields with the production order data and the output data.
3. If the operation is completed, select the **Finished** field.
4. Choose the **Post** action to post the time spent per operation. Capacity ledger entries are updated for the used work or machine centers.

Reverse Output Posting

3/31/2019 • 2 minutes to read

There are times when output posting must be reversed. An example of this would be if a data entry error occurred and an incorrect amount of output is posted to a production order.

To reverse an output posting

1. Choose the  icon, enter **Output Journal**, and then choose the related link. Select your batch.
2. Fill in the fields as necessary. For more information, see [Batch Post Output and Run Times](#).
3. In the **Applies-To Entry** field, select the associated item ledger entry. This reverses the capacity and item ledger entries.
4. Post the reversal by posting the journal.

The output journal entries are posted to the item ledger as a positive adjustment.

Post Scrap Manually

3/31/2019 • 2 minutes to read

If scrap is produced during processing, it can be entered in the output journal.

NOTE

The scrap quantity does not increase the output quantity.

To post scrap manually

1. Choose the  icon, enter **Output Journal**, and then choose the related link.
2. Fill in the fields as necessary. Hover over a field to read a short description.
3. In the **Scrapped Quantity** field, enter the scrap quantity.
4. In the **Scrap Code** field, enter the scrap code.
5. Choose the **Post** action to post the specified scrap per operation.

View Load on Work and Machine Centers

3/31/2019 • 2 minutes to read

In the **Work Center Card** and **Machine Center Card** pages, you can view the shop floor load as a result of planned and released production orders.

To view the load on work centers

1. Choose the  icon, enter **Work Centers**, and then choose the related link.
2. Open the relevant **Work Center** card from the list, and then choose the **Load** action.

Use the **View by** and **View as** fields on the **Options** FastTab to select the required period.

Post Capacities

3/31/2019 • 2 minutes to read

In the capacity journal, you post consumed capacities that are not assigned to the production order. For example, maintenance work must be assigned to capacity, but not to a production order.

To post capacities

1. Choose the  icon, enter **Capacity Journals**, and then choose the related link.
2. Fill in the **Posting Date** and **Document No.** fields.
3. In the **Type** field, enter the type of the capacity, either **Machine Center** or **Work Center**, that you are posting.
4. In the **No.** field, enter the number of the machine center or work center.
5. Enter the relevant data in the other fields, such as **Starting Time**, **Ending Time**, **Quantity**, and **Scrap**.
6. Choose the **Post** action to post the capacities.

To view work center ledger entries

In the **Work Center Card** and **Machine Center Card** pages, you can view the posted capacities as a result of finished production orders.

1. Choose the  icon, enter **Work Centers**, and then choose the related link.
2. Open the relevant **Work Center** card from the list, and then choose the **Capacity Ledger Entries** action.

The **Capacity Ledger Entries** page displays the posted entries from the work center in the order they were posted.

About Finished Production Order Costs

3/31/2019 • 2 minutes to read

Finishing the production order is an important task in completing the costing lifecycle of the item that is being produced. Final costs, including variances in a standard cost environment, actuals in a FIFO, Average, or LIFO cost environment, are calculated using the **Adjust Cost - Item Entries** batch job, which allows for financial reconciliation of the costs of item production. For a production order to be considered for cost adjustment, the status must be **Finished**. It is therefore critical that upon completion, the status of a production order is changed to **Finished**.

Example

In a standard cost environment, when you consume material to produce an item, stated simply, the cost of the item plus labor and overhead go into WIP. When the item is produced, WIP is reduced by the amount of the standard cost of the item. Typically, these costs do not net to zero. So that these costs can net to zero, you must run the **Adjust Cost - Item Entries** batch job, noting that only production orders with the status of **Finished** will be considered for adjustment.

Warehouse Management

3/31/2019 • 2 minutes to read

After goods are received and before goods are shipped, a series of internal warehouse activities take place to ensure an effective flow through the warehouse and to organize and maintain company inventories.

Typical warehouse activities include putting items away, moving items inside or between warehouses, and picking items for assembly, production, or shipment. Assembling items for sale or inventory may also be considered warehouse activities, but these are covered elsewhere. For more information, see [Assembly Management](#).

In large warehouses, these different handling tasks can be separated by departments and the integration managed by a directed workflow. In simpler installations, the flow is less formalized and the warehouse activities are performed with so-called inventory put-aways and inventory picks. For more information about basic versus advanced warehouse configurations, see [Design Details: Warehouse Overview](#).

Before you can perform warehouse activities, you must set the system up for the relevant complexity of warehouse processing. For more information, see [Setting Up Warehouse Management](#).

The inventory-related tasks of counting, adjusting, and reclassifying items may involve warehouse tasks that must be performed on warehouse entries before they can be synchronized with the related item ledger entries. For more information, see [Count, Adjust, and Reclassify Inventory](#).

The following table describes a sequence of tasks, with links to the topics that describe them.

TO	SEE
Record the receipt of items at warehouse locations, either with a purchase order only, in simple location setups, or with a warehouse receipt, in case of semi or fully automated warehouse processing at the location.	Receive Items
Bypass the put-away and pick processes to expedite an item straight from receiving or production to shipping.	Cross-Dock Items
Put away items received from purchases, sales returns, transfers, or production output according to the configured warehouse process.	Putting Items Away
Move items between bins in the warehouse.	Moving Items
Pick items to be shipped, transferred, or consumed in assembly or production, according to the configured warehouse process.	Picking Items
Record the shipment of items from warehouse locations, either with a sales order only, in simple location setups, or with a warehouse shipment, in case of semi or fully automated warehouse processes at the location.	Ship Items

Receive Items

3/31/2019 • 4 minutes to read

When items arrive at a warehouse that is not set up for warehouse receipt processing, you simply record the receipt on the related business document, such as a purchase order, a sales return order, or an inbound transfer order.

When items arrive at a warehouse that is set up for warehouse receipt processing, you must retrieve the lines of the released source document that triggered their receipt. If you have bins, you can either accept the default bin that is filled in, or if the item has never been used before in the warehouse, fill in the bin where the item should be put away. You must then fill in the quantities of the items you have received, and post the receipt.

To receive items with a purchase order

The following describes how to receive items with a purchase order. The steps are similar for sales return orders and transfer orders.

1. Choose the  icon, enter **Purchase Orders**, and then choose the related link.
2. Open an existing purchase order, or create a new one. For more information, see [Record Purchases](#).
3. In the **Qty. to Receive** field, enter the received quantity.

The value in the **Qty. Received** field is updated. If this is a partial receipt, then the value is lower than the value in the **Quantity** field.

4. Choose the **Post** action.

To receive items with a warehouse receipt

1. Choose the  icon, enter **Warehouse Receipts**, and then choose the related link.
2. Choose the **New** action.

Fill in the fields on **General** FastTab. When you retrieve source document lines, some of the information is copied to each line.

For warehouse configuration with directed put-away and pick, if the location has a default zone and bin for receipts, the **Zone Code** and **Bin Code** fields are filled in automatically, but you can change them as appropriate.

NOTE

If you wish to receive items with warehouse class codes other than the class code of the bin in the **Bin Code** field on the document header, you must delete the contents of the **Bin Code** field on the header before you retrieve source document lines for the items.

3. Choose the **Get Source Documents** action. The **Source Documents** page opens.

From a new or an open warehouse receipt, you can use the **Filters to Get Source Docs.** page to retrieve the released source document lines that define which items to receive or ship.

- a. Choose the **Use Filters to Get Src. Docs.** action.
- b. To set up a new filter, enter a descriptive code in the **Code** field, and then choose the **Modify** action.

- c. Define the type of source document lines that you want to retrieve by filling in the relevant filter fields.
- d. Choose the **Run** action.

All released source document lines that fulfill the filter criteria are now inserted in **Warehouse Receipt** page from which you activated the filter function.

The filter combinations that you define are saved on the **Filters to Get Source Docs.** page until the next time you need it. You can make an unlimited number of filter combinations. You can change the criteria at any time by choosing the **Modify** action.

4. Select the source documents for which you want to receive items, and then choose the **OK** button.

The lines of the source documents appear on the **Warehouse Receipt** page. The **Qty. to Receive** field is filled with the quantity outstanding for each line, but you can change the quantity as necessary. If you deleted the contents of the **Bin Code** field on the **General** FastTab before getting the lines, you must fill in an appropriate bin code on each receipt line.

NOTE

To fill in the **Qty. to Receive** field on all the lines with zero, choose the **Delete Qty. to Receive** action. To fill it in once again with the quantity outstanding, choose the **Autofill Qty. to Receive** action.

NOTE

You cannot receive more items than the number in the **Qty. Outstanding** field on the source document line. To receive more items, retrieve another source document that contains a line for the item by using the filter function to get source documents with the item.

5. Post the warehouse receipt. The quantity fields are updated on the source documents, and the items are recorded as part of company inventory.

If you are using warehouse put-away, the receipt lines are sent to the warehouse put-away function. The items, although received, cannot be picked until they have been put away. The received items are identified as available inventory only when the put-away has been registered.

If you are not using warehouse put-away but you are using bins, the put-away of the items in the bin specified on the source document line is recorded.

NOTE

If you use the **Post and Print** function, you both post the receipt and print a put-away instruction that shows you where to place the items in storage.

If your location uses directed put-away and pick, then the put-away templates are used to calculate the best place to put the items away. This is then printed on the put-away instruction.

Cross-Dock Items

3/31/2019 • 8 minutes to read

Cross-docking functionality is available to you if you have set up your location to require warehouse receive and put-away processing.

When you cross-dock items, you process items in receiving and shipping without ever placing them in storage, thereby expediting the item through the put-away and pick processes and limiting the physical handling of items. You can cross-dock items for both shipments and for production orders. When you prepare a shipment or pick items for production and you are using bins, the item is automatically picked from a cross-dock bin before any other bin. You must look in the cross-dock area to see if the items you need are available there before you get the items in their usual storage area.

If you have calculated cross-dock quantities, put-away lines to the cross-dock bin for cross-dock calculations are created when you post the receipt. Other put-away lines are created as usual.

If you want to post the cross-dock items right away to make them available for picking, you must also register a put-away for the other items originating from the receipt line, namely those that need to be stored. If only some items on a receipt line are being cross-docked, you must therefore make an effort to put away the remaining items as quickly as possible. Alternatively, your warehouse policy could be to encourage cross-docking of entire receipt lines whenever possible.

In the put-away instruction, you can to your advantage delete both Take and Place instruction lines for each receipt line that concern receipts that are to be fully put away in storage. These lines can later be created as put-away lines from the put-away worksheet or the posted receipt. When they are deleted, you can then put away and register the lines that concern cross-dock items.

If you have selected the **Use Put-away Worksheet** field on the location card and have posted your receipt with calculated cross-docks, all the receipt lines become available in the worksheet. The cross-dock information is lost and cannot be recreated. Therefore, if you wish to use cross-dock functionality, you should relay lines to the put-away worksheet by deleting put-away instructions rather than using the automatic relay function provided in the **Use Put-away Worksheet** field.

If you post the warehouse receipt and you do not have the **Use Put-away Worksheet** field selected, the items to be cross-docked appear as separate lines on the put-away instruction. The **Cross-Dock Information** field on each put-away line shows whether the line contains cross-dock items, items from the same receipt that all need to be stored, or items that need to be stored originating from a receipt line where some of the items are to be cross-docked. With this field, employees can easily see why the full receipt quantity is not being placed in storage.

The program does not keep separate records about items that have been cross-docked, but registers them as ordinary put-away instructions.

To set up the warehouse for cross-docking

1. Set up at least one cross-dock bin, if you are using bins. Set up a cross-dock zone, if you are using directed put-away and pick.

A cross-dock bin has the **Cross-Dock Bin** field selected and must have both **Receive** and **Pick** bin types selected. For more information, see [Create Bins](#) and [Set Up Bin Types](#).

If you are using zones, create a zone for your cross-dock bins, and select the **Cross-Dock Bin Zone** field. For more information, see [Set Up Locations to Use Bins](#).

2. Choose the  icon, enter **Location**, and then choose the related link.
3. On the **Location** page, select the location that you want to set up the warehouse for cross-docking, and then choose the **Edit** action.
4. On the **Warehouse** FastTab, select the **Use Cross-Docking** check box and fill in the **Cross-Dock Due Date Calc.** field with the time to search for cross-dock opportunities.

The **Use Cross-Docking** option is only available if the **Require Receive**, **Require Shipment**, **Require Pick**, and **Require Put-away** fields are selected.

5. If you are using bins, on the **Bins** FastTab, fill in the **Cross-Dock Bin Code** field with the code of the bin you would like to use as the default cross-dock bin.
6. Choose the  icon, enter **Stockkeeping Unit**, and select the related link.
7. For each item or stockkeeping unit that you want to be able to cross-dock, select the item, and then choose the **Edit** action.
8. On the **Stockkeeping Unit Card** page, select the **Use Cross-Docking** check box.

NOTE

Cross-docking is only possible if your location is set up to require warehouse receive and put-away processing.

To cross-dock items without viewing the opportunities

1. Choose the  icon, enter **Warehouse Receipts**, and then choose the related link.
2. Create a warehouse receipts for an item that has arrived and can perhaps be cross-docked. For more information, see [Receive Items](#).
3. Fill in the **Qty. to Receive** field, and then choose the **Calculate Cross-Dock** action.

Outbound source documents requesting the items that are scheduled to leave the warehouse within the date formula time period are identified. Business Central calculates quantities so that you can cross-dock as much as possible and avoid having to put items away, without piling up too many items in the cross-dock area. The value in the **Qty. to Cross-Dock** field is thus the sum of all the outbound lines requesting the item within the look-ahead period minus the quantity of the items that have already been placed in the cross-dock area, or it is the value in the **Qty. to Receive** field on the receipt line, whichever is smaller. You cannot cross-dock more than you have received.

4. If you want to cross-dock the quantity as suggested, post the receipt. You can also decide to change the quantity to cross-dock to a higher or lower value and then post the receipt.

The amounts to be cross-docked now appear as lines in the put-away instruction, assuming the **Use Put-away Worksheet** field is cleared. The quantities not cross-docked also become lines in the put-away instruction.

If you have bins, the cross-docked items have been assigned to the default cross-dock bin defined on the location card.

5. Delete the **Take** and **Place** lines for items that are not going to be cross-docked at all.
6. Print the put-away instruction for the remaining lines, and place the quantities of the receipt that need to be stored in the appropriate bins or in the appropriate area of the warehouse. Place the cross-dock items in the area or bin designated for them by warehouse policy. Sometimes, warehouse policy might require that you to just leave them in the receiving area.

7. To register the cross-docked items as being put-away and available for picking, choose the **Register** action.

To cross-dock items after viewing the opportunities

1. Choose the  icon, enter **Warehouse Receipts**, and then choose the related link.
2. Create a warehouse receipts for an item that has arrived and can perhaps be cross-docked. For more information, see [Receive Items](#).

You want to view the source document lines that are requesting the item before you post the receipt.

3. Choose the **Calculate Cross-Dock** action.

On the **Cross-Dock Opportunities** page you can see the most important details about the lines requesting the item, such as type of document, quantity requested, and due date. This information might help you to decide how much to cross-dock, where to place the items in the cross-dock area, or how to group them.

4. Choose **Autofill Qty. to Cross-Dock** action to see how the quantities on the receipt lines are calculated. When you change the number of items in the **Qty. to Cross-Dock** field on each line, the calculation is updated as you make changes. This does not mean that the particular shipment or production order will actually receive the items being suggested for cross-docking, because these manipulations are for testing purposes only. The process can be informative, however, if more than one unit of measure is involved.
5. If you want to reserve a quantity of the item for a particular order line, place your cursor on that line, and then choose the **Reserve** action. On the **Reservation** page, you can now reserve any available quantity of the item for this specific order. This reservation is like any other reservation and does not have higher priority because it was created in connection with cross-docking. For more information, see [Reserve Items](#).
6. When you are finished recalculating or reserving, choose the **OK** button to bring the calculation as you have revised it into the **Qty. to Cross-Dock** field on the receipt line, or choose the **Cancel** button if you want to return to the warehouse receipt, where you can calculate the cross-dock again if you wish.
7. Now post the receipt, and you can continue in the put-away instruction as described in steps 3 through 7 in the "To cross-dock items without viewing the opportunities" section.

NOTE

In the warehouse put-away, you can continue to change the quantities that are being put away in storage or cross-docked, as necessary. For example, you might decide to cross-dock an extra quantity to expedite the cross-dock registration.

To view cross-docked items in a shipment or pick worksheet

If you are using bins, you can see, each time you open a shipment or the pick worksheet, an updated calculation of the quantity of each item in the cross-dock bins. This is valuable information if you are waiting for an item to come in. When you see that the item is available in the cross-dock bin, you can then quickly create a pick for all the items on the shipment. In the pick worksheet, you can modify the lines as appropriate and then create a pick.

You have to look for items in the cross-dock area first when you pick items for shipment. If you have noted during the receipt process the source documents that were the basis for cross-docking, you have a better idea of whether the item can be found in the cross-dock area or not.

When a production order has been released, the lines are available in the pick worksheet, and you can see in the **Qty. on Cross-Dock Bin** field whether the items you are waiting for have arrived and been placed in the cross-dock bins. When you create a pick instruction, the program suggests that you first pick the cross-docked items and will only later search for the item in storage bins.

If you are not using bins, you must remember to check the cross-dock area from time to time, or rely on

notifications from receipts that items for production have arrived.

Putting Items Away

3/31/2019 • 2 minutes to read

The warehouse activity of putting items away after they are received or output is performed in different ways depending on how warehouse management features are configured. The complexity can rank from no warehouse features, through basic warehouse configurations for order-by order handling in one or more activities only, to advanced configurations where all warehouse activities must be performed in a directed workflow. For more information, see [Setting Up Warehouse Management](#).

If you decide that you want to organize and record put-away information with warehouse documents, you place a check mark in the **Require Put-away** field on the location card. This indicates that when you have items coming into the warehouse location through an inbound source document, you want the put-away of those items to be controlled by the system. An inbound source document can be a purchase order, a sales return order, an inbound transfer order, or a production order whose output is ready for put-away.

If your location is set up to use put-away processing but not receive processing, you use the **Inventory Put-away** page to organize the put-away information, print it, enter the result of the actual put-away and post the put-away information, which in turn posts the receipt information for the source document. In the case of a production order, the posting process posts the output of the order and finishes the production order.

If your location is set up to require both receive and put-away processing, so that you have placed check marks in both the **Require Receive** and the **Require Put-away** field on the location card, there is a different process for putting items away. In this case, you will use the **Warehouse Put-away** page to handle the put-away. The warehouse put-away functions similarly to the inventory put-away, except that instead of posting the information, you register the put-away. Note that the registering of the warehouse put-away does not post the receipt of the items. It merely updates the bin content. As a warehouse manager, you can use a put-away worksheets to organize put-away information before creating the individual warehouse put-away instructions.

The following table describes a sequence of tasks, with links to the topics that describe them.

TO	SEE
Post the receipt of items directly from the inbound order document and thereby record the put away, because no warehouse configuration exists.	Receive Items
Put items away order by order and post the receipt in the same activity, in a basic warehouse configuration.	Put Items Away with Inventory Put-aways
Put items away for multiple orders in an advanced warehouse configuration.	Put Items Away with Warehouse Put-aways
Put produced or assembled items away in a basic or an advanced warehouse configuration.	Put Away Production or Assembly Output
Plan optimized put-away instructions for a number of posted warehouse receipts rather than have warehouse workers act directly on receipts.	Plan Put-aways in Worksheets
Put back items that were picked technically with an internal pick, for example for a production order that did not consume the expected quantity.	Pick and Put Away Without a Source Document

TO	SEE
Split a put-away line to place part of the put-away quantity in available bins because the designated bin is filled up.	Split Warehouse Activity Lines
Get immediate access to put-aways that are assigned to you as a warehouse worker.	Find Your Warehouse Assignments

Put Items Away with Inventory Put-aways

3/31/2019 • 3 minutes to read

When your location is set up to require put-away processing but not receive processing, you use the **Inventory Put-away** document to record and post put-away and receipt information for your source documents. The inbound source document can be a purchase order, a sales return order, an inbound transfer order, or an assembly or production order whose output is ready to be put away.

You can create an inventory put-away in three ways:

- Create the put-away in two steps by first creating a warehouse request from the source document, which acts as a signal to the warehouse that the source document is ready for put-away. The inventory put-away can then be created from the **Inventory Put-away** page based on the source document.
- Create the inventory put-away directly from the source document itself.
- Create inventory put-aways for several source documents at once by using a batch job.

To request an inventory put-away by releasing the source document

For purchase orders, sales return orders, inbound transfer orders, and assembly orders, you create the warehouse request by releasing the order. The following describes how to do this from a purchase order.

1. Choose the  icon, enter **Purchase Orders**, and then choose the related link.
2. Select the purchase order that you want to release, and then choose the **Release** action.

For production orders, you create the warehouse request by creating an inbound request from the released production order.

3. Choose the  icon, enter **Released Production Orders**, and then choose the related link.
4. Choose the **Create Inbound Whse. Request** action.

NOTE

You can also create the inbound warehouse request by selecting the **Create Inbound Request** check box when you refresh the production order. For more information, see [Refresh or Replan Production Orders](#).

When the warehouse request is created, a warehouse employee assigned to putting items away can see that the source document is ready and can create an inventory put-away document.

To create an inventory put-away based on the source document

Now that the request is created, the warehouse employee can create a new inventory put-away based on the released source document.

1. Choose the  icon, enter **Inventory Put-away**, and then select the related link.
2. Choose the **New** action.
3. In the **Source Document** field, select the type of source document you are putting away for.
4. In the **Source No.** field, select the source document.
5. Alternatively, choose the **Get Source Document** action to select the document from a list of inbound source documents that are ready for put-away at the location.

6. Choose the **OK** button to fill the put-away lines according to the selected source document.

To create an inventory put-away from the source document

1. In the source document, which can be a purchase order, sales return order, inbound transfer order, or production order, choose the **Create Inventory Put-away/Pick** action.
2. Select the **Create Invt. Put-away** check box.
3. Choose the **OK** button. A new inventory put-away is created.

To create multiple inventory put-aways with a batch job

1. Choose the  icon, enter **Create Invt. Put-away / Pick**, and then choose the related link.
2. On the **Warehouse Request** FastTab of the request page, use the **Source Document** and **Source No.** fields to filter on certain types of documents or ranges of document numbers.
3. On the **Options** FastTab, select the **Create Invt. Put-away** check box.
4. Choose the **OK** button. The specified inventory put-aways are created.

To record the inventory put-away

1. Open a previously created put-away document by selecting one from the **Inventory Put-aways** page.
2. In the **Bin Code** field on the put-away lines, the bin where the items must be put away is suggesting per the item's default bin. You can change the bin in this page if necessary.
3. Perform the put-away and enter the information for the actual quantity put away in the **Qty. to Handle** field.

If it is necessary to place the items for one line in more than one bin, for example because the designated bin is full, then use the **Split Line** function on the **Lines** FastTab. For more information about splitting lines, see [Split Warehouse Activity Lines](#).

4. When you have performed the put-away, choose the **Post** action.

The posting process will post the receipt, or for production orders, the output, of the source document lines that have been put away, and if the location uses bins, the posting will also create warehouse entries to post the bin quantity changes.

Put Items Away with Warehouse Put-aways

3/31/2019 • 4 minutes to read

When your location is set up to require warehouse put-away processing and warehouse receive processing, you use the warehouse put-away documents function to control the putting away of items.

When you post a warehouse receipt, the source documents, such as purchase, inbound transfer, or sales return orders, are updated, the quantity received is posted to the item ledger, and the lines about the items received are sent to the put-away function in the warehouse. If you have internal put-away and pick, the internal put-away can also create lines for put-away.

Depending on the warehouse setup, the lines are either made available to the put-away worksheet or used to generate put-away instructions immediately. For more information, see [Plan Put-aways in Worksheets](#).

In addition to the standard ways to create warehouse put-aways that are described in this topic, you can create the put-away from the related posted warehouse receipt. This is useful if you have deleted put-away lines, or if you use directed put-away and pick and have decided not to use the put-away worksheet, because you can create or recreate put-away instructions from the posted receipt lines.

To put items away without directed put-away and pick

1. Choose the  icon, enter **Put-aways**, and then choose the related link.
2. Open the warehouse put-away that is ready to handle.

You can sort the put-away lines by various criteria, for example, by item, shelf number, or due date, and thereby optimize the put-away process.

3. On each line, in the **Qty. to Handle** field, enter the quantity you want to put away.
4. After you have completed putting the items away, choose the **Register Put-away** action to record the completion of the activity and make the items available for picking.

To put items away with directed put-away and pick

1. Choose the  icon, enter **Put-aways**, and then choose the related link. If put-away instructions have been created, a warehouse put-away is visible.
2. Open the warehouse put-away that you want to work on.
3. If your warehouse requires, enter your user ID on the **General** FastTab when you begin work on a particular put-away.
4. Perform the take and place actions indicated in the **Action Type** field on the lines.

Note that each receipt line has become at least two lines in the warehouse put-away:

- The first line, with **Take** in the **Action Type** field, indicates where the items are located in the receiving area. You cannot change the zone and bin field on this line.
- The next line, with **Place** in the **Action Type** field, shows where you must place the items in warehouse storage. If the warehouse has received a large number of items on one receipt line, they may have to be put away in several bins, so there is a Place line for each bin.

If the Take and Place lines for each receipt line do not immediately follow one another, and you want

them to do so, you can sort the lines by selecting **Item** in the **Sorting Method** field on the **General** FastTab.

If the physical layout of the warehouse reflects the bin rankings, you can use the **Bin Ranking** sorting method to prepare a put-away round that will minimize your steps through the warehouse.

5. When you have placed all the items in bins as instructed, choose the **Register Put-away** action.

At locations that are set up to use directed put-away and pick, the following settings are prerequisites for the procedure above:

- A put-away template is set up. For more information, see [Set Up Put-away Templates](#).
- The weight, cubage, and special storage requirements of the item or stockkeeping unit are defined. For more information, see [Gross Weight](#).
- The capacity, bin type, and bin ranking of the bins. For more information, see [Bin Ranking](#).

The bin ranking is taken into consideration when more than one bin matches put-away template criteria. If both the put-away template criteria and the bin ranking are the same for more than one bin, the bin with the highest number is selected.

To create a put-away from a posted receipt

If your location uses both put-away processing and receive processing and you have deleted put-away lines, or if you use directed put-away and pick and have decided not to use the put-away worksheet, you can create or recreate put-away instructions for the posted receipt lines.

1. Choose the  icon, enter **Posted Whse. Receipts**, and then choose the related link.
2. Select a posted receipt that might need to be put away.
3. Choose the **Card** action.

If the **Document Status** field is blank, the receipt has not been put away at all. Otherwise, the field indicates the receipt is partially put-away or completely put-away.

4. If the receipt is partially put away or not put away at all, choose the **Create Put-away** action.
5. Fill in the batch job request page to create the put-away, and then choose the **OK** button.

Put Away Production or Assembly Output

3/31/2019 • 4 minutes to read

How you put away your output from production depends on how your warehouse is set up as a location. For more information, see [Setting Up Warehouse Management](#).

In basic warehouse configurations where the location requires put-away processing, but not receive processing, you use the **Inventory Put-away** document to organize and record the put-away of output.

In advanced warehouse configurations where the location requires both put-away and receive processing, you create either an internal put-away document or a movement document to put away the output.

The first step in creating putting output away is to create the inbound warehouse request. This request informs the warehouse that the production or assembly order output is ready to be put away.

To create the inbound warehouse request

1. Choose the  icon, enter **Released Production Order**, and then choose the related link.
2. On the production order that is ready for put-away, choose the **Create Inbound Whse. Request** action.

NOTE

You can also create the inbound warehouse request by selecting the **Create Inbound Request** check box when you refresh the production order. For more information, see [Refresh or Replan Production Orders](#).

To put output away with an inventory put-away

1. Choose the  icon, enter **Inventory Put-away**, and then choose the related link.
2. Create a new inventory put-away. For more information, see [Put Items Away with Inventory Put-aways](#).
3. To access the production order output, choose the **Get Source Documents** action, and then select the released production order.
4. Fill in the put-away lines as appropriate.
5. When the lines are ready for posting, choose the **Post** action. The posting will create the necessary warehouse entries and post the output of the items.

You can also create an **Inventory Put-away** directly from the released production order. For more information, see [Put Items Away with Inventory Put-aways](#).

When you post an inventory put-away, it is assumed that all the operations are posted according to the standard routing, that is, output quantity is posted according to the last operation. You can use the output journal to post variances in output quantity and the setup and run times. If it is required to post partially after you have created the inventory put-away, you can do so on setup times and quantities for all operations except the last one. In that case, the last operation is controlled by the inventory put-away.

If you only need to post setup or run time on the last operation, then set the output quantity on the last operation to 0. Alternatively, you can choose not to post the last line at all by simply deleting it

To put output away with a warehouse internal put-away

1. Choose the  icon, enter **Whse. Internal Put-away**, and then choose the related link.

2. Choose the **New** action.
3. Fill in the header of a new internal put-away with at least the **Location Code**.
4. Fill in a line for each item you wish to move to the warehouse. You only have to fill in the **Item No.** and the **Quantity** fields.

NOTE

When you select the **Item No.** field, the **Bin Contents List** opens instead of the **Item List**. This is because you want to put away an item that is in a particular bin - a Bin Content - not just an item, and you already know the bin the item should be taken from.

5. To fill the worksheet lines with the entire bin content or the filtered bin content of bins in the location, choose the **Get Bin Content** action.
6. Choose the **Create Put-away** action, and the items you want to move out of production are now on put-away instructions waiting to be stored in the warehouse.

NOTE

When your warehouse location is set up to use directed put-away and pick, the warehouse is linked to your manufacturing facility through the default production bins: the inbound and outbound production bins and the open shop bin, all of which you define on the **Bins** FastTab of the location card. When you post the output of a production order, the output is placed in the **Outbound Production Bin**. You follow the same procedure as described above to put-away the production output, except that instead of using the item's default bin, you will move or put-away the items from the **Outbound Production Bin** to the item's default bin.

To manually specify a bin to store items from production output

1. Choose the  icon, enter **Movement Worksheet**, and then choose the related link.
2. Fill in the header, and create a line for each item you wish to move to the warehouse.
3. Fill in both the **From Bin Code** and the **To Bin Code** fields, and enter the quantity in the **Quantity** field.
4. To fill the worksheet lines with the entire bin content or the filtered bin content of bins in the location, choose the **Get Bin Content** action.
5. Choose the **Create Movement** action. The warehouse movement instructions are created with Take and Place lines for warehouse employees to perform.

NOTE

You cannot enter the source document number, such as the Production Order No., in the internal put-away, put-away, or movement documents for either of these procedures.

Plan Put-aways in Worksheets

3/31/2019 • 3 minutes to read

If your location requires both put-away and receive processing, and you want to plan put-away instructions for a number of receipts, rather than have employees follow the instructions that the program creates for separate posted receipts, you can use the put-away worksheet.

To set up your warehouse so that receipt lines are available to you in the put-away worksheet as soon as they are posted, select the **Use Put-away Worksheet** field on the **Warehouse** FastTab of the location card. For more information, see [Setting Up Warehouse Management](#).

If you do not select this field, the program will automatically create put-away instructions for receipts as they are posted.

NOTE

Regardless of the status of the **Use Put-away Worksheet** field on the location card, you can always get put-away instruction lines, that is, posted receipt lines, into the put-away worksheet by doing the following:

1. On the **Warehouse Put-away** page, press Ctrl+D to delete the entire put-away instruction, or select the lines that you want to process in the worksheet and delete them.
2. Continue the process in as many put-aways as you wish, until you have deleted the lines you want to work on in the worksheet. Now choose **Put-away Worksheets** and proceed with planning.

To plan instructions in the put-away worksheet

1. Choose the  icon, enter **Put-away Worksheet**, and then choose the related link.
2. Choose the **Get Warehouse Documents** action. The **Put-away Selection** page opens.

You see all the posted receipts and registered internal put-aways that have been forwarded to the put-away function, including those for which put-away instructions have already been created. Documents with put-away lines that have been completely put away and registered are not shown on this list.

3. Select the documents that you want to work on in the worksheet. You can work on lines from several documents at the same time.

NOTE

If you try to select a receipt or internal put-away document for which you have already created instructions for all its lines, the program informs you that there is nothing to handle.

4. Fill in the **Sorting Method** field to sort the lines the way you prefer.

NOTE

The way the lines are sorted in the worksheet does not carry through automatically to the put-away instruction, but the same sorting possibilities exist, along with bin ranking. The line order you plan in the worksheet is thus easily recreated when you create the put-away instructions or by sorting in the put-away instructions.

5. Fill in the **Qty. to Handle** field. Choose the **Autofill Qty.to Handle** action, or fill in the fields manually.

6. If necessary, edit the lines manually. You can delete lines, for example, if some items need to be put away in a bin far away from the bins for the other items.

NOTE

Lines deleted are only deleted from this worksheet, not from the put-away selection list.

7. Choose the **Create Put-away** action. The **Create Document** page opens, where you can add more information to the put-away you are creating, as follows:
 - You can assign the put-away to a specific employee.
 - You can sort the put-away instruction lines as you did in the worksheet or by bin ranking. When you sort according to bin ranking, the Take lines appear first, since most receipt bins have a 0 bin ranking, and the Place lines appear last, starting with the bins with the lowest bin ranking. If you have structured your warehouse so bins of similar bin ranking are side by side, sorting lines in this way will ultimately save steps for your warehouse employees.
 - You can choose not to see the intermediate lines created when the program breaks a larger unit of measure to smaller units of measure by selecting the **Set Breakbulk Filter** field. For more information, see [Enable Automatic Breaking Bulk with Directed Put-away and Pick](#).
 - You can choose not to have the **Qty. to Handle** field automatically filled in on the put-away instructions.
 - You can choose to print the document immediately.
8. Choose the **OK** button, and the program creates the put-away according to your requests.

Pick and Put Away Without a Source Document

3/31/2019 • 2 minutes to read

After items have been put away and before they are picked to fulfill the needs of a production order or shipment, they are stored in the warehouse as part of available inventory.

Situations can arise where items must be taken out of the warehouse pick bins temporarily, perhaps to serve as demonstration models in a sales presentation. These items are still owned by the company and are part of inventory, but they are not available for picking. They are registered in a special purpose bin that you create for this purpose; technically, the items are in the warehouse, but physically, they could be in a conference or demonstration room.

In other situations, the production unit might unexpectedly need a few parts for a process. You can pick items for the production bins using the internal pick. When the process is over and output is created, you post the consumption of the items and empty the production bin, which in turn decreases the quantity of the item at your location.

Likewise, items can be returned to the warehouse to be put away. The items may have been taken out of available inventory for a production order, and then not used at all. To make them part of available inventory again, they must be put away in the bin.

The **Internal Put-aways** enables you to perform put-aways without having to refer to a particular source document. You can easily set up all the information you need to create a put-away warehouse instruction.

NOTE

If you are not using internal picks and internal put-aways, these adjustments can be performed using the methods to move items from bin to bin or to post quantity adjustments in a bin.

When the location uses directed put-away and pick, and therefore uses bin types, you cannot manually move items in or out of a bin of bin type RECEIVE, because items that are in a RECEIVE-type bin must be registered as being put away before they are part of available inventory.

To create an internal pick

1. Choose the  icon, enter **Whse. Internal Pick**, and then choose the related link.
2. Fill in the **No.** field and the **To Bin Code** field on the **General** FastTab. The **To Bin Code** field specifies the bin from which you want to get the items. For production purposes, this bin would be the inbound production bin or the open shop bin. For other purposes, choose a To Bin Code of a bin type that is not used for picking, most likely a staging, shipping or special purpose bin.
3. Select an item in the **Item No.** field, and fill in the quantities you want to pick.
4. Choose the **Create Pick** action. A warehouse pick instruction is now ready for a warehouse employee to perform.

To create an internal put-away

1. Choose the  icon, enter **Whse. Internal Put-away**, and then choose the related link.
2. Fill in the **No.** and **From Bin Code** fields on the **General** FastTab. The **From Bin Code** field specifies the bin where the items being returned to the warehouse, perhaps from production, are located.
3. Fill in the item numbers and quantities on the lines.

4. Choose the **Create Put-away** action. A warehouse put-away instruction is now ready for a warehouse employee to perform.

Walkthrough: Receiving and Putting Away in Basic Warehouse Configurations

3/31/2019 • 4 minutes to read

Note: This walkthrough must be performed on a demonstration company with the **Full Evaluation - Complete Sample Data** option, which is available in the Sandbox environment. For more information, see [Creating a Sandbox Environment](#).

In Business Central, the inbound processes for receiving and putting away can be performed in four ways using different functionalities depending on the warehouse complexity level.

METHOD	INBOUND PROCESS	BINS	RECEIPTS	PUT-AWAYS	COMPLEXITY LEVEL (SEE DESIGN DETAILS: WAREHOUSE SETUP)
A	Post receipt and put-away from the order line	X			2
B	Post receipt and put-away from an inventory put-away document			X	3
C	Post receipt and put-away from a warehouse receipt document		X		4/5/6
D	Post receipt from a warehouse receipt document and post put-away from a warehouse put-away document		X	X	4/5/6

For more information, see [Design Details: Inbound Warehouse Flow](#).

The following walkthrough demonstrates method B in the previous table.

About This Walkthrough

In basic warehouse configurations where your location is set up to require put-away processing but not receive processing, you use the **Inventory Put-away** page to record and post put-away and receipt information for your inbound source documents. The inbound source document can be a purchase order, sales return order, inbound transfer order, or production order with output that is ready to be put away.

NOTE

Even though the settings are called **Require Pick** and **Require Put-away**, you can still post receipts and shipments directly from the source business documents at locations where you select these check boxes.

This walkthrough demonstrates the following tasks.

- Setting up SILVER location for inventory put aways.
- Setting up SILVER location for bin handling.
- Defining a default bin for item LS-81. (LS-75 is already set up in CRONUS.)
- Creating a purchase order for vendor 10000 for 40 loudspeakers.
- Verifying that the put-away bins are preset by setup.
- Releasing the purchase order for warehouse handling.
- Creating an inventory put-away based on a released source document.
- Verifying that the put-away bins are inherited from the purchase order.
- Registering the warehouse movement into the warehouse and at the same time posting the purchase receipt for the source purchase order.

Roles

This walkthrough demonstrates tasks that are performed by the following user roles:

- Warehouse Manager
- Purchasing Agent
- Warehouse Worker

Prerequisites

To complete this walkthrough, you will need:

- CRONUS International Ltd. installed.
- To make yourself a warehouse employee at SILVER location by following these steps:
 1. Choose the  icon, enter **Warehouse Employees**, and then choose the related link.
 2. Choose the **User ID** field, and select your own user account on the **Users** page.
 3. In the **Location Code** field, enter SILVER.
 4. Select the **Default** field.

Story

Ellen, the warehouse manager at CRONUS International Ltd., creates a purchase order for 10 units of item LS-75 and 30 units of item LS-81 from vendor 10000 to be delivered to SILVER Warehouse. When the delivery arrives at the warehouse, John, the warehouse worker, puts the items away in default bins defined for the items. When John posts the put-away, the items are posted as received into inventory and available for sale or other demand.

Setting up the Location

The setup of the **Location Card** page defines the company's warehouse flows.

To set up the location

1. Choose the  icon, enter **Locations**, and then choose the related link.
2. Open the SILVER location card.

3. Select the **Require Put-away** check box.

Proceed to set up a default bin for the two item numbers to control where they are put away.

4. Choose the **Bins** action.

5. Select the first row, for bin S-01-0001, and then choose the **Contents** action.

Notice on the **Bin Content** page that item LS-75 is already set up as content in bin S-01-0001.

6. Choose the **New** action.

7. Select the **Fixed** and the **Default** fields.

8. In the **Item No.** field, enter LS-81.

Creating the Purchase Order

Purchase orders are the most common type of inbound source document.

To create the purchase order

1. Choose the  icon, enter **Purchase Orders**, and then choose the related link.
2. Choose the **New** action.
3. Create a purchase order for vendor 10000 on the work date (January 23) with the following purchase order lines.

ITEM	LOCATION CODE	BIN CODE	QUANTITY
LS_75	SILVER	S-01-0001	10
LS-81	SILVER	S-01-0001	30

NOTE

The bin code is entered automatically according to the setup that you performed in the "Setting up the Location" section.

Proceed to notify the warehouse that the purchase order is ready for warehouse handling when the delivery arrives.

4. Choose the **Release** action.

The delivery of loudspeakers from vendor 10000 has arrived at SILVER warehouse, and John proceeds to put them away.

Receiving and Putting the Items Away

On the **Inventory Put-away** page, you can manage all inbound warehouse activities for a specific source document, such as a purchase order.

To receive and put the items away

1. Choose the  icon, enter **Inventory Put-aways**, and then choose the related link.
2. Choose the **New** action.
3. Select the **Source Document** field, and then select **Purchase Order**.

4. Select the **Source No.** field, select the line for the purchase from vendor 10000, and then choose the **OK** button.

Alternatively, on the **Actions** tab, in the **Functions** group, choose **Get Source Document**, and then select the purchase order.

5. Choose the **Autofill Qty. to Handle** action.

Alternatively, in the **Qty. to Handle** field, enter 10 and 30 respectively on the two inventory put-away lines.

6. Choose the **Post** action, select the **Receive** action, and then choose the **OK** button.

The 40 loudspeakers are now registered as put away in bin S-01-0001, and a positive item ledger entry is created reflecting the posted purchase receipt.

Walkthrough: Receiving and Putting Away in Advanced Warehouse Configurations

3/31/2019 • 7 minutes to read

Note: This walkthrough must be performed on a demonstration company with the **Full Evaluation - Complete Sample Data** option, which is available in the Sandbox environment. For more information, see [Creating a Sandbox Environment](#).

In Business Central, the inbound processes for receiving and putting away can be performed in four ways using different functionalities depending on the warehouse complexity level.

METHOD	INBOUND PROCESS	BINS	RECEIPTS	PUT-AWAYS	COMPLEXITY LEVEL (SEE DESIGN DETAILS: WAREHOUSE SETUP)
A	Post receipt and put-away from the order line	X			2
B	Post receipt and put-away from an inventory put-away document			X	3
C	Post receipt and put-away from a warehouse receipt document		X		4/5/6
D	Post receipt from a warehouse receipt document and post put-away from a warehouse put-away document		X	X	4/5/6

For more information, see [Design Details: Inbound Warehouse Flow](#).

The following walkthrough demonstrates method D in the previous table.

About This Walkthrough

In advanced warehouse configurations where your location is set up to require receiving processing in addition to put-away processing, you use the **Warehouse Receipt** page to record and post the receipt of items on multiple inbound orders. When the warehouse receipt is posted, one or more warehouse put-away documents are created to instruct warehouse workers to take the received item and place them in designated places according to bin setup or in other bins. The specific placement of the items is recorded when the warehouse put-away is registered. The inbound source document can be a purchase order, sales return order, inbound transfer order, or assembly or production order with output that is ready to be put away. If the receipt is created from an inbound order, more than one inbound source document can be retrieved for the receipt. By using this method you can register many

items arriving from different inbound orders with one receipt.

This walkthrough demonstrates the following tasks.

- Setting up WHITE location for receiving and putting away.
- Creating and releasing two purchase orders for full warehouse handling.
- Creating and posting a warehouse receipt document for multiple purchase order lines from specific vendors.
- Registering a warehouse put-away for the received items.

Roles

This walkthrough demonstrates tasks that are performed by the following user roles:

- Warehouse Manager
- Purchasing Agent
- Receiving Staff
- Warehouse Worker

Prerequisites

To complete this walkthrough, you will need:

- CRONUS International Ltd. installed.
- To make yourself a warehouse employee at WHITE location by following these steps:

1. Choose the  icon, enter **Warehouse Employees**, and then choose the related link.
2. Choose the **User ID** field, and select your own user account on the **Users** page.
3. In the **Location Code** field, enter WHITE.
4. Select the **Default** field.

Story

Ellen, the warehouse manager at CRONUS International Ltd., creates two purchase orders for accessory items from vendors 10000 and 20000 to be delivered to WHITE warehouse. When the deliveries arrive at the warehouse, Sammy, who is responsible for receiving items from vendors 10000 and 20000, uses a filter to create receipt lines for purchase orders arriving from the two vendors. Sammy posts the items as received into inventory in one warehouse receipt and makes the items available for sale or other demand. John, the warehouse worker, takes the items from the receiving bin and puts them away. He puts all units away in their default bins, except 40 out of 100 received hinges that he puts away in the assembly department by splitting the put-away line. When John registers the put-away, the bin contents are updated and the items are made available for picking from the warehouse.

Reviewing the WHITE Location Setup

The setup of the **Location Card** page defines the company's warehouse flows.

To review the location setup

1. Choose the  icon, enter **Locations**, and then choose the related link.
2. Open the WHITE location card.
3. Note on the **Warehouse** FastTab that the **Directed Put-away and Pick** check box is selected.

This means that the location is set up for the highest complexity level, reflected by the fact that all warehouse handling check boxes on the FastTab are selected.

4. Note on the **Bins** FastTab that bins are specified in the **Receipt Bin Code** and the **Shipment Bin Code**

fields.

This means that when you create a warehouse receipt, this bin code is copied to the header of the warehouse receipt document by default and to the lines of the resulting warehouse put-aways.

Creating the Purchase Orders

Purchase orders are the most common type of inbound source document.

To create the purchase orders

1. Choose the  icon, enter **Purchase Orders**, and then choose the related link.
2. Choose the **New** action.
3. Create a purchase order for vendor 10000 on the work date (January 23) with the following purchase order lines.

ITEM	LOCATION CODE	QUANTITY
70200	WHITE	100 PCS
70201	WHITE	50 PCS

Proceed to notify the warehouse that the purchase order is ready for warehouse handling when the delivery arrives.

4. Choose the **Release** action.

Proceed to create the second purchase order.

5. Choose the **New** action.
6. Create a purchase order for vendor 20000 on the work date with the following purchase order lines.

ITEM	LOCATION CODE	QUANTITY
70100	WHITE	10 CAN
70101	WHITE	12 CAN

Choose the **Release** action.

The deliveries of items from vendors 10000 and 20000 have arrived at WHITE warehouse, and Sammy starts to process the purchase receipts.

Receiving the Items

On the **Warehouse Receipt** page, you can manage multiple inbound orders for source documents, such as a purchase order.

To receive the items

1. Choose the  icon, enter **Warehouse Receipts**, and then choose the related link.
2. Choose the **New** action.
3. In the **Location Code** field, enter WHITE.
4. Choose the **Use Filters to Get Src. Docs.** action.

5. In the **Code** field, enter **ACCESSORY**.
6. In the **Description** field, enter **Vendors 10000 and 20000**.
7. Choose the **Modify** action.
8. On the **Purchase** FastTab, in the **Buy-from Vendor No. Filter** field, enter **10000|20000**.
9. Choose the **Run** action. The warehouse receipt is filled with four lines representing purchase order lines for the specified vendors. The **Qty. to Receive** field is filled because you did not select the **Do not Fill Qty. to Handle** check box on the **Filters to Get Source Docs.** page.
10. Optionally, if you want to use a filter as described earlier in this section, choose the **Get Source Document** action, and then select purchase orders from the vendors in question.
11. Choose the **Post Receipt** action, and then choose the **Yes** button.

Positive item ledger entries are created reflecting the posted purchase receipts of accessories from vendors 10000 and 20000, and the items are ready to be put away in the warehouse from the receiving bin.

Putting the Items Away

On the **Warehouse Put-away** page, you can manage put-aways for a specific warehouse receipt document covering multiple source documents. Like all warehouse activity documents, each item on the warehouse put-away is represented by a Take line and a Place line. In the following procedure, the bin code on the Take lines is the default receiving bin at WHITE location, W-08-0001.

To put the items away

1. Choose the  icon, enter **Put-Aways**, and then choose the related link.
2. Select the only warehouse put-away document in the list, and then on the **Home** tab, in the **Manage** group, choose **Edit**.

The warehouse put-away document opens with a total of eight Take or Place lines for the four purchase order lines.

The warehouse worker is told that 40 hinges are needed in the assembly department, and he proceeds to split the single Place line to specify a second Place line for bin W-02-0001 in the assembly department where he places that part of the received hinges.

3. Select the second line on the **Warehouse Put-away** page, the Place line for item 70200.
4. In the **Qty. to Handle** field, change the value from 100 to 60.
5. On the **Lines** FastTab, choose **Functions**, and then choose **Split Line**. A new line is inserted for item 70200 with 40 in **Qty. to Handle** field.
6. In the **Bin Code** field, enter W-02-0001. The **Zone Code** field is automatically filled.

Proceed to register the put-away.

7. Choose the **Register Put-Away** action, and then choose the **Yes** button.

The received accessories are now put-away in the items' default bins, and 40 hinges are placed in the assembly department. The received items are now available for picking to internal demand, such as assembly orders, or to external demand, such as sales shipments.

Moving Items

3/31/2019 • 2 minutes to read

The warehouse activity of moving items within the warehouse is performed in different ways depending on how warehouse management features are configured. The complexity can rank from no warehouse features, through basic warehouse configurations for order-by order handling in one or more activities only, to advanced configurations where all warehouse activities must be performed in a directed workflow. For more information, see [Setting Up Warehouse Management](#).

While in one warehouse location, items may need to be moved between bins to support the daily warehouse activities involved in keeping items flowing through the warehouse. Some movements happen in direct relation to internal operations, such as a production order that needs components delivered or end items put away. Other movements happen as mere warehouse space optimization or as ad-hoc movements to and from operations.

Additional movement tasks are to periodically replenish picking bins or shop floor bins and to modify bin content information.

Moving items to other locations affects the item ledger entries and must therefore be done by transfer order. For more information, see [Transfer Inventory Between Locations](#).

The inventory-related tasks of counting, adjusting, and reclassifying items may involve warehouse tasks that must be performed on warehouse entries before they can be synchronized with the related item ledger entries. For more information, see [Count, Adjust, and Reclassify Inventory](#)

The following table describes a sequence of tasks, with links to the topics that describe them.

TO	SEE
Move items between bins in basic warehouse configurations at any time and without source documents.	Move Items in Basic Warehouse Configurations
Use the warehouse movement worksheet to move items in advanced warehouse configurations, both for source documents and ad hoc.	Move Items in Advanced Warehouse Configurations

Move Items Ad Hoc in Basic Warehouse Configurations

3/31/2019 • 3 minutes to read

You may occasionally need to move items between internal bins, not receiving or shipping bins, without a specific demand from a source document. You may perform these ad hoc movements, for example, to reorganize the warehouse, to bring items to an inspection area, or to move additional items to and from a production area without a system relation to the production order source document.

In basic warehouse configurations, that is locations that use the **Bin Mandatory** setup field and possibly the **Require Pick** and the **Require Put-away** setup fields, you can register ad hoc movements without source documents in the following ways:

- With the **Internal Movement** page.
- With the **Item Reclassification Journal** page.

NOTE

In advanced warehouse configurations, that is locations that use the **Directed Put-away and Pick** setup field, you use the **Movement Worksheet** page or the **Internal Whse. Pick** or the **Internal Whse. Put-away** pages to move items ad hoc between bins.

To move items as an internal movement

1. Choose the  icon, enter **Internal Movement**, and then choose the related link.
2. On the **General** FastTab, fill in the **No.** field, either by leaving the field or by choosing the **AssistEdit** button to select from the number series.
3. In the **Location Code** field, enter the location where the movement takes place.

If the location is set up as your default location as a warehouse employee, the location code is inserted automatically.
4. In the **To Bin Code** field, enter a code for the bin that you want to move the item to. For production purposes, this could be the open shop floor bin code, for example, as defined on the location card or work center.
5. In the **Due Date** field, enter the date by which the movement must be completed.
6. On the **Lines** FastTab, choose the **Item No.** field to open the **Bin Contents List** page, and then select the item to move based on its availability in bins. Alternatively, choose the **Get Bin Contents** action to fill the internal movement lines based on your filters. For more information, see the tooltip for the **Get Bin Content** action.

When you have selected the item, the **From Bin Code** field is automatically filled according to the selected bin content, but you can change it to any other bin where the item is available.

NOTE

Because the **Item No.** field and the **From Bin Code** field are connected, their values may change interdependently when you edit either field.

The **To Bin Code** field is filled with the value you entered on the header, but you can change it on the line to any other bin code that isn't blocked or dedicated to special purposes. For more information about making bins dedicated, see [Dedicated](#).

7. When you have defined which bins you want to move the item from and to, enter the quantity to move in the **Quantity** field.

NOTE

Quantity must be available in the From Bin code.

8. When you are ready to process the internal movement, choose the **Create Inventory Movement** action.

NOTE

When you have created the inventory movement, the internal movement lines are deleted.

You perform the remainder of the ad hoc movement on the **Inventory Movement** page in the same way as you would for a movement based on source documents. For more information, see for example [Move Components to an Operation Area in Basic Warehouse Configurations](#)

To move items with the item reclassification journal

In stead of using warehouse movement documents, you can record the moving of items by reclassifying their bin codes. For more information, see [Count, Adjust, and Reclassify Inventory Using Journals](#).

1. Choose the  icon, enter **Item Reclass. Journal**, and then choose the related link.
2. On each journal line, define the bins from which and to which you want to move items by filling in the **Bin Code** and the **New Bin Code** fields.
 - a. To move a bin's entire contents to another bin, choose the **Get Bin Contents** action.
 - b. Fill in the filters to find the bin whose contents you would like to move and then choose the **OK** button. The journal lines are filled with the contents of the bin.
3. Fill in the remaining fields on each journal line.
4. Post the reclassification journal.

NOTE

Unlike with movement documents, a movement posted with the reclassification journal does not create a warehouse request to perform the physical task.

Move Items in Advanced Warehouse Configurations

3/31/2019 • 2 minutes to read

In advanced warehouse configurations, that is, locations with directed put-away and pick, warehouse movements between bins are performed by a senior employee preparing warehouse movements in the movement worksheet and then creating the warehouse movements for warehouse employees to perform.

To move items with the warehouse movement worksheet

The **Movement Worksheet** page has two functions that can assist in automatically filling in the lines. The first is the **Calculate Bin Replenishment** function. This function uses the bin rankings to suggest replenishment for high-ranking bins from low-ranking bins. The second is the **Get Bin Content** function, which fills in the worksheet lines with the entire bin contents of the bin or bins you specify.

1. Choose the  icon, enter **Movement Worksheet**, and then choose the related link.
2. Enter the warehouse movement information on the worksheet lines as appropriate.
3. Choose the **Create Movement** action to create a warehouse movement document which can then be registered when the warehouse movement is completed.

To register the warehouse movement

1. Choose the  icon, enter **Movements**, and then choose the related link.
2. Open the warehouse movement that you want to process.
3. On lines of action type **Place**, specify where, which, and when to move the item in question by editing the **Zone Code**, **Bin Code**, **Qty. to Handle**, or **Due Date** fields.

If your warehouse has been set up so the bin codes follow the physical structure of the warehouse, you can take quantities of several items from successive bulk bins and then place them in forward picking bins, which also might be close to one another.

4. On lines of action type **Take**, specify in the **Qty. to Handle** field a part quantity of the bin content that you want to move. All other fields on lines of action type **Take** are read-only.
5. To move all suggested quantities as specified in the **Quantity** field, choose the **Autofill Qty. to Handle** action.
6. Choose the **Register** action.

NOTE

If the location uses directed put-away and pick, then you cannot manually move items in or out of bins of bin type RECEIVE, because items in such bins must be registered as being put away before they are part of available inventory.

To register the movement of an item that has already occurred

If your location uses directed put-away and pick, and you need to move items to other bins without a pre-existing warehouse put-away, pick, or movement, you can register the correct placement of the items in the warehouse using the **Whse. Reclassification Journal**.

1. Choose the  icon, enter **Whse. Reclassification Journal**, and then choose the related link.
2. Fill in the **Item No.**, **From Zone Code**, **From Bin Code**, **To Zone Code**, and **To Bin Code** fields.

3. Choose the **Register** action.

Move Components to an Operation Area in Basic Warehouse Configurations

3/31/2019 • 4 minutes to read

If item processing operations occur at your warehouse location, then you may have to move items between internal bins to respond to internal source documents, such as production, assembly, or service orders at the location.

NOTE

For information about moving items between bins without source documents, see [Internal Movement](#).

In advanced warehouse configurations, which are locations that use the **Directed Put-away and Pick** setup field, you can use the **Movement Worksheet** page to move items between bins. For more information, see [Move Items in Advanced warehouse Configurations](#).

In basic warehouse configurations, which are locations that use the **Bin Mandatory** setup field and the **Require Pick** setup field, you can register movement of items to internal operation areas based on internal source documents in the following ways:

- With the **Inventory Movement** page.
- With the **Inventory Pick** page.

NOTE

Inventory picks also post negative item ledger entries as consumption and are only supported for production components. For more information, see the [Inventory Pick](#) page.

For detailed information about inventory movements, see the [Inventory Movement](#) page.

Two different roles can create the initial inventory movement. An assembly worker, for example, can create it from a released assembly order so that it shows up in the warehouse worker's list of work to do. To create an inventory movement for assembly order lines that are ready to have components moved to their specified bins, the assembly worker uses the **Create Inventory Movement** function.

Alternatively, a warehouse worker can create it by pointing to the released assembly order in question. This is described in the following procedure.

NOTE

If the movement is for an assembly order where the item is assembled to a sales order, then you can define that the inventory movement document is automatically created when you create the inventory pick document that takes the finished assembly item and posts the shipment. To set this up, select the **Create Movements Automatically** field on the **Assembly Setup** page

For more information about assembly orders and basic warehouse configurations, see [Handling Assemble-to-Order Items with Inventory Picks](#).

This procedure shows how to create an inventory movement from the **Inventory Movement** page by referencing a released assembly order as a source document. The procedure is the same when you move

components for production orders and service orders.

To move components to an operation area in basic warehouse configurations

1. Choose the  icon, enter **Inventory Movement**, and choose the relevant link.
2. On the **General** FastTab, fill in the **No.** field. You can press the Enter key to select from the number series.
3. In the **Location Code** field, enter the location where the movement occurs.
4. Choose the **Get Source Documents** action. Alternatively, fill in the **Source Document** field, and then choose the **AssistEdit** button in the **Source No.** field.
5. On the **Source Documents** page, select the assembly order that you want to move components for, and then choose the **OK** button.

For each needed component that can be moved, one Take line and one Place line are generated on the **Inventory Movements** page. All fields except the **Qty. to Handle** field are prefilled according to the source document lines. The **Qty. to Handle** field is set to zero until you enter the quantity that you have actually moved.

You can change the bin code on a Take line but only according to availability. If you choose the **AssistEdit** button in the **Bin Code** field on a Take line, then the **Bin Contents** page opens and only shows bins where the component is available.

You cannot change the bin code on a Place line. Only the bin code that is defined on the component line of the source document is accepted. This supports the principle that the role who requests a component, which is an assembly worker in this procedure, knows where the component must be placed. If you want to place the components in a different bin, then you must first change the bin code on the component line and then re-create the inventory movement lines.

6. In the **Qty. to Handle** field, enter the full or partial quantity that you have actually moved. The value on the Take and the Place lines must be the same. Otherwise, you cannot register the movement.

NOTE

As in other warehouse activities, you can split the Place line by selecting the **Actions** action and then choosing the **Split Line** action. In that case, the sum of the two split Place lines must equal the quantity on the Take line.

7. When you are ready to register the movements that you have performed, choose the **Register Invt. Movement** action.

Warehouse entries are created reflecting that the components now exist in the bins specified on the assembly order lines.

NOTE

Unlike when you move components with an inventory pick, consumption is not posted when you register an inventory movement. That step must be performed separately by posting the assembly order output and consumption. For more information, see [Assembly Order](#).

Calculate Bin Replenishment

3/31/2019 • 2 minutes to read

When the location is set up to use directed put-away and pick, priorities of the put-away template for the location are taken into account when putting receipts away. Priorities include the minimum and maximum quantities of bin content that have been fixed for a particular bin, and the bin rankings. Therefore, if items are arriving at a steady pace, the most-used pick bins will be filled up as they are emptied.

But inventory does not always arrive in a steady trickle. Sometimes, items are purchased in large quantities so that the company can obtain a rebate, or your production unit might produce a lot of one item to achieve a low unit cost. Then items will not be received in the warehouse again for some time, and the warehouse needs to periodically move items to pick bins from bulk storage areas.

It could also be that the warehouse is expecting new stock to arrive soon and wants to empty the bulk storage area of items before the new merchandise arrives.

Finally, if you have defined your bulk storage bins with a bin type action **Put Away** only, that is, the bin type does not have the **Pick** action selected, you must always keep your pick bins replenished, since Put Away-type bins are not suggested for a pick of inventory.

To replenish pick bins

1. Choose the  icon, enter **Movement Worksheet**, and then choose the related link.
2. Choose the **Calculate Bin Replenishment** action to open the report request page.
3. Fill in the batch job request page to limit the scope of the replenishment suggestions that will be calculated. For example, you might be concerned with particular items, zones, or bins.
4. Choose the **OK** button. Lines are created for the replenishment movements that need to be performed according to the rules that have been set up for the bins and bin contents, that is, items in bins.
5. If you want to perform all the suggested replenishments, choose the **Create Movement** action. Employees can now find instructions in the **Movements** menu item, carry them out and register them.
6. If you only want some of the suggestions to be performed, delete the lines that are less important and then create a movement.

The next time you calculate bin replenishment, the suggestions that you have deleted will be recreated, if they are still valid at that time.

NOTE

If the following conditions are met for an item:

- The item has an expiration date, and
- The **Pick According to FEFO** field on the location card is selected, and
- You use the **Calculate Bin Replenishment** functionality

then the **From Zone** and **From Bin** fields will be blank because the algorithm to calculate from where to move the items is triggered only when you activate the **Create Movement** function.

Plan Warehouse Movements in Worksheets

3/31/2019 • 3 minutes to read

Plan movements in the worksheet using a bin replenishment function or manually planning the lines that you want to create as movement instructions.

To calculate a replenishment movement

As the warehouse ships items out to customers, the bins with the highest bin rankings contain fewer and fewer items. To fill up these high-ranking pick bins with items from other bins, run the **Calculate Bin Replenishment** function on the **Movement Worksheet** page

1. Choose the  icon, enter **Movement Worksheet**, and then choose the related link.
2. Choose the **Calculate Bin Replenishment** action.

Business Central creates lines that indicate precisely how you should move items from the low-ranking bins to the higher-ranking bins.

NOTE

A movement is suggested according to FEFO when you activate the **Create Movement** function if the following conditions are met for an item:

- The item has an expiration date.
- The **Pick According to FEFO** check box on the location card is selected.
- The **Bin Mandatory** check box on the location card is selected.
- The **From Zone** and **From Bin** fields are blank.

For more information, see [Picking by FEFO](#).

3. Look through the lines and change them if necessary, or delete some of them if there is not enough time to perform them all.
4. Choose the **Create Movement** action to make a warehouse instruction for action by warehouse employees.

To move the entire contents of one or more bins by using the Get Bin Content function

You can also use the movement worksheet to plan other movement of inventory within the warehouse. For example, when you want to place items in a bin for quality control, you can use the movement worksheet to plan this action and then create a movement to make instructions for an employee.

1. Choose the  icon, enter **Movement Worksheet**, and then choose the related link.
2. Choose the **Get Bin Content** action. Use the request page to filter which bins and items you want to appear on the movement worksheet lines.
3. Fill in the relevant fields in the batch job request page. For example, if you want to see the bin content of all the bins in a certain zone at the location, fill in the **Zone Code** field. If you want to retrieve lines for each bin that contains a particular item, fill in the **Item No.** field.

NOTE

You cannot manually move items in or out of a bin of bin type RECEIVE, because items that are in a RECEIVE-type bin must be registered as being put away before they are part of available inventory.

4. If you are retrieving many lines, choose **Sort** to select a sorting method to determine the order the lines will appear in the worksheet, and then choose the **OK** button.

NOTE

Movement lines are retrieved according to FEFO when you activate the **Get Bin Content** function if the following conditions are met for an item:

- The item has an expiration date.
- The **Pick According to FEFO** check box on the location card is selected.
- The **Bin Mandatory** check box on the location card is selected.
- The **From Zone** and **From Bin** fields are blank.

5. Complete some of the retrieved lines to reflect the changes you want to make. For each item that you want to move, you must fill in the **Item No.**, **From Bin Code**, **To Bin Code**, and **Quantity** fields.
6. Delete the incomplete lines that you used for information.
7. Once the movement worksheet lines accurately reflect how the movement action should be carried out by the warehouse employee, choose the **Create Movement** action to create the instructions for the employee.

Pick Items

3/31/2019 • 3 minutes to read

The warehouse activity of picking items before they are shipped or consumed is performed in different ways, depending on how warehouse management features are configured. The complexity can rank from no warehouse features, through basic warehouse configurations for order-by-order handling in one or more activities only, to advanced configurations where all warehouse activities must be performed in a directed workflow. For more information, see [Setting Up Warehouse Management](#).

If you decide to organize and record your picking activity with warehouse documents, you place a check mark in the **Require Pick** field on the location card. This indicates that when you have items that need to be picked for an outbound source document you want the picking of those items to be controlled by the system. An outbound source document can be a sales order, a purchase return order, an outbound transfer order, a service order, or a production order whose components should be picked.

NOTE

Even though the setting is called **Require Pick**, you can still post shipments directly from the source business document at location where you select this check box.

If your location is set up to require pick processing but not shipment processing, you use the **Inventory Pick** page to organize the picking information, print the picking information, enter the result of the pick, and post the picking information, which in turn posts the shipment of the items. In the case of picking components for a production order, the posting of the pick also posts the consumption.

If your location is set up to require both pick and shipment processing, so that you have placed check marks in both the **Require Pick** and **Require Shipment** field on the location card, you use the **Warehouse Pick** page to handle the pick. The warehouse pick functions similarly to the inventory pick, except that instead of posting the picking information, you register the pick. This registering process does not post the shipment, but merely makes the items available for shipment. As a warehouse manager, you can use a pick worksheets to organize pick information before creating the individual warehouse pick instructions.

The following table describes a sequence of tasks, with links to the topics that describe them.

TO	SEE
Post the shipment of items directly in the outbound order document because no warehouse features exist. (Works the same for sales orders, outbound transfer orders, and return shipments.)	Ship Items
Pick items order by order and post the shipment in the same activity, in a basic warehouse configuration.	Pick Items with Inventory Picks
Pick items for multiple orders in an advanced warehouse configuration.	Pick Items with Warehouse Picks
Pick components for production or assembly in a basic warehouse configuration.	Pick for Production or Assembly in Basic Warehouse Configurations

TO	SEE
Pick components for production or assembly in an advanced warehouse configuration.	Pick for Production or Assembly in Advanced Warehouse Configurations
Plan optimized pick instructions for a number of shipments rather than have warehouse workers act directly on posted shipments.	Plan Picks in Worksheets
Pick items technically for a special purpose, such as a production unit in need of extra components, in such a way that the items do not technically leave the warehouse.	Pick and Put Away Without a Source Document
Understand how to automatically pick items according to their expiration date, for example perishable goods.	Picking By FEFO
Split a pick line into multiple lines, for example because there are not enough items to take from in the designated bin.	Split Warehouse Activity Lines
Get immediate access to picks that are assigned to you as a warehouse worker.	Find Your Warehouse Assignments

[Working with Business Central](#)

Pick Items with Inventory Picks

3/31/2019 • 7 minutes to read

When your location is set up to require pick processing but not shipment processing, you use the **Inventory Pick** page to record and post picking and shipping information for your source documents. The outbound source document can be a sales order, a purchase return order, an outbound transfer order, or a production order whose components are ready to be picked.

NOTE

Components for assembly orders cannot be picked or posted with inventory picks. Instead, use the **Inventory Movement** page. For more information, see [Move Components to an Operation Area in Basic Warehousing](#).

When picking and shipping sales line quantities that are assembled to the order, you must follow certain rules when creating the inventory pick lines. For more information, see the "Handling Assemble-to-Order Items in Inventory Picks" section.

You can create an inventory pick in three ways:

- Create the pick in two steps by first requesting an inventory pick by releasing the source document. This signals to the warehouse that the source document is ready for picking. The inventory pick can then be created on the **Inventory Pick** page based on the source document.
- Create the inventory pick directly from the source document itself.
- You can create inventory picks for several source documents at the same time by using the batch job.

To request an inventory pick by releasing the source document

For sales orders, purchase return orders, and outbound transfer orders, you create the warehouse request by releasing the order. The following describes how to do this from a sales order.

1. Choose the  icon, enter **Sales Orders**, and then choose the related link.
2. Select the sales order that you want to release, and then choose the **Release** action.

For production orders, you automatically create the warehouse request for the picking of components, called *flushing*, when the production order status is changed to **Released** or when the released production order is created. For more information, see [Pick for Production or Assembly](#).

After the warehouse request has been created, a warehouse employee assigned to picking items can see that the source document is ready to be picked and can create a new pick document based on the warehouse request.

To create an inventory pick based on the source document

Now that the request is created, the warehouse employee can create a new inventory pick based on the released source document.

1. Choose the  icon, enter **Inventory Picks**, and then choose the related link.
2. Choose the **New** action.
3. In the **Source Document** field, select the type of source document you are picking for.
4. In the **Source No.** field, select the source document.
5. Alternatively, choose the **Get Source Document** action to select the document from a list of outbound

source documents that are ready for picking at the location.

6. Choose the **OK** button to fill the pick lines according to the selected source document.

To create an inventory pick from the source document

1. In the source document, which can be a sales order, purchase return order, outbound transfer order, or production order, choose the **Create Inventory Put-away/Pick** action.
2. Select the **Create Invt. Pick** check box.
3. Choose the **OK** button. A new inventory pick will be created.

To create multiple inventory picks with a batch job

1. Choose the  icon, enter **Create Invt. Put-away / Pick**, and then choose the related link.
2. On the **Warehouse Request** FastTab, use the **Source Document** and **Source No.** fields to filter on certain types of documents or ranges of document numbers. For example, you can create picks only for sales orders.
3. On the **Options** FastTab, select the **Create Invt. Pick** check box.
4. Choose the **OK** button. The specified inventory picks are created.

NOTE

If picking and shipping sales line quantities that are assembled to the order you should follow certain rules when creating the inventory pick lines. For more information, see the "Handling Assemble-to-Order Items in Inventory Picks" section.

In basic warehouse configurations, items that are assembled to sales orders are picked from the related sales order, as explained in this topic. For more information, see "Handling Assemble-to-Order Items in Inventory Picks" in Inventory Pick.

To record the inventory picks

1. Choose the  icon, enter **Inventory Pick**, and then choose the related link.
2. In the **Bin Code** field on the pick lines, the bin that the items must be picked from is suggesting per the item's default bin. You can change the bin in this page if necessary.
3. Perform the pick and enter the information for the actual quantity put away in the **Qty. to Handle** field.

If it is necessary to pick the items for one line from more than one bin, for example because they are not available in the designated bin, then use the **Split Line** function on the **Lines** FastTab. For more information about splitting lines, see [Split Warehouse Activity Lines](#).

4. When you have performed the pick, choose the **Post** action.

The posting process will post the shipment of the source document lines that have been picked, or in the case of production orders, the posting process will post the consumption. If the location uses bins, the posting will also create warehouse entries to post the bin quantity changes.

To delete inventory pick lines

If items on the inventory pick are not available, then you can delete those inventory pick lines after posting and then delete the inventory pick document. The source document, such as a sales order or a production order, will have remaining items to be picked, which can be obtained through a new inventory pick later when the items become available.

WARNING

This process is not possible if serial/lot numbers are specified on the source document. For example, if a sales order line contains a serial/lot number, then that item tracking specification will be deleted if an inventory pick line for the serial/lot number is deleted.

If inventory pick lines have serial/lot numbers that are not available, you must not delete the lines in question. Instead, you must change the **Qty. to Handle** field to zero, post the actual picks, and then delete the inventory pick document. This ensures that the inventory pick lines for those serial/lot numbers can be recreated from the sales order later.

Handling Assemble-to-Order Items with Inventory Picks

The **Inventory Pick** page is also used to pick and ship for sales where items must be assembled before they can be shipped. For more information, see [Sell Items Assembled to Order](#).

Items to be shipped are not physically present in a bin until they are assembled and posted as output to a bin in the assembly area. This means that picking assemble-to-order items for shipment follows a special flow. From a bin, warehouse workers take the assembly items to the shipping dock and then post the inventory pick. The posted inventory pick then posts the assembly output, the component consumption, and the sales shipment.

You can set up Business Central to automatically create an inventory movement when the inventory pick for the assembly item is created. To enable this, you must select the **Create Movements Automatically** field on the **Assembly Setup** page. For more information, see [Move Components to an Operation Area in Basic Warehousing](#).

Inventory pick lines for sales items are created in different ways depending on whether none, some, or all of the sales line quantities are assembled to order.

In regular sales where you use inventory picks to post shipment of inventory quantities, one inventory pick line, or several if the item is placed in different bins, is created for each sales order line. This pick line is based on the quantity in the **Qty. to Ship** field.

In assemble-to-order sales where the full quantity on the sales order line is assembled to order, one inventory pick line is created for that quantity. This means that the value in the Quantity to Assemble field is the same as the value in the **Qty. to Ship** field. The **Assemble to Order** field is selected on the line.

If an assembly output flow is set up for the location, then the value in the **Asm.-to-Order Shpt. Bin Code** field or the value in the **From-Assembly Bin Code** field, in that order, is inserted in the **Bin Code** field on the inventory pick line.

If no bin code is specified on the sales order line, and no assembly output flow is set up for the location, then the **Bin Code** field on the inventory pick line is empty. The warehouse worker must open the **Bin Contents** page and select the bin where the assembly items are assembled.

In combination scenarios, where a part of the quantity must first be assembled and another must be picked from inventory, a minimum of two inventory pick lines are created. One pick line is for the assemble-to-order quantity. The other pick line depends on which bins can fulfill the remaining quantity from inventory. Bin codes on the two lines are filled in different ways as described for the two different sales types respectively. For more information, see the "Combination Scenarios" section in [Understanding Assemble to Order and Assemble to Stock](#).

Pick Items for Warehouse Shipment

3/31/2019 • 4 minutes to read

When the location is set up to require warehouse pick processing as well as warehouse shipment processing, you use the warehouse pick documents to create and process pick information prior to posting the warehouse shipment.

You cannot create a warehouse pick document from scratch because a pick activity is always part of a workflow, either in a pull or a push scenario.

You can create warehouse pick documents in a pull fashion by opening an empty warehouse shipment document, detect source documents that are released to shipment, and then create warehouse pick lines for those shipments. You can use the **Get Source Documents** or **Use Filter to Get Source Documents** functions to detect source documents that are ready for shipment.

Alternatively, you can use the **Pick Worksheet** page to pull and create pick lines in batch mode. For more information, see [Plan Picks in Worksheets](#).

You can also create warehouse pick documents in a push fashion from the **Warehouse Shipment** page by selecting **Create Pick**.

NOTE

Picking for warehouse shipment of items that are assembled to the sales order being shipped follows the same steps as for regular warehouse picks for shipment, as described in this topic. However, the number of pick lines per quantity to ship may be many to one because you pick the components, not the assembly item.

The warehouse pick lines are created for the value in the **Remaining Quantity** field on the lines of the assembly order that is linked to the sales order line that is being shipped. This ensures that all components are picked in one action.

For more information, see the "Handling Assemble-to-Order Items in Warehouse Shipments" section.

For information about picking components for assembly orders generally, including situations where the assembly item is not due on a sales shipment, see [Pick for Production or Assembly](#).

To pick items for warehouse shipment

1. Choose the  icon, enter **Picks**, and then choose the related link.

If you need to work on a particular pick, select the pick from the list or filter the list to find the picks that have been assigned to you specifically. Open the pick card.

2. If the **Assigned User ID** field is empty, enter your ID to identify yourself if necessary.
3. Perform the actual picking of items.

If the warehouse is set up to use bins, then the items' default bins are used to suggest where to take the items from. The instructions appear as two separate lines, at least one for each action type, Take and Place.

If the warehouse is set up to use directed put-away and pick, then the bin ranking is used to calculate the best bins to pick from, and those bins are then suggested on the pick lines. The instructions appear as two separate lines, at least one for each action type, Take and Place.

4. When you have performed the pick and placed the items in the shipping area or shipping bin, choose the **Register Pick** action.

The person responsible for shipment can now bring the items to the shipment dock and post the shipment, including the related source document, on the **Warehouse Shipment** page. For more information, see [Ship Items](#).

In addition to picking for source documents, as described in this topic, you can take and place items between bins without referring to source documents. For more information, see [Pick and Put Away Without a Source Document](#).

Handling Assemble-to-Order Items in Warehouse Shipments

In assemble-to-order scenarios, the **Qty. to Ship** field on warehouse shipment lines is used to record how many units are assembled. The specified quantity is then posted as assembly output when the warehouse shipment is posted.

For other warehouse shipment lines, the value in the **Qty. to Ship** field is zero from the start.

When workers in charge of assembly finish assembling parts or all of the assemble-to-order quantity, they record it in the **Qty. to Ship** field on the warehouse shipment line and then choose the **Post Shipment** action. The result is that the corresponding assembly output is posted, including the component consumption. A sales shipment for the quantity is posted for the sales order.

From the assembly order, you can choose **Asm.-to-Order Whse. Shpt. Line** to access the warehouse shipment line. This is convenient for workers who do not typically use the **Warehouse Shipment** page.

After the warehouse shipment is posted, various fields on the sales order line are updated to show progress in the warehouse. The following fields are also updated to show how many assemble-to-order quantities remain to be assembled and shipped:

- **ATO Whse. Outstanding Qty.**
- **ATO Whse. Outstd. Qty. (Base)**

NOTE

In combination scenarios, in which a part of the quantity must first be assembled and another must be shipped from inventory, two warehouse shipment lines are created. One is for the assemble-to-order quantity, and one is for the inventory quantity.

In that case, the assemble-to-order quantity is handled as described in this topic, and the inventory quantity is handled as any other regular warehouse shipment line. For more information about combination scenarios, see [Understanding Assemble to Order and Assemble to Stock](#).

Pick for Production or Assembly in Basic Warehouse Configurations

3/31/2019 • 5 minutes to read

How you put away your pick components for production or assembly orders depends on how your warehouse is set up as a location. For more information, see [Setting Up Warehouse Management](#).

In basic warehouse configurations where the location requires pick processing but not shipment processing, you use the **Inventory Pick** page to organize and record the picking of components.

In basic warehouse configurations, you must pick for assembly orders with the **Inventory Movement** page. For more information, see [Handling Assemble-to-Order Item with Inventory Picks](#).

In advanced warehouse configurations where locations require both picks and shipments, you use the **Warehouse Pick** page to bring components to production or assembly orders. For more information, see [Pick for Production or Assembly in Advanced Warehouse Configurations](#).

NOTE

The following important differences exist between inventory picks and inventory movements:

- When you register an inventory pick for an internal operation, such as production, the consumption of the picked components is posted at the same time. When you register an inventory movement for an internal operation, you only record the physical movement of the required components to a bin in the operation area without posting the consumption.
- When you use inventory picks, the **Bin Code** field on a production order component line defines the *take* bin from where components are decreased when posting consumption. When you use inventory movements, the **Bin Code** field on production order component lines defines the *place* bin in the operation area where the warehouse worker must place the components.

A system precondition for picking, or moving, components for source documents is that an outbound warehouse request exists to notify the warehouse area of the component need. The outbound warehouse request is created whenever the production order status is changed to Released or when a released production order is created.

To pick components in basic warehouse configurations

In basic warehouse configurations where the location is set up to use picking only, you can pick components for production activities with the **Inventory Pick** page. For more information, see [Pick Items with Inventory Picks](#).

1. Choose the  icon, enter **Inventory Picks**, and then choose the related link.
2. To access the production order components, choose the **Get Source Documents** action, and then select the released production order.
3. Perform the pick, and then record the actual picking information in the **Qty. Picked** field.
4. When the lines are ready for posting, choose the **Post** action. The posting creates the necessary warehouse entries and posts the consumption of the items.

You can also create an **Inventory Pick** directly from the released production order. Choose the **Create Inventory Put-away/Pick** action, select the **Create Invt. Pick** check box, and then choose the **OK** button.

Alternatively, you can use the **Inventory Movement** page to move items between bins ad hoc, meaning without reference to a source document. For more information, see [Move Components to an Operation Area in Basic](#)

[Warehouse Configurations.](#)

Handling Assemble-to-Order Items with Inventory Picks

The **Inventory Pick** page is also used to pick and ship for sales where items must be assembled before they can be shipped. For more information, see [Sell Items Assembled to Order](#).

Items to be shipped are not physically present in a bin until they are assembled and posted as output to a bin in the assembly area. This means that picking assemble-to-order items for shipment follows a special flow. From a bin, warehouse workers take the assembly items to the shipping dock and then post the inventory pick. The posted inventory pick then posts the assembly output, the component consumption, and the sales shipment.

You can set up Business Central to automatically create an inventory movement when the inventory pick for the assembly item is created. To enable this, you must select the **Create Movements Automatically** field on the **Assembly Setup** page. For more information, see [Move Components to an Operation Area in Basic Warehousing](#).

Inventory pick lines for sales items are created in different ways depending on whether none, some, or all of the sales line quantities are assembled to order.

In regular sales where you use inventory picks to post shipment of inventory quantities, one inventory pick line, or several if the item is placed in different bins, is created for each sales order line. This pick line is based on the quantity in the **Qty. to Ship** field.

In assemble-to-order sales where the full quantity on the sales order line is assembled to order, one inventory pick line is created for that quantity. This means that the value in the Quantity to Assemble field is the same as the value in the **Qty. to Ship** field. The **Assemble to Order** field is selected on the line.

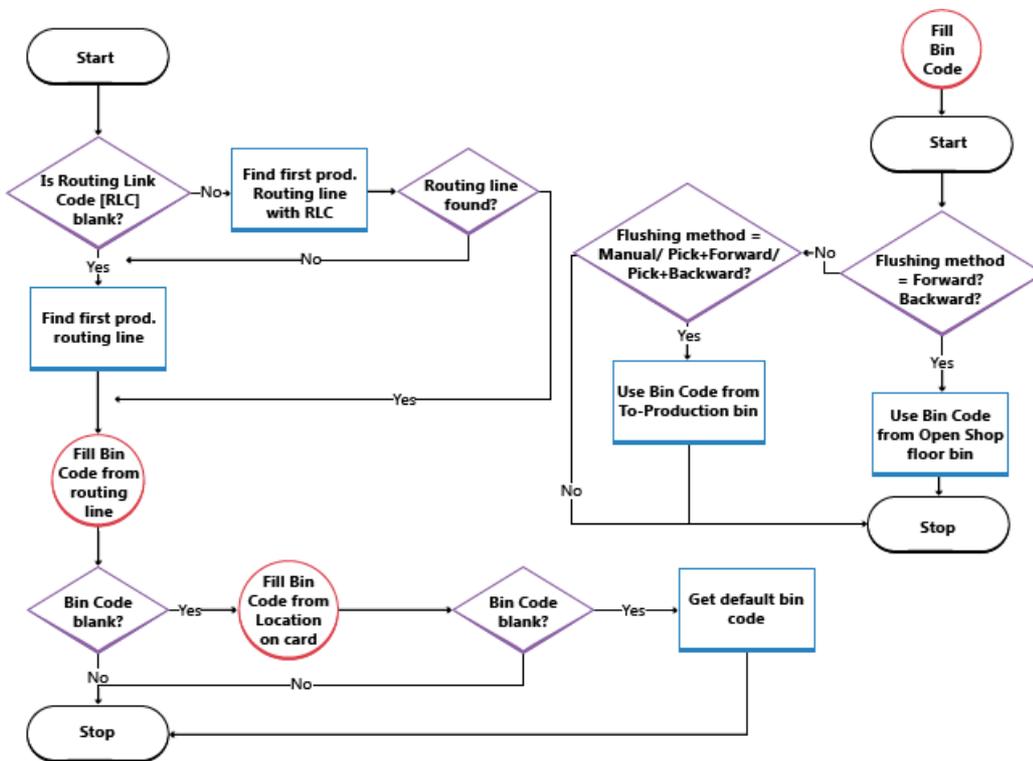

If an assembly output flow is set up for the location, then the value in the **Asm.-to-Order Shpt. Bin Code** field or the value in the **From-Assembly Bin Code** field, in that order, is inserted in the **Bin Code** field on the inventory pick line.

If no bin code is specified on the sales order line, and no assembly output flow is set up for the location, then the **Bin Code** field on the inventory pick line is empty. The warehouse worker must open the **Bin Contents** page and select the bin where the assembly items are assembled.

In combination scenarios, where a part of the quantity must first be assembled and another must be picked from inventory, a minimum of two inventory pick lines are created. One pick line is for the assemble-to-order quantity. The other pick line depends on which bins can fulfill the remaining quantity from inventory. Bin codes on the two lines are filled in different ways as described for the two different sales types respectively. For more information, see the "Combination Scenarios" section in [Understanding Assemble to Order and Assemble to Stock](#).

Filling the Consumption Bin

This flow chart shows how the **Bin Code** field on production order component lines is filled according to your location setup.

Pick for Production or Assembly in Advanced Warehouse Configurations

3/31/2019 • 2 minutes to read

In advanced warehouse configurations where the location is set up to use picking as well as shipping, you can pick components for production and assembly activities with the **Warehouse Pick** page.

Alternatively, you can use the **Movement Worksheet** page to move items between bins ad hoc, meaning without reference to a source document. For more information, see [Move Items in advanced warehouse configurations](#).

For information about picking items for internal operations in basic warehouse locations that are set up for picking only, see [Move Components to an Operation Area in Basic Warehouse Configurations](#).

You cannot create a warehouse pick document from scratch because a pick activity is always part of a workflow, either in a pull or a push scenario.

You can create the warehouse pick document in a push fashion by selecting **Create Whse. Pick** on the source document, such as a released assembly order or warehouse shipment. For more information, see [Pick Items with Warehouse Picks](#).

Alternatively, you can create the warehouse pick document in a pull fashion by using the **Pick Worksheet** page to detect pick requests, both for shipment and internal operations, and then create the required warehouse pick documents.

The following procedure explains a pull scenario where you pick components for a released production order through the **Pick Worksheet** page. The procedure also applies for an assembly order.

To create pick requests, both for pull and for push scenarios, the source documents in question must be released. Release source documents for internal operations in the following ways.

SOURCE DOCUMENT	RELEASE METHOD
Production Order	Change order type to released production order.
Assembly Order	Change status to Released.

To pick components using the pick worksheet

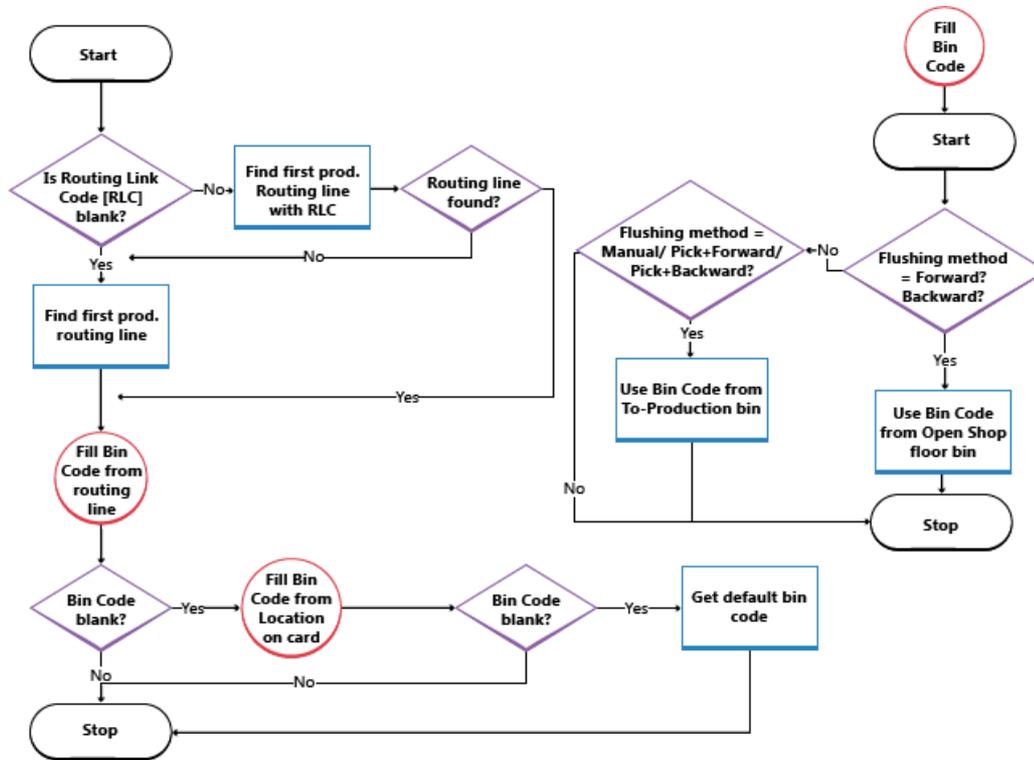

1. Choose the  icon, enter **Pick Worksheet**, and then choose the related link.
2. Choose the **Get Warehouse Documents** action, and then select the component lines from the released production order.
3. Inspect the lines, sort them to ensure an efficient picking round, and combine them with other worksheet lines if necessary to make best use of employee time.
4. Choose the **Create Pick** action.
5. Define how to create the warehouse pick documents and how to sort pick lines by filling fields on the **Create Pick** page.
6. Choose the **OK** button. Warehouse pick documents are created with pick lines for each component that is required in the internal operation.

If the internal operation area, such as a production shop floor, is set up with a default bin for placement of

components to be used in the operation, then that bin code is inserted in the Place lines on the warehouse pick document to instruct warehouse workers where to place the items. For more information, see the **To-Production Bin Code** or the **To-Assembly Bin Code** field.

Filling the Consumption Bin

This flow chart shows how the **Bin Code** field on production order component lines is filled according to your location setup.

Plan Picks in Worksheets

3/31/2019 • 3 minutes to read

If your warehouse is set up to require both pick and shipment processing, the warehouse can choose to operate so that the lines on shipment documents are not automatically transformed into pick instructions, but are made available instead to the pick worksheet.

NOTE

If warehouse pick instructions have already been created, and you would like to combine them into one efficient pick instruction, then you must delete the individual warehouse picks. The lines to be picked can now be listed in the worksheet.

In the pick worksheet, you can set up pick lists for employees that minimize the time the employee has to move about the warehouse picking items. There are fields that contain information about the quantities of items available in the cross-dock bins. This is useful in cross docking situations to plan your work assignments, because the program will always propose a pick from a cross-dock bin before any other bin, regardless of the unit of measure. The lines in the worksheet can come from a number of source documents and be sorted by item, shelf number, source document, due date, or ship-to address.

If you sort by due date, you can choose to delete from the worksheet all lines except those that need immediate attention. The less urgent lines are not deleted as such, but just sent back to the **Pick Selection** worksheet. When you create the pick, the lines have already been sorted by due date, and you can choose to assign the pick to a particular employee.

NOTE

Picking for warehouse shipment of items that are assembled to the sales order being shipped follows the same steps as for regular warehouse picks for shipment, as described in this topic. However, the number of pick lines per quantity to ship may be many to one because you pick the components, not the assembly item.

The warehouse pick lines are created for the value in the **Remaining Quantity** field on the lines of the assembly order that is linked to the sales order line that is being shipped. This ensures that all components are picked in one action.

For more information, see "Handling Assemble-to-Order Items in Warehouse Shipments" in Warehouse Shipment.

For information about picking components for assembly orders generally, including situations where the assembly item is not due on a sales shipment, see [Pick for Assembly or Production in Advanced Warehouse Configurations](#).

To plan picks in the worksheet

1. Choose the  icon, enter **Pick Worksheet**, and then choose the related link.
2. Choose the **Get Whse. Documents** action.
3. Select the shipments for which you want to prepare a pick. You can now sort the lines to some degree, but the sorting you do here will not be carried through to the pick instruction. You can also delete some of the lines to make a more effective pick. For instance, if there are a number of lines with items in cross-dock bins, you might want to create a pick for all the lines associated with these lines. The cross-docked items will be shipped, along with the other items on the shipments, and the cross-dock bins will have space for more incoming items.
4. Choose the **Create Pick** action, and fill in the **Create Pick** request page. The sorting you request here will order the pick lines you create. For example, you can create one pick for each zone and sort the lines by bin ranking within each pick.

5. Choose the  icon, enter **Picks**, and then choose the related link. The **Picks** page opens.
6. You can now find the pick assignment you just created by selecting the pick with the highest number.
7. In the pick, you can still alter, if necessary, the assigned user ID and the way the lines are sorted.
8. Choose the **Print** action to print the pick instructions.
9. After you have performed the pick, choose the **Register** action.

If the bins have been numbered in a way that mirrors the physical layout of the warehouse, the lines sorted by bin code allow the picker to pick for a number of shipments in one round of the warehouse. The worker takes the required number of items for each shipment line out of each bin and places them along with the other items for the particular shipment. A picker can save a great deal of time by picking for several shipments in one visit to a bin.

Another effective sorting option is bin ranking, if the physical layout of the warehouse is more according to bin ranking than bin code.

In the pick worksheet, you can also sort by ship-to address, enabling you to assemble and ship the orders to far-away customers first.

Pick and Put Away Without a Source Document

3/31/2019 • 2 minutes to read

After items have been put away and before they are picked to fulfill the needs of a production order or shipment, they are stored in the warehouse as part of available inventory.

Situations can arise where items must be taken out of the warehouse pick bins temporarily, perhaps to serve as demonstration models in a sales presentation. These items are still owned by the company and are part of inventory, but they are not available for picking. They are registered in a special purpose bin that you create for this purpose; technically, the items are in the warehouse, but physically, they could be in a conference or demonstration room.

In other situations, the production unit might unexpectedly need a few parts for a process. You can pick items for the production bins using the internal pick. When the process is over and output is created, you post the consumption of the items and empty the production bin, which in turn decreases the quantity of the item at your location.

Likewise, items can be returned to the warehouse to be put away. The items may have been taken out of available inventory for a production order, and then not used at all. To make them part of available inventory again, they must be put away in the bin.

The **Internal Put-aways** enables you to perform put-aways without having to refer to a particular source document. You can easily set up all the information you need to create a put-away warehouse instruction.

NOTE

If you are not using internal picks and internal put-aways, these adjustments can be performed using the methods to move items from bin to bin or to post quantity adjustments in a bin.

When the location uses directed put-away and pick, and therefore uses bin types, you cannot manually move items in or out of a bin of bin type RECEIVE, because items that are in a RECEIVE-type bin must be registered as being put away before they are part of available inventory.

To create an internal pick

1. Choose the  icon, enter **Whse. Internal Pick**, and then choose the related link.
2. Fill in the **No.** field and the **To Bin Code** field on the **General** FastTab. The **To Bin Code** field specifies the bin from which you want to get the items. For production purposes, this bin would be the inbound production bin or the open shop bin. For other purposes, choose a To Bin Code of a bin type that is not used for picking, most likely a staging, shipping or special purpose bin.
3. Select an item in the **Item No.** field, and fill in the quantities you want to pick.
4. Choose the **Create Pick** action. A warehouse pick instruction is now ready for a warehouse employee to perform.

To create an internal put-away

1. Choose the  icon, enter **Whse. Internal Put-away**, and then choose the related link.
2. Fill in the **No.** and **From Bin Code** fields on the **General** FastTab. The **From Bin Code** field specifies the bin where the items being returned to the warehouse, perhaps from production, are located.
3. Fill in the item numbers and quantities on the lines.

4. Choose the **Create Put-away** action. A warehouse put-away instruction is now ready for a warehouse employee to perform.

Enable Picking Items by FEFO

3/31/2019 • 2 minutes to read

First-Expired-First-Out (FEFO) is a sorting method that ensures that the oldest items, those with the earliest expiration dates, are picked first.

This functionality only works when the following criteria are met:

- The item must have a serial/lot number.
- On the item's item tracking code setup, the **SN-Specific Warehouse Tracking** field or the **Lot-Specific Warehouse Tracking** field must be selected.
- The item must be posted to inventory with an expiration date.
- On the location card, the **Require Pick** check box must be selected.
- On the location card, the **Pick According to FEFO** check box must be selected.
- On the location card, the **Bin Mandatory** check box must be selected.

When all the criteria are met, then serial/lot-numbered items to be picked are sorted with the oldest first in all picks and movements, except for items that use SN-specific or lot-specific tracking.

NOTE

If some serial/lot-numbered items use specific tracking, then those are respected first and under them, the remaining, non-specific, serial/lot numbers are listed according to FEFO.

If two serial/lot-numbered items have the same expiration date, then the program selects the item with the lowest serial or lot number.

When picking serial/lot-numbered items in locations set up for directed put-away and pick, only quantities on bins of type *Pick* are picked according to FEFO.

To enable movements according to FEFO, either on the **Inventory Movement** page or the **Movement Worksheet** page, you must leave the **From Bin** field empty.

If the **Strict Expiration Posting** field is selected, then only items that are not expired will be included in the pick. This applies even if you are not using Pick according to FEFO.

Split Warehouse Activity Lines

3/31/2019 • 2 minutes to read

In warehouse put-aways, movements, or picks, and in inventory put-aways and inventory picks, bins are suggested for the picking or putting away of items. The actual quantity in the bin suggested may not be sufficient, or there is not enough room in the suggested bin to put away the required quantity. In these cases, you need to split the line, so that the items for one line are either taken from or placed into more than one bin.

The following procedure applies to warehouse documents, such as warehouse put-away, movement, and pick lines, or inventory put-away, movement, and pick lines.

To split warehouse activity lines

1. Open a warehouse activity line where you are trying to handle an insufficient quantity.
2. In the **Qty. to Handle** field, enter the reduced quantity that you are able to handle.
3. On the **Lines** FastTab, choose the **Actions** action, choose the **Functions** action, and then choose the **Split Line** action. A new line appears, which is a copy of the original line, except that the **Qty. to Handle** field contains the quantity that you removed from the original line.
4. Assign an appropriate bin and, if you are using directed put-away and pick, a zone, to this new line, or continue splitting the line as necessary until you find appropriate bins for all of the quantity.

NOTE

If the location uses directed put-away and pick and you split the lines, you must be familiar with the warehouse and be able to choose a bin that matches the storage requirements of the item and that fulfills the general requirements of the warehouse document. For example, you would not split a line on a pick document and place some items in the bulk storage.

Walkthrough: Picking and Shipping in Basic Warehouse Configurations

3/31/2019 • 4 minutes to read

Note: This walkthrough must be performed on a demonstration company with the **Full Evaluation - Complete Sample Data** option, which is available in the Sandbox environment. For more information, see [Creating a Sandbox Environment](#).

In Business Central, the outbound processes for picking and shipping can be performed in four ways using different functionalities depending on the warehouse complexity level.

METHOD	INBOUND PROCESS	BINS	PICKS	SHIPMENTS	COMPLEXITY LEVEL (SEE DESIGN DETAILS: WAREHOUSE SETUP)
A	Post pick and shipment from the order line	X			2
B	Post pick and shipment from an inventory pick document		X		3
C	Post pick and shipment from a warehouse shipment document			X	4/5/6
D	Post pick from a warehouse pick document and post shipment from a warehouse shipment document		X	X	4/5/6

For more information, see [Design Details: Outbound Warehouse Flow](#).

The following walkthrough demonstrates method B in the previous table.

About This Walkthrough

In basic warehouse configurations where your location is set up to require pick processing but not ship processing, you use the **Inventory Pick** page to record and post pick and ship information for your outbound source documents. The outbound source document can be a sales order, purchase return order, outbound transfer order, or a production order with component need.

This walkthrough demonstrates the following tasks:

- Setting up SILVER location for inventory picks.

- Creating a sales order for customer 10000 for 30 loudspeakers.
- Releasing the sales order for warehouse handling.
- Creating an inventory pick based on a released source document.
- Registering the warehouse movement from the warehouse and at the same time posting the sales shipment for the source sales order.

Roles

This walkthrough demonstrates tasks that are performed by the following user roles:

- Warehouse Manager
- Order Processor
- Warehouse Worker

Prerequisites

To complete this walkthrough, you will need:

- CRONUS International Ltd. installed.
- To make yourself a warehouse employee at SILVER location by following these steps:
 1. Choose the  icon, enter **Warehouse Employees**, and then choose the related link.
 2. Choose the **User ID** field, and select your own user account on the **Users** page.
 3. In the **Location Code** field, enter SILVER.
 4. Select the **Default** field.
- Make item LS-81 available at SILVER location by following these steps:
 1. Choose the  icon, enter **Item Journals**, and then choose the related link.
 2. Open the default journal, and then create two item journal lines with the following information about the work date (January 23).

ENTRY TYPE	ITEM NUMBER	LOCATION CODE	BIN CODE	QUANTITY
Positive Adjmt.	LS-81	SILVER	S-01-0001 Note: The item's default bin in CRONUS	20
Positive Adjmt.	LS-81	SILVER	S-01-0002	20

3. Choose the **Post** action, and then select the **Yes** button.

Story

Ellen, the warehouse manager at CRONUS, sets up SILVER warehouse for basic pick handling where warehouse workers process outbound orders individually. Susan, the order processor, creates a sales order for 30 units of item LS-81 to be shipped to customer 10000 from the SILVER Warehouse. John, the warehouse worker must make sure that the shipment is prepared and delivered to the customer. John manages all involved tasks on the **Inventory Pick** page, which automatically points to the bins where LS-81 is stored.

Setting Up the Location

The setup of the **Location Card** page defines the company's warehouse flows.

To set up the location

1. Choose the  icon, enter **Locations**, and then choose the related link.
2. Open the SILVER location card.
3. Select the **Require Pick** check box.

Creating the Sales Order

Sales orders are the most common type of outbound source document.

To create the sales order

1. Choose the  icon, enter **Sales Orders**, and then choose the related link.
2. Choose the **New** action.
3. Create a sales order for customer 10000 on the work date (January 23) with the following sales order line.

ITEM	LOCATION CODE	QUANTITY
LS_81	SILVER	30

Proceed to notify the warehouse that the sales order is ready for warehouse handling.

4. Choose the **Release** action.

John proceeds to pick and ship the sold items.

Picking and Shipping Items

On the **Inventory Pick** page, you can manage all outbound warehouse activities for a specific source document, such as a sales order.

To pick and ship items

1. Choose the  icon, enter **Inventory Picks**, and then choose the related link.
2. Choose the **New** action.
3. Select the **Source Document** field, and then select **Sales Order**.
4. Select the **Source No.** field, select the line for the sale to customer 10000, and then choose the **OK** button.

Alternatively, choose the **Get Source Document** action, and then select the sales order.

5. Choose the **Autofill Qty. to Handle** action.

Alternatively, in the **Qty. to Handle** field, enter 10 and 30 respectively on the two inventory pick lines.

6. Choose the **Post** action, select **Ship**, and then choose the **OK** button.

The 30 loudspeakers are now registered as picked from bins S-01-0001 and S-01-0002, and a negative item ledger entry is created reflecting the posted sales shipment.

Ship Items

3/31/2019 • 5 minutes to read

When you ship items from a warehouse that is not set up for warehouse shipment processing, you simply record the shipment on the related business document, such as a sales order, service order, purchase return order, or outbound transfer order.

When you ship items from a warehouse that is set up for warehouse shipment processing, you can ship items only on the basis of source documents that other company units have released to the warehouse for action.

NOTE

If your warehouse uses cross-docking and bins, for each line, you can view the quantity of items that have been placed in the cross-dock bins. The program calculates these quantities automatically whenever the fields on the shipment are updated. If they are the items that apply to the shipment you are preparing, you can create a pick for all the lines and then complete the shipment. For more information, see [Cross-Dock Items](#).

To ship items with a sales order

The following describes how to receive items with a purchase order. The steps are similar for purchase return orders, service orders, and outbound transfer orders.

1. Choose the  icon, enter **Sales Orders**, and then choose the related link.
2. Open an existing sales order, or create a new one. For more information, see [Sell Products](#).
3. In the **Qty. to Ship** field, enter the received quantity.

The value in the **Qty. Shipped** field is updated. If this is a partial shipment, then the value is lower than the value in the **Quantity** field.

4. Choose the **Post** action.

To ship items with a warehouse shipment

First you create a shipment document from a business source document. Then you pick the specified items for the shipment.

To create a warehouse shipment

Typically, employee responsible for shipping creates a warehouse shipment.

1. Choose the  icon, enter **Warehouse Shipments**, and then choose the related link.
2. Choose the **New** action.

Fill in the fields on **General** FastTab. When you retrieve source document lines, some of the information is copied to each line.

For warehouse configuration with directed put-away and pick, if the location has a default zone and bin for shipments, the **Zone Code** and **Bin Code** fields are filled in automatically, but you can change them as appropriate.

NOTE

If you wish to ship items with warehouse class codes other than the class code of the bin in the **Bin Code** field on the document header, you must delete the contents of the **Bin Code** field on the header before you retrieve source document lines for the items.

3. Choose the **Get Source Documents** action. The **Source Documents** page opens.

From a new or an open warehouse shipment, you can use the **Filters to Get Source Docs.** page to retrieve the released source document lines that define which items to ship.

- a. Choose the **Use Filters to Get Src. Docs.** action.
- b. To set up a new filter, enter a descriptive code in the **Code** field, and then choose the **Modify** action.
- c. Define the type of source document lines that you want to retrieve by filling in the relevant filter fields.
- d. Choose the **Run** action.

All released source document lines that fulfill the filter criteria are now inserted in **Warehouse Shipment** page from which you activated the filter function.

The filter combinations that you define are saved on the **Filters to Get Source Docs.** page until the next time you need it. You can make an unlimited number of filter combinations. You can change the criteria at any time by choosing the **Modify** action.

4. Select the source documents for which you want to ship items, and then choose the **OK** button.

The lines of the source documents appear on the **Warehouse Shipment** page. The **Qty. to Ship** field is filled with the quantity outstanding for each line, but you can change the quantity as necessary. If you deleted the contents of the **Bin Code** field on the **General** FastTab before getting the lines, you must fill in an appropriate bin code on each shipment line.

NOTE

You cannot ship more items than the number in the **Qty. Outstanding** field on the source document line. To ship more items, retrieve another source document that contains a line for the item by using the filter function to get source documents with the item.

When you have the lines you want to ship, you can start the process that sends the lines to warehouse employees to pick.

To pick and ship

Typically, a warehouse worker responsible for picking creates a pick document, or opens an already created pick document.

1. Choose the  icon, enter **Warehouse Shipments**, and then choose the related link.
2. Select the warehouse shipment that you want to pick for, and then choose the **Create Pick** action.
3. Fill in the fields in the request page, and then choose the **OK** button. The specified warehouse pick document is created.

Alternatively, open an existing warehouse pick.

4. Choose the  icon, enter **Picks**, and then choose the related link. Select the warehouse pick that you want to work on.

If the warehouse is set up to use bins, then the pick lines have been converted to Take and Place action lines.

You can sort the lines, assign an employee to the pick, set a break-bulk filter, if you are using directed put-away and pick, and print the pick instructions.

5. Perform the actual picking of items and place them in the specified shipping bin, or in the shipping area, if you do not have bins.
6. Choose the **Register Pick** action.

The **Qty. to Ship** field and the **Document Status** field on the header of the shipment document are updated. The items you have picked are no longer available for picking for other shipments or for internal operations.

7. Print your shipping documents, prepare the shipment packages, and then post the shipment.

For more information about picking for warehouse shipments, see [Pick Items for Warehouse Shipment](#).

You can also use the pick worksheet to make several pick instructions into one instruction (for several shipments) and thereby improve the efficiency of picking in the warehouse. For more information, see [Plan Pick in Worksheets](#).

NOTE

If you are waiting for particular items to arrive at the warehouse, and you use cross-dock functionality, then Business Central calculates on each shipment or pick worksheet line the quantity of the item that is in the cross-dock bin. It updates this field each time you leave and open the shipment document or worksheet. For more information, see [Cross-Dock Items](#).

Find Your Warehouse Assignments

3/31/2019 • 2 minutes to read

To find your warehouse assignments, open the card page for a selected item. If warehouse instructions have been created, Take and Place lines are visible, and you can begin working on an assignment. In some warehouses, the manager may have assigned specific instructions to each employee. For more information, see [Set Up Warehouse Employees](#).

To find an instruction assigned to you

1. Choose the  icon, enter **Warehouse Put-aways**, **Warehouse Picks**, or **Warehouse Movement**, and then choose the related link.

All three pages show assignments for all warehouse locations.

2. Sort the items by location. You can now see the instructions that have been assigned to you.
3. Select one of the lines with your initials in the **Assigned User ID** field and then choose the **OK** button. The put-away assignment then appears on the page, with your initials in the **Assigned User ID** field on the **General** FastTab.

You can use the **Assigned User ID** field on the header to claim work assignments, if the warehouse manager does not assign particular instructions to individuals. Simply enter your user ID in the header of the warehouse before you begin work on an instruction. Your co-workers can then choose to work on other instructions, and the warehouse will avoid a duplication of effort.

Use Automated Data Capture Systems (ADCS)

3/31/2019 • 5 minutes to read

NOTE

In the standard version of Business Central, ADCS only works in on-premise deployments. However, a Microsoft partner can make it work in online deployments by using PowerApps or similar.

You can use your automatic data capture system (ADCS) to register the movement of items in the warehouse and to register some journal activities, such as quantity adjustments in the warehouse item journal and physical inventories.

To use ADCS, you must give each item stored in the warehouse an item identifier. You must also set up miniforms, handheld functions, data exchanges, and specify settings for fields that control ADCS. You specify whether to use ADCS on the location card of a warehouse.

Based on the needs of your warehouse, you define the amount of information displayed in the miniform setup for the particular handheld device. The following are examples of information that you can display:

- Data from tables within Business Central, such as a list of pick documents from which the user can select.
- Text information.
- Messages to show confirmations or errors about activities performed and registered by the handheld device user.

For more information, see [Configuring an Automated Data Capture System](#) in the developer and IT-pro help.

To set up a warehouse to use ADCS

To use ADCS, you must specify which warehouse locations use the technology.

NOTE

We recommend that you do not set up a warehouse to use ADCS if the warehouse also has a bin capacity policy.

1. Choose the  icon, enter **Locations**, and choose the related link.
2. Select a warehouse from the list for which you want to enable ADCS, and then choose the **Edit** action.
3. On the **Location Card** page, select the **Use ADCS** check box.

To specify an item to use ADCS

Each warehouse item that you want to use with ADCS must be assigned an identifier code to link it with its item number. For example, you can use the item's bar code as the identifier code. An item can also have multiple identifier codes. You may find this useful in the case where an item is available in various units of measures, such as pieces and pallets. In this case, assign an identifier code to each.

1. Choose the  icon, enter **Items**, and then choose the related link.
2. Select an item from the list that is part of your ADCS solution, and then choose the **Edit** action.
3. On the **Item Card** page, choose the **Identifiers** action.

4. On the **Item Identifiers** page, choose the **New** action.
5. In the **Code** field, specify the identifier for the item. For example, the identifier could be the item's bar code number.

You can also enter a **Variant Code** and a **Unit of Measure** code.
6. If needed, enter multiple codes for each item.
7. Choose the **OK** button.
8. To review the information, choose the **Identifier Code** field to open the **Item Identifiers** page.

To add an ADCS user

You can add any user as a user of an Automated Data Capture System (ADCS). When you do this, the user must also provide a password. Optionally, you can also provide a connection that identifies the ADCS user as a warehouse employee. The ADCS user password can be different from the Windows logon password of the user. For more information, see [Managing Users and Permissions](#).

1. Choose the  icon, enter **ADCS Users**, and then choose the related link.
2. Choose the **New** action.
3. In the **Name** field, enter a name for the user. The name cannot contain more than 20 characters, including spaces.
4. In the **Password** field, enter a password. The password is masked.

To specify that a warehouse employee is an ADCS user

1. Choose the  icon, enter **Warehouse Employees**, and then choose the related link.
2. If needed, add a new warehouse employee. For more information, see [Set Up Warehouse Employees](#).
3. Choose the **Edit List** action.
4. Select a warehouse employee from the list. In the **ADCS User** field, choose the drop-down arrow, and then select the name of an ADCS user from the list.

NOTE

The default warehouse for the employee must be one that uses ADCS.

To create and customize miniforms

You use miniforms to describe the information that you want to present on a handheld device. For example, you can create miniforms to support the warehouse activity of picking items. After you create a miniform, you can add functions to it for the common actions that a user takes with handheld devices, such as moving up or down a line.

To implement or change the functionality of a miniform function, you must create a new codeunit or modify an existing one to perform the required action or response. You can learn more about ADCS functionality by examining codeunits such as 7705, which is the handling codeunit for logon functionality. Codeunit 7705 shows how a Card-type miniform works.

To create a miniform for ADCS

1. Choose the  icon, enter **Miniforms**, and then choose the related link.
2. Choose the **New** action.
3. In the **Code** field, enter a code for the miniform. Optionally, enter values in all other fields.

Select the **Start Miniform** check box to indicate that the miniform is the first form that the user sees at

logon.

4. On the **Lines** FastTab, define the fields that appear on the miniform. The order in which you enter lines is the order in which the lines appear on the handheld device.

When you have created a miniform, the next steps are to create functions and to associate functionality for various keyboard inputs.

To add support for a function key

1. Add code similar to the following example to the .xsl file for the plug-in. This creates a function for the **F6** key. The key sequence information can be obtained from the device manufacturer.

```
<xsl:template match="Function[.='F6']">
  <Function Key1="27" Key2="91" Key3="49" Key4="55" Key5="126" Key6="0"><xsl:value-of select="."/>
</Function>
</xsl:template>
```

2. In the Business Central development environment, open table 7702 and add a code representing the new key. In this example, create a key that is named **F6**.
3. Add C/AL code to the relevant function of the miniform-specific codeunit to handle the function key.

To customize miniform functions

1. Choose the  icon, enter **Miniforms**, and then choose the related link.
2. Select a miniform from the list, and then choose the **Edit** action.
3. Choose the **Functions** action.
4. In the **Function Code** drop-down list, select a code to represent the function that you want to associate with the miniform. For example, you can select **ESC**, which associates functionality with the press of the **ESC** key.

In the Business Central development environment, edit the code for the **Handling Codeunit** field to create or modify code to perform the required action or response.

For more information, see [Configuring an Automated Data Capture System](#) in the developer and IT-pro help.

Service Management

3/31/2019 • 2 minutes to read

NOTE

Functionality described in this topic and sub topics is only visible in the user interface if you have the **Premium** experience. For more information, see [Changing Which Features are Displayed](#).

Providing ongoing service to customers is an important part of any business and one that can be a source of customer satisfaction and loyalty, in addition to revenue. However, managing and tracking service is not always easy, and Business Central provides a set of tools to help. These tools are designed to support repair shop and field service operations, and can be used in business scenarios such as complex customer service distribution systems, industrial service environments with bills of materials, and high volume dispatching of service technicians with requirements for spare parts management.

With these tools you can accomplish the following:

- Schedule service calls and set up service orders.
- Track repair parts and supplies.
- Assign service personnel based on skill and availability.
- Provide service estimates and service invoices.

In addition, you can standardize coding, set up contracts, implement a discounting policy, and create route maps for service employees.

In general, there are two aspects to service management: configuring and setting up your system, and using it for pricing, contracts, orders, service personnel dispatch, and job scheduler.

The following table describes a sequence of tasks, with links to the topics that describe them.

TO	SEE
Set up Service Management, including fault codes, policies, default documents and templates.	Setting Up Service Management
Manage service pricing, create service items, and understand how to monitor progress.	Planning Service

Planning Services

3/31/2019 • 2 minutes to read

With Business Central, you can set up the standard tasks that you need to fulfill your customer service requirements. To do this, you must determine what service items and offerings your service organization supports, and at what price.

Business Central also provides some statistics tools that you can use to determine how well things are going, and identify areas where you can improve.

The following table describes a sequence of tasks, with links to the topics that describe them.

TO	SEE
Establish pricing for the services you provide.	Managing Service Pricing
Set up and customize service items and service groups. This includes establishing which skills a service requires and troubleshooting guidance.	Create Service Items
Know how to manage the status of repairs on service orders, and how to identify their priority.	Understanding Service Order and Repair Status
Understand the relationship between the status of a repair, and the effect they have on allocated resources, and vice versa.	Understanding Allocation Status and Repair Status
Use statistics to analyze your service processes.	Viewing Service Statistics

Service Price Management

3/31/2019 • 5 minutes to read

The service price management functionality lets you apply the best price to service orders, set up personalized service price agreements for customers, improve service employees' efficiency, and accelerate the invoicing process.

Service price management lets you set up different service price groups so you can consider the service item or service item group, in addition to the type of fault that the service task involves. You can set up these groups for a limited period of time, or for a specific customer or currency. You can use price calculation structures as templates to assign a specific price to a specific service task.

For example, this makes it possible to assign specific items included in the service price, in addition to the type of work included. This also makes it possible to use different VAT and discount amounts for different service price groups. To make sure that the correct prices are applied, you can assign fixed, minimum, or maximum prices, depending on the agreements that you have with your customers.

Before adjusting the price of a service item on a service order, you are provided with an overview of what the results of the price adjustment will be. You can approve of these results, or you can make additional changes, if you want to have a different result. The whole adjustment is performed line by line, which means that there are no additional lines created.

Finally, service price group statistics and standard reports let you keep track of the profitability of each service price group.

Service Price Adjustment Groups

You use service price adjustment groups to set up the different types of price adjustments. For example, you can set up a service price adjustment group that adjusts prices for spare parts, one that adjust prices for labor, one that adjusts prices for costs, and so on. You can also specify whether the service price adjustment should be applied to just one specific item or resource, or to all items or resources.

Each service price adjustment group holds the information about the adjustments that you want to make on the service lines.

The service price adjustment function does not apply to service items that belong to service contracts. You can only adjust the service prices of items that are part of a service order. You cannot adjust the price of a service item if it has a warranty. You cannot adjust the price of a service item on a service order if the service line linked to it has been posted as invoice, either fully or in part.

When you run the service price adjustment function, all of the discounts in the order will be replaced by the values of the service price adjustment.

Service Price Groups

You can set up service price groups to create groups of service items that receive the same special service pricing. When you have set up service price groups, you can then assign them to service items on service item lines. You can also assign service price groups to service item groups.

Before you can assign a service price group to a service item, you have to determine to which fault area, currency, or service price adjustment group the service price group applies. You have to determine to which amount the service price should be adjusted, and whether this amount should include VAT and discounts. You also have to

determine whether this adjustment concerns a fixed amount, or should only be applied under certain conditions.

When you assign a service price group to a service item, all the special service pricing that you set up in this group will then apply for this service item.

Service Pricing

You set up the actual types of service pricing (price adjustment type and price) for a combination of service price groups and customer price groups. For each type of service pricing, you select a service price adjustment group. You also specify the service price adjustment type, fixed, maximum, or minimum, and the actual price.

For example, you can set up types of service pricing for a radio service price group. For customers without a price group, you can decide to have service pricing with maximum price on labor, which is the labor price adjustment group. For customers with a particular price group, you can decide to have service pricing with a fixed price on labor, the same labor price adjustment group.

Service Price Adjustment

Service price adjustment lets you adjust the price of an item, resource, general ledger account, or cost on a service order.

After you have entered an item on the service item line, you then enter all information about the costs of this item on the service lines. When you run the Adjust Service Price function, you can preview the price adjustments. You can make modifications if you have to. When you acknowledge the modifications, the adjustments are calculated, and are then transferred to the service lines. You then post the service order.

Depending on the type of service price adjustment, the total amount of the adjustments is calculated.

The following table describes the calculations.

OPTION	DESCRIPTION
Fixed Price	This means that you charge a fixed price for the service item, resource, general ledger account, or cost, regardless of the real costs or regular charges. Selecting this option means that the service price adjustment will reach the exact amount specified in the service price group.
Maximum	This means that you put an upper limit on the charge to your customer, regardless of the real costs or regular charges. Selecting this option means that the service price adjustment will only be performed if the total price exceeds the amount specified in the service price group.
Minimum	This means that you put a lower limit on the charge to your customer, regardless of the real costs or regular charges. Selecting this option means that the service price adjustment will only be performed if the total amount is less than the amount specified on the service price group.

Service Order Status and Repair Status

3/31/2019 • 3 minutes to read

The **Status** field on the **Service Order** page and the service item repair status, which is represented by the **Repair Status Code** field on the **Service Order** page have a certain relationship in Service Management. The service order status reflects the repair status of all the service items in the service order.

NOTE

These two status field are not related to the **Release Status** field on the service order header, which determines how the warehouse handles service items.

Each time the repair status of a service item is changed in a service order, the status of the order is updated. To display the status that reflects the overall repair status of the individual service items, you must specify the following:

- The service order status that each repair status is linked to. For more information, see [Service Order Status](#).
- The level of priority of each service order status option. For more information, see [Priority](#).

When you convert a service quote to a service order, the repair status of each service item is changed in the order to **Initial** and the service order status is changed to **Pending**.

Specifying Service Order Status for Repair Status

Each repair status is linked to a particular service order status. The options for the service order status are as follows: **Pending**, **In Process**, **On Hold**, and **Finished**. The repair status options are as follows: **Initial**, **In Process**, **Referred**, **Partly Serviced**, **Quote Finished**, **Waiting for Customer**, **Spare Part Ordered**, **Spare Part Received**, and **Finished**.

Pending

The service order status **Pending** indicates that the service can start or continue at any time. Therefore, the repair status options of **Initial**, **Referred**, **Partly Serviced**, and **Spare Part Received** can be linked to this service order status.

In Process

The service order status **In Process** indicates that the service is in process. Therefore, the repair status options **In Process** and **Spare Part Ordered** can both be linked to this service order status. If you link the **Spare Part Ordered** status to an **In Process** service order status, you must also link the **Spare Part Received** status to this service order status.

On Hold

The service order status **On Hold** indicates that the service is temporarily on hold because you are waiting for a customer response or spare parts before the service can start. Therefore, the repair status options of **Quote Finished**, **Spare Part Ordered**, and **Waiting for Customer** can be linked to this service order status.

Finished

The service order status **Finished** indicates that the service has been completed. Therefore, the **Finished** repair status is linked to this status.

Assigning Priority to Service Order Status

When a repair status of a service item is changed, the service order status options linked to the different repair status options of all the service items in the order are identified. If the service items are linked to two or more service order status options, the service order status option with the highest priority is selected.

You must decide which service order status contains the most important information about the status of the service order and assign that status the highest priority, and so on.

Example

A typical priority level assignment could be as follows:

- In Process - High
- Pending - Medium high
- On Hold - Medium low
- Finished - Low

For example, if one service item has the repair status **Initial**, linked to the service order status **Pending**, another has the repair status **In Process**, linked to the service order status **In Process**, and a third has the repair status **Spare Part Ordered**, linked to the service order status **On Hold**, the resulting service order status will be **In Process** because this has the highest priority.

Allocation Status and Repair Status of Service Items

3/31/2019 • 3 minutes to read

The repair status of service items and the allocation status of the allocation entries for the service items have a certain relationship in Service Management. The allocation status changes when you change the repair status of the service item to **Finished** or **Partly Serviced** and when you convert a service quote to a service order. The repair status of the service item changes when you cancel the service item allocation or reallocate the service item to another resource. You can view the repair status of service items on the **Service Tasks** page and you can update the repair status in the **Repair Status Code** field on the **Service Item Worksheet** page. You can view the allocation status in the **Status** field on the **Resource Allocations** page.

Changing Repair Status

When you change the repair status of a service item on a service item line, there is a search for a corresponding allocation entry for this service item that has the status **Active**. If such an allocation entry is found, the status is updated in one of the following ways:

- If you change the repair status to **Finished**, the allocation status is changed from **Active** to **Finished**.
- If you change the repair status to **Partly Serviced**, that is, some of the service has been completed, or **Referred**, that is, no service has been done, the allocation status is changed from **Active** to **Reallocation Needed**.
- When a service order allocation entry is created that indicates that no resource has been allocated, the **Status** field on the **Resource Allocation** page is set to **Nonactive**.
- The allocation entry status is set to **Canceled** when you reallocate the referred service item in the service order allocation entry, which indicates that the allocated resource or resource group has not attempted the service task.

The allocation status reflects when the service process is finished, or when another resource is necessary in order to finish the service of the service item.

Converting Service Quotes to Service Orders

When you convert a service quote to a service order, the service order, the service items in the order and their allocation entries are updated in the following ways:

- The repair status of the service items is changed to **Initial**.
- The service order status is changed to **Pending**.
- There is a search for allocation entries for all the service items in the service order that have the status **Active**. If such allocation entries are found, their allocation status is changed from **Active** to **Reallocation Needed**.

Canceling Allocations

When you cancel an allocation for a service item, Business Central updates the allocation status of the corresponding allocation entry from **Active** to **Reallocation Needed**.

The repair status of the service item in the allocation entry is updated in the following ways:

- If the repair status is **Initial**, the repair status is changed to **Referred** (no service has been started).
- If the repair status is **In Process**, the repair status is changed to **Partly Serviced** (some service has been completed).

Reallocating an Active Allocation Entry

When you reallocate a service item in an allocation entry that is **Active**, the allocation entry is updated in the following ways:

- If service was started when the allocation was **Active** (that is, if the repair status of the service item in the entry was changed to **In Process**), the allocation status is changed from **Active** to **Finished**.
- If service was not started when the allocation was **Active**, the allocation status is changed from **Active** to **Canceled**.

The repair status of the service item in the allocation entry is updated in the same way as if you had canceled the allocation:

- If the repair status is **Initial**, the repair status is changed to **Referred** (no service has been started).
- If the repair status is **In Process**, the repair status is changed to **Partly Serviced** (some service has been completed).

A new allocation entry that contains the new resource is created that has the status **Active**.

Reallocating a Service Item

When you reallocate a service item in an allocation entry that has the status **Reallocation Needed**, the allocation entry is updated in the following ways:

- If service was started when the allocation was **Active** (that is, if the repair status of the service item in the entry was changed to **In Process**), the allocation status is changed from **Reallocation Needed** to **Finished**.
- If service was not started when the allocation was **Active**, the allocation status is changed from **Reallocation Needed** to **Canceled**.

A new allocation entry that contains the new resource is created that has the status **Active**.

Viewing Service Statistics

3/31/2019 • 5 minutes to read

You can use statistics to analyze service documents and determine how well you are managing your service processes. You can analyze service contracts, items, quotes, orders, invoices, and credit memos by choosing the **Statistics** action. For service items and contracts, you can also use the **Service Item Trendscape** or **Contract Trendscape** to view a summary of service ledger entries for a specific service item.

Viewing Statistics for Service Orders

The service order statistics feature gives you a quick overview of the contents of the entire service order, the details on the specific service lines, and information related to invoicing, shipping and consuming, and the customer's balance.

The statistical data is displayed for a service order on the **Service Order Statistics** page for the relevant order. You can open the relevant statistics page from a service order. On the **Service Orders** page, choose **Statistics**. The FastTabs in this page show information such as quantity, amount, VAT, cost, profit, and customer credit limit. The amounts on the page are in the currency of the service order, unless otherwise indicated.

View totals for a service order

You can view the total amount on the service lines, including and excluding VAT, VAT part, cost, and profit on the service lines. The page also displays item-specific information, such as weight, volume, and the quantity of parcels.

View shipping information

You can see information about the items, resources, or costs to be shipped. To provide the information, the values specified in the **Qty. to Ship** field are used on each service line in the order.

View order details

You can view information about the items, resource hours, and costs to be invoiced and consumed. The following table describes this information.

COLUMN	DESCRIPTION
Invoicing	Displays amounts that are to be posted as invoiced from the service order.
Consuming	Displays the quantity and cost of items, or resources that will be posted as consumed.
Total	Displays the total amounts on the service order that result from adding the invoicing amounts to the consuming amounts.

Analyze service order lines

You can analyze the information by the types of service lines included in the service order. The amounts are shown separately for:

- Items
- Resources
- Costs and general ledger accounts

View customer information

See the balance on the customer's account, in addition to the maximum credit that can be ended to the customer who you created the service document for.

Viewing Service Item Statistics

On the **Service Item Statistics** page, you can see up-to-date information about a service item based the following service ledger entry types:

- Resources
- Items
- Service cost
- Service contracts
- Total

For each entry type, you can see the invoiced amount, usage (amount), cost amount, quantity, quantity invoiced and quantity consumed, profit amount and profit percentage. The profit percentage is calculated according to the following formula:

- $(\text{Invoiced Amount} - \text{Usage (Cost)}) \times 100 / \text{Invoiced Amount}$

Using Trendscape

For service items and service contracts, the **Service Item Trendscape** or **Service Contract Trendscape** pages provides a scrollable summary of service ledger entries in a period of time for a specific service item or contract. To view the trendscape, open the service item or service contract, choose the **Statistics** action, and then choose **Trendscape**.

When you scroll the list, the amounts are calculated in the local currency according to the specified time interval. All amounts are calculated from service ledger entries, which are entries that are created when you post service orders or service invoices.

You can filter the list by specifying the service items to include.

TIP

If you have set the time interval to **Day** and you want to scroll over a long period, you can do it faster by shifting to a larger interval such as **Quarter**. When you have found the desired period, you can shift back to the original interval to see the data in more detail.

Viewing Gains and Losses on Contracts

A contract gain or loss entry is generated when a contract quote is converted to a service contract, when contract lines are added or removed from a service contract, or when a contract is canceled. You can view contract gains or losses on the following pages.

PAGE	DESCRIPTION
Contract Gain/Loss (Contracts)	To view the contract gain/loss by service contract.
Contract Gain/Loss (Groups)	To view the contract gain/loss by service contract group.
Contract Gain/Loss (Customers)	To view the contract gain/loss by customer.

PAGE	DESCRIPTION
Contract Gain/Loss (Reasons)	To view the contract gain/loss by reason code.
Contract Gain/Loss (Resp.Ctr)	To view the contract gain/loss by responsibility center.

1. Choose the  icon, enter the name of the page to display, and then choose the related link.
2. Fill in the filter criteria you want to apply. For example, on the **Contract Gain/Loss (Reasons)** page, choose a value for **Reason Code Filter**.
3. Choose the **Show Matrix** action.

Viewing Statistics for Posted Service Documents

The service statistics feature lets you gain a statistical overview of the contents of posted service documents, such as a posted shipment, posted invoice, and posted credit memo.

The statistical information is displayed in the statistics page for the corresponding posted service document. You can open the relevant statistics page from posted service shipment, posted service invoice, or posted service credit memo documents. For each of these document types, in the **Home** tab, in the **Process** group, choose **Statistics**. For example, from the **Posted Service Invoices** page, on the **Home** tab, in the **Process** group, choose **Statistics**.

Posted Service Shipment Statistics

The **Service Shipment Statistics** page provides an overview of a posted service shipment. This includes information about the physical contents of the shipment, such as quantity of the shipped items, resource hours or costs, and weight and volume of the shipped items.

Posted Service Invoice Statistics

You can see a statistical summary on a posted service invoice on the **Service Invoice Statistics** page. You can view the totals of the posted service invoice. The data includes total amount on the service lines (including and excluding VAT) that has been posted as invoiced, VAT part, cost, and profit on the posted invoice. The page also displays information about the following:

- The items on the service invoice lines, such as weight, volume, and the quantity of parcels.
- The balance on the customer's account, and the maximum credit that you can extend the customer.

Posted Service Credit Memo Statistics

You can use the **Service Credit Memo Statistics** page to get a statistical overview of the lines in a posted service credit memo. The overview can include:

- The total amounts on the posted credit memo, displayed as quantity, amount, VAT, cost and profit. There is also information about the items on the service lines of the posted credit memo, such as quantity, weight, and volume.
- General information about the customer, such as the customer's credit limit and balance on the account.

Fulfilling Service Contracts

3/31/2019 • 2 minutes to read

One way to set up a service management business is to have standard contractual agreements between you and your customers that describe the level of service and the service expectations. You can create contract templates that include necessary information, such as customer, start date of contract, and invoice period.

After you set up the template, you can customize the resulting contract to keep track of service hours, or other items that may vary from customer to customer. You can also set up a contract manually from a service contract quote. Finally, you can adjust your service pricing to keep track of discounts that a specific customer qualifies for, by specifying the discount amount on the **Service Contract** page.

The following table describes a sequence of tasks, with links to the topics that describe them.

TO	SEE
Handle a service item under multiple contracts.	Multiple Contracts
Create service contracts either manually, or from a service contract quote.	Create Service Contracts and Service Contract Quotes
Adjust the annual amount of a service contract or contract quote, so make sure that you invoice the right amount.	Change the Annual Amount on Service Contracts or Contract Quotes

[Create Service Contracts and Service Contract Quotes](#)

Multiple Contracts

3/31/2019 • 2 minutes to read

Depending on your service level agreements with a customer, you may have to handle a service item under more than one service contract.

By handling a service item under multiple contracts, you can do the following:

- Issue different contracts for the same service item.
- Service parts separately.
- Consider different skills that are required to service different aspects of a service item, such as mechanical components and software.
- Specify different response times and frequencies in servicing different parts of a service item.
- Address different kinds of activities to be performed on a service item when the service item requires different types of service in different time periods.
- Select and assign an appropriate contract number to a service item line when you are creating a service order.
- Handle relevant financial information about service items and service level agreements.

You can consider the following examples of using the multiple contracts functionality.

Creating Multiple Contracts per Service Item

You can manually create a service contract or contract quote for service items already registered in non-canceled contracts owned by the same customer. To do this, follow the standard procedure of creating service contracts and service contract quotes. For more information, see [Work with Service Contracts and Service Contract Quotes](#).

When you add a service item on a contract line that is registered in other service contracts or contract quotes, a warning message is displayed stating that the service item already belongs to one or more service contracts or contract quotes. If you confirm this message, all relevant service item information is copied to a newly created contract line.

Copying Documents

You can automatically create a service contract or contract quote for service items that are already registered in other service contracts or contract quotes by using the **Copy Document** action.

Creating Service Orders for Multiple Contracts

You can manually create a service order for a service item that is registered in multiple active contracts. A service contract is active when it is signed and not expired.

Work with Service Contracts and Service Contract Quotes

3/31/2019 • 13 minutes to read

You can create a service contract either manually or from a service contract quote. You can use a service contract quote as a forerunner of a service contract, in which your company makes an offer to the customer and obtains customer approval before you can convert it to a service contract. The procedures for creating either a service contract or service contract quote are similar.

To create a service contract or service contract quote

1. Choose the  icon, enter **Service Contracts** or **Service Contract Quotes**, and then choose the related link.
2. Create a new service contract or service contract quote.
3. Fill in the **No.** field. A dialog box opens, asking whether you want to fill it with the common data from a contract template. If you want to create such a service contract or service contract quote, choose the **Yes** button. The **Service Contract Template List** page opens.
4. Select the appropriate template, and then choose **OK** to use it to create the service contract or service contract quote.
5. In the **Customer No.** field, choose the customer.
6. If you do not want an annual amount difference to be distributed automatically, choose the **Allow Unbalanced Amounts** check box. The values in the **Annual Amount** and **Calcd. Annual Amount** fields are not automatically equalized. If you want the program to do automatically distribute any annual amount difference that might occur from a change in the service contract, leave the **Allow Unbalanced Amounts** check box clear.
7. Add contract lines to the service contract or service contract quote.
8. Fill in the rest of the fields as necessary.

To convert a service contract quote to service contract

When a customer has accepted a service contract quote, you convert it to a service contract. At the same time, you can create a service invoice for the starting period of the contract if the starting date of the contract is before the beginning of the next invoice period.

After you complete the following steps, a service contract is created with the status **Signed**. If a service invoice is created for the starting period of the contract, the invoiced amount is calculated in the following way, depending on whether the contract is detailed or not.

For detailed contracts, the invoiced amount is calculated as follows:

- Invoiced amount = sum of the invoiced amount for each contract line.
- Invoiced amount for each contract line = ((quote value ÷ 12) × number of months in the starting period) + ((quote value ÷ number of days in the year) × number of days left in the starting period).
- If the contract line expires before the starting period ends, the expiration date becomes the ending date of the starting period for the line.

For contracts that are not detailed, the invoiced amount is calculated as follows:

- Invoiced amount = (annual amount ÷ number of days in the year) × number of days in the starting period.
- If the contract expires before the starting period ends, the expiration date becomes the ending date of the

starting period.

1. Choose the  icon, enter **Service Contract Quotes**, and then choose the related link.
2. Open the service contract quote you want to convert to a service contract.
3. Choose the **Make Contract** action.
4. If the starting date of the contract is before the beginning of the next invoice period, you are asked if you want to create an invoice for the starting period of the contract. Choose **Yes**.

The service invoice is posted to the service account of the contract, even if the contract is prepaid.

To create contract service credit memos

You can use a contract service credit memo when a customer cancels a prepaid service contract or removes a service item from a prepaid contract. You can also use it to correct an erroneous service invoice.

1. Choose the  icon, enter **Service Credit Memos**, and then choose the related link.
2. Create a new service credit memo.
3. Fill in the **No.** field.
4. In the **Customer No.** field, enter the number of the customer in the service contract.

The **Invoicing** FastTab shows information copied from the **Customer** card. If you want to post the credit memo to a different customer than the one specified on the **General** FastTab, enter the number of that customer in the **Bill-to Customer No.** field.

NOTE

You can compare the credit memo to the original posted document on the **Posted Service Invoices** page. Choose the  icon, enter **Posted Service Invoices**, and then choose the related link.

5. Fill in the **Posting Date** and **Document Date** fields.
6. On the credit memo lines, enter information about the items that have been returned or removed, or the allowance that will be sent. You can also use the **Get Prepaid Contract Entries** batch job.

To automatically create a credit memo when contract lines are removed from a service contract, on the **Service Contract** page, on the **Invoice Details** FastTab, select the **Automatic Credit Memos** check box.

To manually create a credit memo when contract lines are removed from a service contract, on the **Service Contract** page, on the **Actions** tab, in the **Functions** group, choose **Credit Memo**.

Updating and evaluating contracts

Sometimes you have to change the terms of a contract after it has been created. In most cases, you open the relevant contract on the **Service Contract** page, and change it as necessary.

You can change the status of the contract, initially set to **Locked**, add and remove contract lines, and cancel a contract. If you want to see how your business is doing as measured by gain and loss, you can do quick business analysis using the contract trendscape feature.

To add a contract line to a service contract or contract quote

When a customer purchases a new item and wants to include it in the existing service contract or contract quote, you can register the item as a service item and then add it as a new contract line to the contract or contract quote.

1. Choose the  icon, enter **Service Contracts**, and then choose the related link.
2. Open the relevant service contract or service contract quote that you want to add a new contract line for.
3. Choose the **Open Contract** action to open the service contract or service contract quote for editing.
4. On the **Invoice Details** FastTab, select the **Allow Unbalanced Amounts** field if you want to change the annual amount and distribute the annual amount difference manually on the contract lines. Otherwise, clear the check box in the **Allow Unbalanced Amounts** field. This will distribute the annual amount difference automatically on the contract lines after you change the annual amount.
5. On the **Lines** FastTab, add a service item or item, or text description, on each contract line. Alternatively, you can add contract quote lines. Note that you can create multiple contracts per service item to have it included in different service contracts or contract quotes at the same time.
6. Verify and correct the numbers in the **Line Discount %**, **Line Discount Amount**, **Response Time**, **Service Period**, and other fields as needed.

To remove contract lines

You may need to remove contract lines from the service contract as you remove corresponding service items from the service contract. Usually you remove a contract line that is expired or corresponds to the service item that has broken down.

1. Choose the  icon, enter **Service Contracts**, and then choose the related link.
2. Open the service contract from which you want to remove contract lines.
3. Choose the **Open Contract** action to open the service contract for editing.
4. Choose the contract line you want to remove. Fill in the **Contract Expiration Date** field with the date as of which you want to remove the line. For example, you could enter the date when the service item broke down.
5. Choose the **Remove Contract Lines** action. The **Remove Lines from Contract** page opens.
6. Fill in the default filters: **Contract No.**, **Service Item No.**, and **Contract Type**. If needed, you can apply more filters or change the existing ones.
7. Fill in the fields on the **Options** FastTab. In the **Action** field, select **Delete Lines**.

NOTE

If the contract is not detailed, you must update the value in the **Annual Amount** field on the **Invoice Details** FastTab on the **Service Contract** page, reflecting the loss of the service item from the contract.

If the contract is detailed and prepaid, and you have posted invoices for the contract, you can create a credit memo for the contract. On the **Actions** tab, in the **Functions** group, choose **Create Credit Memo**. This is unnecessary if the check box in the **Automatic Credit Memos** field on the **Invoice Details** FastTab is selected. In that case, a credit memo is created automatically when you remove a contract line.

Service Line Cost and Value

On a service contract lines, the amounts in the **Line Cost** and **Line Value** are calculated as described in the following tables.

LINE COST OPTIONS	DESCRIPTION
Service item	<p>The cost is automatically retrieved from the Default Contract Cost field in the Service Item table and copied into the Line Cost field. The following formula is used to calculate the line cost:</p> $\text{Sales Unit Cost} \times \text{Contract Value \%} \div 100$

LINE COST OPTIONS	DESCRIPTION
Item	The cost is automatically retrieved from the Unit Cost field in the Item table and the Contract Value % field value in the Service Mgt. Setup table. The following formula is used to calculate the line cost: Unit Cost × Contract Value % ÷ 100
Text description	The value in the Line Cost field is set to zero.
LINE VALUE OPTIONS	DESCRIPTION
Service item	The price is automatically retrieved from the Default Contract Value field in the Service Item table and copied into the Line Value field.
Item	Depending on the value in the Contract Value Calc. Method field in the Service Mgt. Setup table, the amount is retrieved from either the Unit Price or the Unit Cost field in the Item table. After that, this value is multiplied by the contents of the Contract Value % field in the Service Mgt. Setup table and divided by 100. This amount is copied into the Line Value field. NOTE: If the Contract Value Calc. Method field is set to None , the contents of the Line Value field are not calculated.
Text description	The contents of the Line Value field are set to zero.

To add a contract discount to service contract quotes

You can add contract discounts on services for contract quotes and service contracts. The discounts can be on spare parts in particular service item groups, on resource hours for resources in particular resource groups, and on particular service costs.

1. Choose the  icon, enter **Service Contract Quotes**, and choose the related link.
2. Choose the quote to add discounts for.
3. Choose the **Service Discounts** action. The **Contract/Service Discounts** page opens.
4. To create a new contract discount, choose the **New** action.
5. Fill in the fields on the line as necessary. Hover over a field to read a short description..

TIP

To add contract discounts directly to a service contract, perform similar steps from the **Service Contract** page.

To change the owner of a service contract

You may need to change the owner of a service contract. If a service item in a service contract is registered in noncanceled multiple contracts owned by the same customer, then the owner of all service contracts that include this service item and of all other service items included in these contracts is updated automatically.

NOTE

In this case, only noncanceled contracts are considered. The status of the contract quotes is not taken into account.

IMPORTANT

Service items and contracts can be related. Changing the owner of a service contract can affect these relationships.

For example, suppose service item No. 8 is included in contracts SC00003 and SC00015. Contract SC00015 also contains service item No. 15, which is also included in the contract SC00080. In this case, the owner for all three contracts and service items will be changed.

1. Choose the  icon, enter **Service Contracts**, and then choose the related link. Open the relevant service contract whose owner you want to change.
2. Choose the **Open Contract** action to open the contract for editing.
3. Choose the **Change Customer** action. The **Change Customer in Contract** page opens.
4. In the **Contract No.** and **Service Item No.** fields you can see the numbers of the contract and service item owned by the selected customer. If the customer owns more than one contract with more than one service item included, then the value of these fields will be **Multiple**. To see the list of related contracts or service items, select these field values.
5. In the **New Customer No.** field, choose the new customer.
6. In the **New Ship-to Code** field, choose the address.
7. Choose **OK** to change the customer and ship-to code of the service contracts.
8. Choose the **Lock Contract** action to lock the contract and to make sure that the changes will be part of the contracts.

To update a service contract price

You can update the prices on service contracts by specifying a price update percentage.

1. Choose the  icon, enter **Update Service Contract Prices**, and then choose the related link.
2. Choose the service contract.
3. In the **Update to Date** field, enter a date. The batch job will update prices for contracts with next price update dates on or before this date.
4. In the **Price Update %** field, enter the percentage that you want to update the prices by.
5. In the **Action** field, select **Update Contract Prices**.

To post prepaid contract entries

If you work with prepaid service contracts, you must regularly post prepaid contract entries, thereby transferring the prepaid payments from the prepaid contract accounts to the regular contract accounts.

Before you can post prepaid contract entries, you must specify a number series in the **Prepaid Posting Document Nos.** field on the **Service Mgt. Setup** page.

1. Choose the  icon, enter **Post Prepaid Contract Entries**, and then choose the related link.
2. In the **Post until Date** field, enter a date. The batch job posts prepaid service ledger entries with posting dates up to this date.
3. In the **Posting Date** field, enter the date you want to use as the posting date on the general journal line.
4. In the **Action** field, choose **Post Prepaid Transactions**.
5. Choose **OK** to post the entries.

Changing the Service Contract Status

After the service contract is signed, the **Change Status** field value is automatically set to **Locked**. If you want to modify information in the service contract or service contract quote, first you have to change the status of the contract or contract quote from **Locked** to **Open**. Note that you cannot create service invoices for the service contract with the **Open** change status. After the contract or contract quote is modified, you have to change the status back to **Locked** to make it possible to create service invoices and ledger entries for the service contract, which includes the changes that you made to it.

NOTE

The **Change Status** field is not related to the **Release Status** field on the service order header, which governs the warehouse handling of service items.

To cancel a service contract

You may need to cancel a service contract when the contract has expired or has been canceled by you or the customer.

NOTE

You cannot reopen a contract after it is canceled.

1. Choose the  icon, enter **Service Contracts**, and then choose the related link.
2. Open the relevant service contract to cancel.
3. Choose the **Open Contract** action to open the service contract for editing.
4. In the **Cancel Reason Code** field, choose the relevant reason code. To add more reason codes, choose the **Advanced** action.

If the check box in the **Use Contract Cancel Reason** field on the **Service Mgt. Setup** page is selected, you must specify a cancel reason code when canceling contracts.

5. In the **Status** field, choose **Canceled**.
6. If there are unposted invoices, credit memos, or opened prepaid entries for the contract, a confirmation message will appear. In the message box, choose **No** to return to the contract and post the documents, or **Yes** to continue the cancellation process.

Filing a service contract or contract quote

You can file service contracts and contract quotes at any time to record and archive a copy of the contract or contract quote. Business Central files service contracts automatically when you convert contract quotes to service contracts or cancel service contracts. You can file a contract or quote yourself by choosing the **File Contract** action in the **Service Contracts** or **Service Contract Quotes** pages. If you want to view your archived contracts or quotes by searching for **Filed Contracts**.

Change the Annual Amount on Service Contracts or Contract Quotes

3/31/2019 • 10 minutes to read

You can change the annual amount of the service contract or contract quote to correct the amount that will be invoiced annually.

To change the annual amount of the service contract or contract quote

1. Choose the  icon, enter **Service Contracts** or **Service Contract Quotes**, and then choose the related link.
2. Choose the contract or contract quote.
3. Choose the **Open Contract** action to open the contract or contract quote for editing.
4. Choose the **Allow Unbalanced Amounts** check box if you want to change the annual amount and distribute the annual amount difference manually on the contract lines. Otherwise, clear the check box to automatically distribute the annual amount difference on the contract lines after you change the annual amount.
5. Change the contents of the **Annual Amount** field. You cannot sign, that is, convert into a service contract if you are working on a contract quote, or lock a service contract that has a negative annual amount. If you set the annual amount to zero, the contents of the **Invoice Period** field must be **None** when either signing or locking the service contract.
6. Depending on whether the **Allow Unbalanced Amounts** check box is selected, run either the manual or automatic distribution of the annual amount difference. The contract lines will be updated so that the **Calcd. Annual Amount** field value is equal to the new annual amount.

Distributing Differences Between New and Calculated Annual Amounts

If you change the annual amount of a service contract or contract quote, you may want to distribute the difference between its new and calculated annual amounts on the contract lines. There are three ways to distribute amounts:

- Even distribution
- Distribution based on line amounts
- Distribution based on Profit

Even Distribution

If you change the annual amount of the service contract or contract quote, you may want to distribute the difference between its new and calculated annual amounts on the contract lines. Even distribution is one of the automatic distribution methods that can help you spread equally the new and calculated annual amounts difference between line amounts on the contract lines. The following list of distribution procedure steps describe the main idea of this method:

1. The difference between the new **Annual Amount** and **Calcd. Annual Amount** field values is divided by the number of the contract lines in the service contract or contract quote.
2. The **Line Amount** field value is updated by adding the result of the previous operation.
3. The contents in the **Line Discount Amount**, **Line Discount %**, and **Profit** fields are updated with regard to the new value in the **Line Amount** field in the following way:
 - $\text{Line Discount Amount} = \text{Line Value} - \text{Line Amount}$.
 - $\text{Line Discount \%} = \text{Line Discount Amount} / \text{Line Value} * 100$.
 - $\text{Profit} = \text{Line Amount} - \text{Line Cost}$.

The steps are repeated for each contract line.

Example

The **Allow Unbalanced Amounts** check box is not selected in the service contract that contains three contract lines with such information.

ITEM	LINE COST	LINE VALUE	LINE DISCOUNT %	LINE DISCOUNT AMOUNT	LINE AMOUNT	PROFIT
Item 1	30.00	40.00	0.00	0.00	40.00	10.00
Item 2	40.00	50.00	10.00	5.00	45.00	5.00
Item 3	50.00	70.00	10.00	7.00	63.00	13.00

The **Annual Amount** field value is equal to the contents of the **Calcd. Annual Amount** field, which is always set to the sum of the line amounts. In this case, it is equal to the following: 40 + 45 + 63 = 148.

If you change the **Annual Amount** to 139, the amount is calculated that should be added to each **Line Amount** field value. This amount is calculated by subtracting the **Calcd. Annual Amount** from the new **Annual Amount** field value and dividing the result by the number of the contract lines in the service contract. In this case, it will be equal to the following: $(139 - 148) / 3 = -3$. Then, the last calculated figure is added to each **Line Amount** field value and the **Line Discount %**, **Line Discount Amount**, and **Profit** field values are updated using the formulas in the procedure described above.

Finally, the contract lines will contain this data.

ITEM	LINE COST	LINE VALUE	LINE DISCOUNT %	LINE DISCOUNT AMOUNT	LINE AMOUNT	PROFIT
Item 1	30.00	40.00	7.50	3.00	37.00	7.00
Item 2	40.00	50.00	16.00	8.00	42.00	2.00
Item 3	50.00	70.00	14.29	10.00	60.00	10.00

Distribution Based on Line Amount

If you change the annual amount of the service contract or contract quote, you may want to distribute the difference between its new and calculated annual amounts on the contract lines. Distribution Based on Line Amount is an automatic method that can help you spread the new and calculated annual amounts difference between the line amounts on the contract lines. This distribution will be performed proportionally to their line amount shares in the calculated annual amount. The following list of distribution procedure steps for each contract line describe the main idea of this method:

1. The line amount percentage contribution is calculated as follows: the contents of the **Line Amount** field is divided by the **Calcd. Annual Amount** field values on all contract lines.
2. The **Line Amount** field value is updated by adding to it the difference between the new and calculated annual amounts, which is multiplied by the line amount percentage contribution.
3. The contents in the **Line Discount Amount**, **Line Discount %**, and **Profit** fields are updated with regard to the new value in the **Line Discount Amount** field in the following way:
 - Line Discount Amount = Line Value - Line Amount
 - Line Discount % = Line Discount Amount / Line Value * 100
 - Profit = Line Amount - Line Cost

Distribution Based on Line Amount

If you change the annual amount of the service contract or contract quote, you may want to distribute the difference between its new and calculated annual amounts on the contract lines. Distribution Based on Line Amount is an automatic method that can help you spread the new and calculated annual amounts difference between the line amounts on the contract lines. This distribution will be performed proportionally to their line amount shares in the calculated annual amount. The following list of distribution procedure steps for each contract line describe the main idea of this method:

1. The line amount percentage contribution is calculated as follows: the contents of the **Line Amount** field is divided by the **Calcd. Annual Amount** field values on all contract lines.
2. The **Line Amount** field value is updated by adding to it the difference between the new and calculated annual amounts, which is multiplied by the line amount percentage contribution.
3. The contents in the **Line Discount Amount**, **Line Discount %**, and **Profit** fields are updated with regard to the new value in the **Line Discount Amount** field in the following way:
 - Line Discount Amount = Line Value - Line Amount
 - Line Discount % = Line Discount Amount / Line Value * 100
 - Profit = Line Amount - Line Cost

The steps are repeated for each contract line.

Example

The **Allow Unbalanced Amounts** check box is not selected in the service contract that contains three contract lines with such information.

ITEM	LINE COST	LINE VALUE	LINE DISCOUNT %	LINE DISCOUNT AMOUNT	LINE AMOUNT	PROFIT
Item 1	15.00	17.00	3.00	0.51	25.00	1.49
Item 2	20.00	23.00	None	0.00	55.10	3.00
Item 3	24.00	27.00	3.00	0.81	112.70	2.19

The **Annual Amount** field value is equal to the contents of the **Calcd. Annual Amount** field which is always set to the sum of the line amounts. In this case, it is equal to the following: 16.49 + 23.00 + 26.19 = 65.68.

If you change the **Annual Amount** to 60, the profit percentage contributions for each contract line is calculated:

- Item 1 – $5 / (5 + 5.1 + 12.7) = 0.2193 \%$
- Item 2 – $5.1 / (5 + 5.1 + 12.7) = 0.2237$
- Item 3 – $12.7 / (5 + 5.1 + 12.7) = 0.557$

The **Line Amount** field value is updated on each contract line using the following formula: Line Amount = Line Amount + difference between the new and calculated annual amounts * Percentage Contribution. After that, the **Line Discount Amount**, **Line Discount %**, and **Profit** field values are updated using the formulas described in the procedure above.

Finally, the contract lines will contain this data.

ITEM	LINE COST	LINE VALUE	LINE DISCOUNT %	LINE DISCOUNT AMOUNT	LINE AMOUNT	PROFIT
Item 1	15.00	17.00	11.41	1.94	15.06	0.06

ITEM	LINE COST	LINE VALUE	LINE DISCOUNT %	LINE DISCOUNT AMOUNT	LINE AMOUNT	PROFIT	
Item 2	20.00	23.00	8.65	1.99	21.01	1.01	
Item 3	24.00	27.00	11.37	3.07	23.93	-0.07	- Line Discount % = Line Discount Amount / Line Value * 100

Example

The **Allow Unbalanced Amounts** check box is not selected in the service contract that contains three contract lines with such information.

ITEM	LINE COST	LINE VALUE	LINE DISCOUNT %	LINE DISCOUNT AMOUNT	LINE AMOUNT	PROFIT
Item 1	15.00	17.00	3.00	0.51	25.00	1.49
Item 2	20.00	23.00	None	0.00	55.10	3.00
Item 3	24.00	27.00	3.00	0.81	112.70	2.19

The **Annual Amount** field value is equal to the contents of the **Calcd. Annual Amount** field which is always set to the sum of the line amounts. In this case, it is equal to the following: 16.49 + 23.00 + 26.19 = 65.68.

If you change the **Annual Amount** to 60, the profit percentage contributions for each contract line is calculated:

- Item 1 – $5 / (5 + 5.1 + 12.7) = 0.2193 \%$
- Item 2 – $5.1 / (5 + 5.1 + 12.7) = 0.2237$
- Item 3 – $12.7 / (5 + 5.1 + 12.7) = 0.557$

The **Line Amount** field value is updated on each contract line using the following formula: Line Amount = Line Amount + difference between the new and calculated annual amounts * Percentage Contribution. After that, the **Line Discount Amount**, **Line Discount %**, and **Profit** field values are updated using the formulas described in the procedure above.

Finally, the contract lines will contain this data.

ITEM	LINE COST	LINE VALUE	LINE DISCOUNT %	LINE DISCOUNT AMOUNT	LINE AMOUNT	PROFIT
Item 1	15.00	17.00	11.41	1.94	15.06	0.06
Item 2	20.00	23.00	8.65	1.99	21.01	1.01
Item 3	24.00	27.00	11.37	3.07	23.93	-0.07

Distribution Based on Profit

If you change the annual amount of the service contract or contract quote, you may want to distribute the difference between its new and calculated annual amounts on the contract lines. Distribution Based on Profit is one of the automatic methods that can help you spread the new and calculated annual amounts difference between the

line amounts on the contract lines. This distribution will be performed proportionally to their profit shares in the total contract or contract quote profit. The following list of distribution procedure steps for each contract line describe the main idea of this method:

1. The profit percentage contribution is calculated as follows: the contents of the **Profit** field is divided by the sum of **Profit** field values on all contract lines.
2. The **Line Amount** field value is updated by adding to it the difference between the new and calculated annual amounts, which is multiplied by the profit percentage contribution.
3. The contents in the Line Discount Amount, Line Discount %, and Profit fields are updated with regard to the new value in the **Line Amount** field in the following way:
 - Line Discount Amount = Line Value - Line Amount
 - Line Discount % = Line Discount Amount / Line Value * 100
 - Profit = Line Amount - Line Cost

Example

The **Allow Unbalanced Amounts** check box is not selected in the service contract that contains three contract lines with such information.

ITEM	LINE COST	LINE VALUE	LINE DISCOUNT %	LINE DISCOUNT AMOUNT	LINE AMOUNT	PROFIT
Item 1	20.00	25.00	0.00	0.00	25.00	5.00
Item 2	50.00	58.00	5.00	2.90	55.10	5.10
Item 3	100.00	115.00	2.00	2.30	112.70	12.70

The **Annual Amount** field value is equal to the contents of the **Calcd. Annual Amount** field, which is always set to the sum of the line amounts. In this case, it is equal to the following: 25.00 + 55.10 + 112.70 = 192.80.

If you change the **Annual Amount** to 180, the profit percentage contributions for each contract line are calculated:

- Item 1 – $5 / (5 + 5.1 + 12.7) = 0.2193 \%$
- Item 2 – $5.1 / (5 + 5.1 + 12.7) = 0.2237$
- Item 3 – $12.7 / (5 + 5.1 + 12.7) = 0.557$

The **Line Amount** field value is updated on each contract line using the following formula: Line Amount = Line Amount + difference between the new and calculated annual amounts * Percentage Contribution. After that, the **Line Discount Amount**, **Line Discount %**, and **Profit** field values are updated using the formulas in the step 3 of the procedure described above.

Finally, the contract lines will contain this data.

ITEM	LINE COST	LINE VALUE	LINE DISCOUNT %	LINE DISCOUNT AMOUNT	LINE AMOUNT	PROFIT
Item 1	20.00	25.00	11.24	2.81	22.19	2.19
Item 2	50.00	58.00	9.93	5.76	52.24	2.24
Item 3	100.00	115.00	8.20	9.43	105.57	5.57

Setting Up Service Management

Delivering Service

3/31/2019 • 2 minutes to read

Business Central provides features to help you deliver service according to the contracts that you have created and the service orders that you have committed to fulfilling. Your service technicians or dispatcher will find outstanding service orders easy to locate when they use the **Dispatch Board**. At a glance, the **Dispatch Board** shows which orders are in progress and which orders are complete.

Another way to review pending service orders is to use the **Service Tasks** page. In this view of your service obligations, you can see where in your service workflow an order is and change that status to reflect interactions with your customer.

The following table describes a sequence of tasks, with links to the topics that describe them.

A service management application must interface with a customer request for service. That service request usually is translated into a service order. Business Central provides tools to create an order both directly in response to a customer request or as part of the contract process, if that is how your application is set up.

If needed, you can manage a loaner program for your customers. You can also determine your pricing structure, put service pricing offerings into logical groupings, and create price adjustments.

The following table describes a sequence of tasks, with links to the topics that describe them.

Create Service Quotes

3/31/2019 • 2 minutes to read

You can think of service quotes as the basis for service orders. In fact, they are almost identical. They both contain information such as who the customer is, the type of order, the item that needs service, billing and shipping information, and information about the actual service work.

You can use a service quote as a preliminary draft for a service order, and then convert the quote to a service order.

To create a service quote

1. Choose the  icon, enter **Service Quotes**, and then choose the related link.
2. Create a new service quote.
3. In the **No.** field, enter a number for the service quote. Alternatively, if you have set up a number series for service quotes on the **Service Mgt. Setup** page, you can press Enter to select the next available service quote number.
4. In the **Customer No.** field, select the relevant customer from the list.

NOTE

The customer fields are filled in automatically with information from the **Customer** card. If a **Customer** card does not exist for the customer, and you have set up a customer template, you can create the customer from the service quote. Fill in the relevant fields, and then choose the **Create Customer** action.

5. Depending on the settings on the **Mandatory Fields** FastTab on the **Service Mgt. Setup** page, you may need to fill in the **Service Order Type** field and the **Salesperson Code** field.
6. Fill in the service item lines.
7. Register estimated costs on the service lines.

[Create Service Orders](#)

[Work on Service tasks](#)

Create Service Orders

3/31/2019 • 6 minutes to read

You can use the **Service Order** page to create documents where you enter information about a service, such as repairs and maintenance, on service items by customer request.

When creating a service order, you only have to fill in a few fields. Some fields are optional and many are automatically filled in when you fill in related fields.

To create a service order

1. Choose the  icon, enter **Service Orders**, and then choose the related link.
2. Create a new service order.
3. In the **No.** field, enter a number for the service order.

Alternatively, if you have set up number series for service orders on the **Service Mgt. Setup** page, you can press Enter to select the next available service order number.

4. In the **Customer No.** field, select the relevant customer from the list. The customer-relevant fields are filled in with information from the **Customer** table.
5. Depending on the settings on the **Mandatory Fields** FastTab on the **Service Mgt. Setup** page, you may need to fill in the **Service Order Type** field and the **Salesperson Code** field.
6. Optionally, fill in the rest of the fields.
7. Register the service item lines.

To create a service order from a contract

You can automatically create service orders for the maintenance of service items based on service contracts.

1. Choose the  icon, enter **Create Contract Service Orders**, and then choose the related link.
2. On the **Service Contract Header** FastTab, set the filters you want to apply.
3. On the **Options** FastTab, fill in the **Starting Date** and **Ending Date** fields with the starting date and ending date for the period that you want to create contract service orders for. The batch job creates service orders that include service items in service contracts with next planned service dates within this period.

NOTE

There is a limit to the number of days you can use as the date range each time you use this batch job. You set this limit in the **Contract Serv. Ord. Max. Days** field on the **Service Mgt. Setup** page.

4. In the **Action** field, choose **Create Service Order**.

To convert a service quote to a service order

When a customer has accepted a service quote, you convert it to a service order. The quote is deleted and a new service order is set up with the same description as the service quote. The response date and time are recalculated for the service order and the status is set to **Pending**. The repair status of the service items in the order are

changed to **Initial**.

Business Central searches for allocation entries for all the service items in the service quote that have the status **Active**. If it finds such allocation entries, their allocation status is updated to **Reallocation Needed**. When you reallocate the service items in the service order, the status of the allocation entries registered for the quote are updated to **Finished**.

1. Choose the  icon, enter **Service Contract Quotes**, and then choose the related link.
2. Choose the service quote to convert to a service order.
3. Choose the **Make Order** action.

To check item availability for one or more orders

You can check and see if an item you need to fulfill an order is in stock, and if it is not, when the item will be in stock. In addition, if an item is available to reserve, you can reserve it to make sure it is available for your use. You can check availability for a particular order, or for all orders.

1. Choose the  icon, enter **Dispatch Board**, and then choose the related link.
2. Do one of the following:
 - For a particular order, choose the order, and then choose the **Demand Overview** action.
 - For all orders, choose **Show Document**. The **Service Order** page opens.
3. On the **Demand Overview** page, expand the item grouping, and view information about the availability of the item. For example, you can see how many items are in inventory. You can also see if and when an item will be available if it is on back order, that is, Source Type = Purchase, or whether it has been reserved.

To reserve an item for a service order

If you need to be sure that an item is available for a service order, you can reserve the item.

1. In the **Search** box, enter **Service Orders**, and then choose the related link.
2. Choose the service order, and then choose **Edit**.
3. Choose **Actions**, choose **Order**, and then choose **Service Lines**.
4. On the **Service Lines** page, choose the item to reserve, and then choose the **Reserve** action.
5. On the **Reservation** page, choose **Reserve from Current Line**.

To insert lines based on standard service codes

If you have set up standard service codes and assigned them to service item groups, you can insert the standard lines linked to the standard service codes on service documents. For more information, see [Set Up Standard Service Codes](#).

1. Choose the  icon, enter **Service Orders**, and then choose the related link.
2. Create a new service order.
3. Fill in the fields as necessary..
4. Fill in the service item lines with the required information.
5. Choose the line with the service item that you want to create service lines for, and then choose **Get Std. Service Codes**. The **Standard Serv. Item Gr. Codes** page opens with the standard codes for the service item group specified on the line.
6. Choose the appropriate code, and choose the **OK** button to enter standard service lines.

NOTE

If the **Service Item Group Code** field on the service item line of the document is blank, this means that the service item does not belong to any service item group. In this case, the **Standard Serv. Item Gr. Codes** page will contain a list of all standard service codes. You should select from the list to insert standard service lines in the document. You may also select from the list of standard service codes assigned to a specific service item group. To view the list, select the relevant code in the **Service Item Group Code** field on the **Standard Serv. Item Gr. Codes** page.

To register internal or public comments

You can add comments that will be printed on service orders and service quotes to provide additional information. You can add up to 80 characters, including spaces. If you need to enter additional text, choose another line. To register a comment, choose a line, and then choose the **Comments** action.

To delete invoiced service orders

Orders are usually deleted automatically after having been fully invoiced. When an invoice is posted, a corresponding entry is created on the **Posted Service Invoices** page. The posted document can be viewed on the **Posted Service Invoice** page.

Service orders are not deleted automatically, however, if the total quantity on the order has been posted not from the service order itself, but from the **Service Invoice** page. Then you may need to delete invoiced orders that were not deleted. You can do this by running the **Delete Invoiced Service Orders** batch job.

1. Choose the  icon, enter **Delete Invoiced Service Orders**, and then choose the related link. The **Delete Invoiced Service Orders** batch job request page opens.
2. To select the orders to be deleted, you can set filters in the **No.**, **Customer No.**, and **Bill-to Customer No.** fields.
3. Choose **OK**.

Create Service Invoices or Credit Memos

3/31/2019 • 5 minutes to read

Ease in invoicing your service orders is a key feature of Business Central. You can send an invoice to your customers at any time, or create invoices periodically.

To create an invoice directly, you can use the **Service Contract** page. You can also set up your system so that a service technician in the field can create an invoice for service that is not connected to a contract or order.

To invoice a service contract from the Service Contract page

1. Choose the  icon, enter **Create Service Contract Invoices**, and then choose the related link.
2. Set the filters you want to apply.
3. In the **Posting Date** field, enter the date to use as the posting date on the service invoices.
4. In the **Invoice to Date** field, enter the date up to which you want to invoice contracts. The batch job will include the contracts with the next invoice dates, up to this date.
5. In the **Action** field, choose **Create Invoices**.
6. Choose **OK** to create the service invoices.

NOTE

You cannot create service invoices for the service contract when the **Change Status** field value is set to **Open**.

To post an invoice from a service order

The following procedure describes how to define the part of service that you will charge the customer for.

1. Choose the  icon, enter **Service Orders**, and then choose the related link.
2. Choose the service order to invoice, and open the order card.
3. Choose the **Service Lines** action.
4. Find the required entries, and then specify the quantities for which you will charge the customer in the **Qty. to Invoice** field.

NOTE

You can invoice the customer for the registered service either fully or in parts. If you choose to invoice the customer fully, the value in the **Qty. to Invoice** field must be equal to the value in the **Quantity** field. You can post a full invoice together with a full shipment, and you can post a full invoice for an already posted full shipment that has been neither invoiced nor consumed previously.

When you post a partial invoice, there are two ways of specifying the quantity to invoice. If you are going to post the service with **the Ship and Invoice** option, the value in the **Qty. to Invoice** field must be equal to that in the **Qty. to Ship** field. If you want to invoice an already posted shipment, the quantity to invoice must be no larger than the value in the **Quantity Shipped** field.

5. Choose **Post**, and then either **Invoice** or **Ship and Invoice**. For more information about these options, see [Posting in Service Management](#).

The service line you have selected is posted. You can post several service lines at once by selecting them all and choosing **Post**. If you do this, make sure you have filled in all the necessary information on the lines you want to post.

When you post the order with the **Invoice** option, a posted service invoice is created along with the corresponding ledger entries and updates to the relevant fields on the service lines of the order. In addition, previously posted shipment documents are updated with the quantities that have been invoiced. If you select the **Ship and Invoice** posting option, a posted shipment is created.

To create a service invoice manually

Typically, after you post a service order with the **Invoice** or **Ship and Invoice** option, a service invoice is posted automatically. Yet, you may need to issue an invoice that is not linked either to a service contract or to a service order. This procedure explains how to issue an invoice at the same time that the customer receives the service.

1. Choose the  icon, enter **Service Invoices**, and then choose the related link.
2. Create a new service invoice.
3. Fill in the **No.** field.

NOTE

If you have set up number series for service invoices on the **Service Mgt. Setup** page, you can press Enter to select the next available service invoice number.

4. In the **Customer No.** field, enter the number of a customer. Select the relevant customer from the list.

The customer fields are filled in with information from the **Customer** card.

5. Enter a date in the **Posting Date** field. This date will appear on the posted entries. This field is filled with the current working date, but you can change it manually.
6. Fill in the **Document Date** field. The date you enter here will appear on the printed invoice and will be used to calculate the due date.
7. Fill in the service lines of the invoice. Fill in the **Type**, **No.**, and **Quantity** fields to register items, resources and costs that have been used in servicing.

To invoice posted shipment lines

You might need to create a service invoice for the service that has already been shipped, either from one or several service orders, but not yet invoiced or consumed. You can fill in the invoice lines automatically with the selected posted shipment lines for a specific customer.

1. Choose the  icon, enter **Service Invoices**, and then choose the related link.
2. Fill in the fields on the line as necessary. Hover over a field to read a short description.
3. Create invoice lines for services shipped but not invoiced. Alternatively, you can use the **Get Shipment Lines** action to add posted shipment lines to the invoice.
4. Post the service invoice.

The posted service invoice and the corresponding ledger entries are created. Previously posted shipment documents are updated with the invoiced quantities and the relevant quantities on the service lines of the source orders.

To create a combined invoice

You can invoice the customer for services provided on different service orders. Invoice lines are created for items, resource hours, or costs that have already been shipped from different service orders but not yet invoiced.

1. Choose the  icon, enter **Service Invoices**, and then choose the related link.
2. Fill in the fields on the line as necessary. Hover over a field to read a short description.
3. Choose the **Get Shipment Lines** action. The **Get Service Shipment Lines** page displays all lines that are shipped but not invoiced for the customer.
4. Choose the lines for the service to invoice, and then choose **OK** to add the service shipment lines to the invoice.

To create a service credit memo

A service credit memo document is typically used when a customer returns an item, but it can also be used to give a customer some compensation or to correct an erroneous invoice.

1. Choose the  icon, enter **Service Credit Memos**, and then choose the related link.
2. Fill in the fields on the line as necessary. Hover over a field to read a short description.
3. The **Posting Date** and **Document Date** fields display the work date. If needed, you can change it.
4. On the credit memo lines, enter information about the items that have been returned or removed, or the compensation that will be given to the customer.

[Service Posting](#)

Allocate Resources

3/31/2019 • 9 minutes to read

The key element to service management is the people who supply service. You can set up Business Central to assign the appropriate people to the appropriate jobs. Assignments can be based on service zones where the people are located or where the service occurs. In addition, you can group resources together when responding to service requests. For more information, see [Set Up Resource Allocation](#).

You can allocate resources, for example, technicians, by using the **Dispatch Board**, or from a service order. You can use resource availability to allocate resources to perform the service tasks in the orders or quotes.

You can allocate the same resource, for example, a technician, or resource group to all the service items in a service order. Allocation entries are created for the other service items in the order with the same resource number and allocation date as the line you allocated. The allocated hours are the hours you allocated divided by the number of service items in the order. The **Status** field is automatically set to **Active** for all the entries that were created.

To see an overview of service orders and service quotes

You may often need to see the list of service orders or service quotes that meet certain requirements to be able to perform specific actions with them one by one. For example, you may need to allocate resources to service orders that belong to a specific customer.

1. Choose the  icon, enter **Dispatch Board**, and then choose the related link.
2. In the **Document Filter** field, choose the type of the documents you want to see.
3. To get a list of documents that contain service tasks a certain resource or resource group is allocated to, fill in the **Resource Filter** and **Resource Group Filter** fields and press **Enter**.
4. To get a list of documents with a certain response date or response dates within a certain date period, fill in the **Response Date Filter** field and press **Enter**.
5. To get a list of documents with a specified allocation state or document status, fill in the **Allocation Filter/Status Filter** field and press **Enter**.
6. To get a list of documents that belong to a certain contract, customer, or zone, fill in the **Contract Filter/Customer Filter/Zone Filter** field and press **Enter**.
7. Choose a line that corresponds to a service order or service quote, and then choose the **Show Document** action.

The **Service Order** or **Service Quote** page opens, and you can work with the document. To return to the **Dispatch Board** page, choose **OK**.

To allocate a resource using resource or resource group availability

1. Choose the  icon, enter **Dispatch Board**, and choose the related link.
2. Choose the service order, and then choose the **Resource Allocations** action.
3. Choose the entry with the service task to which you want to allocate a resource.
4. Choose either the **Resource Availability** or **Res. Group Availability** action.

5. On the **Res. Availability (Service)** page, choose **Show Matrix**.
6. Choose a resource to allocate. You can base your selection on whether the resource is skilled for the task, whether it is located in the customer zone, and/or whether it is preferred by the customer.
7. Specify a date on which the resource has enough available hours for the task, and which is close to the response date of the service order.
8. In the **Qty. to Allocate** field, enter the number of hours you want to allocate the resource to the service task for.
9. On the **Actions** tab, in the **Functions** group, choose **Allocate** to allocate the selected resource on the selected date.

The **Status** field is automatically set to **Active**.

Repeat these steps for each date that you want to allocate the resource to the service task.

NOTE

For a service item in a service order, there can only be **Active** allocation entries with one resource or resource group at a time.

To allocate a resource using a service order

After you have created and filled in a service order or service quote, you can allocate resources, for example, technicians, to perform service tasks registered as service item lines in the document.

1. Choose the  icon, enter **Service Orders**, and then choose the related link.
2. Choose the service order, and then choose **Edit**.
3. Choose the service item line corresponding to the service task you want to allocate a resource to.
4. Choose **Resource Allocations**.
5. On the **Resource Allocations** page, choose a nonactive allocation entry with the service task you want to allocate the resource to. If the allocation entry does not exist, you can create a new one by choosing **New**.
6. Specify the service task by filling in the **Service Item No.** field on the same line.
7. In the **Resource No.** field, choose the resource. If the resource is a member of a resource group, the number of the resource group is entered automatically into the **Resource Group No.** field.
8. Fill in the **Allocation Date** and **Allocated Hours** fields. The **Status** field is set to **Active**. This means that the resource is allocated to the service task.
9. Optionally, to assign the resource to all items, choose **Allocate to All Service Items**.

NOTE

For a service item in a service order, there can only be active allocation entries with one resource or resource group at a time.

To reallocate resources on a service order

You can reallocate resources directly from a service order or service quote when you are working with it. The original entry will still exist, but its status is updated as follows:

- If service was started while the allocation was **Active**, that is, if the repair status of the service item in the entry was changed to **In Process**, the allocation status changes from **Reallocation Needed** to **Finished**.
- If service was not started while the allocation was **Active**, allocation status changes from **Reallocation**

Needed to Canceled.

- If you are reallocating a service order that you have converted from a quote, the status of the allocation entries registered for the quote always changes to **Finished** when you reallocate the service items in the service order.
1. Choose the  icon, enter **Service Orders**, and then choose the related link.
 2. Open the relevant service order.
 3. Select the service item line corresponding to the service task you want to allocate a resource to. Choose **Actions**, choose **Line**, and then choose **Resource Allocations**.
 4. On the **Resource Allocations** page, select an allocation entry with the service task you want to reallocate the resource to. In the **Resource No.** field, select the relevant resource. This overwrites the resource number already in the field.
 5. Press the Enter key. A dialog box opens, asking whether you want to reallocate this entry. Fill in the **Reason Code** field if appropriate and choose the **Yes** button to confirm the reallocation.
 6. Fill in the **Allocation Date** and **Allocated Hours** fields. The entry now contains the new resource and its status is **Active**.

To reallocate a resource using the dispatch board

If the resource allocated to a service task cannot accomplish the work, it means that this service task needs reallocation. Usually you reallocate resources to a service task by using the **Dispatch Board**.

1. Choose the  icon, enter **Dispatch Board**, and then choose the related link.
2. In the **Allocation Filter** field, select **Reallocation Needed**. The **Dispatch Board** page now shows the list of service orders that include service tasks that need reallocation.
3. Select the relevant service order. On the **Navigate** tab, in the **Planning** group, choose **Resource Allocations**. The **Resource Allocations** page opens.
4. Select the allocation entry with the service task you want to reallocate a resource to.
5. In the **Resource No.** field, select the relevant resource. It overwrites the resource number already in the field.
6. Press Enter. The **Reallocation Entry Reasons** dialog box opens, asking whether you want to reallocate this entry. Fill in the **Reason Code** field if appropriate and choose the **Yes** button to confirm the reallocation.
7. Fill in the **Allocation Date** and **Allocated Hours** fields. The entry now contains the new resource and its status is **Active**.

NOTE

The old entry still exists but the status is updated in the following ways:

- If service was started while the allocation was **Active**, that is, if the repair status of the service item in the entry was changed to **In Process**, the allocation status changes from **Reallocation Needed** to **Finished**.
- If service was not started while the allocation was **Active**, the allocation status changes from **Reallocation Needed** to **Canceled**.
- If you are reallocating a service order that you have converted from a quote, the status of the allocation entries registered for the quote always changes to **Finished** when you reallocate the service items in the service order.

To register resource hours

When working on service items in service orders, you need to register the resource hours used for the service.

The following procedure shows how to register the resource hours on the **Service Item Worksheet** page.

You can use the same procedure to register the hours on the **Service Lines** page, which you can open from the Service Order page. Open the relevant service card, and then choose **Actions**, choose **Order**, and then choose **Service Lines**.

If the same resource works on all the service items in the service order, you can register the total resource hours for one service item only and then split the resource line to assign the resource hours to the other service items.

1. Choose the  icon, enter **Service Tasks**, and then choose the related link.
2. Select the line that includes the relevant service item, and then choose the **Item Worksheet** action.
3. Fill in the fields as necessary. Hover over a field to read a short description.

To assign a resource to all service items in an order

If the same resource, for example a technician, works on all the service items in the service order, you can register the total resource hours for one service item only and then split the resource line to divide the resource hours onto the resource lines for the other service items.

The following procedure shows how to split resource lines on the **Service Invoice Lines** page.

1. Choose the  icon, enter **Service Orders**, and then choose the related link.
2. Open the relevant service order.
3. On the **Lines** FastTab, choose **Actions**, choose **Order**, and then choose **Service Lines**. The **Service Lines** page opens.
4. Select the resource line you want to split. The contents of the **Quantity** field is divided between all the service items in the order.
5. On the **Actions** tab, choose the **Split Resource Line** action. Choose **Yes** to confirm.

Resource lines for the other service items in the order are created with the same resource number as the line you split. The quantity is the quantity for the line you split divided by the number of service items in the order.

To cancel an allocation

You can cancel resource allocations for service tasks without reallocating the tasks.

1. Choose the  icon, enter **Dispatch Board**, and then choose the related link.
2. Choose the service order, and then choose the **Resource Allocations** action.
3. Choose the allocation entry with the service task that you want to cancel allocation for.
4. Choose the **Cancel Allocation** action.
5. In the **Reason Code** field, select the appropriate reason code.
6. Choose **Yes** to confirm the cancellation.

NOTE

In the **Status** field, the **Reallocation Needed** option is automatically selected. If the repair status of the service item in the entry is **Initial**, the repair status is changed to **Referred**, that is, no service has been started. If the repair status is **In Process**, it is changed to **Partly Serviced**, that is, some service has been completed.

[Allocation Status and Repair Status](#)

Work on Service Tasks

3/31/2019 • 5 minutes to read

After you have created a service order or service quote, registered service item lines, and allocated resources to the service items in the order or quote, you can start repairing and maintaining the service items.

Business Central features a **Service Tasks** page that gives an overview of all the service items that need attention. Think of it as your service dashboard where you can see what orders are pending, look for and register spare parts, and keep your inventory up-to-date.

To track changes and get a graphical view of your service business, use Business Central statistics tools for quick, automatically generated charting and analysis.

To work on a service task

1. Choose the  icon, enter **Service Tasks**, and then choose the related link.
2. If you want a list of service tasks a certain resource or resource group is allocated to, fill in the **Resource Filter** or **Resource Group Filter** field and press Enter.
3. If you want a list of service tasks with a certain response date or response dates within a certain time period, fill in the **Response Date Filter** field and press Enter.
4. If you want a list of service tasks with a certain allocation status or repair status, fill in the **Allocation Status Filter** or **Repair Status Code Filter** field and press Enter.
5. Select the service task you want to work on. On the **Navigate** tab, in the **Service Tasks** group, choose **Item Worksheet**. The **Service Item Worksheet** page opens.
6. Register standard texts, spare parts, resource hours, and costs as appropriate using the corresponding options in the **Type** field: , **Item**, **Resource**, and **Cost**.
7. In the **Repair Status** field, select the appropriate status.

NOTE

Fill in the **Repair Status** field with the **Finished** or **Partly Serviced** status if the service item has been completely serviced or another resource will continue servicing. The **Finished** or **Reallocation Needed** status is specified automatically for the allocation entry corresponding to the service item.

To register service operations

When performing a service on a service order, you can register the details specifying the items used, costs incurred, and the time spent. The data you specify is stored on the **Service Item Worksheet** page. You can update the data when necessary.

1. Choose the  icon, enter **Service Orders**, and then choose the related link.
2. Open the service order to register the service for, and choose the item line.
3. Choose **Actions**, choose **Line**, and then choose **Service Item Worksheet**.
4. On the lines, specify the items used, costs incurred, and the time spent on the service.

NOTE

You can also register service directly on the service lines linked to the service order.

To register spare parts

When working on service items in service orders, you may need to use spare parts for the service. The following procedure shows how to register the spare parts you use on the **Service Item Worksheet** page.

1. Choose the  icon, enter **Service Tasks**, and then choose the related link.
2. Choose the line that includes the relevant service item, and then choose the **Item Worksheet** action.
3. Enter a new service line.
4. In the **Type** field, choose **Item**.
5. In the **No.** field, choose the relevant spare part.
6. In the **Quantity** field, enter the quantity of items you want to use.

You can use a similar procedure to register the spare parts on the **Service Lines** page, which you can open from the **Service Order** page.

To register spare parts from a service order

1. Choose the  icon, enter **Service Orders**, and then choose the related link.
2. Open the service order you want to register spare parts for.
3. Choose the line that includes the relevant service item. Choose **Actions**, choose **Order**, and then choose **Service Lines**.
4. enter a new service line.

To replace a service item or a service item component

When you service a service item that is composed of components, you may need to replace a faulty component with a new one. Every time that you enter a spare part for a service item with components, you have the option of replacing a component or creating a new one. The new item is not registered as a component of the service item until you post this service line or the service order.

1. Choose the  icon, enter **Service Tasks**, and then choose the related link.
2. Choose the line that includes the service item, and then choose the **Item Worksheet** action.
3. Enter a new service line.
4. In the **Type** field, choose **Item**.
5. In the **No.** field, choose the component to replace.
6. Press **Enter**. A dialog box opens with three options: **Replace Component**, **New Component**, and **Ignore**. The following table describes the options.

OPTION	DESCRIPTION
Replace Component	Changes the status of the component you are replacing to not active, and it will appear on the replaced component list for the service item.

OPTION	DESCRIPTION
New Component	Enters the new component in the component list of the service item.
Ignore	Does nothing to the component list of the service item.

7. Choose **Replace Component**.
8. Choose the component to replace, and then choose **OK**.

To change the response time for a service item line

When you register a service item line in a service order or quote, depending on whether the service item is on a service contract the response time in hours is automatically entered and the response date and time are calculated accordingly. You can change the response time in hours and the response date and time if you need to.

1. Choose the  icon, enter **Service Orders** or **Service Quotes**, and then choose the related link.
2. Choose the service order or quote to open the card.
3. On the service item line you want to change the response time for, either in the **Response Time (Hours)** field or in the **Response Date** and **Response Time** fields, enter the new response hours or response date and time.

To register fault/resolution codes

After repairing a service item, you can register both the fault code and the resolution code for the item by selecting a combination from the existing fault/resolution codes relationships. The fault and resolution codes will appear in the corresponding fields on the **Service Item Worksheet** page. You can also register the codes directly in this page.

1. Choose the  icon, enter **Service Tasks**, and then choose the related link.
2. Choose the line that includes the relevant service item, and then choose the **Item Worksheet** action.
3. On the **Service Item Worksheet** page, choose **Fault/Resol. Codes Relationships**. The **Fault/Resolution Codes Relationships** page opens.

[!Note] Filters are set on the relationships that are shown on the page by copying the service item group and the fault codes from the **Service Item Worksheet** page.

4. Fill out the line. Choose the combination of fault and resolution codes, and then choose **OK** to copy it to the service item. If an appropriate combination cannot be found, you can create a new combination on the page.

[Set Up Fault Reporting Allocation Status and Repair Status Service Posting](#)

Service Posting

3/31/2019 • 3 minutes to read

Service posting functionality lets you process your documents efficiently and maintain successful customer service policy. You can create and update posted documents, and create ledger entries both in the service area and in other modules to ensure the correct update.

NOTE

The following describes service posting regardless of how items are physically handled in the warehouse.

In a location that is not set up to require warehouse handling, you perform the posting actions directly from the **Service Lines** page. In locations that involve warehouse handling, the described posting actions, except Ship and Consume, are performed indirectly through varying warehouse ship functions, depending on setup. For more information, see [Pick Items with Inventory Picks](#).

Ship

The ship option lets you register the relevant items and time entered on the lines of a service order after you complete the service. A posted shipment is created and updates occur in the Inventory module and other modules in Business Central to reflect that the items have been taken out of the inventory and sent to the customer. In particular, the item ledger entries, value ledger entries, service ledger entries, and warranty ledger entries are produced.

If the location is set up to require warehouse handling, then the shipping and moving of service line items functions in the same ways as for other source documents. The only difference is that service line items can be consumed either externally or internally, which requires two different release functions.

Invoice

You have to use the invoice option to issue an invoice to the customer you want to charge for the service. Usually, it is the difference between the shipped quantity registered by the **Post Shipment** function and the consumed quantity registered by the **Post Consumption** function that is subject to invoice. You cannot invoice what has not been shipped. When you run the **Post Invoice** function, you create a posted service invoice and update the documents posted before to make them consistent with the quantities that are contained in the issued invoice. Like in other posting procedures, the relevant ledger entries that includes general ledger entries, are generated.

Ship and Invoice

The ship and invoice option lets you issue both a service shipment and an invoice at the same time.

Ship and Consume

With the ship and consume option, you can register and post items, costs, or hours that have been used for servicing but that cannot be included in the invoice to the customer. An invoice is not issued, but you can issue both a service shipment and service consumption at the same time to reflect the fact that some items or hours have been given to the customer free of charge. The corresponding ledger entries are also created to register consumption.

NOTE

The service posting procedure enables you to perform partial posting. You can create a partial shipment or a partial invoice by filling in the **Qty. to Ship** and **Qty. to Invoice** fields on the individual service lines of the service orders before you post. Note that you cannot create an invoice for something that is not shipped. That is, before you can invoice, you must have registered a shipment, or you must choose to ship and invoice at the same time.

After the posting has been completed, you will be able to view the posted service documents from the corresponding **Posted Service Shipment** and **Posted Service Invoice** pages. The posted entries created can be seen in various pages that contain posted entries, such as **G/L Entries**, **Item Ledger Entries**, **Warehouse Entries**, **Service Ledger Entries**, **Job Ledger Entries**, and **Warranty Ledger Entries**.

To view information about a posted service document

When you post a service invoice, a service shipment, or a service credit memo, the information on the document is transferred to the **Posted Service Invoice**, **Posted Service Shipment**, or **Posted Service Credit Memo** pages respectively. You cannot enter, change, or delete anything in these pages. You can print a shipment, invoice, or credit memo from these pages.

The following procedure uses a posted service invoice as an example, but the same procedure can apply to posted service shipments and posted credit memos.

1. Choose the  icon, enter **Posted Service Invoice**, and then choose the related link.
2. Open the posted service invoice you want to view.
3. To get an overview of the posted invoice, choose the **Statistics** action.

The **Service Order Statistics** page opens. The page displays information such as quantity, amount, VAT, cost, profit, and customer credit limit for the posted document.

[Post Service Orders](#)

[Create Service Orders](#)

Post Service Orders and Credit Memos

3/31/2019 • 7 minutes to read

When you have created a service order, filled in all the necessary information and made any modifications, you can post the service order. The order must contain at least one service item line and one service line before you can post it. Should the order contain more than one service line, all the lines are posted at one time.

If you have a large number of service orders, you can save time by using a batch job to post them at the same time. You can run the batch job from any service order.

TIP

Before you post a service document, it's a good idea to use the **Test Report** action to check for any errors or missing information. If there are errors, you must correct the problem. You can print a new test report to verify the fix, and then post the document.

To post a service order

1. Choose the  icon, enter **Service Orders**, and then choose the related link.
2. Open the relevant service order.
3. On the **Service Order** page, choose one of the following actions.

ACTION	RESULT
Test Report	Checks all parts of the document and presents the result in a report. If the report indicates any errors or a lack of information, you must correct the problem. You can then print a new test report.
Post	Posts the order without printing a shipment or an invoice.
Post and Print	Posts the order and prints a shipment (if you ship the order without invoicing it) or an invoice (if you invoice the order).
Post Batch	Posts multiple service orders at one time once.

4. When you post the order, you must specify one of the following options for how you want to post the order.

POSTING OPTION	RESULT
Ship	Posts shipment of the items.
Invoice	Invoices items that have already been shipped.
Ship and Invoice	Invoices and ships the items.

POSTING OPTION	RESULT
Ship and Consume	Posts shipment and consumption on the order. It updates the relevant quantities on the service lines of the order and on the previously posted service shipment document.

You can post consumption only if the line contains a quantity that has shipped but not invoiced or consumed.

When posting the order, the corresponding ledger entries and posted documents are created. The relevant fields are updated in the service order document.

To batch post service orders

1. Choose the  icon, enter **Service Orders**, and then choose the related link.
2. Choose the **Post Batch** action.
3. You can set a filter to select specific service order numbers or an interval of order numbers for the batch job to process.
4. Choose **OK** to start the batch job.

To post a service credit memo

When you have created a service credit memo and filled it in, you can post the credit memo. If there are errors or a lack of information on the credit memo while posting, the process will be interrupted by an error message.

1. Choose the  icon, enter **Service Credit Memos**, and then choose the related link.
2. Create a new service credit memo. On the **Home** tab, in the **New** group, choose **New**.
3. Fill in the necessary fields.
4. On the **Actions** tab, in the **Posting** group, choose **Post**. If you want to print the credit memo at the same time as you post, choose **Post and Print** instead.
5. To test credit memos before you post them, choose **Test Report**. When you run the report, the posting dates specified in the document are verified.
6. To post several service credit memos at the same time, run the **Batch Post Service Cr. Memos** batch job. This can be an advantage if you have a large number of credit memos that must be posted.

NOTE

It is important to enter all the necessary information on the credit memos before they are batch posted. Otherwise, it is possible that they will not be posted. When the batch job has finished posting, a message is displayed that shows how many of the service credit memos have been posted.

To post consumption from a service order

The following procedure describes how to post the items, resource hours, and or costs used for a specific service operation for which you will not charge your customer. Note that you can post consumed items, hours, or costs only for a posted shipment that has no posted invoices or consumption.

1. Choose the  icon, enter **Service Orders**, and then choose the related link.
2. Open the service order to post consumption for.
3. Choose the service item. Choose **Actions**, choose **Order**, and then choose **Service Lines**.
4. Find the required entries, and specify the quantities for which you will post consumption in the **Qty. to Consume** field. The quantity cannot be larger than the quantity already shipped and the quantity

remaining but not invoiced after partial invoicing of this shipment.

NOTE

To register consumption with respect to a job, fill in the **Job No.**, **Job Task No.**, and the **Job Line Type** fields on the service line.

5. Choose the lines to post, and then choose the **Post** action. On the page that opens, select **Ship and Consume**.

The service is posted as consumed either partially or fully, depending on the value in the **Qty. to Consume** field, and the relevant ledger entries are created. In addition, previously posted service shipment documents are updated chronologically with the consumed quantities. The relevant quantities will be updated on the service lines of the order.

To post shipments from service orders

After specifying the details of a service, you can adjust and post the quantities of items used, time spent, and costs incurred. As a result, Business Central makes the necessary changes to reflect the new state of your inventory and current status of the specific order processing.

The following procedure shows how to post shipment of service line items in locations that are not set up to require warehouse handling.

1. Choose the  icon, enter **Service Order**, and then choose the related link. 2. on the page for the selected service order, choose **Actions, Order, Service Lines**.
2. On the **Service Lines** page, find the required entries and specify the quantity to be posted in the **Qty. to Ship** field.

NOTE

The quantity to ship value depends on whether you want to post shipment fully or partially. If you choose to ship fully, the value in the **Qty. to Ship** field must be equal to the value in the **Quantity** field. When you post a partial shipment, you must specify the quantity you want to ship initially. If you have already shipped part of the service on the order, make a note of the value in the **Quantity Shipped** field. The maximum quantity you can enter in the **Quantity to Ship** field is the number of units that have not yet been shipped.

3. Choose **Actions, Posting, Post**. on the page that appears, choose **Ship**.

Business Central creates ledger entries (in the warranty ledger, item ledger, service ledger, or G/L), produces the posted service shipment document, and updates the relevant fields on the service lines of the service order.

If the location is set up to require warehouse handling, then the shipping and moving of service line items function in the same ways as for other source documents. The only difference is that service line items can be consumed either externally or internally and therefore require two different release functions.

For information about shipping service line items in advanced warehouse configurations, see [Picking Items for Warehouse Shipment](#).

To undo posted consumption

You can cancel the consumption on the service orders. For example, because it was posted by mistake.

1. Choose the  icon, enter **Posted Service Shipments**, and then choose the related link.
2. Open the posted service shipment for which the erroneous consumption was posted.

3. Choose **Actions**, choose **Shipment**, and then choose **Service Shipment Lines**.
4. Choose the lines that contain the incorrect consumption, and then choose the **Undo Consumption** action.

A balancing service shipment line is inserted with negative values in the quantity fields for the selected lines.

NOTE

You cannot undo service consumption if:

- The service order has been closed.
- It has been posted to the Jobs area, so there are job ledger entries linked to it.

To post service lines

If you have to work on a service order for a considerable time without posting it, you may want to post some of the service lines linked to it as a way, for example, of keeping your inventory updated. You can post by specifying the relevant quantities on the lines to be posted. You may choose to post the lines one by one or by selecting several lines at a time.

The following procedure describes shipment posting directly from a service order in locations without warehouse handling set up. If the location is set up to require warehouse handling, then shipment posting happens in a different warehouse document, depending on the location setup.

1. Choose the  icon, enter **Service Orders**, and then choose the related link.
2. Open the service order, and then choose the **Service Lines** action.
3. On the lines you are going to post, fill in the **Qty. to Ship**, **Qty. to Invoice**, and **Qty. to Consume** fields, depending on how you will post the lines.
4. Choose the **Post** action.

Lend and Receive Loaners

3/31/2019 • 2 minutes to read

You can lend customers loaners to temporarily replace service items that you have received for servicing.

To lend a loaner item

1. Choose the  icon, enter **Service Orders**, and then choose the related link.
2. Open the relevant service order card.
3. Select the service item line with the service item you want to replace with a loaner.
4. In the **Loaner No.** field, choose the relevant loaner item.
5. Choose **Yes** to confirm the loan.

To receive a loaner

When you receive a loaner from a customer, you must register the receipt. You do this in the **Service Order**, **Posted Service Shipment**, and **Loaner Card** pages. This procedure shows how to receive loaners on the **Service Order** page.

1. Choose the  icon, enter **Service Orders**, and then choose the related link.
2. Open the relevant service order.
3. Choose the service item line with the loaner you want to receive.
4. Choose **Actions**, choose **Functions**, and then choose **Receive Loaner**.

To register loaner comments

You can use the **General Service Comment Sheet** page to register comments on registered loaners.

1. Choose the  icon, enter **Loaners**, and then choose the related link.
2. Open the relevant loaner card.
3. Choose the **Comments** action. The **General Service Comment Sheet** page opens.
4. In the **Date** field, enter a date.
5. In the **Comment** field, enter a comment. You can enter a maximum of 80 characters. If you need to enter additional text, go to the next line. You can fill in as many lines as necessary.

Business Process Walkthroughs

3/31/2019 • 2 minutes to read

This selection of walkthroughs provides step-by-step, end-to-end business processes that you can perform using the CRONUS International Ltd. demonstration company. The walkthroughs consist of multiple procedures, some of which would normally be performed by one user, while others incorporate several different user roles. In order to simulate the working environment, some of the walkthroughs contain setup steps necessary to complete the exercises as described. These steps can provide insight into the kind of information users need to share with their company's IT professionals.

The walkthroughs are complete scenarios, and should be performed from beginning to end for the greatest benefit. Many are based on Business Central demonstrations, and enable you to try those procedures yourself, at your own pace.

NOTE

Some of the walkthroughs use demonstration data that is not available in the standard CRONUS company. For those walkthroughs, you must perform the steps in a company created from the **Full Evaluation - Complete Sample Data** option, which is available in the Sandbox environment. For more information, see [Creating a Sandbox Environment](#).

Walkthrough: Conducting a Sales Campaign

3/31/2019 • 9 minutes to read

A campaign is any kind of activity that involves several contacts. An important part of setting up a campaign involves selecting the target audience for your campaign. For this purpose, in Business Central, you create a segment, or a group of contacts using filters.

You use these features in Sales & Marketing to carefully plan your marketing activities and to manage your interactions with contacts and customers. You can create campaigns and set up segments of your contacts for mailings and other types of interactions with your contacts and prospective customers.

The Campaign and Segment features with their automated processes enable you to plan, organize, and keep track of your marketing activities. This will increase the chances of winning new customers and retaining existing customers.

About This Walkthrough

This walkthrough demonstrates the process for following up on a trade show and targeting potential customers (contacts) in a follow-up campaign.

The walkthrough introduces the campaign and segment management feature in the Sales & Marketing department. This walkthrough illustrates the following tasks:

- Setting up a campaign.
- Selecting the target audience.
- Mining data.
- Sending letters to contacts.
- Registering campaign responses.

Roles

This walkthrough demonstrates tasks that are performed by the following user roles:

- Marketing Manager or Sales Manager
- Marketing Staffer

Prerequisites

Before you can perform the tasks in the walkthrough, you must install the Business Central.

Story

The marketing manager in the Sales department of CRONUS is responsible for planning campaigns and for executing them. He also makes decisions about which trade shows to participate in and he evaluates campaign progress.

The marketing staffer in the Marketing department handles producing, distributing, and placing marketing material.

The company has just launched a new product called the Millennium Server. The product was recently promoted at a trade show, Computer Futurus. Many customers expressed great interest in the product, and as part of a promotional effort, customers who bought Millennium Server during a campaign period were offered a special

campaign price.

One of the marketing staffer's tasks after the trade show is to enter all the potential customers as contacts.

The marketing manager sets up a campaign, creates a segment that contains all the new contacts and then mines the contact data to select the target audience for the campaign.

The staffer helps send out thank you letters to all the contacts who left their cards with the staff at the stand, and finally, the manager records all the responses they receive from the prospective customers.

Setting Up a Campaign

As soon as the staffer has entered the business cards received at the trade show, the marketing manager sets up a campaign card to manage the activities involved in the campaign.

To set up a campaign

1. Choose the  icon, enter **Campaigns**, and then choose the related link.
2. Choose the **New** action to create a new campaign. On the campaign card, press Enter to have a campaign number automatically inserted.
3. In the **Description** field, enter a description for the campaign, for example, **FUTURUS trade show**.
4. Choose the **Status Code** field, and select a status code from the list that opens on the **Campaign Status** page.
5. Fill in the **Starting Date** and **Ending Date** fields of the campaign as appropriate.

Selecting the Target Audience

The marketing manager creates a segment to select the contacts that he wants to interact with.

To create a segment with the relevant contacts

1. Choose the **Segments** action.
2. Choose the **New** action to create a new segment. On the segment card, press Enter to have a segment number automatically inserted.
3. On the **General** FastTab, in the **Description** field, enter, for example, **Visitors at the FUTURUS trade show**.

After entering general information about the segment, select the contacts to be included in the segment.

You can use a variety of criteria to select contacts, for example, you can select contact persons who work at a customer site or a prospective customer site who are responsible for purchases at their company.

You use filters to add contacts according to the criteria that best fit your purposes. For example, you can choose to filter by the job responsibility of the contact person or the business relation or industry of the contact company. For this walkthrough, choose the **Job Responsibility** filter to select contacts.

4. On the **Segment** page, choose the **Add Contacts** action to open the **Add Contacts** filter.
5. On the **Job Responsibility** FastTab, select the **Purchase** filter as the **Job Responsibility Code** and choose the **OK** button.

The **Segment** page now contains a list of contacts based on the filter you entered. On the **General** FastTab, in the **No. of Lines** field, you can see at a glance the number of contacts that meet these criteria.

NOTE

You can save your segmentation criteria to be reused at a later stage.

- a. On the **Segment** page, choose the **Segment** action, and then choose the **Save Criteria** action.
- b. On the **Save Segment Criteria** page, enter a code for the segment. In the **Description** field, enter a description of the segment criteria.
- c. Choose the **OK** button.

Mining the Data

The marketing manager takes a closer look at the segmented list of contacts and realizes that the list is much too big. He decides to reduce the list based on actual, prospective customers to make sure he focuses on the correct target group. This process of refining and reducing the data is also referred to as data mining.

To remove contacts from the segment

1. On the **Segment** page, choose the **Contacts** action, and then choose the **Reduce Contacts** action to open the **Remove Contacts – Reduce** page.
2. On the **Business Relation** FastTab, select the **PROS** filter as the **Business Relation Code**, and choose the **OK** button.

The **Segment** page now contains a reduced list of contacts, and in the **No. of Lines** field, you can see the number of contacts that now meet these new criteria.

NOTE

If you have to reverse this removal of a group of contacts, you can do this using the **Go Back** function. In other words, you can undo your last segmentation.

On the **Segment** page, choose the **Segment** action, and then choose the **Go Back** action.

The contacts that you just removed are added back to the list of contacts.

Linking a Segment to a Campaign

The marketing manager decides that the reduced list is the final list of contacts that he wants to be part of the campaign. He therefore links this segment to the campaign FUTURUS trade show.

To link a segment to the campaign

1. On the **Segment** page, on the **Campaign** FastTab, choose the **Campaign No.** field to select the campaign that you want the segment to be attached to, for example, **CP0001**.
2. Since this segment is the target of the campaign, select the **Campaign Target** check box.

Sending Letters and Email Messages to Contacts

The marketing staffer helps the marketing manager send out correspondence to the prospective customers, in which he thanks them for visiting the trade show.

To use a segment to send a letter to a contact

1. Open the **Segment** card for the **Visitors at the FUTURUS trade show**.
2. On the **Interaction** FastTab, in the **Interaction Template Code** field, select the Business Letter template, code **BUS**.
3. In the **Subject (Default)** field, enter the following example text: **Thank you for visiting the trade show**.

NOTE

This template consists of more than one attachment document, each of them written in a different language. Example languages include English and Danish.

4. Choose the **Language Code (Default)** field to open the **Segment Interaction Languages** page. Select a language code and then choose the **OK** button.
5. You can display the document in the selected language. Choose the **Attachment** action, and then choose the **Open** action.

To respond to the message that requests permission to start Word, choose the **Allow for this client session** option.

This opens the attached Word document so that you can inspect it. You can also take this opportunity to edit and modify the letter. Close Word when you are finished.

6. Enter the subject of the letter in the **Subject** field, in the language selected for the template.
7. Choose the **Log** action.
8. Choose the **Send Attachments** check box to have the attachments printed.
 - a. Select the **Create Follow-up Segment** check box.
 - b. Choose the **OK** button to start the **Log Segment** batch job.
9. The attachments are sent. When the process is done, choose the **OK** button for the message that states that the segment has been logged.

The letters are automatically printed and the segment is logged. Because the segment has been logged, it is no longer in the list of segments but is moved to the list of logged segments. To see that list, Choose the  icon, enter **Logged Segments**, and then choose the related link.

10. After the segment is logged, each letter that is sent is recorded as an interaction, which you can view in the log.

Choose the  icon, enter **Interaction Log Entries**, and then choose the related link. There is an entry for each sent letter.

To send an email message to a contact

1. On the **Interaction** FastTab, in the **Interaction Template Code** field, select the Business Letter template, code **BUS**.
2. In the **Subject (Default)** field, enter the following example text: **Thank you for visiting the trade show**.
3. In the **Correspondence Type** field, choose **E-Mail**.
4. Specify language settings, as in the previous procedure.
5. Choose the **Log** action. The **Log Segment** page opens.
6. Select the **Send Attachments** check box to have the attachments sent by email.
7. Select the **Create Follow-up Segment** check box.
8. Choose the **OK** button.

The letters are automatically sent by email, and the segment is logged. Because the segment has been logged, it is no longer in the list of segments but is saved in the list of logged segments. To see that list, Choose the  icon, enter **Logged Segments**, and then choose the related link.

Registering Campaign Responses

During the next couple of weeks, the prospective customers respond to the letter. The marketing manager wants to keep track of the responses and record these interactions.

For this purpose, set up a segment for the contacts who have responded to the letter.

To register campaign responses

1. On the **Segment** page, expand the **Interaction** FastTab.
2. Choose the **Interaction Template Code** field.

There is no interaction template for recording responses to campaigns. Therefore, create a new template.

3. On the **Interaction Templates** page, choose the **New** action.
4. In the **Code** field, enter **RESP**, and in the **Description** field, enter **Campaign Responses**.
5. Choose the **OK** button.
6. Select this interaction template in the **Interaction Template Code** field and confirm the message that asks if you want to update the segment lines with the same Interaction Template Code.

Now specify that these contacts have responded to the campaign:

7. On the **Campaign** FastTab, in the **Campaign No.** field, select your campaign.
8. Leave the **Campaign No.** field and confirm the message that asks if you want to update the segment lines with the same Interaction Template Code.
9. Select the **Campaign Response** field and confirm the subsequent message.

Log the segment to make sure that the interactions are recorded.

10. On the **Segment** page, choose the **Log** action.
11. On the **Log Segment** page, clear the **Send Attachments** check box, and then choose the **OK** button and confirm the message that appears.

After the segment is logged, an entry for the campaign is automatically created to record this action on the **Campaign Entries** page.

Walkthrough: Setting Up and Invoicing Sales Prepayments

3/31/2019 • 9 minutes to read

Note: This walkthrough must be performed on a demonstration company with the **Full Evaluation - Complete Sample Data** option, which is available in the Sandbox environment. For more information, see [Creating a Sandbox Environment](#).

Prepayments are payments that are invoiced and posted to a sales or purchase prepayment order before final invoicing. You may require a deposit before you manufacture items to order, or you may require payment before you ship items to a customer. You use the prepayments functionality in Business Central to invoice and collect deposits that are required from customers or remit deposits to vendors. Thus, you can make sure that all payments are posted against an invoice.

Prepayment requirements can be defined for a customer or vendor for all items or selected items. After you complete the required setup, you can generate prepayment invoices from sales and purchase orders for the calculated prepayment amount. You can change the default amounts on the invoice as needed. For example, you can send additional prepayment invoices if additional items are added to the order.

About This Walkthrough

This walkthrough will take you through the following scenarios:

- Setting up prepayments
- Creating an order that requires a prepayment
- Creating a prepayment invoice
- Correcting the prepayment requirements on an order
- Applying prepayments to an order
- Invoicing the final amount on an order with prepayment

Roles

This walkthrough includes tasks for the following roles:

- Accounting Manager (Phyllis)
- Order Processor (Susan)
- Accounts Receivable Administrator (Arnie)

Story

Phyllis is an accounting manager. She makes decisions about which customers are required to pay a deposit before items are manufactured or shipped. Phyllis sets up Business Central to calculate prepayments automatically.

Susan is a sales order processor. When a customer calls to place an order, she enters the order into the system while the customer is on the telephone. This way, she can verify prices and payment terms with the customer immediately, and she can make adjustments to the order while she negotiates with the customer.

Arnie works in the Accounts Receivable department, where he posts invoices and payments.

In this scenario, Phyllis sets up prepayment requirements for the customer Selangorian, based on their credit

history, and gives Susan instructions for how to handle their orders.

When the customer calls, Susan negotiates with the customer until they reach an agreement. She can then choose to calculate the prepayment in several different ways.

After Susan sends the prepayment invoice, the customer orders an extra item. Susan updates the order and creates a second prepayment invoice.

Arnie registers the customer's payment and applies it to the invoices, and then sends the final invoice.

Setting Up Prepayments

Phyllis sets up the system to handle prepayments for customers.

- Phyllis decides to have the same number series for prepayments as the one used for sales invoicing.
- Phyllis sets the program to check if prepayments are required before final invoicing on an order.
- Phyllis sets up default values for a required prepayment percentage for particular items and customers.

The following procedures describe how to complete Phyllis' tasks:

To set up number series for prepayments

1. Choose the  icon, enter **Sales & Receivables Setup**, and then choose the related link.
2. On the **Sales & Receivables Setup** page, expand the **Numbering** FastTab.
3. Verify that the number series for posted prepayment invoices in the **Posted Prepmt. Inv. Nos.** field is the same as for posted sales invoices (**Posted Invoice Nos.**) and the number series for posted prepayment credit memos (**Posted Prepmt. Cr. Memo Nos.**) is the same as for posted credit memos (**Posted Credit Memo Nos.**).

To block shipments for unpaid prepayment

1. On the **Sales & Receivables Setup** page, on the **General** FastTab, select the **Check Prepayment when Posting** check box.

Now you cannot ship or invoice an order that has an unpaid prepayment amount.

By default, Phyllis requires customer 20000 to be invoiced for a 30% down payment on all orders. Therefore, she will enter a default prepayment percentage on the customer card.

Phyllis requires all customers to be invoiced a 20% deposit for item 1100. Customer 20000 has a poor payment history. Therefore, she requires a 40% prepayment from customer 20000 for item 1100. The following procedure illustrates how to set up default prepayment percentages.

To assign default prepayment percentages to customers and items

1. Choose the  icon, enter **Customers**, and then choose the related link.
2. Open the card for customer 20000 (Selangorian).
3. In the **Prepayment %** field, type **30**.
4. Choose the **OK** button to close the customer card.
5. Choose the  icon, enter **Items**, and then choose the related link.
6. Open the card for customer 1100.
7. Choose the **Prepayment Percentages** action.
8. Fill in two lines on the **Sales Prepayment Percentages** page as follows.

SALES TYPE	SALES CODE	ITEM NO.	PREPAYMENT %
Customer	20000	1100	40
All Customers		1100	20

IMPORTANT

Depending on your country/region, you must also specify a tax group code on the **Invoicing** FastTab for items 1000 and 1100.

9. Close all pages.

To specify an account for sales prepayments in general posting setup

1. Choose the  icon, enter **General Posting Setup**, and then choose the related link.
2. Select the line where the **Gen. Bus. Posting Group** field is set to **EXPORT**, and the **Gen. Prod. Posting Group** field is set to **RETAIL**, and then choose the **Edit** action.
3. On the **General Posting Setup Card** page, in the **Sales Prepayments Account** field, specify the relevant account.
4. Choose the **OK** button.

Creating an Order that Requires a Prepayment

In the following scenario, Susan, the order processor, creates an order when talking to a customer. The items that the customer orders require a prepayment, and the customer has made some late payments in the past. Therefore, Susan has been instructed to require a fixed amount of 2,000 as a prepayment on the order.

The customer requests to be able to pay 35%, to which Susan can agree. Therefore, she changes the order.

Susan creates the prepayment invoice and sends it to the customer.

To create a sales order with a prepayment

1. Choose the  icon, enter **Sales Orders**, and then choose the related link.
2. Choose the **New** action.
3. In the **Sell-to Customer No.** field, select **20000**.
4. Accept the overdue balance warning that is displayed.
5. Fill in two sales lines with the following information.

TYPE	NO.	QUANTITY
Item	1000	1
Item	1100	1

By default, the prepayment fields on the sales line are hidden, so you must display them.

6. Verify that the **Prepayment %** field on the line with item **1000** contains **30**. The default value was taken from the sales header, which was populated from the customer card.

The **Prepayment %** field on the line with item **1100** contains **40**. This is the percentage you entered on the **Sales Prepayment Percentages** page for item **1100** and customer **20000**.

For more information, see [Set Up Prepayments](#).

7. Choose the **Statistics** action.
8. On the **Prepayment** FastTab, the **Prepmt. Line Amount Excl. VAT** field contains **1,560**. If you create a prepayment invoice for the order now, then this is the amount that is displayed on the invoice.

In this scenario, Susan has been instructed to suggest a total prepayment of 2000 for the order.

IMPORTANT

Depending on your country/region, the following step might not apply.

9. Change the amount in the **Prepmt. Line Amount Excl. VAT** field to **2000** and then close the page.
10. Verify the **Prepayment %** field on the sales lines, and you will see that it has been recalculated to **40.81625**.

The recalculation includes all lines that have a prepayment percentage that is greater than 0.

Now the customer asks if the prepayment percent can be set to 35%. Susan's supervisor approves the change.

11. On the **Sales Order** page, in the **Prepayment %** field, enter **35**.
12. In the warning that appears, choose the **Yes** button. A rate of 35% will be applied as the payment percentage for the whole order.
13. Verify that the lines have been updated accordingly.

Creating a Prepayment Invoice

After entering the correct prepayment values on the order, Susan creates the prepayment invoice and sends it to the customer.

To create a prepayment invoice

1. On the **Sales Order** page, choose the **Post Prepayment Invoice** action.

NOTE

Susan would select **Post and Print Prepmt. Invoice** and mail the invoice to the customer.

Creating an Additional Prepayment Invoice

The following day, the customer calls Susan and makes changes to the order. The customer wants two of item 1100. Susan reopens and updates the order, and then she creates a second prepayment invoice on the order and sends it to the customer.

To create an additional prepayment invoice

1. On the **Sales Order** page, choose the **Reopen** action.
2. On the line for item **1100**, in the **Quantity** field, enter **2**.

Scroll to see the prepayment fields. The **Prepayment Line Amount Excl. VAT** field now contains **630**, and the **Prepmt. Amt. Inv. Excl. VAT** field contains **315**. This shows that there is an additional prepayment amount that has not been invoiced yet.

3. To post an invoice for the additional prepayment amount, on the **Actions** tab, in the **Posting** group,

choose **Prepayment**, and then choose **Post Prepayment Invoice**.

Applying the Prepayments

The customer pays the prepayments amount and Arnie, who works in the accounts department, registers the payment and applies it to the prepayment invoices.

To apply a payment to the prepayment invoices

1. Choose the  icon, enter **Cash Receipt Journals**, and then choose the related link.
2. Fill in a journal line with the following information.

FIELD NAME	ENTER
Document Type	Payment
Account Type	Customer
Account No.	20000

3. Choose the **Apply Entries** action.
4. On the **Apply Customer Entries** page, select the first prepayment invoice, and then choose the **Set Applies-to ID** action.
5. Repeat the previous step for the second prepayment.
6. Choose the **OK** button.

The amount field has now been filled in with the sum of the two prepayment invoices.

7. Post the journal.

Invoicing the Remaining Amount

Now Arnie has been informed that the items on the order have been shipped and that the order is ready for invoicing. Arnie creates the invoice for the order.

To invoice the remaining amount

1. Open the sales order.
2. Choose the **Ship and Invoice** action, and then choose the **OK** button.

NOTE

Normally, the shipping department would have already posted the shipment.

Arnie can view the history to verify that the sales invoice was created as intended.

1. Choose the  icon, enter **Posted Sales Invoices**, and then choose the related link.

Next Steps

This walkthrough has taken you through steps to set up Business Central to handle prepayments. You have set up default prepayment percentages on customers and items, and you have also used different methods to calculate the prepayments on an order. You have tried to assign one total prepayment amount to the order, and you have had the prepayment amount calculated as a percentage of the whole order.

You have also posted a prepayment invoice, created a second prepayment invoice when the order has changed, and posted the final invoice for the remaining amount.

The prepayments functionality in Business Central makes it easy to set up and enforce prepayment rules for customers and items, and it enables you to post every payment against an invoice.

Walkthrough: Setting Up and Using a Purchase Approval Workflow

3/31/2019 • 6 minutes to read

You can automate the process of approving new or changed records, such as documents, journal lines, and customer cards, by creating workflows with steps for the approvals in question. Before you create approval workflows, you must set up an approver and substitute approver for each approval user. You can also set approvers' amount limits to define which sales and purchase records they are qualified to approve. Approval requests and other notifications can be sent as email or internal note. For each approval user setup, you can also set up when they receive notifications.

NOTE

In addition to the Workflow functionality within Business Central, you can integrate to Microsoft Flow to define workflows for events in Business Central. Note that although they are two separate workflow systems, any Flow template that you create with Microsoft Flow is added to the list of workflow templates within Business Central. For more information, see [Using Business Central in an Automated Workflow](#).

You can set up and use workflows that connect business-process tasks performed by different users. System tasks, such as automatic posting, can be included as steps in workflows, preceded or followed by user tasks. Requesting and granting approval to create new records are typical workflow steps. For more information, see [Workflow](#).

About This Walkthrough

This walkthrough illustrates the following tasks:

- Setting up approval users.
- Setting up notifications for approval users.
- Modifying and enabling an approval workflow.
- Requesting approval of a purchase order, as Alicia.
- Receiving a notification and then approving the request, as Sean.

Prerequisites

To complete this walkthrough, you will need the CRONUS International Ltd. demonstration company.

Story

Sean is a super user at CRONUS. He creates two approval users. One is Alicia who represents a purchasing agent. The other is himself representing Alicia's approver. Sean then gives himself unlimited purchase approval rights and specifies that he will receive notifications by internal note as soon as a relevant event occurs. Last, Sean creates the required approval workflow as a copy of the existing Purchase Order Approval Workflow workflow template, leaves all existing event conditions and response options unchanged, and then enables the workflow.

To test the approval workflow, Sean first logs into Business Central as Alicia, and then requests approval of a purchase order. Sean then logs in as himself, sees the note on his Role Center, follows the link to the approval request for the purchase order, and approves the request.

Setting Up Sample Data

Before you can set up approval users and their notification method, you must make sure that two users exist in Business Central: One user will represent Alicia. The other user, yourself, will represent Sean. For more information, see [Managing Users and Permissions](#).

Setting Up Approval Users

When logged in as yourself, set Alicia up as an approval user whose approver is yourself. Set up your approval rights and specify how and when you are notified of approval requests.

To set up yourself and Alicia as approval users

1. Choose the  icon, enter **Approval User Setup**, and then choose the related link.
2. On the **Approval User Setup** page, choose the **New** action.

NOTE

You must set up an approver before you can set up users who require that approver's approval. Therefore, you must set up yourself before you set up Alicia.

3. Set up the two approval users by filling the fields as described in the following table.

USER ID	APPROVER ID	UNLIMITED PURCHASE APPROVAL
YOU		Selected
ALICIA	YOU	

Setting Up Notifications

In this walkthrough, the user is notified by internal note about requests to approve. Approval notification can also be by email. For more information, see [Specify When and How to Receive Notifications](#).

To set up how and when you are notified

1. On the **Approval User Setup** page, select the line for yourself, and then choose the **Notification Setup** action.
2. On the **Notification Setup** page, in the **Notification Type** field, choose **Approval**.
3. In the **Notification Method** field, choose **Note**.
4. On the **Notification Setup** page, choose the **Notification Schedule** action.
5. On the **Notification Schedule** page, in the **Occurrence** field, select **Instantly**.
6. Choose the **OK** button.

Creating the Approval Workflow

Create the purchase order approval workflow by copying the steps from the Purchase Order Approval Workflow workflow template. Leave the existing workflow steps unchanged, and then enable the workflow.

To create and enable a purchase order approval workflow

1. Choose the  icon, enter **Workflows**, and then choose the related link.
2. On the **Workflows** page, choose the **Create Workflow from Template** action.
3. On the **Workflow Templates** page, select the workflow template named Purchase Order Approval Workflow, and then choose the **OK** button.

The **Workflow** page opens for a new workflow containing all the information of the selected template.

The value in the **Code** field is extended with “-01” to indicate that this is the first workflow that is created from the Purchase Order Approval Workflow workflow template.

4. On the header of the **Workflow** page, select the **Enabled** check box.

Using the Approval Workflow

Use the new Purchase Order Approval Workflow workflow by first logging into Business Central as Alicia to request approval of a purchase order. Then log in as yourself, view the note on the Role Center, follow the link to the approval request, and then approve the request.

To request approval of a purchase order, as Alicia

1. Log in as Alicia.
2. Choose the  icon, enter **Purchase Orders**, and then choose the related link.
3. Select the line for open purchase order 104001, and then choose the **Edit** action.
4. On the **Purchase Order** page, choose the **Send Approval Request** action.

Notice that the value in the **Status** field has changed to **Pending Approval**.

To approve the purchase order, as Sean

1. Log in as Sean.
2. On the Role Center, on the **My Notifications** page, look for a new note from Alicia.
3. When the note appears on the **My Notifications** page, choose the **Approval Entry: XX, XX** value in the **Page** field. The **Requests to Approve** page opens with Alicia’s request for the purchase order highlighted.
4. On the **Requests to Approve** page, choose the **Approve** action.

The value in the **Status** field on Alicia’s purchase order changes to **Released**.

You have now set up and tested a simple approval workflow based on the first two steps of the Purchase Order Approval Workflow workflow. You can easily extend this workflow to automatically post Alicia’s purchase order when Sean approves it. To do this, you must enable the Purchase Invoice Workflow workflow, in which the response to a released purchase invoice is to post it. First you must change the event condition on the first workflow step from (purchase) **Invoice** to **Order**.

The generic version of Business Central includes a number of workflow templates for scenarios that are supported by the application code. Most of these are for approval workflows.

You define variations of workflows by filling fields on workflow lines from fixed lists of event and response values representing scenarios that are supported by the application code. For more information, see [Create Workflows](#).

If a business scenario requires a workflow event or response that is not supported, a Microsoft partner must implement them by customizing the application code. For more information, see [Walkthrough: Implementing New Workflow Events and Responses](#) in the developer and IT-pro help.

Walkthrough: Picking and Shipping in Basic Warehouse Configurations

3/31/2019 • 4 minutes to read

Note: This walkthrough must be performed on a demonstration company with the **Full Evaluation - Complete Sample Data** option, which is available in the Sandbox environment. For more information, see [Creating a Sandbox Environment](#).

In Business Central, the outbound processes for picking and shipping can be performed in four ways using different functionalities depending on the warehouse complexity level.

METHOD	INBOUND PROCESS	BINS	PICKS	SHIPMENTS	COMPLEXITY LEVEL (SEE DESIGN DETAILS: WAREHOUSE SETUP)
A	Post pick and shipment from the order line	X			2
B	Post pick and shipment from an inventory pick document		X		3
C	Post pick and shipment from a warehouse shipment document			X	4/5/6
D	Post pick from a warehouse pick document and post shipment from a warehouse shipment document		X	X	4/5/6

For more information, see [Design Details: Outbound Warehouse Flow](#).

The following walkthrough demonstrates method B in the previous table.

About This Walkthrough

In basic warehouse configurations where your location is set up to require pick processing but not ship processing, you use the **Inventory Pick** page to record and post pick and ship information for your outbound source documents. The outbound source document can be a sales order, purchase return order, outbound transfer order, or a production order with component need.

This walkthrough demonstrates the following tasks:

- Setting up SILVER location for inventory picks.

- Creating a sales order for customer 10000 for 30 loudspeakers.
- Releasing the sales order for warehouse handling.
- Creating an inventory pick based on a released source document.
- Registering the warehouse movement from the warehouse and at the same time posting the sales shipment for the source sales order.

Roles

This walkthrough demonstrates tasks that are performed by the following user roles:

- Warehouse Manager
- Order Processor
- Warehouse Worker

Prerequisites

To complete this walkthrough, you will need:

- CRONUS International Ltd. installed.
- To make yourself a warehouse employee at SILVER location by following these steps:
 1. Choose the  icon, enter **Warehouse Employees**, and then choose the related link.
 2. Choose the **User ID** field, and select your own user account on the **Users** page.
 3. In the **Location Code** field, enter SILVER.
 4. Select the **Default** field.
- Make item LS-81 available at SILVER location by following these steps:
 1. Choose the  icon, enter **Item Journals**, and then choose the related link.
 2. Open the default journal, and then create two item journal lines with the following information about the work date (January 23).

ENTRY TYPE	ITEM NUMBER	LOCATION CODE	BIN CODE	QUANTITY
Positive Adjmt.	LS-81	SILVER	S-01-0001 Note: The item's default bin in CRONUS	20
Positive Adjmt.	LS-81	SILVER	S-01-0002	20

3. Choose the **Post** action, and then select the **Yes** button.

Story

Ellen, the warehouse manager at CRONUS, sets up SILVER warehouse for basic pick handling where warehouse workers process outbound orders individually. Susan, the order processor, creates a sales order for 30 units of item LS-81 to be shipped to customer 10000 from the SILVER Warehouse. John, the warehouse worker must make sure that the shipment is prepared and delivered to the customer. John manages all involved tasks on the **Inventory Pick** page, which automatically points to the bins where LS-81 is stored.

Setting Up the Location

The setup of the **Location Card** page defines the company's warehouse flows.

To set up the location

1. Choose the  icon, enter **Locations**, and then choose the related link.
2. Open the SILVER location card.
3. Select the **Require Pick** check box.

Creating the Sales Order

Sales orders are the most common type of outbound source document.

To create the sales order

1. Choose the  icon, enter **Sales Orders**, and then choose the related link.
2. Choose the **New** action.
3. Create a sales order for customer 10000 on the work date (January 23) with the following sales order line.

ITEM	LOCATION CODE	QUANTITY
LS_81	SILVER	30

Proceed to notify the warehouse that the sales order is ready for warehouse handling.

4. Choose the **Release** action.

John proceeds to pick and ship the sold items.

Picking and Shipping Items

On the **Inventory Pick** page, you can manage all outbound warehouse activities for a specific source document, such as a sales order.

To pick and ship items

1. Choose the  icon, enter **Inventory Picks**, and then choose the related link.
2. Choose the **New** action.
3. Select the **Source Document** field, and then select **Sales Order**.
4. Select the **Source No.** field, select the line for the sale to customer 10000, and then choose the **OK** button.

Alternatively, choose the **Get Source Document** action, and then select the sales order.

5. Choose the **Autofill Qty. to Handle** action.

Alternatively, in the **Qty. to Handle** field, enter 10 and 30 respectively on the two inventory pick lines.

6. Choose the **Post** action, select **Ship**, and then choose the **OK** button.

The 30 loudspeakers are now registered as picked from bins S-01-0001 and S-01-0002, and a negative item ledger entry is created reflecting the posted sales shipment.

Walkthrough: Receiving and Putting Away in Advanced Warehouse Configurations

3/31/2019 • 7 minutes to read

Note: This walkthrough must be performed on a demonstration company with the **Full Evaluation - Complete Sample Data** option, which is available in the Sandbox environment. For more information, see [Creating a Sandbox Environment](#).

In Business Central, the inbound processes for receiving and putting away can be performed in four ways using different functionalities depending on the warehouse complexity level.

METHOD	INBOUND PROCESS	BINS	RECEIPTS	PUT-AWAYS	COMPLEXITY LEVEL (SEE DESIGN DETAILS: WAREHOUSE SETUP)
A	Post receipt and put-away from the order line	X			2
B	Post receipt and put-away from an inventory put-away document			X	3
C	Post receipt and put-away from a warehouse receipt document		X		4/5/6
D	Post receipt from a warehouse receipt document and post put-away from a warehouse put-away document		X	X	4/5/6

For more information, see [Design Details: Inbound Warehouse Flow](#).

The following walkthrough demonstrates method D in the previous table.

About This Walkthrough

In advanced warehouse configurations where your location is set up to require receiving processing in addition to put-away processing, you use the **Warehouse Receipt** page to record and post the receipt of items on multiple inbound orders. When the warehouse receipt is posted, one or more warehouse put-away documents are created to instruct warehouse workers to take the received item and place them in designated places according to bin setup or in other bins. The specific placement of the items is recorded when the warehouse put-away is registered. The inbound source document can be a purchase order, sales return order, inbound transfer order, or assembly or production order with output that is ready to be put away. If the receipt is created from an inbound order, more

than one inbound source document can be retrieved for the receipt. By using this method you can register many items arriving from different inbound orders with one receipt.

This walkthrough demonstrates the following tasks.

- Setting up WHITE location for receiving and putting away.
- Creating and releasing two purchase orders for full warehouse handling.
- Creating and posting a warehouse receipt document for multiple purchase order lines from specific vendors.
- Registering a warehouse put-away for the received items.

Roles

This walkthrough demonstrates tasks that are performed by the following user roles:

- Warehouse Manager
- Purchasing Agent
- Receiving Staff
- Warehouse Worker

Prerequisites

To complete this walkthrough, you will need:

- CRONUS International Ltd. installed.
- To make yourself a warehouse employee at WHITE location by following these steps:
 1. Choose the  icon, enter **Warehouse Employees**, and then choose the related link.
 2. Choose the **User ID** field, and select your own user account on the **Users** page.
 3. In the **Location Code** field, enter WHITE.
 4. Select the **Default** field.

Story

Ellen, the warehouse manager at CRONUS International Ltd., creates two purchase orders for accessory items from vendors 10000 and 20000 to be delivered to WHITE warehouse. When the deliveries arrive at the warehouse, Sammy, who is responsible for receiving items from vendors 10000 and 20000, uses a filter to create receipt lines for purchase orders arriving from the two vendors. Sammy posts the items as received into inventory in one warehouse receipt and makes the items available for sale or other demand. John, the warehouse worker, takes the items from the receiving bin and puts them away. He puts all units away in their default bins, except 40 out of 100 received hinges that he puts away in the assembly department by splitting the put-away line. When John registers the put-away, the bin contents are updated and the items are made available for picking from the warehouse.

Reviewing the WHITE Location Setup

The setup of the **Location Card** page defines the company's warehouse flows.

To review the location setup

1. Choose the  icon, enter **Locations**, and then choose the related link.
2. Open the WHITE location card.
3. Note on the **Warehouse** FastTab that the **Directed Put-away and Pick** check box is selected.

This means that the location is set up for the highest complexity level, reflected by the fact that all

warehouse handling check boxes on the FastTab are selected.

4. Note on the **Bins** FastTab that bins are specified in the **Receipt Bin Code** and the **Shipment Bin Code** fields.

This means that when you create a warehouse receipt, this bin code is copied to the header of the warehouse receipt document by default and to the lines of the resulting warehouse put-aways.

Creating the Purchase Orders

Purchase orders are the most common type of inbound source document.

To create the purchase orders

1. Choose the  icon, enter **Purchase Orders**, and then choose the related link.
2. Choose the **New** action.
3. Create a purchase order for vendor 10000 on the work date (January 23) with the following purchase order lines.

ITEM	LOCATION CODE	QUANTITY
70200	WHITE	100 PCS
70201	WHITE	50 PCS

Proceed to notify the warehouse that the purchase order is ready for warehouse handling when the delivery arrives.

4. Choose the **Release** action.

Proceed to create the second purchase order.

5. Choose the **New** action.
6. Create a purchase order for vendor 20000 on the work date with the following purchase order lines.

ITEM	LOCATION CODE	QUANTITY
70100	WHITE	10 CAN
70101	WHITE	12 CAN

Choose the **Release** action.

The deliveries of items from vendors 10000 and 20000 have arrived at WHITE warehouse, and Sammy starts to process the purchase receipts.

Receiving the Items

On the **Warehouse Receipt** page, you can manage multiple inbound orders for source documents, such as a purchase order.

To receive the items

1. Choose the  icon, enter **Warehouse Receipts**, and then choose the related link.
2. Choose the **New** action.

3. In the **Location Code** field, enter WHITE.
4. Choose the **Use Filters to Get Src. Docs.** action.
5. In the **Code** field, enter **ACCESSORY**.
6. In the **Description** field, enter **Vendors 10000 and 20000**.
7. Choose the **Modify** action.
8. On the **Purchase** FastTab, in the **Buy-from Vendor No. Filter** field, enter **10000|20000**.
9. Choose the **Run** action. The warehouse receipt is filled with four lines representing purchase order lines for the specified vendors. The **Qty. to Receive** field is filled because you did not select the **Do not Fill Qty. to Handle** check box on the **Filters to Get Source Docs.** page.
10. Optionally, if you want to use a filter as described earlier in this section, choose the **Get Source Document** action, and then select purchase orders from the vendors in question.
11. Choose the **Post Receipt** action, and then choose the **Yes** button.

Positive item ledger entries are created reflecting the posted purchase receipts of accessories from vendors 10000 and 20000, and the items are ready to be put away in the warehouse from the receiving bin.

Putting the Items Away

On the **Warehouse Put-away** page, you can manage put-aways for a specific warehouse receipt document covering multiple source documents. Like all warehouse activity documents, each item on the warehouse put-away is represented by a Take line and a Place line. In the following procedure, the bin code on the Take lines is the default receiving bin at WHITE location, W-08-0001.

To put the items away

1. Choose the  icon, enter **Put-Aways**, and then choose the related link.
2. Select the only warehouse put-away document in the list, and then on the **Home** tab, in the **Manage** group, choose **Edit**.

The warehouse put-away document opens with a total of eight Take or Place lines for the four purchase order lines.

The warehouse worker is told that 40 hinges are needed in the assembly department, and he proceeds to split the single Place line to specify a second Place line for bin W-02-0001 in the assembly department where he places that part of the received hinges.

3. Select the second line on the **Warehouse Put-away** page, the Place line for item 70200.
4. In the **Qty. to Handle** field, change the value from 100 to 60.
5. On the **Lines** FastTab, choose **Functions**, and then choose **Split Line**. A new line is inserted for item 70200 with 40 in **Qty. to Handle** field.
6. In the **Bin Code** field, enter W-02-0001. The **Zone Code** field is automatically filled.

Proceed to register the put-away.

7. Choose the **Register Put-Away** action, and then choose the **Yes** button.

The received accessories are now put-away in the items' default bins, and 40 hinges are placed in the assembly department. The received items are now available for picking to internal demand, such as assembly orders, or to external demand, such as sales shipments.

Walkthrough: Planning Supplies Manually

3/31/2019 • 10 minutes to read

Note: This walkthrough must be performed on a demonstration company with the **Full Evaluation - Complete Sample Data** option, which is available in the Sandbox environment. For more information, see [Creating a Sandbox Environment](#).

This walkthrough demonstrates the process of planning supply orders to fulfill new demand. You can initiate supply planning at fixed intervals, for example, every morning or every Monday, or when you are notified by sales or production, depending on the type of demand. In this walkthrough you will use the **Order Planning** page, a simple supply planning tool that is based on manual decision-making instead of parameter-based automatic planning.

About This Walkthrough

This walkthrough illustrates the following tasks:

- Planning a purchase order for manufacturing components.
- Planning a transfer order to fulfill sales demand.
- Planning a production order for a multilevel item.

Roles

This walkthrough demonstrates tasks performed by the following user roles:

- Production Planner
- Purchasing Agent
- Sales Order Processor

Prerequisites

Before you begin this walkthrough, you must install the Business Central. The following modifications must be made to the database:

- Delete all existing sales orders for bicycles.
- Create one sales order for 10 bicycles at BLUE location.
- Delete all planned and firm planned production orders. Do not delete started orders with entries that are already posted.

As a rule, use the suggested data in this walkthrough because this data has the necessary records.

Story

Eduardo, the Production Planner of a small manufacturing company, is about to plan production and purchase orders to fulfill new sales demand.

Because the products have few BOM levels and the flow of orders is relatively low, Eduardo uses the **Order Planning** page to manually create supply orders, one product level at a time.

In a more complex manufacturing environment, the planning worksheet is used to plan supply based on item parameters such as rescheduling period, safety lead time, reorder point, and batch calculations of consolidated

demand from all product levels.

Setting Up the Sample Data

The standard CRONUS demonstration company currently has lots of unplanned demand. During the different planning tasks in this walkthrough, you will have to deviate from the realistic business flow by ignoring demand with close due dates and instead use demand with later due dates.

Using the Order Planning Page

To use the Order Planning page

1. Choose the  icon, enter **Order Planning**, and then choose the related link.

When the **Order Planning** page first opens, a plan must be calculated to show the new demand since it was last calculated.

2. Choose the **Calculate Plan** action.

The planning system analyzes any new demand that has been introduced, such as new sales, changed sales, or production orders.

Based on total availability, the quantity needed for each demand line is calculated. This calculation is performed order-by-order. This means that the order which includes the demand line with the earliest due date or shipment date will be calculated first. After that, additional demand lines will be calculated in the same order, regardless of the due date or shipment date.

3. Be sure that the **Order Planning** page is maximized and that column fields are resized to show all the default field names.

When the calculation is completed, the page displays all unfulfilled demand as collapsed order header lines sorted by earliest demand date.

Notice that CRONUS has several orders with unfulfilled demand. Each bold planning line represents an order, sales order, or production order, including at least one order line with insufficient availability.

4. In the **Show Demand As** field, select the **All Demand** filter.

With the **Demand Type** field, you can choose which order types that you want to display.

Orders that do not have availability problems are not shown. If no orders exist when a plan is calculated, a message will display and no planning lines will appear.

Planning a Purchase Order to Fulfill Component Demand

In this procedure, you create a purchase order for needed manufacturing components.

To plan a purchase order to fulfill component need in production

1. Expand the first line (choose the + symbol).
2. Choose the first demand line, with item **LSU-15**, and then choose the **Show Document** action.
3. Close the opened production order to return to the **Order Planning** page.
4. In the **Replenishment System** field, select **Purchase**.

The default value is from the item card, or SKU card, but you can change it to one of the following options:

- **Purchase** – To create a purchase order.
- **Transfer** – To create a transfer order.

- **Prod. Order** – To create a production order.

5. In the **Supply From** field, select one of the following options according to the selected replenishment system:

- **Vendor** – For purchases
- **Location** – For transfers

If the field is not filled in, an error message will display when you try to create the supply orders.

NOTE

If the components have a default vendor number set up on the item cards, the lines will be preset.

6. Choose the **Supply From** field.

7. On the **Item Vendor Catalogue** page, choose the **New** action, and then select vendor **30000**.

8. Choose the **OK** button to return to the **Order Planning** page.

9. Copy vendor **30000** to the other lines for loudspeaker components on this production order.

You are now ready to create a purchase order.

10. Choose the **Make Orders** action. The **Make Supply Orders** page opens.

11. On the **Order Planning** FastTab, in the **Make Orders for** field, choose the **Active Order** option.

12. On the **Options** FastTab, in the **Create Purchase Order** field, choose the **Make Purch. Order** option.

13. Choose the **OK** button to create purchase orders for all the components of the order.

The purchase orders are now created and saved as the last orders in the list of purchase orders.

Planning a Transfer Order to Fulfill Sales Demand

In this procedure, you will plan for demand from a sales order. Demand lines represent sales lines and not component lines, as in production demand.

To plan a transfer order to fulfill sales demand

1. Move the pointer to the planning line for order **2008**.
2. Expand the line and move the pointer to the demand line.

Sales order **2008** is for ten loudspeakers, item **LS-120**, ordered by John Haddock Insurance Co.

The item's defined replenishment system and default vendor will display.

NOTE

At the bottom of the page, there are four information fields. In the **Earliest Date Available** field, the ten pieces that are needed will be available, on an inbound supply order, nine days later than the current due date. If this is too late for the customer, the **Available for Transfer** field shows 13 pieces of the item at another location. You will want to plan for this stock.

3. Choose the **Available for Transfer** field to open the **Get Alternative Supply** page.

4. Choose the **OK** button to book the ten items that are available.

NOTE

In the demand line, the suggested purchase has been exchanged with a transfer from GREEN location. The **Make Orders** function creates a transfer order from GREEN to the demanded location. The **Substitutes Exists** field works in the same way.

5. Choose the **Make Orders** action. The **Make Supply Orders** page opens.
6. On the **Order Planning** FastTab, in the **Make Orders for** field, choose the **The Active Order** option.
7. On the **Options** FastTab, in the **Create Transfer Order** field, select the **Make Trans. Orders** option.
8. Choose the **OK** button to create the transfer order to supply the sales order.

The transfer order is now created and saved in the list as the last order in the list of open transfer orders.

Planning a Multilevel Production Order to Fulfill Sales Demand

In this procedure, you will plan to fulfill sales demand for a produced item with multiple product levels, each creating dependent production demand.

To plan multilevel production to fulfill sales demand

1. Select the planning line with sales demand for order **1001**, created earlier as prerequisite data.

This demand is a sales line, but the item has a defined replenishment system of **Prod. Order**. Proceed to add an extra bell to the component need of each bicycle.

2. Choose the **Components** action to open the **Planning Components** page.
3. On the line with the Bell item, change the **Quantity per** field from **1** to **2**.
4. On the **Order Planning** page, consider your planning alternatives. In this case, you have no alternative means of supply, no transfer, substitute, or later delivery. You must create the suggested supply order, a production order.
5. Choose the **Make Orders** action to create the production order.

On the **Order Planning** page, notice that the planning line for sales order **1001** no longer exists and that the initial sales demand has been covered.

6. Close the **Order Planning** page.

Now, you could choose to stay in this view and complete all the planning tasks. Instead, you will now take on the Production Planner role by going to the production order that you just created and access the **Order Planning** page.

As a production planner you now must plan a specific production order.

To plan a specific production order

1. Open the production order **101001**, for ten bicycles, that you just created by using the **Make Orders** function.
2. Open the **Prod. Order Components** page to check that the extra bell is reflected on the production order.
3. Choose the **Planning** action.

The **Order Planning** page opens in a view that is always filtered on the specific production demand. Sales demand is not displayed. You must calculate a plan before you can see any additional demand.

4. Choose the **Calculate Plan** action.

Notice that four new production orders appear as unplanned production demand derived from order **101001**. The new lines represent new production demand from the subassemblies that must be created to produce the order.

5. Choose the **Expand All** action to get an overview of all the production demand for the production orders.

To provide additional information about the demand lines, you may want to add the **Demand Quantity** and **Demand Qty. Available** fields to your view.

Now you must supply ten of each component.

Note that four of the demand lines have replenishment system Prod. Order. These four subassemblies represent the second product level of the bicycle.

The default replenishment settings are already filled in and you can proceed to make orders.

6. Choose the **Make Orders** action.

Before you choose the **OK** button, notice the text on the **Order Planning** FastTab. This text is important because you know that the bicycle has several produced components, subassemblies, in its product structure that might be in demand when you create this production order.

7. On the **Make Supply Order** page, in the **Make Orders for** field, choose the **All Lines** option, and then choose the **OK** button to create production orders for the second product level of the order.

Note that the top-level production demand for production order 101001 no longer exists. This means that the initial production demand for subassemblies has been planned for.

On the **Order Planning** page, you calculate a plan again in order to plan the bicycle structure.

8. Choose the **Calculate Plan** action to recalculate the plan as instructed by the embedded Help text.

The two new lines represent additional production demand derived from the subassemblies planned in the previous steps. It is suggested that you make two production orders to supply the wheel hubs, one for 10 front hubs and one for 10 back hubs.

9. Choose the **Expand All** action to get an overview of all the demand for the two production orders.

The suggested supply plan indicates that a total of four purchase orders will be created for the components. You decide to make the proposed orders.

10. Choose the **Make Orders** action.

11. In the **Make Orders for** field, select the **All Lines** option, and then choose the **OK** button. Check if additional demand exists for the production of the parent item, the bicycle, which is being sold on sales order 1001.

12. Choose the **Calculate Plan** action.

The message indicates that all required items are now supplied. Verify the firm planned production orders that are created.

13. Choose the  icon, enter **Firm Planned Prod. Orders**, and then choose the related link.

On the **Firm Planned Prod. Orders** page review how start times and end times of individual orders are scheduled according to the product structure. The lowest-level components are produced first. Therefore, you must plan multilevel orders as demonstrated in this planning workflow.

Business Process Walkthroughs
Walkthrough: Planning Supplies Automatically

Walkthrough: Planning Supplies Automatically

3/31/2019 • 14 minutes to read

Note: This walkthrough must be performed on a demonstration company with the **Full Evaluation - Complete Sample Data** option, which is available in the Sandbox environment. For more information, see [Creating a Sandbox Environment](#).

Phrases like “run planning” and “run MRP” refer to the calculation of the master production schedule (MPS) and the material requirements plan (MRP) based on actual and forecasted demand.

- MPS is the calculation of a master production schedule based on actual demand and the demand forecast. The MPS calculation is used for end items that have a forecast or a sales order line. These items are called “MPS items” and are identified dynamically when the calculation starts.
- MRP is the calculation of material requirements based on actual demand for components and the demand forecast on the component level. MRP is calculated only for items that are not MPS items. The overall purpose of MRP is to provide time-phased formal plans, by item, to supply the right item at the right time, in the right place, in the right quantity.

The planning algorithms used for both MPS and MRP are identical. The planning algorithms use netting, reuse of existing supply orders, and action messages. The planning system process examines what is needed or will be needed (demand) and what is available or expected (supply). When these quantities are netted against each other, action messages are displayed in the planning worksheet. Action messages are suggestions to create a new supply order, change a supply order (quantity or date), or cancel an existing supply order. Supply orders can be production orders, purchase orders, and transfer orders. For more information, see [Design Details: Supply Planning](#).

The planning result is calculated partly from the demand-supply sets in the database and partly by the setup of stockkeeping unit cards or item cards, production BOMs, and routings.

About This Walkthrough

This walkthrough demonstrates how to use the supply planning system to automatically plan all the purchase and production orders required to produce 15 touring bicycles demanded on different sales orders. To provide a clear and realistic walkthrough, the number of planning lines is delimited by filtering out all other demand-supply sets in the CRONUS International Ltd. demonstration company except the sales demand at location BLUE.

This walkthrough illustrates the following tasks:

- Creating the sales order and calculating a complete supply plan.
- Viewing planning parameters and order tracking entries behind the planning lines.
- Automatically creating the suggested supply orders.
- Creating new sales demand and replanning accordingly.

Roles

- Production Planner
- Purchasing Agent

Prerequisites

To complete this walkthrough, you will need:

- The CRONUS International Ltd. demonstration company.
- To change various item setup values by following the steps in the "Preparing Sample Data" section, later in this walkthrough.

Story

The customer, Cannon Group PLC, orders five touring bikes for shipment on 02-05-2014 (February 5).

Eduardo, the production planner, performs the routine supply planning for the first week of February 2014. He filters on his own location, BLUE, and enters a planning interval of the work date (01-23-2014) to 02-07-2014 before he calculates an initial supply plan.

The only demand that week is for the Cannon Group sales order. Eduardo sees that none of the planning lines have warnings, and he proceeds to create supply orders without changes for the suggested planning lines.

The next day, before any of the initial supply orders are started or posted, Eduardo is notified that another customer has ordered ten touring bikes for shipment on 02-12-2014. He recalculates to adjust the supply plan according to the change of demand. The recalculation gives you a net change plan that suggests changes to both time and quantity of some of the supply orders created in the first run.

During the various planning steps, Eduardo looks up the involved orders, and uses the Order Tracking feature to see which demand is covered by which supply.

Preparing Sample Data

Create stockkeeping units (SKUs) for the touring bike and a selection of its components, item numbers 1001 to 1300. (Some components are excluded to simplify the procedures.) Adjust the planning parameters of the selected components to provide a more transparent planning result.

To create stockkeeping units

1. Open the item card for item 1001, Touring Bicycle.
2. Choose the **Create Stockkeeping Unit** action.
3. On the **Create Stockkeeping Unit** page, leave all options and filters unchanged, and then choose the **OK** button.
4. Repeat steps 1 through 3 for all items in the number range between 1100 and 1300.

To change selected planning parameters

1. Choose the  icon, enter **Stockkeeping Units**, and then choose the related link.
2. Open the BLUE stockkeeping unit card for item 1100, Front Wheel.
3. On the **Planning** FastTab, fill in the fields as described in the following table.

REORDERING POLICY	SAFETY STOCK QUANTITY	LOT ACCUMULATION PERIOD	RESCHEDULING PERIOD
Lot-for-Lot	Blank	2W	2W

4. Repeat steps 2 and 3 for all SKUs in the number range between 1100 and 1300.

This completes the preparation of sample data for the walkthrough.

Creating a Regenerative Supply Plan

In reaction to a new sales order for five touring bikes, Ricardo begins the planning process by setting options, filters, and planning interval to exclude all other demand except that of the first week of February at location BLUE.

He begins by calculating a master production schedule (MPS), and then proceeds to calculate a complete supply plan for all lower-level demand (MRP).

To create the sales order

1. Choose the  icon, enter **Sales Orders**, and then choose the related link.
2. Choose the **New** action.
3. On the **Sales Order** page, fill in the fields as described in the following table.

SELL-TO CUSTOMER NAME	SHIPMENT DATE	ITEM NO.	LOCATION	QUANTITY
Cannon Group	02-05-2014	1001	BLUE	5

4. Accept the availability warning and choose the **Yes** button to record the new demand quantity.

To create a regenerative plan to fulfill demand at location BLUE

1. Choose the  icon, enter **Planning Worksheet**, and then choose the related link.
2. Choose the **Calculate Regenerative Plan** action.
3. On the **Calculate Plan - Plan. Wksh.** page, fill in the fields as described in the following table.

CALCULATE PLAN	STARTING DATE	ENDING DATE	SHOW RESULTS:	LIMIT TOTALS TO
MPS = Yes	01-23-2014	02-07-2014	1001..1300	Location Filter = BLUE
MRP = No	(work date)			

4. Choose the **OK** button to start the planning run.

One planning line is created suggesting that a planned production order be issued to produce the ten touring bikes, item 1001, by 02-05-2014, the shipment date of the sales order.

Next, verify that this planning line relates to the Cannon Group sales order by using the **Order Tracking** function, which dynamically links demand with its planned supply.

5. Select the new planning line, and then choose the **Order Tracking** action.
6. On the **Order Tracking** page, choose the **Show** action.

The sales order for five touring bikes shipping to customer number 10000 on 02-05-2014, is shown.

7. Close the **Sales Order** and **Order Tracking** pages.

To calculate MRP to include underlying component needs

1. Choose the  icon, enter **Planning Worksheet**, and then choose the related link.
2. Choose the **Calculate Regenerative Plan** action.
3. On the **Calculate Plan - Plan. Wksh.** page, fill in the fields as described in the following table.

CALCULATE	STARTING DATE	ENDING DATE	SHOW RESULTS:	LIMIT TOTALS TO:
MPS = Yes	01-23-2014	02-07-2014	1001..1300	Location Filter = BLUE
MRP = Yes				

4. Choose the **OK** button to start the planning run.

A total of 14 planning lines are created suggesting supply orders for all the demand that the touring bike sales order at BLUE location represents.

Analyzing the Planning Result

To analyze the suggested quantities, Eduardo drills down on selected planning lines to view order tracking entries and planning parameters.

On the **Planning Worksheet** page, note in the **Due Date** column that the suggested supply orders are scheduled backward from the due date of the sales order, 02-05-2014. The timeline begins on the top planning line with the production order to produce the finished touring bikes. The timeline ends on the bottom planning line with the purchase order for one of the lowest-level items, 1255, Socket Back, due on 01-30-2014. Like the planning line for item 1251, Axle Back Wheel, this line represents a purchase order for components that are due on the starting date of its produced parent, subassembly item 1250, which in turn is due on 02-03-2014. Throughout the worksheet, you can see that all underlying items are due on the starting date of their parents.

The planning line for item 1300, Chain Assy, suggests ten pieces. This deviates from the five pieces that we expect to need to fulfill the sales order. Proceed to view the order tracking entries.

To view order tracking entries for item 1300

1. Select the planning line for item 1300, and then choose the **Order Tracking** action.

The two lines on the **Order Tracking** page show that five pieces are tracked from the planning line (first order tracking line) to sales order 1001 (second order tracking line). The last five pieces suggested on the planning line are not related to any document lines, but to a planning parameter, forecast entry, or blanket order entry. Such untracked quantities are summed in the **Untracked Quantity** field in the header of the **Order Tracking** page.

2. Choose the **Untracked Quantity** field.

The **Untracked Planning Elements** page shows that item 1300 uses a planning parameter, Minimum Order Quantity, of 10.00. Therefore, the planning line is for ten pieces in total, of which only five can be tracked to a demand. The last five pieces are an untracked quantity to satisfy the planning parameter. Proceed to review the planning parameter.

To check the planning parameter

1. On the **Untracked Planning Elements** page, select the order tracking line for item 1300.
2. Choose the **Item No.** field, and then choose the **Advanced** action.
3. On the **Item List** page, choose the **Stockkeeping Units** action.
4. On the **Stockkeeping Unit List** page, open the BLUE stockkeeping unit card.
5. On the **Planning** FastTab, note that the **Minimum Order Quantity** field contains 10.
6. Close all pages except the **Planning Worksheet** page.

To view more order tracking entries

1. Select the planning line for item 1110, Rim, and then choose the **Order Tracking** action.

The **Order Tracking** page shows that five rims are needed for each production order for front and back wheels respectively.

The same order tracking applies to the planning lines for items 1120, 1160, and 1170. For item 1120, the **Quantity per** field on the production BOM of each wheel item is 50 PCS, which result in a total need of 100.

The planning line for item 1150 for six pieces looks irregular. Proceed to analyze.

2. Select the planning line for item 1150, and then, on then choose the **Order Tracking** action.

The **Order Tracking** page shows that five units are tracked to the front wheel, and one unit is untracked. Proceed to view the untracked quantity.

3. Choose the **Untracked Quantity** field.

The **Untracked Planning Elements** page shows that item 1150 uses a planning parameter, Order Multiple, of 2.00, which specifies that when the item is ordered, it must be in a quantity that is divisible by 2. The closest number to 5 that is divisible by 2 is 6.

The same order tracking applies to the planning lines for the Front Hub components, items 1151 and 1155, except that each need is multiplied by the scrap percentage that is defined for item 1150 in the **Scrap Percentage** field on the item card.

This completes the analysis of the initial supply plan. Notice that the **Accept Action Message** check box is selected in all planning lines indicating that they are ready to be converted to supply orders.

Carrying Out Action Messages

Next, Eduardo converts the suggested planning lines to supply orders by using the **Carry Out Action Msg.** function.

To automatically create the suggested supply orders

1. Select the **Accept Action Message** check box on all planning lines with a warning of type Exception.
2. Choose the **Carry Out Action Message** action.
3. On the **Carry Out Action Msg.-Plan.** page, fill in the fields as described in the following table.

PRODUCTION ORDER	PURCHASE ORDER	TRANSFER ORDER
Firm Planned	Make Purch. Orders	Make Trans. Orders

4. Choose the **OK** button to automatically create all the suggested supply orders.
5. Close the empty **Planning Worksheet** page.

This completes the initial calculation, analysis, and creation of a supply plan for demand at location BLUE in the first week of February. In the following section, another customer orders ten touring bikes, and Eduardo must replan.

Creating a Net Change Plan

The next day, before any supply orders are started or posted, a new sales order arrives from Libros S.A. for ten touring bikes to be shipped on 02-12-2014. Eduardo is notified of the new demand, and he proceeds to replan in order to adjust the current supply plan. Eduardo uses the Net Change Plan function to calculate only the changes that are made to demand or supply since the last planning run. In addition, he expands the planning period to 02-14-2014 to include the new sales demand on 02-12-2014.

The planning system calculates the best way to cover the demand for these two identical products, such as to consolidate some purchase and production orders, reschedule other orders, and create new orders where it is required.

To create the new sales demand and replan accordingly

1. Choose the **New** action.
2. On the **Sales Order** page, fill in the fields as described in the following table.

SELL-TO CUSTOMER NAME	SHIPMENT DATE	ITEM NO.	LOCATION	QUANTITY
Libros S.A.	02-12-2014	1001	BLUE	10

3. Accept the availability warning and choose the **Yes** button to record the demand quantity.
4. Proceed to replan to adjust the current supply plan.
5. Choose the  icon, enter **Planning Worksheet**, and then choose the related link.
6. Choose the **Calculate Net Change Plan** action.
7. On the **Calculate Plan - Plan. Wksh.** page, fill in the fields as described in the following table.

CALCULATE PLAN	STARTING DATE	ENDING DATE	SHOW RESULTS:	LIMIT TOTALS TO
MPS = Yes	01-23-2014	02-14-2014	1001..1300	Location Filter = BLUE
MRP = Yes				

8. Choose the **OK** button to start the planning run.

A total of 14 planning lines are created. Notice in the first planning line that the **Action Message** field contains **New**, the **Quantity** field 10, and the **Due Date** field 02-12-14. This new line for the top parent item, 1001, Touring Bike, is created because the item uses a reordering policy of **Order**, which means that it must be supplied in a one-to-one relationship to its demand, the sales order of ten pieces.

The next two planning lines are the production orders for touring bike wheels. Each existing order of five, in the **Original Quantity** field, is increased to 15, in the **Quantity** field. Both production orders have unchanged due dates, as indicated in the **Action Message** field that contains **Change Qty**. This is also the case for the planning line for item 1300, except its order multiple of 10.00 rounds the tracked demand for 15 pieces up to the 20.

All other planning lines have an action message of **Resched. & Chg. Qty**. This means that apart from being increased in quantity, the due dates are moved in relation to the supply plan to include the extra quantity in the available production time (capacity). Purchased components are rescheduled and increased to supply the production orders. Proceed to analyze the new plan.

Analyzing the Changed Planning Result

Because all lot-for-lot-planned items within the filter, 1100 to 1300, have a rescheduling period of two weeks, their existing supply orders are all modified to meet the new demand, which occurs within the specified two weeks.

Several planning lines are simply multiplied by three to provide 15 touring bikes instead of 5, and the due dates are moved back in time to provide the increased quantities by the shipment date of the sales order to the Cannon Group. For these planning lines, all quantities can be tracked. The remaining planning lines are increased by ten pieces in addition to moving their due dates. For these planning lines, a part of the quantities are untracked due to different planning parameters. Proceed to view some of these order tracking entries.

To view order tracking entries for item 1250

1. Select the planning line for item 1250, and then choose the **Order Tracking** action.

The seven lines on the **Order Tracking** page show that five and ten pieces are tracked through the back wheel to the touring bikes on the two sales orders respectively.

The last five pieces are untracked. Proceed to analyze.

2. Choose the **Untracked Quantity** field.

The **Untracked Planning Elements** page shows that item 1250 uses a planning parameter, Order Multiple, of 10.00. Therefore, the planning line is for 20 pieces in total to round the actual need up to the nearest number divisible by 10. The last five pieces are an untracked quantity to satisfy the planning parameter.

3. Close all pages except the **Planning Worksheet** page.

To view an existing order

1. In the planning line for item 1250, choose the **Ref. Order No.** field.
2. On the **Firm Planned Prod. Order** page for the Back Hub. The existing order for ten pieces, which you created in the first planning run, opens.
3. Close the firm planned production order.

This completes the walkthrough of how the planning system is used to automatically detect demand, calculate the appropriate supply orders according to demand and planning parameters, and then automatically create different types of supply orders with the appropriate dates and quantities.

Walkthrough: Selling, Assembling, and Shipping Kits

3/31/2019 • 20 minutes to read

Note: This walkthrough must be performed on a demonstration company with the **Full Evaluation - Complete Sample Data** option, which is available in the Sandbox environment. For more information, see [Creating a Sandbox Environment](#).

To support just-in-time inventory and the ability to customize products to customer requests, assembly orders can be automatically created and linked as soon as the sales order line is created. The link between the sales demand and the assembly supply enables sales order processors to customize the assembly item and promise delivery dates according to component availability. In addition, assembly consumption and output are posted automatically with the shipment of the linked sales order.

Special functionality exists to govern the shipping of assemble-to-order quantities, both in basic and in advanced warehouse configurations. When workers in charge of assembly finish assembling parts or all of the assemble-to-order quantity, they record it in the **Qty. to Ship** field on the warehouse shipment line, in advanced configurations, and then choose **Post Shipment**. The result is that the corresponding assembly output is posted, including the related component consumption, and a sales shipment for the quantity is posted for the linked sales order. This walkthrough illustrates the advanced warehouse process.

In basic warehouse configurations, when an assemble-to-order quantity is ready to be shipped, the warehouse worker in charge posts an inventory pick for the sales order lines. This creates an inventory movement for the components, posts the assembly output, and the sales order shipment. For more information, see [Handling Assemble-to-Order Items in Inventory Picks](#).

About This Walkthrough

This walkthrough demonstrates the following tasks:

Setting up Assembly Items

Assembly items are characterized by their replenishment system and the assembly BOM. The item's assembly policy can be either assemble-to-order (ATO) or assemble-to-stock (ATS). This section covers the following tasks:

- Setting the appropriate replenishment system and assembly policy on a new assembly item card.
- Creating an assembly BOM that lists the assembly components and the resource that go into the assembly item.

Selling Customized Assembly Items

Business Central provides the flexibility to enter both an inventory quantity and an assemble-to-order quantity on one sales order line. This section covers the following tasks:

- Creating a pure ATO sales order line where the full quantity is unavailable and must be assembled before shipment.
- Customizing ATO items.
- Recalculating the unit price of a customized assembly item.
- Creating a mixed sales order line where parts of the sales quantity is provided from inventory and the remaining part must be assembled before shipment.
- Understanding ATO availability warnings.

Planning for Assembly Items

Assembly demand and supply are handled by the planning system, just like for purchase, transfer, and production.

This section covers the following tasks:

- Running a regenerative plan for items with sales demand for assembled supply.
- Generating an assembly order to fulfill a sales line quantity by the demanded shipment date.

Assembling Items

Assembly orders function in a similar way as production orders, except the consumption and output is recorded and posted directly from the order. When the items are assembled to inventory, the assembly worker has full access to all header and line fields. When the items are assembled to an order where the quantity and date are promised to the customer, then certain fields on the assembly order are not editable. In that case, the assembly posting is performed from the warehouse shipment for the linked sales order. This section covers the following tasks.

- Recording and posting assembly consumption and output to inventory.
- Accessing a warehouse shipment line from an ATO assembly order to record assembly work.
- Accessing an ATO assembly order from a warehouse shipment line to review the automatically entered data.

Shipping Assembly Items, from Stock and Assembled to Order

Special functionality exists to govern the shipping of assemble-to-order quantities. This section covers the following tasks:

- Creating a warehouse pick for inventory assembly items and for assembly components to be assembled before shipment.
- Registering warehouse picks for assembly components and then for assembly items.
- Accessing an assembly order from a warehouse shipment to review picked or consumed components.
- Shipping assemble-to-order quantities.
- Shipping inventory assembly items.

Roles

This walkthrough demonstrates tasks that are performed by the following user roles:

- Sales Order Processor
- Planner
- Assembly Worker
- Picker
- Shipping Responsible

Prerequisites

Before you can perform the tasks in the walkthrough, you must do the following:

- Install Business Central.
- Make yourself a warehouse employee at WHITE location by following these steps:
 1. Choose the  icon, enter **Warehouse Employees**, and then choose the related link.
 2. Choose the **User ID** field, and select your own user account on the **Users** page.
 3. In the **Location Code** field, enter WHITE.
 4. Select the **Default** field.

Prepare WHITE location for assembly processing by following these steps:

1. Choose the  icon, enter **Locations**, and then choose the related link.
2. Open the location card for WHITE location.

3. On the **Bins** FastTab, enter **W-10-0001** in the **To-Assembly Bin Code** field.

By entering this non-pick bin code, all assembly order lines are ready to receive their components in the bin.

4. In the **From-Assembly Bin Code** field, enter **W-01-0001**.

By entering this pick bin code, finished assembly items will be output to the bin.

Remove the default lead time for internal processes by following these steps:

1. Choose the  icon, enter **Manufacturing Setup**, and then choose the related link.
2. On the **Manufacturing Setup** page, on the **Planning** FastTab, remove the value in the **Default Safety Lead Time** field.

Create inventory for assembly components by following [Prepare Sample Data](#).

Story

On January 23, Susan, the sales order processor takes an order from The Device Shop for three units of Kit B, which is an ATO item. All three units are customized and must contain the strong graphics card and an extra RAM block. The disc drives are upgraded to DWD because the CD drives are unavailable. Susan knows that the units can be assembled immediately, so she leaves the suggested shipment date of January 23.

At the same time, the customer orders fifteen units of Kit A with a special request that five units be customized to contain the strong graphics card. Although Kit A is typically an assemble-to-stock item, the order processor combines the sales line quantities to sell ten units from stock and assemble five customized units to the order. The ten units of Kit A are unavailable and must first be supplied to inventory by an assembly order according to the item's assembly policy. Susan learns from the assembly department that Kit A units cannot be completed in the current week. She sets the shipment date of the second sales order line, for the mixed ATO and inventory quantity, to January 27 and informs the customer that the 15 units of Kit A will be shipped four days later than the three units of Kit B. To signal to the shipping department that this sales order requires assembly processing, Susan creates the warehouse shipment document from the sales order.

Eduardo, the planner, runs the planning worksheet and generates an assembly order for ten standard units of Kit A with an internal due date of January 27.

Sammy, who is responsible for shipping, gets three warehouse shipment lines for the sales order: One line for the three pure ATO units, one line for the five ATO units on the mixed sales order line, and one line for the ten ATS units on the mixed sale order line. He creates a warehouse pick document for all the assembly components that are needed to assemble the total of eight ATO units on the warehouse shipment document.

John, the picker, retrieves components for all the ATO quantities on the warehouse shipment document and brings them to the assembly area. He enters the quantity to handle and registers the warehouse pick.

Linda assembles the three ATO units of Kit B. The components are already picked, and she does not record output and consumption quantities or post the order, because both of these actions are performed automatically through the related warehouse shipment lines.

Sammy records the assembled quantity on the warehouse shipment line and posts the shipment of the three units of Kit B. The first line on the sales order is updated as shipped. The linked assembly order remains open until the sales order is fully invoiced. The two warehouse shipment lines, one ATO and one ATS, for Kit A with due dates on January 27 remain open.

On January 27, Linda processes two assembly orders for Kit A. The first order is the ATO order for five units, which she processes differently than the ATO order for Kit B that she processed on January 23. On this order, she is authorized to access the warehouse shipment line herself to record the completed assembly work. The needed components are ready in the assembly department, as they were picked together with components for Kit B.

The second assembly order is the ATS order for ten units that were created by the planning system. On this ATS order, Linda performs all involved actions from the assembly order. She creates a warehouse pick document for the assembly components that are needed to assemble the ten units. When the PCs are assembled, Linda posts the assembly order and thereby signals that the items are available in inventory and can be picked for shipment.

Sammy creates a warehouse pick document for any quantities that remain before the warehouse shipment can be posted. A pick document is created for the ten units of Kit A that have just finished. The components needed to assemble the five units of Kit A to order where picked on January 23.

John brings the ten units of Kit A from the warehouse to the specified shipping area, records the quantity to handle, and then registers the pick.

Sammy packs the ten ATS units with the five ATO units that Linda assembled earlier in the day. He fills in the quantity to ship on both lines and then posts the last shipment for The Device Shop. The related assembly order for five units of Kit A is automatically posted. The second line on the sales order is updated as shipped. Two linked assembly order remains open until the sales order is invoiced and closed.

When the sales order is later posted as fully invoiced, the sales order and the linked assembly orders are removed.

Prepare Sample Data

1. Choose the  icon, enter **Whse. Item Journals**, and then choose the related link.
2. Choose the **Batch Name** field, and then select the default journal.
3. Create positive inventory adjustments at WHITE location on the work date, January 23, by entering the following information.

ITEM NO.	ZONE CODE	BIN CODE	QUANTITY
80001	PICK	W-01-0001	20
80005	PICK	W-01-0001	20
80011	PICK	W-01-0001	20
80014	PICK	W-01-0001	20
80203	PICK	W-01-0001	20
80209	PICK	W-01-0001	20

4. On the **Home** tab, in the **Registering** group, choose **Register**, and then choose the **Yes** button.

Next, synchronize the new warehouse entries with inventory.

5. Choose the  icon, enter **Item Journals**, and then choose the related link. The **Item Journal** page opens.
6. On the **Actions** tab, in the **Functions** group, choose **Calculate Whse. Adjustment**.
7. On the **Calculate Whse. Adjustment** page, choose the **OK** button.
8. On the **Item Journal** page, on the **Actions** tab, in the **Functions** group, choose **Post**, and then choose the **Yes** button.

Creating the Assembly Items

1. Choose the  icon, enter **Items**, and then choose the related link.

- On the **Home** tab, in the **Manage** group, choose **New**.
- Create the first assembly item based on the following information.

FIELD	VALUE
Description	Kit A – Basic PC
Base Unit of Measure	PCS
Item Category Code	Misc.
Replenishment System	Assembly
Assembly Policy	Assemble-to-Stock
Reordering Policy	Lot-for-Lot

NOTE

Kit A is typically supplied by assembly to stock and therefore has a reordering policy to make it part of general supply planning.

- On the **Navigate** tab, in the **Assembly/Production** group, choose **Assembly**, and then choose **Assembly BOM**.
- Define an assembly BOM for Kit A with the following information.

TYPE	NO.	QUANTITY PER
Item	80001	1
Item	80011	1
Item	80209	1
Resource	Linda	1

- Create the second assembly item based on the following information.

FIELD	VALUE
Description	Kit B – Pro PC
Base Unit of Measure	PCS
Item Category Code	Misc.
Replenishment System	Assembly
Assembly Policy	Assemble-to-Order

NOTE

Kit B is usually supplied by assembly to order and therefore does not have a reordering policy, because it should not be part of general supply planning.

- On the **Navigate** tab, in the **Assembly/Production** group, choose **Assembly**, and then choose **Assembly BOM**.
- Define an assembly BOM for Kit B with the following information.

TYPE	NO.	QUANTITY PER
Item	80005	1
Item	80014	1
Item	80210	1
Resource	Linda	1

Selling the Assembly Items

- Choose the  icon, enter **Sales Orders**, and then choose the related link.
- On the **Home** tab, in the **Manage** group, choose **New**.
- Create two sales order lines for customer 62000, The Device Shop, on the work date with the following information.

TYPE	DESCRIPTION	QUANTITY	QTY. TO ASSEMBLE TO ORDER	SHIPMENT DATE
Item	Kit B – Pro PC	3	3	January 23
Item	Kit A – Basic PC	15	5	January 27

NOTE

The following availability issue exists for the sales order line for Kit B:

- Assembly component 80210 is not available. This means that the three specified units of Kit B cannot be assembled, indicated by **0** in the **Able to Assemble** field on the **Assembly Availability** page.

The following availability issue exists for the sales order line for Kit A:

- The ten units of Kit A are not available. This indicates to the planning system that the quantity must be assembled to inventory.

Next, customize the sales order.

- Select the sales order line for three units of Kit B.
- On the **Lines** FastTab, choose **Line**, choose **Assemble to Order**, and then choose **Assemble-to-Order Lines**.
- On the **Assemble-to-Order Lines** page, on the assembly order line for item 80014, enter **2** in the **Quantity per** field.

7. On the assembly order line for item 80210, choose the **No.** field, and then select item 80209 instead.

8. Create a new assembly order line with the following information.

TYPE	NO.	QUANTITY PER
Item	80203	1

9. Close the **Assemble-to-Order Lines** page.

Next, update the unit price of Kit B according to the customization that you just performed. Notice the current value in the **Unit Price Excl. VAT** field.

10. On the **Lines** FastTab, choose **Line**, choose **Assemble to Order**, and then choose **Roll Up Price**.

11. Choose the **Yes** button. Notice the increased value in the **Unit Price Excl. VAT** field.

12. Select the sales order line for 15 units of Kit A.

13. On the **Lines** FastTab, choose **Line**, choose **Assemble to Order**, and then choose **Assemble-to-Order Lines**.

14. On the **Assemble-to-Order Lines** page, create a new assembly order line with the following information.

TYPE	NO.	QUANTITY PER
Item	80203	1

Next, change the shipment date of the second sales order line according to the assembly schedule.

15. On the sales order line for 15 units of Kit A, enter **01-27-2014** in the **Shipment Date** field.

16. On the **Actions** tab, in the **Release** group, choose **Release**.

17. On the **Actions** tab, in the **Warehouse** group, choose **Create Whse. Shipment**.

18. Close the sales order.

Planning for the Unavailable ATS Items

1. Choose the  icon, enter **Planning Worksheet**, and then choose the related link.

2. On the **Action** tab, in the **Functions** group, choose **Calculate Regenerative Plan**.

3. On the **Calculate Plan** page, set the following filters.

STARTING DATE	ENDING DATE	NO.
01-23-2014	01-27-2014	Kit A – Basic PC

4. Choose the **OK** button.

A new planning line is created for the needed assembly order of ten units, due on January 27. It needs no changes, so now you can create the order.

5. On the **Actions** tab, in the **Functions** group, choose **Carry Out Action Message**.

6. On the **Carry Out Action Msg.** page, choose the **Assembly Order** field, and then select **Make Assembly Orders**.

7. Choose the **OK** button.

Assembling and Shipping the First ATO Quantity

1. Choose the  icon, enter **Warehouse Shipment**, and then choose the related link.

NOTE

In this section, the person who is responsible for shipping is in charge of recording the completed ATO assembly work on the warehouse shipment line. This workflow may occur in environments where the assembly work is performed by the person who is responsible for shipping or by assembly workers in the shipping area.

In this section, actions on the assembly order are performed indirectly from the warehouse shipment line. For more information about how to process an assembly order directly, see the "Assemble Items to Inventory" section in this walkthrough.

2. Open the most recent warehouse shipment that is created at WHITE location.

Notice the three warehouse shipment lines: One line for the ATO quantity of Kit B, due on January 23. One line for the ATO quantity of Kit A, due on January 27. One line for the inventory quantity of Kit A, due on January 27.

The **Assemble to Order** field specifies the assembly method.

Next, create a pick document for all the ATO assembly components that are needed on the warehouse shipment.

3. On the **Actions** tab, in the **Functions** group, choose **Create Pick**, and then choose the **OK** button.

Next, perform the picker's task.

4. Choose the  icon, enter **Picks**, and then choose the related link.

5. Open the warehouse pick document that you created in step 3 in this section.

Notice the value in the **Source Document** field and that all the pick lines are for assembly components.

Next, register the pick without changing the default information.

6. On the **Actions** tab, in the **Functions** group, choose **Autofill Qty. to Handle**.

7. On the **Home** tab, in the **Registering** group, choose **Register Pick**.

Return to performing the shipping tasks.

8. Reopen the **Warehouse Shipment** page.

Notice that the **Qty. Picked** field is still empty on all lines. This is because you still have not picked the items to be shipped, but only the components needed to assemble the ATO quantities.

Proceed to review the related assembly order.

9. Select the shipment line for three units of Kit B.

10. On the **Lines** FastTab, choose **Line**, and then choose **Assemble to Order**. The **Assembly Order** page opens.

Notice that several fields on the assembly order are unavailable because the order is linked to a sales order.

Notice on the assembly order lines that the **Qty. Picked** field is filled. This is due to the pick that you registered in step 7 in this section.

11. In the **Quantity to Assemble** field, try to enter any value lower than **3**.

Read the error message explaining why this field can only be filled through the **Qty. to Ship** field on the

related shipment.

The **Quantity to Assemble** field is editable to support situations where you want to partially ship an inventory quantity instead of assembling more units to the order. For more information, see the "Combination Scenarios" section in [Understanding Assemble to Order and Assemble to Stock](#).

12. Close the **Assembly Order** page to return to the **Warehouse Shipment** page.
13. On the shipment line for three units of Kit B, in the **Qty. to Ship** field, enter **3**.
14. On the **Actions** tab, in the **Posting** group, choose **Post Shipment**, and then select **Ship**.

Along with this warehouse shipment posting, the full consumption and output quantities of the related assembly order are posted, and the **Remaining Quantity** field is empty. The sales order line for Kit B is updated to show that the three units are shipped.

Warehouse activities to fulfill the first sales order line by January 23 are completed. Next, fulfill the sales order lines that are shipping on January 27

Assembling and Recording the Second ATO Quantity

1. Choose the  icon, enter **Assembly Orders**, and then choose the related link.

Notice that the ATO order for shipped units of Kit B is still in the list, although the **Remaining Quantity** is empty. This is because the linked sales order is still not fully invoiced.

NOTE

In this section, the assembly worker is responsible for recording the completed ATO assembly work on the warehouse shipment line. This workflow may occur in environments where the assembly work is performed in a separate assembly department and assembly workers are authorized to change the warehouse shipment line.

2. Open the ATO assembly order for five units of Kit A.

Notice that the **Quantity to Assemble** and the **Quantity to Consume** fields are empty because no work is recorded yet.

Notice on the assembly order lines that the **Qty. Picked** field is filled. This is due to the pick that was registered on January 23.

Next, record that the assembly order is completed.

3. On the **Navigate** tab, in the **Warehouse** group, choose **Asm.-to-Order Whse. Shpt. Line**.
4. On the **Asm.-to-Order Whse. Shpt. Line** page, in the **Qty. to Ship** field, enter **5**, and then close the page.

Notice on the **Assembly Order** page that the **Quantity to Assemble** and the **Quantity to Consume** fields are now filled with the output and consumption quantities that will be posted with the shipment.

5. Close the **Assembly Order** page.

Assembling the ATS Quantity

1. Choose the  icon, enter **Assembly Orders**, and then choose the related link.
2. Open the assembly order for ten units of Kit A.

Notice that the **Quantity to Assemble** field is filled with the expected quantity.

Next, create a pick document to retrieve the needed components.

3. On the **Actions** tab, in the **Release** group, choose **Release**.

4. On the **Actions** tab, in the **Warehouse** group, choose **Create Whse. Pick**, and choose the **OK** button.

Next, perform the picker's task.

5. Choose the  icon, enter **Picks**, and then choose the related link.
6. Open the warehouse pick document that you created in step 4 in this section.

Proceed to register the pick without changing the default information.

7. On the **Actions** tab, in the **Functions** group, choose **Autofill Qty. to Handle**.
8. On the **Home** tab, in the **Registering** group, choose **Register Pick**.

Return to the assembly order to perform the last assembly task.

9. In the **Assembly Order**, on the **Actions** tab, in the **Posting** group, choose **Post**, and then choose the **Yes** button.

Notice that the assembly order is removed from the list of open orders.

Shipping the Remaining Items, Partly from Stock and Partly Assembled to the Order

1. Choose the  icon, enter **Warehouse Shipment**, and then choose the related link.

2. Open the most recent warehouse shipment that is created at WHITE location.

Notice on the line for ten units of Kit A that the **Qty. to Ship** and **Qty. Picked** field are empty.

Next, pick any remaining items.

3. On the **Actions** tab, in the **Functions** group, choose **Create Pick**, and then choose the **OK** button.

Next, perform the picker's last task for this warehouse shipment.

4. Choose the  icon, enter **Picks**, and then choose the related link.
5. Open the warehouse pick document that you created in step 3 in this section.

Notice that this pick document is for assembly item, not for assembly components.

Next, register the pick without changing the default information.

6. On the **Actions** tab, in the **Functions** group, choose **Autofill Qty. to Handle**.
7. On the **Home** tab, in the **Registering** group, choose **Register Pick**, and then choose the **Yes** button.

Return to the warehouse shipment to perform the last task.

8. Reopen the **Warehouse Shipment** page.

On the **Warehouse Shipment** page, on the line for ten units of Kit A, notice that the **Qty. to Ship** and **Qty. Picked** fields now contain **10**.

9. On the **Actions** tab, in the **Posting** group, choose **Post Shipment**, and then choose **Ship**.

The warehouse shipment document is removed, which indicates that the involved warehouse activities are completed. Next, verify that the sales order has been processed.

10. Choose the  icon, enter **Sales Orders**, and then choose the related link

11. Open the sales order for The Device Shop.

Notice that the **Quantity Shipped** field contains the full quantity on both lines.

When the The Device Shop pays for their receipt of the 18 PCs from CRONUS, the sales order and its

linked assembly orders are removed.

Walkthrough: Managing Projects with Jobs

3/31/2019 • 18 minutes to read

This walkthrough introduces you to the project management features in jobs. Jobs are a way for you to schedule the usage of your company's resources and to keep track of the various costs associated with the resources on a specific project. Jobs involves the consumption of employee hours, machine hours, inventory items, and other types of usage that you may want to track as a job progresses.

This walkthrough covers the setup of a new job in addition to some common tasks such as handling fixed pricing, making payment by installments, posting invoices from jobs, and copying jobs.

About This Walkthrough

This walkthrough demonstrates the following tasks:

Setting Up a Job

With the budget structure set up for jobs, creating a job is straightforward. This walkthrough covers the following procedures:

- Setting up job task lines and planning lines.
- Creating job-specific prices for items, resources, and general ledger accounts.
- Invoicing from a job.

Handling Fixed Prices

In jobs, you can handle fixed prices and the prices for services or goods that are agreed upon in advance with customers. In this walkthrough, you can do the following:

- See how contract and invoice values are determined.
- Allow for extra work in the schedule that has not been invoiced.

Copying a Job

This part of the walkthrough focuses on how to copy part or all of a job in order to reduce manual data entry and improve accuracy. It includes the following:

- Copying part of a job to a new job.
- Copying job-specific prices.
- Copying planning lines.

Making Payment by Installment

When a large, expensive project lasts for a long period, the customer often makes an agreement with the company to pay by installments. This scenario shows how you set up payment by installments and covers:

- Creating payment by installments for a job.
- Invoicing payments to customers.
- Accounting for usage in a job set up for payment by installments.

Roles

This walkthrough includes tasks for the following roles:

- Project Manager

- Project Team Member

Prerequisites

Before you can perform the tasks in the walkthrough, you must do the following:

- Install the CRONUS International Ltd. demonstration database.
- Create sample data by using the steps in the following section.

Story

This walkthrough focuses on CRONUS International Ltd., a design and consultancy firm that designs and fits new infrastructures, such as conference halls and offices, with furniture, accessories, and storage units. Most of its work is project oriented. Prakash is a project manager at CRONUS. He uses jobs to give him an overview of each ongoing job that CRONUS has started, as well as the jobs that are completed. He is usually the one who sets up deals with customers and enters the core of the job, which is task and planning lines in addition to prices, into Business Central. He finds that creating, maintaining, and reviewing information is straightforward. Prakash also likes the way Business Central enables copying jobs and payment by installments.

Tricia, a project team member who reports to Prakash, is responsible for monitoring the job day-to-day. She enters her own work in addition to the work performed by technicians on every task. She records the items that they have used and the costs that they have incurred.

Preparing Sample Data

To prepare for this walkthrough, you must add Tricia as a new resource.

To prepare the sample data

1. Choose the  icon, enter **Resources**, and then choose the related link.
2. Choose the **New** action to create a new resource card.
3. On the **General** FastTab, enter the following information:
 - **No.:** Tricia
 - **Name:** Tricia
 - **Type:** Person
4. Choose the **Base Unit of Measure** field, and choose the **New** action to open the **Resource Unit of Measure** page. In the **Code** field, select **Hour**. Choose the **OK** button.
5. On the **Invoicing** FastTab, enter the following information:
 - **Direct Unit Cost:** 5
 - **Indirect Cost %:** 4
 - **Unit Cost:** 10
 - **Gen. Prod. Posting Group:** Services
 - **VAT Prod. Posting Group:** VAT 25
6. Choose the **OK** button to save the changes.

In the next procedure, you create a job journal batch for Tricia in order to post her usage.

To create a Job Journal batch

1. Choose the  icon, enter **Job Journals**, and then choose the related link.
2. On the **Job Journal** page, choose the **Batch Name** field. The **Job Journal Batches** page opens.

3. Choose the **New** action to create a new line with the following information:

- **Name: Tricia**
- **Description: Tricia**
- **No. Series: JJNL-GEN**

4. Choose the **OK** button to close all open pages.

Setting Up a Job

In this scenario, CRONUS has won a contract with a customer, Progressive Home Furnishings, to design a conference and dining hall. The customer is based in the United States and the project will require special software. The project manager reaches an agreement with the customer and creates a job that covers the agreement.

To set up a job

1. Choose the  icon, enter **Jobs**, and then choose the related link.

2. Choose the **New** action to create a new card.

3. On the **General** FastTab, enter the following information:

- **Description: Advising on conference hall setup**
- **Bill-to-Customer No.: 01445544**

4. On the **Posting** FastTab, enter the following information:

- **Status: Order**
- **Job Posting Group: Setting Up**
- **WIP Method: Cost Value**

5. On the **Duration** FastTab, type today's date into the **Starting Date** and **Ending Date** fields. These dates will help apply currency conversions when the job is invoiced.

6. On the **Foreign Trade** FastTab, set the currency code to **USD**. If you select USD in the **Invoice Currency Code** field, then the job will be invoiced in U.S. dollars and planned in the local currency of CRONUS only.

You can customize the pricing for customers on a per job basis, depending on the agreements you have set up. In the next procedure, the project manager specifies a cost for Tricia's time, sets the price for the required software, and adds in the travel costs that the customer has agreed to pay.

To customize pricing

1. From the job card, choose the **Resource** action.

2. On the **Job Resource Prices** page, enter the following information:

- **Code: Tricia**
- **Unit Price: 20**

3. Choose the **OK** button to close the page.

4. Choose the **Item** action.

5. On the **Job Item Prices** page, enter the following information and customized price:

- a. **Item No.: 80201 (Graphic Program)**
- b. **Unit Price: 200**

6. Choose the **OK** button to close the page.

7. Choose the **G/L Account** action.

8. On the **Job G/L Account Prices** page, enter the following information and the cost of travel, for which the

customer has agreed to pay cost plus 25 percent:

a. **G/L Account: 8430 (Travel)**

b. **Unit Cost Factor: 1.25**

9. Choose the **OK** button to close the page.

The final steps in setting up a job are adding the job tasks and the planning lines that are part of each task. The planning lines determine what is invoiced to the customer.

To add job tasks

1. On the **Job** card for the new job, choose the **Job Task Lines** action.
2. The following table describes the information that you should enter in the fields.

JOB TASK NO.	DESCRIPTION	JOB TASK TYPE
1000	Consulting on hall setup	Begin-Total
1010	Consultation meeting with customer	Posting
1020	Development	Posting
1090	Consulting Total	End-Total

3. To show that some tasks are subcategories of other tasks, on the **Actions** tab, in the **Functions** group, choose **Indent Job Tasks**.

A planning line can be one of the following types:

- **Schedule:** Added to the schedule, but not invoiced.
- **Contract:** Invoiced, but not added to the schedule.
- **Both Schedule and Contract:** Invoiced and added to the schedule.

In this walkthrough, the project manager uses **Both Schedule and Contract**. He creates three planning lines for task 1010, and two planning lines for task 1020.

To create planning lines

1. Select line 1010, and then choose the **Job Planning Lines** action. Enter the following information:

Line 1

- **Line Type: Both Schedule and Contract**
- **Planning Date: (today's date)**
- **Type: Resource**
- **No.: Tricia**
- **Quantity: 40**

Line 2

- **Line Type: Both Schedule and Contract**
- **Planning Date: (today's date)**
- **Type: Resource**
- **No.: Timothy**
- **Quantity: 40**

Line 3

- **Line Type: Both Schedule and Contract**
- **Planning Date: (today's date)**
- **Type: G/L Account**
- **No.: 8430 (Travel)**
- **Quantity: 2**
- **Unit Cost: 400**

2. Choose the **OK** button to close the page. The totals are updated on the **Job Task Lines** page.

3. Select line 1020, and then choose the **Job Planning Lines** action. Enter the following information:

Line 1

- **Line Type: Both Schedule and Contract**
- **Planning Date: (today's date)**
- **Type: Resource**
- **No.: Tricia**
- **Quantity: 80**

Line 2

- **Line Type: Both Schedule and Contract**
- **Planning Date: (today's date)**
- **Type: Item**
- **No.: 80201 (Graphic program)**
- **Quantity: 1**

4. Choose the **OK** button to close the page. Totals are updated on the **Job Task Lines** page.

Calculating Remaining Usage

Tricia, the team project member, has been working on the job for a while and wants to register her hours and usage on the job. She has not worked more hours than was agreed upon with the customer in advance. She uses the **Calculate Remaining Usage** batch job to calculate remaining usage for the job in a job journal. For each task, the batch job calculates the difference between scheduled usage of items, resources, and general ledger expenses and the actual usage posted in job ledger entries. The remaining usage is then displayed in the job journal from where she can post it.

To calculate remaining usage

1. Choose the  icon, enter **Job Journals**, and then choose the related link.
2. On the **Job Journal** page, in the **Batch Name** field, open the **Job Journals Batches** list. Select the **Tricia** job journal batch.
3. Choose the **Calc. Remaining Usage** action.
4. On the **Job Calc. Remaining Usage** page, on the **Job Task** FastTab, choose the **Job No.** field, and select the relevant job number, typically job J00010.
5. On the **Options** FastTab, type **J00001** in the **Document No.** field. This makes future tracking of the posting easier.
6. Enter today's date as the posting date.
7. Choose the **OK** button. This will generate job journal lines derived from the planning lines that Prakash created for the job.
8. Choose the **OK** button in the confirmation page. The generated lines are added to the job journal.
9. Make sure that all the document numbers are J00001, and then choose the **Post** action. Choose **Yes** to confirm the posting.
10. The lines are now posted. Choose the **OK** button to close the pages.

Creating and Posting a Job Sales Invoice

Next, Tricia can create a new invoice for the whole job or for part of a job. She can also attach the invoice to another invoice for the same customer for the same job. In this case, she invoices for the whole job, because the project is now completed.

To create a job sales invoice

1. Choose the  icon, enter **Jobs**, and then choose the related link.
2. Select the job that you created earlier, and then choose the **Create Job Sales Invoice** action.
3. On the **Job Task** FastTab, clear any filter on **Job Task No.** in order to invoice the job. In the **Job No.** field, select the relevant job.
4. On the **Options** FastTab, fill in the posting date and define whether you want to create one invoice per task or just a single invoice for all tasks.
5. Choose the **OK** button to create the invoice and choose the **OK** button in the confirmation page.

After Tricia creates the invoice, she can access it from **Sales & Marketing** under **Order Processing** and do additional processing.

To post a new sales invoice

1. Choose the  icon, enter **Sales Invoices**, and then choose the related link.
2. Open the invoice for Customer No. 01445544. You can see the information that was entered from the planning lines.
3. Choose the **Post** action. Choose **Yes** to confirm the posting.

To view the posted invoice

1. Open the job, and then choose the **Job Planning Lines** action.
2. Select any of the planning lines that have been invoiced, and then choose the **Sales Invoice/Credit Memo** action.
3. On the **Job Invoices** page, choose the **Open Sales Invoice/Credit Memo** action.

Tricia has a question about the prices, costs, and profits that are relevant to this particular job, so she accesses that information on the **Statistics** page.

To open the Statistics page

1. Choose the  icon, enter **Jobs**, and then choose the related link.
2. Choose the **Statistics** action. You can review detailed information about the job prices, costs, and profits in both local and foreign currencies.
3. Choose the **Close** button to close the **Job Statistics** page.

Handling Fixed Prices

CRONUS has been contracted to set up conference rooms. As the project manager, Prakash wants a good overview of the tasks required for the job with the associated budgeted and incurred costs for each task. In addition, he wants to know the total contracted price for the job and the amount that has been invoiced to this point. He has reached an agreement with the customer regarding fixed pricing for the job.

To manage fixed pricing in jobs

1. Choose the  icon, enter **Jobs**, and then choose the related link.
2. Select the **Guildford** job number, and then choose the **Jobs Task Lines** action.
3. Select line 1120, and in the **Schedule (Total Cost)** field, right-click the amount and choose **DrillDown**.

By reviewing the Job Planning lines, Prakash determines that he will also need Tricia for 30 hours for this

stage of the project. He agrees on a fixed price with the customer.

4. On the **Job Task Lines** page, select line 1120, and then choose the **Job Planning Lines** action.
5. Choose the **New** to create a new line with the following information:
 - **Line Type: Both Schedule and Contract**
 - **Type: Resource**
 - **No.: Tricia**
 - **Quantity: 30**
6. Choose the **OK** button to close the page.
7. In the **Schedule (Total Cost)** field, right-click the field, and choose **Drilldown** again on the **Job Task Lines** page. View the changes to the schedule. You see that 30 hours have been added to the schedule.
8. Choose the **OK** button to close the pages.

After Tricia has been added to the schedule for this task line, she works 25 hours on the job. She enters these hours into the job journal.

To enter hours in the Job Journal

1. Choose the  icon, enter **Job Journals**, and then choose the related link.
2. On a new line, enter the following information:
 - **Line Type: (blank)**
 - **Posting Date: (today's date)**
 - **Document No.: J00002**
 - **Job No.: Guildford**
 - **Job Task No.: 1120**
 - **Type: Resource**
 - **No.: Tricia**
 - **Quantity: 25**
3. Choose the **Post** action.

A few days later, Tricia works for another 10 hours on the job. She has now worked 35 hours in all. Because the agreement is for 30 hours with the customer, only five of these hours will be charged to the customer. Tricia will manually add the additional five hours she worked to the schedule.

4. On the **Job Journal** page, choose the **Calc. Remaining Usage** action.
5. On the **Job Calc. Remaining Usage** page, on the **Options** FastTab, enter the following information:
 - **Document No.: J00003**
 - **Posting Date: (today's date)**
6. On the **Job Task** FastTab, enter the following information:
 - **Job No.: Guildford**
 - **Job Task No.: 1120**

Choose the **OK** button to run the calculation. There are five hours of work remaining for Tricia. The **Line Type** field is blank, which indicates that only the usage remains to be posted because the work has already been scheduled.

7. In the **Job Journal**, create a new line with the following information. Make sure that both job numbers are sequential with those that you have already used:
 - **Line Type: Schedule**

- **Job No.: Guildford**
- **Job Task No.: 1120**
- **Type: Resource**
- **No.: Tricia**
- **Quantity: 5**

By using the **Schedule** line type, there are updates to the scheduled costs and prices, but no updates to the contract costs and prices that are invoiced to the customer.

8. Choose the **Post** action. Choose the **OK** button to close the page.
9. Open the **Jobs** list.
10. Select the GUILDFORD job, and then choose the **Job Task Lines** action.
11. Select line 1120 and in the **Schedule (Total Cost)** field, right-click the amount. Choose **DrillDown** to view the information.

Changes are automatically entered on the line for Job Task No. 1120. In the total cost of scheduled work, five additional hours of work by Tricia has been added to the schedule.

12. Choose the **Close** button to close the page.
13. Right-click the amount in the **Contract (Total Cost)** field and choose **DrillDown** to view the information.

In the total price for the contract, only the original contracted 30 hours are included, because this is what was agreed upon with the customer.

Copying Jobs

Prakash has reached an agreement with a customer, Selagorian Ltd, to set up 10 conference rooms. The agreement resembles an earlier job. Therefore, it will save time to copy that earlier job.

On the **Copy Job** page, you can select the job and task lines that you want to copy. You can also select to copy the source job ledger entries, which creates planning lines based on actual usage, or you can copy the source job planning lines, which copies the original planning lines to the new job. You can then choose what planning line or ledger entry line type that you want to include, selecting only what is relevant to this new job. Finally, you can select the job that you want to copy to and define whether prices and quantities should be copied as well.

To copy a job

1. Choose the  icon, enter **Jobs**, and then choose the related link.
2. Choose the **New** action to create a new job. Enter the following information:
 - **Description: Setting up 10 Conference Rooms**
 - **Bill-To Customer No.: 20000**
3. Choose the **Copy Job Tasks from** action.
4. On the **Copy Job Tasks** page, enter the following:
 - **Job No.: Guildford**
 - **Job Task No. From: 1000**
 - **Source: Job Planning Lines**
 - **Incl. Planning Line Type: Schedule + Contract**
 - **To Job No.: GuildfordSetting up 10 Conference Rooms**
 - Select the **Copy Dimensions** and **Copy Quantity** fields.
5. Choose the **OK** button to copy the job and then choose the **OK** button to close the confirmation page.

By comparing prices, job task lines, and job planning lines for the two jobs, you can see that the information was successfully copied.

Making Payments by Installments

CRONUS has just landed a large project that will take a year to be completed. Because it requires the dedication of many resources, the project manager sets up the contract so that the customer pays part of the price up front, part when the project is halfway completed, and the final payment upon completion.

To set up a new account

1. Choose the  icon, enter **Chart of Accounts**, and then choose the related link.
2. On the **Chart of Accounts** page, choose the **New** action to create a new card.
3. On the **New G/L Account** card, enter the following information:
 - **No.: 6630**
 - **Name: Job Payment**
4. On the **Posting** FastTab, in the **Gen. Prod. Posting Group** field, select **MISC**. Choose the **OK** button to close the page.
5. On the **Chart of Accounts** page, select **No. 6630 Job Payment**, and then choose the **Indent Chart of Accounts** action. Choose **Yes** to confirm.

The following procedures show how to create a new job, set pricing, and then set up payment by installment. In the job task lines, you can create specific lines dedicated to the payment by installments. All work completed on the job that is added to the schedule will be entered on the usage lines. For each payment task line on the planning lines, the line type is Contract, which means that the customer will be invoiced. Enter a new line for the down payment. On the usage task line, you can enter the information for the items and resources that have been used in this project, which will increase the schedule, such as employee hours and items used on the job.

To make a payment by installment

1. Create a new job.
2. On the new **Job** card, fill in the following information:
 - **Description: Redecoration of Reception Area**
 - **Bill-to-Customer No.: 30000**
 - **Job Posting Group: Setting up**
 - **WIP Method: Cost Value**
3. On the job card, choose the **Resource** action. Enter the following information:
 - **Code: Tricia**
 - **Unit Price: 10**

Choose the **OK** button to close the page.

4. On the **Job** card, choose the **Job Task Lines** action.

The following table describes the lines that you will create.

LINE	JOB TASK NO.	DESCRIPTION	JOB TASK TYPE
1	1000	Payment-Down Payment	Posting
2	2000	Usage	Posting

LINE	JOB TASK NO.	DESCRIPTION	JOB TASK TYPE
3	3000	Payment - Midway	Posting
4	4000	Payment - Completion	Posting

5. On the **Job Task Lines** page, select task 1000, and then choose the **Job Planning Lines** action.

6. Create a planning line with the following information:

- **Line Type: Contract**
- **Planning Date: (today's date)**
- **Type: G/L Account**
- **No.: 6630**
- **Quantity: 1**
- **Unit Price: 5000**

Choose the **OK** button to close the page.

7. On the **Job Task Lines** page, select **task 2000**, and open its **Job Planning Lines**.

The following table describes the planning lines that you will create.

LINE	LINE TYPE	PLANNING DATE	TYPE	NO.	QUANTITY
1	Schedule	(today's date)	Resource	Tricia	120
2	Schedule	(today's date)	Item	70104	10

Choose the **OK** button to close the page. On the **Job Task Lines** page, you can see the schedule amounts have been updated.

8. On the **Job Task Lines** page, select **task 3000**.

9. Create a planning line with the following information:

- **Line Type: Contract**
- **Planning Date: a future date**
- **Type: G/L Account**
- **No.: 6630**
- **Quantity: 1**
- **Unit Price: 5000**

Choose the **OK** button to close the page.

10. Create a similar planning line entry for job task 4000.

Now that the task and planning lines have been entered, Prakash creates an invoice for the first payment. He does this from the job task lines to make sure that the invoice only contains the lines for the first payment. You can open the sales order from the planning lines or the task lines.

To create an invoice

1. On the **Job Task Lines** page, select line 1000, and then choose the **Create Sales Invoice** action.
2. On the **Create Sales Invoice** page, set today's date as the posting date, specify **Per Task**, and choose the **OK** button to create an invoice with the default information. Choose the **OK** button to close the confirmation page.
3. Choose the **Sales Invoice/Credit Memo** action. On the sales invoice, you can see that only the down payment

is included in the invoice. You can now send this to the customer as agreed.

Next Steps

This walkthrough has taken you through some of the basic steps of working with jobs in Business Central. You have learned about how to create a new job, how to copy a job, and how to handle payments. Also, you have seen a demonstration of how to track hours and create invoices.

Walkthrough: Calculating Work in Process for a Job

3/31/2019 • 8 minutes to read

Note: This walkthrough must be performed on a demonstration company with the **Full Evaluation - Complete Sample Data** option, which is available in the Sandbox environment. For more information, see [Creating a Sandbox Environment](#).

With jobs, you can schedule the usage of your company's resources and keep track of the various costs associated with the usage of resources on a specific project. Jobs involve the consumption of employee hours, machine hours, inventory items, and other types of usage that have to be tracked as a job progresses. If a job runs over a long period, you may want to transfer these costs to a Work in Process (WIP) account on the balance sheet while the job is being completed. You can then recognize the costs and sales in your income statement accounts when it is appropriate.

About This Walkthrough

This walkthrough illustrates the following tasks:

- Calculating WIP.
- Selecting a WIP calculation method.
- Excluding part of a job from the WIP.
- Posting the WIP to the general ledger.
- Reversing a WIP posting.

Each step of the process calculates the value and moves the job transactions to the general ledger. The calculation and posting steps are separated to help you review your data and to make modifications before posting to the general ledger. Therefore, you should make sure that all information is correct after you run the calculation batch jobs and before you run the posting batch jobs.

Roles

This walkthrough uses the project team member (Tricia) as the persona.

Prerequisites

Before you can perform the tasks in the walkthrough, the Business Central must be installed on your computer.

Story

This walkthrough focuses on CRONUS International Ltd., a design and consultancy firm that designs and fits new infrastructures, such as conference halls and offices, with furniture, accessories, and storage units. Most of the work at CRONUS is project-oriented and Tricia, a project team member, uses jobs to have an overview of each ongoing job that CRONUS has started and also the jobs that are completed. Some of the jobs can be very lengthy and can run over months. Tricia can use a WIP account to record the work in process and to track the costs throughout the job.

Calculating WIP

CRONUS has taken on a lengthy project that has now extended across reporting periods. Tricia, a project team member, calculates the work in process (WIP) to make sure that the financial statement of the company will be

accurate.

During this procedure, Tricia will select a specific group of tasks that will be included in the WIP calculation. On the **Job Task Lines** page, she can specify these lines in the **WIP-Total** column.

The following table describes the three options.

FIELD	DESCRIPTION
	Leave blank if the job task is a part of a group of tasks.
Total	Defines the range or group of tasks that are included in the WIP and recognition calculation. Within the group, any job task with Job Task Type set to Posting will be included in the WIP Total, unless its WIP-Total field is set to Excluded .
Excluded	Applies only to a task with Job Task Type of Posting . The task is not included when WIP and recognition are calculated.

In the following walkthrough, Tricia applies the Cost Value method, her company standard, to calculate WIP. She specifies what part of the job will be included in the WIP calculation by assigning WIP-Total values to various job task lines.

To calculate WIP

1. Choose the  icon, enter **Jobs**, and then choose the related link.
2. In the **Jobs** list, select the **Deerfield** job, and then choose the **Edit** action. This will open the job card in edit mode.

WIP can be calculated based on Cost Value, Sales Value, Cost of Sales, Percentage of Completion, or Completed Contract. In this example, CRONUS uses the Cost Value method.

3. On the **Posting** FastTab, choose the **WIP Method** field, and then select **Cost Value**.
4. Choose the **Job Task Lines** action and set the following values in the **WIP-Total** field.

The following table describes the values.

JOB TASK NO.	WIP-TOTAL FIELD
1130	Excluded
1190	Total
1210	Excluded
1310	Excluded

5. Choose the **WIP** action, and then choose the **Calculate WIP** action.
6. On the **Job Calculate WIP** page, you can select a job that you want to calculate WIP. On the **Job** FastTab, select **Deerfield** in the **No.** field.
7. In the **Posting Date** field, enter a date that is later than the work date.
8. In the **Document No.** field, enter **1**. This creates a document that you can refer to later for traceability.
9. Choose the **OK** button to run the batch job. A message is displayed. Choose the **OK** button to continue. Close the **Job Task Lines** page.

NOTE

The message states that there are warnings associated with the WIP calculation. You will review the warnings in the next procedure.

10. On the **Job** card, expand the **WIP and Recognition** FastTab to see the calculated values. You can also see the **WIP Posting Date** and the values that have been posted to the general ledger, if any.

Notice that the value for **Recog. Costs Amount** is 215.60 in the **To Post** column. This reflects the total costs of two of the items in the group of job tasks 1110 – 1130. The third item was set to **Excluded**, and therefore is not included in the WIP calculation.

To review WIP warnings

1. Choose the  icon, enter **Job WIP Cockpit**, and then choose the related link.
2. Select the **Deerfield** job, and then choose the **Show Warnings** action.
3. On the **Job WIP Warnings** page, review the warning associated with the job.

After the accounting period ends, Tricia has to recalculate the WIP to include completed work to this point.

To recalculate WIP

1. On the **Job** card, choose the **WIP Entries** action to view the WIP calculation.

The **Job WIP Entries** page shows the WIP entries that were last calculated on a job, even if WIP has not yet been posted to the general ledger.

2. You can follow the steps in the procedure that explains how to calculate WIP to recalculate WIP. Every time WIP is calculated, an entry is created on the **Job WIP Entries** page.
3. Close the page.

NOTE

Work in Process and Recognition is only calculated. It is not posted to the general ledger. To do so, you must run **Post WIP to G/L** batch job after you have calculated the WIP and Recognition.

Posting WIP to General Ledger

Now that Tricia has calculated WIP for this job, she can post it to the general ledger.

To post WIP to general ledger

1. From the **Jobs** list, select the **Deerfield** job.
2. Choose the **WIP** action, and then choose the **Post WIP to G/L** action.
3. On the **Job Post WIP to G/L** page, on the **Job** FastTab, select **Deerfield** in the **No.** field.
4. On the **Options** FastTab, in the **Reversal Document No.** field, enter **1**.
5. Choose the **OK** button to post WIP to the general ledger.
6. Choose the **OK** button to close the confirmation page.

After you have completed the posting, you can view the posting information on the **WIP G/L Entries** page.

7. In the **Jobs** list, select the **Deerfield** job, and then choose the **WIP G/L Entries** action.

On the **Job WIP G/L Entries** page, verify that the WIP has been posted to the general ledger.

8. Close the page.
9. Open the **Job** card for the **Deerfield** job.
10. On the **WIP and Recognition** FastTab, notice that in the **Posted** column, the **Recog. Costs G/L Amount** field is now filled in, which indicates that WIP was posted to the general ledger successfully.
11. Choose the **OK** button to close the card.

Reversing a WIP Posting

Tricia determines that the job tasks that were excluded from the calculation of WIP should have been calculated in WIP. She can reverse the incorrect postings without having to post new WIP postings.

To reverse a WIP posting

1. From the **Jobs** list, select the **Deerfield** job.
2. Choose the **WIP** action, and then choose the **Post WIP to G/L** action.
3. On the **Job Post to WIP to G/L** page, on the **Job** FastTab, select **Deerfield** in the **No.** field.
4. On the **Options** FastTab, in the **Reversal Document No.** field, enter **1**.
5. In the **Reversal Posting Date** field, enter the original posting date. It should be the same date that you used to calculate WIP the first time.
6. Select the **Reverse Only** check box. This will reverse previously posted WIP, but does post new WIP to the general ledger.
7. Choose the **OK** button to run the batch job, and choose the **OK** button to close the confirmation page.
8. Open the **Job** card for **Deerfield**.
9. On the **WIP and Recognition** FastTab, verify that there are no posted WIP entries.
10. Close this page.
11. In the **Jobs** list, select the **Deerfield** job, choose the **WIP** action, and then choose the **WIP G/L Entries** action. The WIP entries have the **Reversed** check box selected.
12. Close this page.
13. Open **Job Task Lines** for the job, include the parts of the job that should be in the WIP calculation, and then recalculate and post the new value to the general ledger.

NOTE

Suppose Tricia calculated and posted WIP for a job with incorrect dates. Following the method that was discussed earlier, she can reverse the incorrect postings, correct the dates, and repost to the general ledger.

Next Steps

This walkthrough has taken you through the steps of calculating WIP in Business Central. In larger jobs, it may be useful to transfer the costs to a WIP account periodically while the job is being completed. This walkthrough has shown you how to exclude task lines from a calculation. It also shows you when you would have to recalculate. And finally, this walkthrough demonstrates how to post the WIP to the general ledger. An example of how to reverse a WIP posting to the general ledger is also included.

Walkthrough: Picking and Shipping in Basic Warehouse Configurations

3/31/2019 • 4 minutes to read

Note: This walkthrough must be performed on a demonstration company with the **Full Evaluation - Complete Sample Data** option, which is available in the Sandbox environment. For more information, see [Creating a Sandbox Environment](#).

In Business Central, the outbound processes for picking and shipping can be performed in four ways using different functionalities depending on the warehouse complexity level.

METHOD	INBOUND PROCESS	BINS	PICKS	SHIPMENTS	COMPLEXITY LEVEL (SEE DESIGN DETAILS: WAREHOUSE SETUP)
A	Post pick and shipment from the order line	X			2
B	Post pick and shipment from an inventory pick document		X		3
C	Post pick and shipment from a warehouse shipment document			X	4/5/6
D	Post pick from a warehouse pick document and post shipment from a warehouse shipment document		X	X	4/5/6

For more information, see [Design Details: Outbound Warehouse Flow](#).

The following walkthrough demonstrates method B in the previous table.

About This Walkthrough

In basic warehouse configurations where your location is set up to require pick processing but not ship processing, you use the **Inventory Pick** page to record and post pick and ship information for your outbound source documents. The outbound source document can be a sales order, purchase return order, outbound transfer order, or a production order with component need.

This walkthrough demonstrates the following tasks:

- Setting up SILVER location for inventory picks.

- Creating a sales order for customer 10000 for 30 loudspeakers.
- Releasing the sales order for warehouse handling.
- Creating an inventory pick based on a released source document.
- Registering the warehouse movement from the warehouse and at the same time posting the sales shipment for the source sales order.

Roles

This walkthrough demonstrates tasks that are performed by the following user roles:

- Warehouse Manager
- Order Processor
- Warehouse Worker

Prerequisites

To complete this walkthrough, you will need:

- CRONUS International Ltd. installed.
- To make yourself a warehouse employee at SILVER location by following these steps:
 1. Choose the  icon, enter **Warehouse Employees**, and then choose the related link.
 2. Choose the **User ID** field, and select your own user account on the **Users** page.
 3. In the **Location Code** field, enter SILVER.
 4. Select the **Default** field.
- Make item LS-81 available at SILVER location by following these steps:
 1. Choose the  icon, enter **Item Journals**, and then choose the related link.
 2. Open the default journal, and then create two item journal lines with the following information about the work date (January 23).

ENTRY TYPE	ITEM NUMBER	LOCATION CODE	BIN CODE	QUANTITY
Positive Adjmt.	LS-81	SILVER	S-01-0001 Note: The item's default bin in CRONUS	20
Positive Adjmt.	LS-81	SILVER	S-01-0002	20

3. Choose the **Post** action, and then select the **Yes** button.

Story

Ellen, the warehouse manager at CRONUS, sets up SILVER warehouse for basic pick handling where warehouse workers process outbound orders individually. Susan, the order processor, creates a sales order for 30 units of item LS-81 to be shipped to customer 10000 from the SILVER Warehouse. John, the warehouse worker must make sure that the shipment is prepared and delivered to the customer. John manages all involved tasks on the **Inventory Pick** page, which automatically points to the bins where LS-81 is stored.

Setting Up the Location

The setup of the **Location Card** page defines the company's warehouse flows.

To set up the location

1. Choose the  icon, enter **Locations**, and then choose the related link.
2. Open the SILVER location card.
3. Select the **Require Pick** check box.

Creating the Sales Order

Sales orders are the most common type of outbound source document.

To create the sales order

1. Choose the  icon, enter **Sales Orders**, and then choose the related link.
2. Choose the **New** action.
3. Create a sales order for customer 10000 on the work date (January 23) with the following sales order line.

ITEM	LOCATION CODE	QUANTITY
LS_81	SILVER	30

Proceed to notify the warehouse that the sales order is ready for warehouse handling.

4. Choose the **Release** action.

John proceeds to pick and ship the sold items.

Picking and Shipping Items

On the **Inventory Pick** page, you can manage all outbound warehouse activities for a specific source document, such as a sales order.

To pick and ship items

1. Choose the  icon, enter **Inventory Picks**, and then choose the related link.
2. Choose the **New** action.
3. Select the **Source Document** field, and then select **Sales Order**.
4. Select the **Source No.** field, select the line for the sale to customer 10000, and then choose the **OK** button.

Alternatively, choose the **Get Source Document** action, and then select the sales order.

5. Choose the **Autofill Qty. to Handle** action.

Alternatively, in the **Qty. to Handle** field, enter 10 and 30 respectively on the two inventory pick lines.

6. Choose the **Post** action, select **Ship**, and then choose the **OK** button.

The 30 loudspeakers are now registered as picked from bins S-01-0001 and S-01-0002, and a negative item ledger entry is created reflecting the posted sales shipment.

Walkthrough: Tracing Serial/Lot Numbers

3/31/2019 • 13 minutes to read

Note: This walkthrough must be performed on a demonstration company with the **Full Evaluation - Complete Sample Data** option, which is available in the Sandbox environment. For more information, see [Creating a Sandbox Environment](#).

When product defects occur, the errors must be identified and affected items must be prevented from leaving the company. If defective items have already been shipped, you must trace who received them and, if you need to, recall the items.

The first task of defects management is to investigate where the defective items came from and where they were used. This investigation is based on historic data and is made easier by searching through item tracking entries using the **Item Tracing** page.

The second task of defects management is to determine whether the traced items are planned for in open documents, such as non-posted sales orders or consumption journals. This work is performed on the **Navigate** page. You can use the Navigate feature to search all kinds of database records.

About This Walkthrough

This walkthrough demonstrates how to identify which items are defective, which vendor supplied them, and where they are used so that those orders can be stopped or recalled.

This walkthrough illustrates the following tasks:

- Tracing usage to origin.
- Tracing origin to usage.
- Searching for all current records which hold the traced serial/lot number.

Roles

This walkthrough demonstrates tasks that are performed by the following user roles:

- Quality Controller
- Warehouse Manager
- Order Processor
- Purchasing Agent

Prerequisites

To complete this walkthrough, you will need:

- The Business Central company.
- To create new items and several business transactions by following the [Prepare Sample Data](#).

Story

Ricardo, the quality controller, is acting on a sales return of item 1002, Racing Bike. The customer, Selangorian Ltd., complained that the frame has cracked welding seams. Quality control engineers have confirmed that the racing frame of the returned bike is defective. The quality controller must now determine:

- Which lot of racing frames was faulty.
- On which purchase order the faulty lot was received.

From the sales department, the quality controller knows that the returned racing bike, item 1002, had the serial number SN1. By using this basic information, he must determine where the finished racing bike was last used, and then he must trace backward to the earliest origin to establish which lot number the faulty component, the racing frame, came from.

The results of this first item tracking task identify which racing frames were defective and which vendor supplied them. Afterward, but in the same overall tracking process, the quality controller must find all the sold racing bikes that contain racing frames from the faulty lot so that those orders can be stopped or recalled. Lastly, the quality controller must find any open documents where the faulty lot is used so that no additional transactions are made.

The first two defects-management tasks are performed on the **Item Tracing** page. The last task is performed on the **Navigate** page in integration with the **Item Tracing** page.

Prepare Sample Data

You must create the following new items:

- 2000, Racing Frame: lot-specific tracking, component of 1002
- 1002, Racing Bike: serial number-specific tracking

Then you must create various purchase, production, and sales transactions with the two items.

To create the items

1. Choose the  icon, enter **Items**, and then choose the related link.
2. Choose the **New** action.
3. In the **No.** field, enter **2000**, and then proceed to fill in the following fields.

DESCRIPTION	BASE UNIT OF MEASURE	GEN. PROD. POSTING GROUP	VAT PROD. POSTING GROUP	INVENTORY POSTING GROUP	ITEM TRACKING CODE
Racing Frame	PCS	RAW MAT	VAT25	RAW MAT	LOTALL

NOTE

To enter the base unit of measure, choose the **New** button, and then select **PSC** on the **Item Units of Measure** page.

4. All other fields have acceptable default data or do not have to be filled in.
5. Choose the **OK** button to create the first new item card, 2000.
6. Choose **New**.
7. In the **No.** field, enter **1002**, and then proceed to fill in the following fields.

DESCRIPTION	BASE UNIT OF MEASURE	GEN. PROD. POSTING GROUP	VAT PROD. POSTING GROUP	INVENTORY POSTING GROUP	REPLENISHMENT SYSTEM	ITEM TRACKING CODE
Racing Bike	PCS	RETAIL	VAT25	FINISHED	Prod. Order	SNALL

NOTE

To enter the base unit of measure, choose the **New** button, and then select **PSC** on the **Item Units of Measure** page.

Next, define the item's manufacturing setup.

8. On the **Replenishment** FastTab, in the **Routing No.** field, enter **1000**.
9. Choose the **Production BOM No.** field, and then choose **Advanced**.
10. On the **Production BOM List** page, choose the first line, **1000**, and then choose the **Edit** action.
11. On the **Production BOM** page, change the value in the **Status** field to **Under Development**.
12. Go to an empty line, enter **2000** in the **No.** field, and then enter **1** in the **Quantity Per** field.
13. Change the value in the **Status** field back to **Certified**.
14. Choose the **OK** button to insert the production BOM on the item card and close the **Production BOM** page.

Next, purchase racing frames from Custom Metals Incorporated.

To purchase components

1. Choose the  icon, enter **Purchase Orders**, and then choose the related link.
2. Choose the **New** action.
3. Create a purchase order for vendor, Custom Metals Incorporated, by filling in the following line fields.

ITEM	QUANTITY	LOT NO.
2000	10	LOT1

4. To enter the lot number, choose the **Item Tracking Lines** action.
5. On the **Item Tracking Lines** page, fill in the **Lot No.** and **Quantity (Base)** fields, and then close the page.
6. In the **Vendor Invoice No.** field, enter any value.
7. Choose the **Post** action, select the **Receive and Invoice** option, and then choose the **OK** button.

Next, purchase racing frames from Coolwood Technologies.

8. Choose the  icon, enter **Purchase Orders**, and then choose the related link.
9. Choose the **New** action.
10. Create a purchase order for vendor, Coolwood Technologies, by filling in the following line fields.

ITEM	QUANTITY	LOT NO.
2000	11	LOT2

11. To enter the lot number, on the **Lines** FastTab, in the **Line** group, choose the **Item Tracking Lines** action.
12. On the **Item Tracking Lines** page, fill in the **Lot No.** and **Quantity (Base)** fields, and then close the page.
13. In the **Vendor Invoice No.** field, enter any value.

14. Choose the **Post** action, select the **Receive and Invoice** option, and then choose the **OK** button.

Next, produce two racing bikes, SN1 and SN2.

To produce end items

1. Choose the  icon, enter **Released Prod. Orders**, and then choose the related link.
2. Choose the **New** group.
3. Create a new released production order by filling in the following fields.

|:-|:-|

|Source No.|Quantity|Serial No.|

|1002|2|SN1|

|1002|2|SN2|

4. Choose the **Refresh Production Order** action, and then choose the **OK** button to fill the line.
5. To enter the serial numbers, choose the **Item Tracking Lines** action.
6. On the **Item Tracking Lines** page, fill in the **Serial No.** and **Quantity (Base)** fields, and then close the page.

Next, post consumption of racing frames from LOT1.

7. On the **Released Production Order** page, choose the **Production Journal** action.
8. On the **Production Journal** page, select the consumption line for item 2000, choose the **Item Tracking Lines** action.
9. On the **Item Tracking Lines** page, choose the **Lot No.** field, choose **LOT1**, and then choose the **OK** button.
10. Leave all other defaults on the **Production Journal** page, and then choose the **Post** action.

Next, produce two more racing bikes, SN3 and SN4.

11. Choose the  icon, enter **Released Prod. Orders**, and then choose the related link.
12. Choose the **New** action.
13. Create a new released production order by filling in the following fields on the header.

SOURCE NO.	QUANTITY	SERIAL NO.
1002	2	SN3
1002	2	SN4

14. Choose the **Refresh Production Order** action to fill the line.
15. To enter the serial numbers, choose the **Item Tracking Lines** action, and then the numbers on two lines in the **Serial No.** field on the **Item Tracking Lines** page.

Next, post more consumption of racing frames from LOT1.

16. On the **Released Production Order** page, choose the **Production Journal** action.
17. On the **Production Journal** page, select the consumption line for item 2000, choose the **Item Tracking Lines** action.
18. On the **Item Tracking Lines** page, choose the **Lot No.** field, choose **LOT1**, and then choose the **OK** button.

19. Leave all other defaults on the **Production Journal** page, and then choose the **Post** action.

You have produced four racing bikes, SN1 to SN4, and consumed four of the ten racing frames from LOT1, two frames in each production order.

20. Close the production journal and the production orders.

Next, sell racing bikes. First sell the racing bike with SN1 to Selangorian Ltd..

To sell the end items

1. Choose the  icon, enter **Sales Orders**, and then choose the related link.
2. Choose the **New** action, and then, create a sales order by filling in the following fields.

CUSTOMER	ITEM	QTY.	SERIAL NO.
Selangorian Ltd.	1002	1	SN1

3. To enter the serial number, choose the **Item Tracking Lines** action, and then the number in the **Serial No.** field on the **Item Tracking Lines** page.
4. Choose the **Post** action, select the **Ship and Invoice** option, and then choose the **OK** button.

Next, sell the racing bike with SN2 to The Cannon Group PLC.

5. Choose the  icon, enter **Sales Orders**, and then choose the related link.
6. Choose the **New** action, and then, create a sales order by filling in the following fields.

CUSTOMER	ITEM	QTY.	SERIAL NO.
Cannon Group PLC.	1002	1	SN2

7. To enter the serial number, choose the **Item Tracking Lines** action, and then the number in the **Serial No.** field on the **Item Tracking Lines** page.
8. Choose the **Post** action, select the **Ship and Invoice** option, and then choose the **OK** button.

Finally, sell some racing frames separately. The Cannon Group PLC. also orders four separate racing frames for their own assembly line.

9. Choose the  icon, enter **Sales Orders**, and then choose the related link.
10. Choose the **New** action, and then, create a sales order by filling in the following fields.

CUSTOMER	ITEM	QTY.	SERIAL NO.
Cannon Group PLC.	2000	5	LOT1

11. To enter the serial number, on the **Lines** FastTab, in the **Line** group, choose the **Item Tracking Lines** action, and then the number in the **Serial No.** field on the **Item Tracking Lines** page.

NOTE

Do not post the last sales order for five racing frames.

This completes the preparation of data to demonstrate the Item Tracing and Navigate features.

Tracing from Usage to Origin

From the sales department, the quality controller knows that the returned racing bike, item 1002, has the serial number SN1. By using this basic information, he can determine where the finished racing bike was last used, in this case, on the sales shipment to Selangorian Ltd.. Then, the quality controller must trace backward to the earliest origin to establish which lot number the faulty racing frame came from and which vendor supplied it.

To determine which lot included the faulty frame and who supplied it

1. Choose the  icon, enter **Item Tracing**, and then choose the related link.
2. On the **Item Tracing** page, enter **SN1** in the **Serial No. Filter** field, and then enter **1002** in the **Item Filter** field.
3. Keep the default setting of **Item-Tracked Only** in the **Show Components** field, and keep the default trace method of **Usage – Origin** in the **Trace Method**.

4. Choose the **Trace** action.

Note that one sales shipment header matches the search criteria. Before you continue the trace, verify that the shipment is the one that shipped the faulty racing bike to Selangorian Ltd.

5. Select the trace line, and then choose the **Show Document** action.

Now continue to trace the origin of the sales shipment of the racing bike with number SN1.

6. Choose the + icon on the trace lines to gradually expand and trace backward in the chain of transactions that the sales shipment originates from.

You can trace the following transaction history:

- The first posted document backward in the chain of transactions is the output posting of SN1 from the first released production order.
- The next posted document backward after that is the consumption posting from the first released production order. Here the quality controller sees that a racing frame from LOT1 was used.
- The lowest posted document in this chain is the posted purchase receipt on which racing frames with LOT1 entered inventory.

The quality controller has now established which lot of racing frames was faulty and he can search for the last trace line to see which vendor supplied them, namely Custom Metals Incorporated.

NOTE

Do not make any additional modifications to the trace result, as you will use it in the next section.

This completes the first defects-management task using the **Item Tracing** page. The quality controller must now determine whether other posted documents have processed racing frames from LOT1.

Tracing from Origin to Usage

The quality controller has established that the faulty racing frames came from LOT1. He must now find any other racing bikes that contain racing frames from the faulty lot so that those bikes can be stopped or recalled.

One way to prepare this trace task on the **Item Tracing** page is to manually enter LOT1 in the **Lot No. Filter** field and 2000 in the **Item Filter** field. However, this walkthrough will use the **Trace Opposite - from Line** function.

To find all usage of the faulty lot

1. On the **Item Tracing** page, select the line of the purchase receipt, the last trace line, and then choose **Trace Opposite – from Line**.

The trace result is now based on the filters of the trace line for the purchase receipt, LOT1 and item 2000, and the result is based on trace method **Origin - Usage**.

To obtain an overview of all usage of item 2000 with LOT1, continue to expand all trace lines.

2. Choose the **Expand All** action.

The first four trace lines refer to the sales shipment to Selangorian Ltd., which is already resolved. The last line indicates that one more racing bike, SN2, was produced in the same released production order and then sold and shipped on another sales shipment.

The quality controller immediately informs the sales department so that they can initiate a recall of the defective racing bike from the customer, Cannon Group PLC.

At the same time, he can see from the last three trace lines that another two items, SN3 and SN4, have been produced based on racing frames from LOT1. He takes action to block these end items in inventory.

This completes the second defects management task using the **Item Tracing** page for defects management. Since the **Item Tracing** page is based on posted entries only, the quality controller must continue to the **Navigate** page to make sure that LOT1 is not used in non-posted documents.

Finding All Records of a Serial/Lot Number

With the **Item Tracing** page, the quality controller learned that LOT1 contained the faulty racing frames, which vendor supplied them, and in which posted transaction they have been used. He must now determine whether LOT1 is in any open documents by integrating from the trace result to the **Navigate** page where he can perform a search through all database records.

To find all occurrences of LOT1 in non-posted records, such as open orders

1. On the **Item Tracing** page, select the first trace line, the purchase receipt of LOT1.
2. Choose the **Navigate** action.

The **Navigate** page is preset with search filters based on the trace result for LOT1. The quality controller recognizes most of the records as pertaining to documents already identified on the **Item Tracing** page. For example, the last Navigate line of type Production Order refers to the two released production orders that consumed racing frames from LOT1.

However, the second Navigate line of type **Sales Line** is a non-posted document line, so the quality controller proceeds to investigate.

3. To open the sales line record, select the second Navigate line, choose the **Show** action. Alternatively, choose the value in the **No. of Records** field.

Here the quality controller sees one open sales line for the faulty racing frames. He immediately suggests to the sales department that this order be canceled and a new production order, based on good racing frames, be initiated.

This completes the walkthrough of how to use the **Navigate** page for defects management in integration with the **Item Tracing** page.

Walkthrough: Making Cash Flow Forecasts by Using Account Schedules

3/31/2019 • 2 minutes to read

This walkthrough describes how you can use account schedules to make cash flow forecasts. Account schedules perform calculations that cannot be done directly in the chart of cash flow accounts. In the account schedules, you can set up subtotals for cash flow receipts and disbursements. These subtotals can be included in new totals that can then be used in making cash flow forecasts.

About This Walkthrough

This walkthrough describes the following tasks:

- Setting up a new cash flow account schedule name.
- Setting up account schedule lines.
- Setting up a new column layout.
- Assigning a column layout to an account schedule.
- Viewing and printing the cash flow forecast.

Prerequisites

To complete this walkthrough, you will need:

- Business Central installed.
- The cash flow worksheet lines are registered.

Roles

This walkthrough demonstrates tasks that are performed by the following user role:

- Controller

Story

Ken is a controller at CRONUS who makes monthly cash flow forecasts. He includes finance, sales, purchase, and fixed assets in the forecast, and then he presents it to CFO Sara for business insight.

Setting Up a New Account Schedule Name

An account schedule consists of a cash flow account schedule name with a series of lines and a column layout.

To set up a new account schedule name

1. Choose the  icon, enter **Account Schedules**, and then choose the related link.
2. On the **Account Schedule Names** page, choose the **New** to create a new cash flow account schedule name.
3. In the **Name** field, enter **Forecast**.
4. In the **Description** field, enter **Cash Flow Forecast**.
5. Leave the **Default Column Layout** and **Analysis View Name** fields blank.

Setting Up Account Schedule Lines

After an account schedule name is set up, Ken defines each line that appears in the cash flow account schedule. Ken defines lines that can be shown in reports in addition to lines that are only for calculation purposes.

To set up account schedule lines

1. On the **Account Schedule Names** page, select the new **Forecast** account schedule name that you have created. On the **Home** tab, in the **Process** group, choose **Edit Account Schedule**.
2. On the **Account Schedule** page, enter each line exactly as shown in the following table.

NOTE

Using the **Insert CF Accounts** function, you can quickly mark the cash flow accounts from the chart of cash flow accounts and copy them to account schedule lines.

[Row No.]	[Description]	[Totaling Type]	[Totaling]	[Row Type]	[Amount Type]	[Show]
[C10]	Amount	Net Change	Entries	Net Amount	Always	
[C20]	Amount until Date	Balance at Date	Entries	Net Amount	Always	
[C30]	Entire Fiscal Year	Entire Fiscal Year	Entries	Net Amount	Always	

3. Choose the **OK** button.

Assigning the Column Layout to the Account Schedule Name

Ken is now ready to assign the column layout to the account schedule name.

To assign the column layout to the account schedule name

1. On the **Account Schedule Names** page, select **Forecast** in the **Name** field.
2. In the **Default Column Layout** field, choose the column layout **Cash Flow** to assign as the default column layout.

To view and print the cash flow forecast

1. On the **Account Schedule Names** page, choose the **Overview** action to view the cash flow forecast.
2. On the **Acc. Schedule Overview** page, you can select an amount and then view the cash flow forecast entries that make up the amount. In addition, you can view the formula that is used to calculate the amount. You can also filter the amounts by date and dimension.
3. Choose the **Print** action to print the cash flow forecast.

Design Details: Supply Planning

3/31/2019 • 2 minutes to read

This documentation provides detailed technical insight to the concepts and principles that are used within the Supply Planning features in Business Central.

It explains how the planning system works and how to adjust the algorithms to meet planning requirements in different environments. It first introduces central solution concepts and then describes the logic of the central mechanism, supply balancing, before proceeding to explain how inventory planning is performed with the use of reordering policies.

Design Details: Central Concepts of the Planning System

3/31/2019 • 21 minutes to read

The planning functions are contained in a batch job that first selects the relevant items and period to plan for. Then, according to each item's low-level code (BOM position), the batch job calls a code unit, which calculates a supply plan by balancing supply-demand sets and suggesting possible actions for the user to take. The suggested actions appear as lines in the planning worksheet or the requisition worksheet.

The screenshot displays the SAP 'EDIT - PLANNING WORKSHEET' interface. The main table lists planning lines with columns for Warnings, Action Message, Original Due Date, Due Date, Starting Date-Time, Ending Date-Time, Description, Original Quantity, MPS Order, Quantity, Ref. Order Type, Ref. Order No., and Ref. C. Status. The table includes lines for various components like 'Black', 'Loudspeaker, Black, 120W', 'Loudspeaker, Cherry, 150W', and 'Chain Wheel Front'. A right-hand pane shows 'Item Details - Planning' for item LS-150, listing various parameters like Reorder Policy, Reorder Point, and Reorder Quantity.

Warnings	Action Message	Original Due Date	Due Date	Starting Date-Time	Ending Date-Time	Description	Original Quantity	MPS Order	Quantity	Ref. Order Type	Ref. Order No.	Ref. C. Status

The planner of a company, such as a purchaser or a production planner is presumed to be the user of the planning system. The planning system assists the user by performing the extensive but rather straightforward calculations of a plan. The user can then concentrate on solving the more difficult problems, such as when things differ from normal.

The planning system is driven by anticipated and actual customer demand, such as forecast and sales orders. Running the planning calculation will result in the program suggesting specific actions for the user to take concerning possible supply from vendors, assembly or production departments, or transfers from other warehouses. These suggested actions could be to create new supply orders, such as purchase or production orders. If supply orders already exist, the suggested actions could be to increase or expedite the orders to meet the changes in demand.

Another goal of the planning system is to ensure that the inventory does not grow unnecessarily. If demand decreases, the planning system will suggest that the user postpone, decrease in quantity, or cancel existing supply orders.

MRP and MPS, Calculate Net Change Plan, and Calculate Regenerative Plan are all functions within one code unit that contains the planning logic. However, the supply plan calculation involves different sub systems.

Note that the planning system includes no dedicated logic for capacity leveling or fine scheduling. Therefore, such scheduling work is performed as a separate discipline. The lack of direct integration between the two areas also means that substantial capacity or schedule changes will require that the planning is rerun.

Planning Parameters

Planning parameters that the user sets for an item or a group of items control which actions the planning system will suggest in the various situations. The planning parameters are defined on each item card to control when, how much, and how to replenish.

Planning parameters can also be defined for any combination of item, variant, and location by setting up a stockkeeping unit (SKU) for each needed combination, and then specifying individual parameters.

For more information, see [Design Details: Handling Reordering Policies](#) and [Design Details: Planning Parameters](#).

Planning Starting Date

To avoid a supply plan that incorporates open orders in the past and suggests potentially impossible actions, the planning system treats all dates before the planning starting date as a frozen zone where the following special rule applies:

All supply and demand before the starting date of the planning period will be considered a part of inventory or shipped.

In other words, it assumes that the plan for the past is executed according to the given plan.

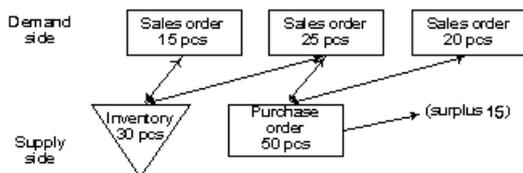

For more information, see [Design Details: Dealing with Orders Before the Planning Starting Date](#).

Dynamic Order Tracking (Pegging)

Dynamic Order Tracking, with its simultaneous creation of action messages in the planning worksheet, is not a part of the supply planning system in Business Central. This feature links, in real-time, the demand and the quantities that could cover them, whenever a new demand or supply is created or changed.

For example, if the user enters or changes a sales order, the dynamic order tracking system will instantly and search for an appropriate supply to cover the demand. This could be from inventory or from an expected supply order (such as a purchase order or a production order). When a supply source is found, the system creates a link between the demand and the supply, and displays it in view-only pages that are accessed from the involved document lines. When appropriate supply cannot be found, the dynamic order tracking system creates action messages in the planning worksheet with supply plan suggestions reflecting the dynamic balancing. Accordingly, the dynamic order tracking system offers a very basic planning system that can be of help both to the planner and other roles in the internal supply chain.

Accordingly, Dynamic Order Tracking can be considered a tool that assists the user in assessing whether to accept supply order suggestions. From the supply side, a user can see which demand has created the supply, and from the demand side, which supply should cover the demand.

For more information, see [Design Details: Reservation, Order Tracking, and Action Messaging](#).

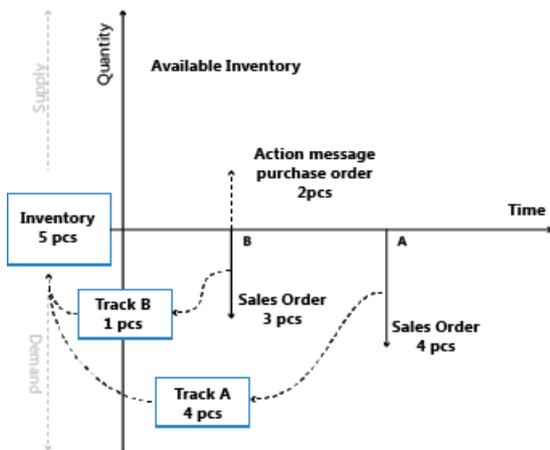

In companies with a low item flow and less advanced product structures, it may be adequate to use the Dynamic Order Tracking as the main means of supply planning. However, in busier environments, the planning system should be used to ensure a properly balanced supply plan at all times.

Dynamic Order Tracking versus the Planning System

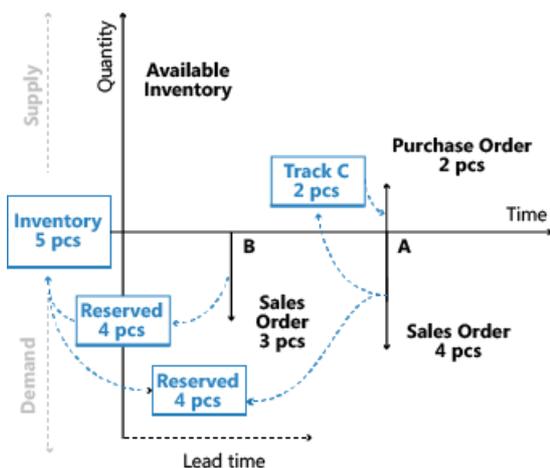

At a quick glance, it may be difficult to differentiate between the planning system and Dynamic Order Tracking. Both features display output in the planning worksheet by suggesting actions that the planner should take. However, the way this output is produced differs.

The planning system deals with the entire supply-demand pattern of an item through all levels of the BOM hierarchy along the time line, whereas Dynamic Order Tracking only addresses the situation of the order that activated it. When balancing demand and supply, the planning system creates links in a user-activated batch mode, whereas Dynamic Order Tracking creates the links automatically and on the fly, whenever the user enters a demand or a supply in the program, such as a sales order or purchase order.

Dynamic Order Tracking establishes links between demand and supply when data is entered, on a first-come/first-served basis. This may lead to some disorder in priorities. For example, a sales order entered first, with a due date next month, may be linked to the supply in inventory, while the next sales order due tomorrow may cause an action message to create a new purchase order to cover it, as illustrated below.

In contrast, the planning system deals with all demand and supply for a particular item, in prioritized order according to due dates and order types, that is, on a first-needed/first-served basis. It deletes all order tracking links that were created dynamically and reestablishes them according to due date priority. When the planning system has run, it has solved all imbalances between demand and supply, as illustrated below for the same data.

After the planning run, no action messages remain in the Action Message Entry table, because they have been replaced by the suggested actions in the planning worksheet

For more information, see Order Tracking Links during Planning in [Design Details: Balancing Supply with Demand](#).

Sequence and Priority in Planning

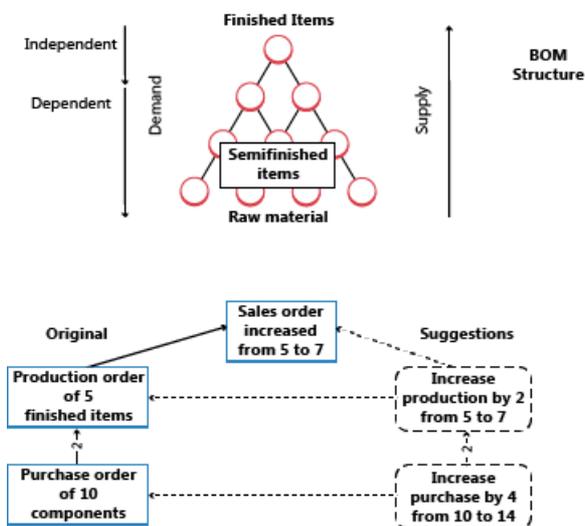

When establishing a plan, the sequence of the calculations is important to get the job done within a reasonable timeframe. In addition, the prioritization of requirements and resources play an important role in obtaining the

best results.

The planning system in Business Central is demand-driven. High-level items should be planned before low-level items, because the plan for high-level items might generate additional demand for the lower-level items. This means, for example, that retail locations should be planned before distribution centers are planned, because the plan for a retail location may include additional demand from the distribution center. On a detailed balancing level, this also means that a sales order should not trigger a new supply order if an already released supply order is can cover the sales order. Likewise, a supply carrying a specific lot number should not be allocated to cover a generic demand if another demand requires this specific lot.

Item Priority / Low-Level Code

In a manufacturing environment, the demand for a finished, sellable item will result in derived demand for components that comprise the finished item. The bill-of-material structure controls the component structure and can cover several levels of semi-finished items. Planning an item at one level will cause derived demand for components at the next level, and so on. Eventually, this will result in derived demand for purchased items. Consequently, the planning system plans for items in order of their ranking in the total BOM hierarchy, starting with finished saleable items at the top level and continuing down through the product structure to the lower level items (according to the low-level code).

The figures illustrates in which sequence the system makes suggestions for supply orders at the top level and, assuming that the user will accept these suggestions, for any lower-level items as well.

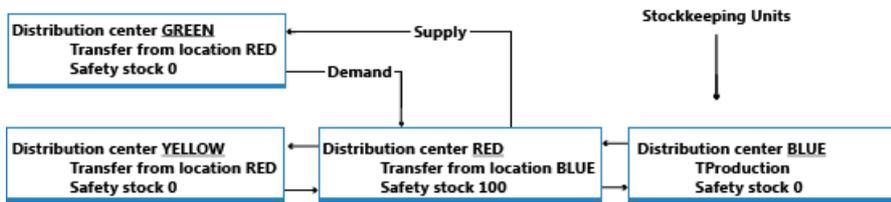

For more information about manufacturing considerations, see [Design Details: Loading the Inventory Profiles](#).

Locations / Transfer-Level Priority

Companies that operate at more than one location may need to plan for each location individually. For example, an item's safety stock level and its reordering policy may differ from one location to another. In this case, the planning parameters must be specified per item and also per location.

This is supported with the use of SKUs, where individual planning parameters can be specified at the SKU level. An SKU can be regarded as an item at a specific location. If the user has not defined a SKU for that location, the program will default to the parameters that have been set on the item card. The program calculates a plan for active locations only, which is where there is existing demand or supply for the given item.

In principle, any item can be handled at any location, but the program's approach to the location concept is quite strict. For example, a sales order at one location cannot be fulfilled by some quantity on stock at another location. The quantity on stock must first be transferred to the location specified on the sales order.

For more information, see [Design Details: Transfers in Planning](#).

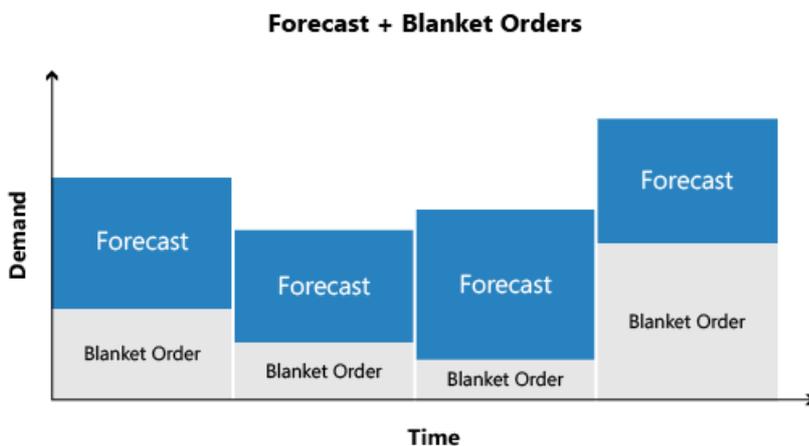

Order Priority

Within a given SKU, the requested or available date represents the highest priority; the demand of today should be dealt with before the demand of the coming days. But apart from this some kind of priority, the different demand and supply types are sorted according to business importance to decide which demand should be satisfied before satisfying another demand. On the supply side, the order priority will tell what source of supply should be applied before applying other sources of supply.

For more information, see [Design Details: Prioritizing Orders](#).

Demand Forecasts and Blanket Orders

Forecasts and blanket orders both represent anticipated demand. The blanket order, which covers a customer’s intended purchases over a specific period of time, acts to lessen the uncertainty of the overall forecast. The blanket order is a customer-specific forecast on top of the unspecified forecast as illustrated below.

For more information, see the “Forecast Demand is Reduced by Sales Orders” section in [Design Details: Loading the Inventory Profiles](#).

Planning Assignment

All items should be planned for, however, there is no reason to calculate a plan for an item unless there has been a change in the demand or supply pattern since the last time a plan was calculated.

If the user has entered a new sales order or changed an existing one, there is reason to recalculate the plan. Other reasons include a change in forecast or the desired safety stock quantity. Changing a bill-of-material by adding or removing a component would most likely indicate a change, but for the component item only.

The planning system monitors such events and assigns the appropriate items for planning.

For multiple locations, the assignment takes place at the level of item per location combination. If, for example, a sales order has been created at only one location, the program will assign the item at that specific location for planning.

The reason for selecting items for planning is a matter of system performance. If no change in an item’s demand-supply pattern has occurred, the planning system will not suggest any actions to be taken. Without the planning assignment, the system would have to perform the calculations for all items in order to find out what to plan for,

and that would drain system resources.

The full list of reasons for assigning an item for planning is provided in [Design Details: Planning Assignment Table](#).

The planning options in Business Central are:

- Calculate Regenerative Plan – Calculates all selected items, whether it is necessary or not.
- Calculate Net Change Plan – Calculates only those selected items that have had some change in their demand-supply pattern and, therefore, have been assigned for planning.

Some users believe that net change planning should be performed on the fly, for example, when sales orders are entered. However, this could be confusing because dynamic order tracking and action messaging are also calculated on the fly. Besides, Business Central offers real-time available-to-promise control, which provides pop-up warnings when entering sales orders if the demand cannot be fulfilled under the present supply plan.

In addition to these considerations, the planning system only plans for those items that the user has prepared with appropriate planning parameters. Otherwise, it is assumed that the user will plan the items manually or semi-automatically by using the Order Planning feature.

For more information about the automatic planning procedures, see [Design Details: Balancing Demand and Supply](#).

Item Dimensions

Demand and supply can carry variant codes and location codes that must be respected when the planning system balances demand and supply.

The system treats variant and location codes as item dimensions on a sales order line, inventory ledger entry, and so on. Accordingly, it calculates a plan for each combination of variant and location as if the combination were a separate item number.

Instead of calculating any theoretical combination of variant and location, the program calculates only those combinations that actually exist in the database.

For more information on how the planning system deals with location codes on demand, see [Design Details: Demand at Blank Location](#).

Item Attributes

Apart from general item dimensions, such as item number, variant code, location code, and type of order, each demand and supply event can carry additional specifications in the form of serial/lot numbers. The planning system plans these attributes in certain ways depending on their level of specification.

An order-to-order link between demand and supply is another type of attribute that affects the planning system.

Specific Attributes

Certain attributes on demand are specific and must be matched exactly by a corresponding supply. The following two specific attributes exist:

- Demanded serial/lot numbers that require specific application (The **SN Specific Tracking** or **Lot Specific Tracking** check box is selected on the **Item Tracking Code Card** page for the item tracking code that is used by the item.)
- Links to supply orders created manually or automatically for a specific demand (order-to-order links).

For these attributes, the planning system applies the following rules:

- Demand with specific attributes can only be fulfilled by supply with matching attributes.

- Supply with specific attributes can also satisfy demand that does not ask specifically for those attributes.

Accordingly, if a demand for specific attributes cannot be met by inventory or projected supplies, the planning system will suggest a new supply order to cover this specific demand with no regard of planning parameters.

Non-Specific Attributes

Serial/lot-numbered items without specific item tracking setup may carry serial/lot numbers that do not need to be applied to the exact same serial/lot number, but can be applied to any serial/lot number. This gives the planning system more freedom to match, for example, a serialized demand with a serialized supply, typically in inventory.

Demand-supply with serial/lot numbers, specific or non-specific, are considered high priority and are therefore exempt from the frozen zone, meaning that they will be part of planning even if they are due before the planning starting date.

For more information, see the “Serial/Lot Numbers are Loaded by Specification Level” section in [Design Details: Loading the Inventory Profiles](#).

For more information about how the planning system balances attributes, see the “Serial/Lot Numbers and Order-to-Order Links are Exempt from the Frozen Zone” in [Design Details: Dealing with Orders Before the Planning Starting Date](#).

Order-to-Order Links

Order-to-order procurement means that an item is purchased, assembled, or produced to exclusively cover a specific demand. Typically it relates to A-items and the motivation for choosing this policy can be that the demand is infrequent, the lead-time is insignificant, or the required attributes vary.

Another special case that uses order-to-order links is when an assembly order is linked to a sales order in an assemble-to-order scenario.

Order-to-order links are applied between demand and supply in four ways:

- When the planned item uses the reordering policy Order.
- When using the manufacturing policy Make-to-Order to create multi-level or project-type production orders (producing needed components on the same production order).
- When creating production orders for sales orders with the Sales Order Planning feature.
- When assembling an item to a sales order. (Assembly Policy is set to Assemble-to-Order).

In these instances, the planning system will only suggest to order the required quantity. Once created, the purchase, production, or assembly order will continue to match the corresponding demand. For example, if a sales order is changed in time or quantity, the planning system will suggest that the corresponding supply order is changed accordingly.

When order-to-order links exist, the planning system does not involve linked supply or inventory in the balancing procedure. It is up to the user to evaluate if the linked supply should be used to cover other or new demand and, in that case, delete the supply order or reserve the linked supply manually.

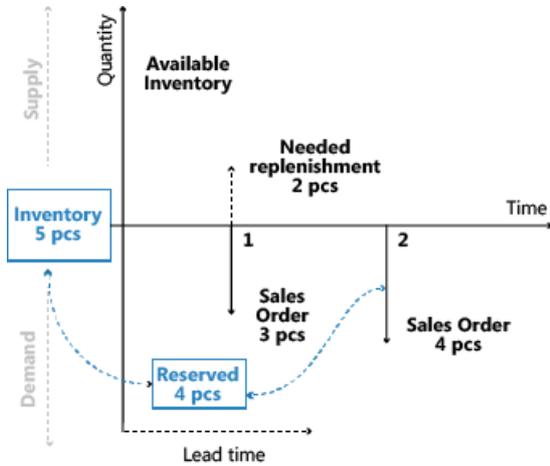

Reservations and order tracking links will break if a situation becomes impossible, such as moving the demand to a date earlier than the supply. However, the order-to-order link adapts to any changes in the respective demand or supply and thereby the link is never broken.

Reservations

The planning system does not include any reserved quantities in the calculation. For example, if a sales order has been totally or partially reserved against the quantity in inventory, the reserved quantity in inventory cannot be used to cover other demand. The planning system does not include this demand-supply set in its calculation.

However, the planning system will still include reserved quantities in the projected inventory profile because all quantities must be considered when determining both when the reorder point has been passed and how many to reorder to reach and not exceed the maximum inventory level. Consequently, unnecessary reservations will lead to increased risks that inventory levels run low because the planning logic does not detect reserved quantities.

The following illustration shows how reservations can hinder the most feasible plan.

For more information, see [Design Details: Reservation, Order Tracking, and Action Messaging](#).

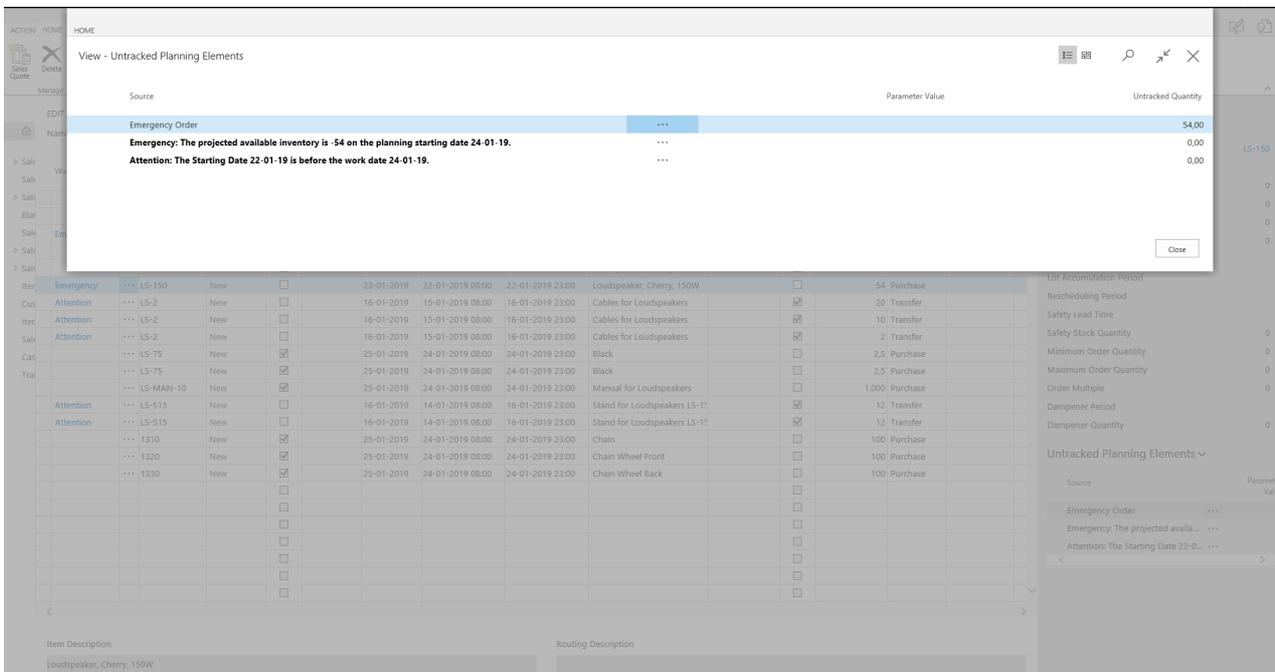

Warnings

The first column in the planning worksheet is for the warning fields. Any planning line created for an unusual situation will display a warning icon in this field, which the user can click for additional information.

Supply on planning lines with warnings will normally not be modified according to planning parameters. Instead, the planning system only suggests a supply to cover the exact demand quantity. However, the system can be set up to respect certain planning parameters for planning lines with certain warnings. For more information, see the description of these options for the **Calculate Plan - Plan. Wksh.** batch job and the **Calculate Plan - Req. Wksh.** batch job respectively.

The warning information is shown on the **Untracked Planning Elements** page, which is also used to show order tracking links to non-order network entities. The following warning types exist:

- Emergency
- Exception
- Attention

Emergency

The emergency warning is displayed in two situations:

- When the inventory is negative on the planning starting date.
- When back-dated supply or demand events exist.

If an item’s inventory is negative on the planning starting date, the planning system suggests an emergency supply for the negative quantity to arrive on the planning starting date. The warning text states the starting date and the quantity of the emergency order. For more information, see [Design Details: Handling Projected Negative Inventory](#).

Any document lines with due dates before the planning starting date are consolidated into one emergency supply order for the item to arrive on the planning starting date.

Exception

The exception warning is displayed if the projected available inventory drops below the safety stock quantity. The planning system will suggest a supply order to meet the demand on its due date. The warning text states the item’s safety stock quantity and the date on which it is violated.

Violating the safety stock level is considered an exception because it should not occur if the reorder point has been set correctly. For more information, see [Design Details: The Role of the Reorder Point](#).

In general, exceptional order proposals ensure that the projected available inventory is never lower than the safety stock level. This means that the proposed quantity is just enough to cover the safety stock, without considering planning parameters. However, in some scenarios, order modifiers will be considered.

NOTE

The planning system may have consumed the safety stock intentionally and will then replenish it straight away. For more information, see [Safety Stock May Be Consumed](#).

Attention

The attention warning is displayed in three situations:

- The planning starting date is earlier than the work date.
- The planning line suggests changing a released purchase or production order.

- The projected inventory exceeds the overflow level on the due date. For more information, see [Design Details: Staying under the Overflow Level](#).

NOTE

In planning lines with warnings, the **Accept Action Message** field is not selected, because the planner is expected to further investigate these lines before carrying out the plan.

Error Logs

In the Calculate Plan request page, the user can select the **Stop and Show First Error** field to have the planning run stop when it encounters the first error. At the same time, a message is displayed with information about the error. If an error exists, only the successful planning lines that were made before the error was encountered will be presented in the planning worksheet.

If the field is not selected, the Calculate Plan batch job will continue until it has completed. Errors will not interrupt the batch job. If one or more errors exist, the program will display a message after completion saying how many items are affected by errors. The **Planning Error Log** page then opens to provide more details about the error and to provide links to the affected documents or setup cards.

The screenshot shows a web application interface with a top navigation bar containing 'HOME' and 'ACTIONS' tabs. Below the navigation bar are icons for 'Show', 'Notes', 'Links', and 'Open in Excel'. The main content area is titled 'View - Planning Error Log - DEFAULT Default Journal Batch'. It features a table with two columns: 'Item No.' and 'Error Description'. The table lists several items with error messages related to reordering policies. A 'Close' button is located at the bottom right of the table area.

Item No.	Error Description
C-100	Reorder Quantity must not be 0 in Item C-100 when Reordering Policy is Fixed Reorder Qty..
FF-100	Reorder Quantity must not be 0 in Item FF-100 when Reordering Policy is Fixed Reorder Qty..
HS-100	Reorder Quantity must not be 0 in Item HS-100 when Reordering Policy is Fixed Reorder Qty..
LSU-15	Reorder Quantity must not be 0 in Item LSU-15 when Reordering Policy is Fixed Reorder Qty..
LSU-4	Reorder Quantity must not be 0 in Item LSU-4 when Reordering Policy is Fixed Reorder Qty..
LSU-8	Reorder Quantity must not be 0 in Item LSU-8 when Reordering Policy is Fixed Reorder Qty..
SPK-100	Reorder Quantity must not be 0 in Item SPK-100 when Reordering Policy is Fixed Reorder Qty..

Planning Flexibility

It is not always practical to plan an existing supply order, such as when production has started or extra people are hired on a specific day to do the job. To indicate whether an existing order can be changed by the planning system, all supply order lines have a Planning Flexibility field with two options: Unlimited or None. If the field is set to None, the planning system will not try to change the supply order line.

The field can be manually set by the user, however, in some cases it will be set automatically by the system. The fact that planning flexibility can be manually set by the user is important, because it makes it easy to adapt the usage of the feature to different workflows and business cases.

For more information about how this field is used, see [Design Details: Transfers in Planning](#).

Order Planning

The basic supply planning tool represented by the **Order Planning** page is designed for manual decision making. It does not consider any planning parameters and is therefore not discussed further in this document. For more information on the Order Planning feature, refer to Help in Business Central.

NOTE

It is not advisable to use Order Planning if the company already uses the planning or requisition worksheets. Supply orders created through the **Order Planning** page may be changed or deleted during the automated planning runs. This is because the automated planning run uses planning parameters and these may not be considered by the user who made the manual plan in the Order Planning page.

Finite Loading

Business Central is a standard ERP system, not a dispatching or shop floor control system. It plans for a feasible utilization of resources by providing a rough-cut schedule, but it does not automatically create and maintain detailed schedules based on priorities or optimization rules.

The intended use of the Capacity-Constrained Resource feature is 1): to avoid overload of specific resources and 2): to ensure that no capacity is left unallocated if it could increase the turn-around time of a production order. The feature includes no facilities or options to prioritize or optimize operations as one would expect to find in a dispatching system. However, it can provide rough-cut capacity information useful to identify bottlenecks and to avoid overloading resources.

When planning with capacity-constrained resources, the system ensures that no resource is loaded above its defined capacity (critical load). This is done by assigning each operation to the nearest available time slot. If the time slot is not big enough to complete the entire operation, then the operation will be split into two or more parts placed in the nearest available time slots.

NOTE

In case of operation splitting, the setup time is only assigned once because it is assumed that some manual adjustment is done to optimize the schedule.

Dampener time can be added to resources to minimize operation splitting. This enables the system to schedule load on the last possible day by exceeding the critical load percent slightly if this can reduce the number of operations that are split.

This completes the outline of central concepts relating to supply planning in Business Central. The following sections investigate these concepts deeper and place them in the context of the core planning procedures, balancing demand and supply as well as the use of reordering policies.

Design Details: Reservation, Order Tracking, and Action Messaging

3/31/2019 • 15 minutes to read

The reservations system is comprehensive and includes the interrelated and parallel features of Order Tracking and Action Messaging.

At the core of the reservation system is the linking of a demand entry and a corresponding supply entry, either through reservation or order tracking. A reservation is a user-generated link, and an order tracking record is a system-generated link. An item quantity that is entered in the reservation system is either reserved or order tracked, but not both at the same time. How the systems handle an item depends on how the item is set up.

The reservation system interacts with the planning system by creating action messages on planning lines during planning runs. An action message can be considered an appendage to an order tracking record. Action messages, whether created dynamically in order tracking or during the planning run, provide a convenient tool for efficient supply planning.

NOTE

Reserved quantities are ignored by the planning system, that is, the hard link that is made between supply and demand cannot be changed through planning.

The reservations system also forms the structural foundation for the item tracking system. For more information, see [Design Details: Item Tracking](#).

For more detailed information about how the reservation system works, see the "Reservation Entry Table" white paper on [PartnerSource](#).

Reservation

A reservation is a firm link that connects a specific demand and a specific supply to each other. This link directly affects the subsequent inventory transaction and ensures the proper application of item entries for costing purposes. A reservation overrides the default costing method of an item. For more information, see "Design Details: Costing Methods".

The **Reservation** page is accessible from all order lines of both demand and supply type. In this page, the user can specify which demand or supply entry to create a reservation link to. The reservation consists of a pair of records that share the same entry number. One record has a negative sign and points to the demand. The other record has a positive sign and points to the supply. These records are stored in the **Reservation Entry** table with status value **Reservation**. The user can view all reservations on the **Reservation Entries** page.

Offsetting in Reservations

Reservations are made against available item quantities. Item availability is calculated in basic terms as follows:

available quantity = inventory + scheduled receipts - gross requirements

The following table shows the details of the order network entities that are part of the availability calculation.

	FIELD IN T27	SOURCE TABLE	TABLE FILTER	SOURCE FIELD
Inventory	Inventory	Item Ledger Entry	N/A	Quantity
Scheduled receipts	FP Order Receipt (Qty.)	Prod. Order Line	= Firm Planned	Remaining Qty. (Base)
Scheduled receipts	Rel. Order Receipt (Qty.)	Prod. Order Line	= Released	Remaining Qty. (Base)
Scheduled receipts	Qty. on Assembly Order	Assembly Header	= Order	Remaining Qty. (Base)
Scheduled receipts	Qty. on Purch. Order	Purchase Line	= Order	Outstanding Qty. (Base)
Scheduled receipts	Trans. Ord. Receipt (Qty.)	Transfer Line	N/A	Outstanding Quantity
Gross requirements	Qty. On Sales Order	Sales Line	= Order	Outstanding Qty. (Base)
Gross requirements	Scheduled Need (Qty.)	Prod. Order Component	< > Simulated	Remaining Qty. (Base)
Gross requirements	Qty. on Asm. Component	Assembly Line	= Order	Remaining Qty. (Base)
Gross requirements	Trans. Ord. Shipment (Qty.)	Transfer Line	N/A	Outstanding Quantity

For more information, see [Design Details: Availability in the Warehouse](#).

Manual Reservation

When a user intentionally creates a reservation, the user gains full ownership of and responsibility for these items. This means that the user must also manually change or cancel a reservation. Such manual changes may cause automatic modification of the involved reservations.

The following table shows when and which modifications may occur:

USER ACTION	SYSTEM REACTION
Decreasing the reserved quantity	The related quantity fields are updated.
Changing date fields	The related date fields are updated. Note: If the due date on a demand is changed to precede the shipment date or due date of the supply, then the reservation is canceled.
Deleting the order	The reservation is canceled.
Changing location, bin, variant, serial number, or lot number	The reservation is canceled.

NOTE

The Late Binding functionality may also change reservations without informing the user, by reshuffling nonspecific reservations of serial or lot numbers. For more information, see "Design Details: Item Tracking and Reservations".

Automatic Reservations

The item card can be set up to always be reserved automatically from demand, such as sales orders. In that case, reservation is made against inventory, purchase orders, assembly orders, and production orders. A warning is issued if supply is insufficient.

In addition, items are automatically reserved by various planning functions to keep a demand linked to a specific supply. The order tracking entries for such planning links contain **Reservation** in the **Reservation Status** field in the **Reservation Entry** table. Automatic reservations are created in the following situations:

- A multilevel production order where the **Manufacturing Policy** field of the involved parent and child items is set to **Make-to-Order**. The planning system creates reservations between the parent production order and the underlying production orders to ensure that they are processed together. Such a reservation binding overrides the item's default costing and application method.
- A production, assembly, or purchase order where the **Reordering Policy** field of the involved item is set to **Order**. The planning system creates reservations between the demand and the planned supply to ensure that the specific supply is created. For more information, see [Design Details: Order](#).
- A production order created from a sales order with the **Sales Order Planning** function is linked to the sales order with an automatic reservation.
- An assembly order created automatically for a sales order line to fulfill the quantity in the **(\$ T_37_900 Qty. to Assemble to Order \$)** field. This automatic reservation links the sales demand and the assembly supply so that sales order processors can customize and promise the assembly item to the customer directly. In addition, the reservation links the assembly output to the sales order line through to the shipping activity that fulfills the customer order.

In the case of supply or demand that is not allocated, the planning system automatically assigns a reservation status of type **Surplus**. This could result from demand that is due to forecasted quantities or user-entered planning parameters. This is legitimate surplus, which the system recognizes, and it does not give rise to action messages. Surplus could also be genuine, excess supply or demand that remains untracked. This is an indication of an imbalance in the order network, which causes the system to issue action messages. Note that an action message that suggests a change in quantity always refers to type **Surplus**. For more information, see the "Example: Order Tracking in Sales, Production, and Transfers" section in this topic.

Automatic reservations that are created during the planning run are handled in the following ways:

- They are applied against item quantities that are part of the availability calculation, as are manual reservations. For more information, see the "Offsetting in Reservations" section in this topic.
- They are included and potentially changed in subsequent planning runs, as opposed to manually reserved items.

Order Tracking

Order Tracking helps the planner maintain a valid supply plan by providing an overview of the offsetting between demand and supply in the order network. The order tracking records serve as the foundation for creating dynamic action messages and planning line suggestions during planning runs.

NOTE

The order tracking system offsets available stock as orders are entered into the order network. This implies that the system does not prioritize orders that may be more urgent in terms of their due date. It is therefore up to the logic of the planning system or the wisdom of the planner to rearrange these priorities in a meaningful way.

NOTE

Order tracking policy and the Get Action Messages function are not integrated with Jobs. That means that demand related to a job is not automatically tracked. Because it is not tracked, it could cause the use of an existing replenishment with job information to be tracked to another demand, for example, a sales order. Consequently, you may encounter the situation in which your information about available inventory is out of sync.

The Order Network

The order tracking system is based on the principle that the order network must always be in a state of balance, in which every demand that enters the system is offset by a corresponding supply and vice versa. The system provides this by identifying logical links between all demand and supply entries in the order network.

This principle implies that a change in demand results in a corresponding imbalance on the supply side of the order network,. Conversely, a change in supply results in a corresponding imbalance on the demand side of the order network. In reality, the order network is in a state of constant flux as users enter, amend, and delete orders. Order Tracking processes orders dynamically, reacting to each change at the time that it enters the system and becomes a part of the order network. As soon as new order tracking records are created, the order network is in balance, but only until the next change occurs.

To increase the transparency of calculations in the planning system, the **Untracking Planning Elements** page displays untracked quantities, which represent the difference in quantity between known demand and suggested supply. Each line on the page refers to the cause of the excess quantity, such as **Blanket Order, Safety Stock Level, Fixed Reorder Quantity, Minimum Order Qty., Rounding,** or **Dampener.**

Offsetting in Order Tracking

In contrast to reservations, which can only be made against available item quantities, order tracking is possible against all order network entities that are part of the net requirements calculation of the planning system. The net requirements are calculated as follows:

net requirements = gross requirements + reorder point - scheduled receipts - planned receipts - projected available balance

NOTE

Demand that is related to forecasts or planning parameters is not order tracked.

Example: Order Tracking in Sales, Production, and Transfers

The following scenario shows which order tracking entries are created in the **Reservation Entry** table as results of various order network changes.

Assume the following data for two items that are set up for order tracking.

ITEM 1	NAME	"COMPONENT"
--------	------	-------------

ITEM 1	NAME	"COMPONENT"
	Availability	100 units in RED location - 30 units of LOTA - 70 units of LOTB
Item 2	Name	"Produced Item"
	Production BOM	1 qty. per of "Component"
	Demand	Sale for 100 units at BLUE location
	Supply	Released production order (generated with the Sales Order Planning function for the sale of 100 units)

On the **Manufacturing Setup** page, the **Components at Location** field is set to **RED**.

The following order tracking entries exist in the **Reservation Entry** table based on the data in the table.

Entry No.	Positive	Item No.	Location Code	Quantity	Reservation Status	Description	Lot No.	Source Type	Source ID	Binding
8	<input checked="" type="checkbox"/>	COMPONENT	RED	-70	Tracking	Component	LOTB	5407	101004	
9	<input type="checkbox"/>	COMPONENT	RED	-30	Tracking	Component	LOTA	5407	101004	
9	<input checked="" type="checkbox"/>	COMPONENT	RED	30	Tracking	Component	LOTA	32		
10	<input type="checkbox"/>	PRODUCED ITEM	BLUE	-100	Reservation	Produced Item		37	1001	Order-to-Order
10	<input checked="" type="checkbox"/>	PRODUCED ITEM	BLUE	100	Reservation	Produced Item		5406	101004	Order-to-Order

Entry Numbers 8 and 9

For the component need for LOTA and LOTB respectively, order tracking links are created from the demand in table 5407, **Prod. Order Component**, to the supply in table 32, **Item Ledger Entry**. The **Reservation Status** field contains **Tracking** to indicate that these entries are dynamic order tracking links between supply and demand.

NOTE

The **Lot No.** field is empty on the demand lines, because the lot numbers are not specified on the component lines of the released production order.

Entry Numbers 10

From the sales demand in table 37, **Sales Line**, an order tracking link is created to the supply in table 5406, **Prod. Order Line**. The **Reservation Status** field contains **Reservation**, and the **Binding** field contains **Order-to-Order**. This is because the released production order was generated specifically for the sales order and must remain linked unlike order tracking links with a reservation status of **Tracking**, which are created and changed dynamically. For more information, see the "Automatic Reservations" section in this topic.

At this point in the scenario, the 100 units of LOTA and LOTB are transferred to BLUE location by a transfer order.

NOTE

Only the transfer order shipment is posted at this point, not the receipt.

Now the following order tracking entries exist in the **Reservation Entry** table.

Entry No.	Positive	Item No.	Location Code	Quantity	Reservation Status	Description	Lot No.	Source Type	Source ID	Binding
8	<input checked="" type="checkbox"/>	COMPONENT	RED	-70	Surplus	Component		5407	101004	
9	<input type="checkbox"/>	COMPONENT	RED	-30	Surplus	Component		5407	101004	
10	<input type="checkbox"/>	PRODUCED ITEM	BLUE	-100	Reservation	Produced Item		37	1001	Order-to-Order
10	<input checked="" type="checkbox"/>	PRODUCED ITEM	BLUE	100	Reservation	Produced Item		5406	101004	Order-to-Order
12	<input checked="" type="checkbox"/>	COMPONENT	BLUE	70	Surplus	Component	LOTB	5741	1011	
14	<input checked="" type="checkbox"/>	COMPONENT	BLUE	30	Surplus	Component	LOTA	5741	1011	
15	<input checked="" type="checkbox"/>	COMPONENT	OUT. LOG.	70	Surplus		LOTB	32		
16	<input checked="" type="checkbox"/>	COMPONENT	OUT. LOG.	30	Surplus		LOTA	32		

Entry Numbers 8 and 9

Order tracking entries for the two lots of the component reflecting demand in table 5407 are changed from a reservation status of **Tracking** to **Surplus**. The reason is that the supplies that they were linked to before, in table 32, have been used by the shipment of the transfer order.

Genuine surplus, as in this case, reflects excess supply or demand that remains untracked. It is an indication of imbalance in the order network, which will generate an action message by the planning system unless it is resolved dynamically.

Entry Numbers 12 to 16

Because the two lots of the component are posted on the transfer order as shipped but not received, all related positive order tracking entries are of reservation type **Surplus**, indicating that they are not allocated to any demands. For each lot number, one entry relates to table 5741, **Transfer Line**, and one entry relates to the item ledger entry at the in-transit location where the items now exist.

At this point in the scenario, the transfer order of the components from BLUE to RED location is posted as received.

Now the following order tracking entries exist in the **Reservation Entry** table.

Entry No.	Positive	Item No.	Location Code	Quantity	Reservation Status	Description	Lot No.	Source Type	Source ID	Binding
8	<input checked="" type="checkbox"/>	COMPONENT	RED	-70	Surplus	Component		5407	101004	
9	<input type="checkbox"/>	COMPONENT	RED	-30	Surplus	Component		5407	101004	
10	<input type="checkbox"/>	PRODUCED ITEM	BLUE	-100	Reservation	Produced Item		37	1001	Order-to-Order
10	<input checked="" type="checkbox"/>	PRODUCED ITEM	BLUE	100	Reservation	Produced Item		5406	101004	Order-to-Order
17	<input checked="" type="checkbox"/>	COMPONENT	BLUE	70	Surplus		LOTB	32		
18	<input checked="" type="checkbox"/>	COMPONENT	BLUE	30	Surplus		LOTA	32		

The order tracking entries are now similar to the first point in the scenario, before the transfer order was posted as shipped only, except entries for the component are now of reservation status **Surplus**. This is because the

component need is still at RED location, reflecting that the **Location Code** field on the production order component line contains **RED** as set up in the **Components at Location** setup field. The supply that was allocated to this demand before has been transferred to BLUE location and can now not be fully tracked unless the component need on the production order line is changed to BLUE location.

At this point in the scenario, the **Location Code** on the production order line is set to **BLUE**. In addition, on the **Item Tracking Lines** page, the 30 units of LOTA and the 70 units of LOTB are assigned to the production order line.

Now the following order tracking entries exist in the **Reservation Entry** table.

Entry No.	Positive	Item No.	Location Code	Quantity	Reservation Status	Description	Lot No.	Source Type	Source ID	Binding
10	<input checked="" type="checkbox"/>	PRODUCED ITEM	BLUE	-100	Reservation	Produced Item		37	1001	Order-to-Order
	<input checked="" type="checkbox"/>	PRODUCED ITEM	BLUE	100	Reservation	Produced Item		5406	101004	Order-to-Order
21	<input type="checkbox"/>	COMPONENT	BLUE	-70	Tracking	Component	LOTB	5407	101004	
21	<input checked="" type="checkbox"/>	COMPONENT	BLUE	70	Tracking	Component	LOTB	32		
22	<input type="checkbox"/>	COMPONENT	BLUE	-30	Tracking	Component	LOTA	5407	101004	
22	<input checked="" type="checkbox"/>	COMPONENT	BLUE	30	Tracking	Component	LOTA	32		

Entry Numbers 21 and 22

Since the component need has been changed to BLUE location, and the supply is available as item ledger entries at BLUE location, all order tracking entries for the two lot numbers are now fully tracked, indicated by the reservation status of **Tracking**.

The **Lot No.** field is now filled in the order tracking entry for table 5407, because the lot numbers were assigned to the production order component lines.

For more examples of order tracking entries in the **Reservation Entry** table, see the "Reservation Entry Table" white paper on [PartnerSource](#) (requires login).

Action Messaging

When the order tracking system detects an imbalance in the order network, it automatically creates an action message to notify the user. Action messages are system-generated calls for user action that specify the details of the imbalance and the suggestions about how to restore balance to the order network. They are displayed as planning lines on the **Planning Worksheet** page when you choose **Get Action Messages**. In addition, action messages are displayed on planning lines that are generated by the planning run to reflect the planning system's suggestions about how to restore balance to the order network. In both cases, the suggestions are run on the order network, when you choose **Carry Out Action Messages**.

An action message addresses one BOM level at a time. If the user accepts the action message, this may give rise to additional action messages at the next BOM level.

The following table shows the action messages that exist.

ACTION MESSAGE	DESCRIPTION
Change Qty.	Changes the quantity on an existing supply order to cover a changed or new demand.

ACTION MESSAGE	DESCRIPTION
Reschedule	Reschedules the due date on an existing order.
Resched. & Chg. Qty.	Reschedules the due date and changes the quantity on an existing order.
New	Creates a new order if demand cannot be fulfilled by either of the previous action messages.
Cancel	Cancels an existing order.

The order tracking system always attempts to resolve an imbalance in the existing order network. If this is not possible, it issues an action message to create a new order. Following is the prioritized list that the order tracking system uses when it determines how to restore balance. If an additional demand has entered the order network, the system seeks to order track through the following checks:

1. Check for any excess supply in the existing order tracking record for this demand.
2. Check for planned and scheduled receipts in order of receipt date. The latest possible date is selected.
3. Check for available stock.
4. Check if a supply order exists in the current order tracking record. If so, the system issues an action message of type **Change** to increase the order.
5. Check that no supply order exists in the current order tracking record. If so, the system issues an action message of type **New** to create a new order.

An open demand passes through the list and offsets the available supply at each point. Any remaining demand is always covered by check 4 or check 5.

If a decrease in demand quantity occurs, the order tracking system attempts to resolve the imbalance by performing the previous checks in reverse order. This means that existing action messages could be modified or even deleted, if necessary. The order tracking system always presents the net result of its calculations to the user.

Order Tracking and Planning

When the planning system runs, it deletes all existing order tracking records and action message entries and recreates them as planning line suggestions according to supply/demand pairs and priorities. When the planning run has finished, the order network is in balance.

Planning System versus Order Tracking and Action Messaging

The following comparison shows the differences between the methods that are used by the planning system to create planning line suggestions and the methods that are used by the order tracking system to create order tracking records and action messages.

- The planning system deals with the entire supply and demand pattern of a particular item, whereas order tracking deals with the order that activated it.
- The planning system deals with all levels of the BOM hierarchy, whereas order tracking deals with one BOM level at a time.
- The planning system establishes links between demand and supply according to the prioritized due date. Order tracking establishes links between demand and supply according to the order entry sequence.
- The planning system takes planning parameters into account, whereas order tracking does not.
- The planning system creates links in a user-activated batch mode when it balances demand and supply, whereas order tracking creates the links automatically and dynamically as the user enters orders.

Design Details: Balancing Demand and Supply

3/31/2019 • 20 minutes to read

To understand how the planning system works, it is necessary to understand the prioritized goals of the planning system, the most important of which are to ensure that:

- Any demand will be met by sufficient supply.
- Any supply serves a purpose.

Generally, these goals are achieved by balancing supply with demand.

Demand and Supply

Demand is the common term used for any kind of gross demand, such as a sales order and component need from a production order. In addition, the program allows more technical types of demand, such as negative inventory and purchase returns.

Supply is the common term used for any kind of positive or inbound quantity, such as inventory, purchases, assembly, production, or inbound transfers. In addition, a sales return may also represent supply.

To sort out the many sources of demand and supply, the planning system organizes them on two time lines called inventory profiles. One profile holds demand events, and the other holds the corresponding supply events. Each event represents one order network entity, such as a sales order line, an item ledger entry, or a production order line.

When inventory profiles are loaded, the different demand-supply sets are balanced to output a supply plan that fulfills the listed goals.

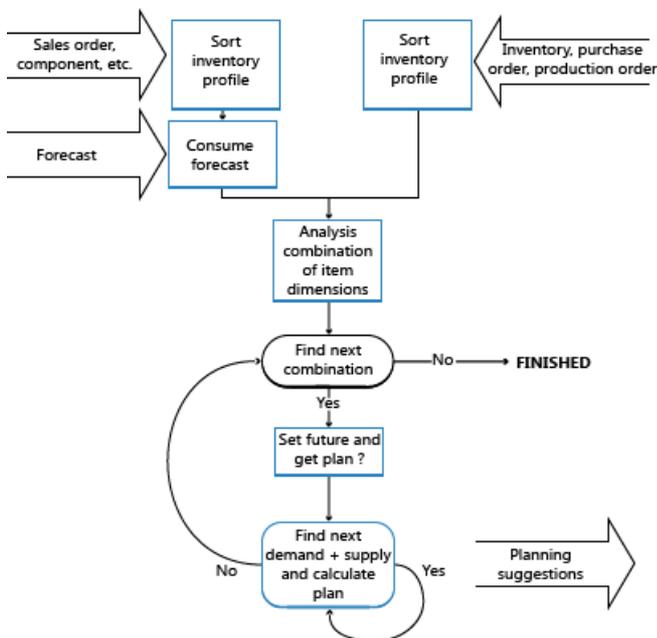

Planning parameters and inventory levels are other types of demand and supply respectively, which undergo integrated balancing to replenish stock items. For more information, see [Design Details: Handling Reordering Policies](#).

The Concept of Balancing in Brief

Demand is given by a company's customers. Supply is what the company can create and remove to establish balance. The planning system starts with the independent demand and then tracks backwards to the supply.

The inventory profiles are used to contain information about the demands and supplies, quantities, and timing. These profiles essentially make up the two sides of the balancing scale.

The objective of the planning mechanism is to counterbalance the demand and supply of an item to ensure that supply will match demand in a feasible way as defined by the planning parameters and rules.

Dealing with Orders Before the Planning Starting Date

To avoid that a supply plan shows impossible and therefore useless suggestions, the planning system regards the period up until the planning starting date a frozen zone where nothing is planned for. The following rule applies to the frozen zone:

All supply and demand before the starting date of the planning period will be considered a part of inventory or shipped.

Accordingly, the planning system will not, with a few exceptions, suggest any changes to supply orders in the frozen zone, and no order tracking links are created or maintained for that period.

The exceptions to this rule are as follows:

- If the projected available inventory, including the sum of supply and demand in the frozen zone, is below zero.
- If serial/lot numbers are required on the backdated order(s).
- If the supply-demand set is linked by an order-to-order policy.

If the initial available inventory is below zero, the planning system suggests an emergency supply order on the day before the planning period to cover the missing quantity. Consequently, the projected and available inventory will always be at least zero when planning for the future period begins. The planning line for this supply order will display an Emergency warning icon and additional information is provided upon lookup.

Serial/Lot Numbers and Order-to-Order Links are Exempt from the Frozen Zone

If serial/lot numbers are required or an order-to-order link exists, the planning system will disregard the frozen zone and incorporate such quantities that are back-dated from the starting date and potentially suggest corrective actions if demand and supply is not synchronized. The business reason for this principle is that such specific demand-supply sets must match to ensure that this specific demand is fulfilled.

Loading the Inventory Profiles

To sort out the many sources of demand and supply, the planning system organizes them on two timelines called inventory profiles.

The normal types of demand and supply with due dates on or after the planning starting date are loaded into each inventory profile. When loaded, the different demand and supply types are sorted according to overall priorities, such as due date, low-level codes, location, and variant. In addition, order priorities are applied to the different types to ensure that the most important demand is fulfilled first. For more information, see [Design](#)

Details: Prioritizing Orders.

As previously mentioned, demand could also be negative. This means that it should be treated as supply; however, unlike the normal types of supply, negative demand is considered fixed supply. The planning system can take it into account, but will not suggest any changes to it.

In general, the planning system considers all supply orders after the planning starting date as subject to change in order to fulfill demand. However, as soon as a quantity is posted from a supply order, it can no longer be changed by the planning system. Accordingly, the following different orders cannot be replanned:

- Released production orders where consumption or output has been posted.
- Assembly orders where consumption or output has been posted.
- Transfer orders where shipment has been posted.
- Purchase orders where receipt has been posted.

Apart from loading demand and supply types, certain types are loaded with attention to special rules and dependencies that are described in the following.

Item Dimensions are Separated

The supply plan must be calculated per combination of the item dimensions, such as variant and location. However, there is no reason to calculate any theoretical combination. Only those combinations that carry a demand and/or supply need to be calculated.

The planning system controls this by running through the inventory profile. When a new combination is found, the program creates an internal control record that holds the actual combination information. The program inserts the SKU as the control record, or outer loop. As a result, the proper planning parameters according to a combination of variant and location are set, and the program can proceed to the inner loop.

NOTE

The program does not require the user to enter a SKU record when entering demand and/or supply for a particular combination of variant and location. Therefore, if a SKU does not exist for a given combination, the program creates its own temporary SKU record based on the item card data. If Location Mandatory is set to Yes in the Inventory Setup page, then either a SKU must be created or Components at Location must be set to Yes. For more information, see [Design Details: Demand at Blank Location](#).

Serial/Lot Numbers are Loaded by Specification Level

Attributes in the form of serial/lot numbers are loaded into the inventory profiles along with the demand and supply that they are assigned to.

Demand and supply attributes are arranged by order priority as well as by their level of specification. Because serial/lot number matches reflect the level of specification, the more specific demand, such as a lot number selected specifically for a sale line, will seek a match before less specific demand, such as a sale from any lot number selected.

NOTE

There are no dedicated prioritization rules for serial/lot-numbered demand and supply, other than the level of specification defined by their combinations of serial and lot numbers and the item tracking setup of the involved items.

During balancing, the planning system regards supply that carries serial/lot numbers as inflexible and will not try to increase or reschedule such supply orders (unless they are used in an order-to-order relation). See [Order-to-Order Links are Never Broken](#)). This protects the supply from receiving several, possibly conflicting, action messages when a supply carries varying attributes—such as a collection of different serial numbers.

Another reason that serial/lot numbered supply is inflexible is that serial/lot numbers are generally assigned so late in the process that it would be confusing if changes are suggested.

The balancing of serial/lot numbers does not respect the [Frozen Zone](#). If demand and supply is not synchronized, the planning system will suggest changes or suggest new orders, regardless of the planning starting date.

Order-to-Order Links are Never Broken

When planning an order-to-order item, the linked supply must not be used for any demand other than what it was originally intended for. The linked demand should not be covered by any other random supply, even if, in its present situation, it is available in time and quantity. For example, an assembly order that is linked to a sales order in an assemble-to-order scenario cannot be used to cover other demand.

Order-to-order demand and supply must balance precisely. The planning system will ensure the supply under all circumstances without regarding order sizing parameters, modifiers, and quantities in inventory (other than quantities relating to the linked orders). For the same reason, the system will suggest decreasing excess supplies if the linked demand is decreased.

This balancing also affects the timing. The limited horizon that is given by the time bucket is not regarded; the supply will be rescheduled if the timing of the demand has changed. However, dampener time will be respected and will prevent order-to-order supplies from being scheduled out, except for the internal supplies of a multi-level production order (project order).

NOTE

Serial/lot numbers can also be specified on order-to-order demand. In that case, the supply is not regarded inflexible by default, as is normally the case for serial/lot numbers. In this case, the system will increase/decrease according to changes in demand. Furthermore, if one demand carries varying serial/lot numbers, such as more than one lot number, one supply order will be suggested per lot.

NOTE

Forecasts should not lead to creating supply orders that are bound by an order-to-order link. If the forecast is used, it should only be used as a generator of dependent demand in a manufacturing environment.

Component Need is Loaded according to Production Order Changes

When handling production orders, the planning system must monitor the needed components before loading them into the demand profile. Component lines that result from an amended production order will replace those of the original order. This ensures that the planning system establishes that planning lines for component need are never duplicated.

Safety Stock May Be Consumed

The safety stock quantity is primarily a demand type and is therefore loaded into the inventory profile on the planning starting date.

Safety stock is an inventory quantity set aside to compensate for uncertainties in demand during the replenishment lead time. However, it may be consumed if it is necessary to take from it to fulfill a demand. In that case, the planning system will ensure that the safety stock is quickly replaced by suggesting a supply order to replenish the safety stock quantity on the date it is consumed. This planning line will display an Exception warning icon explaining to the planner that the safety stock has been partly or fully consumed by means of an exception order for the missing quantity.

Forecast Demand is Reduced by Sales Orders

The demand forecast expresses anticipated future demand. While actual demand is entered, typically as sales orders for produced items, it consumes the forecast.

The forecast itself is not actually reduced by sales orders; it remains the same. However, the forecast quantities used in the planning calculation are reduced (by the sales order quantities) before the remaining quantity, if any, enters the demand inventory profile. When the planning system examines actual sales during a period, both open sales orders and item ledger entries from shipped sales are included, unless they are derived from a blanket order.

A user is required to define a valid forecast period. The date on the forecasted quantity defines the start of the period, and the date on the next forecast defines the end of the period.

The forecast for periods prior to the planning period is not used, regardless of whether it was consumed or not. The first forecast figure of interest is either the date on or the closest date prior to the planning starting date.

The forecast can be for independent demand, such as sales orders, or dependent demand, like production order components (module-forecast). An item can have both types of forecast. During planning, the consumption takes place separately, first for independent demand and then for dependent demand.

Blanket Order Demand is Reduced by Sales Orders

Forecasting is supplemented by the blanket sales order as a means of specifying future demand from a specific customer. As with the (unspecified) forecast, actual sales should consume the anticipated demand, and the remaining quantity should enter the demand inventory profile. Again, the consumption does not actually reduce the blanket order.

The planning calculation considers open sales orders linked to the specific blanket order line, but it does not consider any valid time period. Nor does it consider posted orders, since the posting procedure has already reduced the outstanding blanket order quantity.

Prioritizing Orders

Within a given SKU, the requested or available date represents the highest priority; the demand of today should be dealt with before the demand of next week. But in addition to this overall priority, the planning system will also suggest which type of demand should be fulfilled before fulfilling another demand. Likewise, it will suggest what source of supply should be applied before applying other sources of supply. This is done according to order priorities.

Loaded demand and supply contribute to a profile for the projected inventory according to the following priorities:

Priorities on the Demand Side

1. Already shipped: Item Ledger Entry
2. Purchase Return Order
3. Sales Order
4. Service Order
5. Production Component Need
6. Assembly Order Line
7. Outbound Transfer Order
8. Blanket Order (that has not already been consumed by related sales orders)
9. Forecast (that has not already been consumed by other sales orders)

NOTE

Purchase returns are usually not involved in supply planning; they should always be reserved from the lot that is going to be returned. If not reserved, purchase returns play a role in the availability and are highly prioritized to avoid that the planning system suggests a supply order just to serve a purchase return.

Priorities on the Supply Side

1. Already in inventory: Item Ledger Entry (Planning Flexibility = None)
2. Sales Return Order (Planning Flexibility = None)
3. Inbound Transfer Order
4. Production Order
5. Assembly Order
6. Purchase Order

Priority Related to the State of Demand and Supply

Apart from priorities given by the type of demand and supply, the present state of the orders in the execution process also defines a priority. For example, warehouse activities have an impact, and the status of sales, purchase, transfer, assembly, and production orders is taken into account:

1. Partly handled (Planning Flexibility = None)
2. Already in process in the warehouse (Planning Flexibility = None)
3. Released – all order types (Planning Flexibility = Unlimited)
4. Firm Planned Production Order (Planning Flexibility = Unlimited)
5. Planned/Open – all order types (Planning Flexibility = Unlimited)

Balancing Supply with Demand

The core of the planning system involves balancing demand and supply by means of suggesting user actions to revise the supply orders in case of imbalance. This takes place per combination of variant and location.

Imagine that each inventory profile contains a string of demand events (sorted by date and priority) and a corresponding string of supply events. Each event refers back to its source type and identification. The rules for counterbalancing the item are straightforward. Four instances of matching demand and supply can occur at any point of time in the process:

1. No demand or supply exists for the item => the planning has finished (or should not start).
2. Demand exists but there is no supply => supply should be suggested.
3. Supply exists but there is no demand for it => supply should be canceled.
4. Both demand and supply exist => questions should be asked and answered before the system can ensure that demand will be met and supply is sufficient.

If the timing of the supply is not suitable, perhaps the supply can be rescheduled as follows:

- a. If the supply is placed earlier than the demand, perhaps the supply can be rescheduled out so that inventory is as low as possible.
- b. If the supply is placed later than the demand, perhaps the supply can be rescheduled in. Otherwise, the system will suggest new supply.
- c. If the supply meets the demand on the date, the planning system can proceed to investigate whether the quantity of the supply can cover the demand.

Once the timing is in place, the adequate quantity to be supplied can be calculated as follows:

- a. If the supply quantity is less than the demand, it is possible that the supply quantity could be increased (or not, if limited by a maximum quantity policy).
- b. If the supply quantity is greater than the demand, it is possible that the supply quantity can be decreased (or not, if limited by a minimum quantity policy).

At this point, either of these two situations exists:

- a. The current demand can be covered, in which case it can be closed and planning for the next demand

can start.

- b. The supply has reached its maximum, leaving some of the demand quantity uncovered. In this case, the planning system can close the current supply and proceed to the next one.

The procedure starts all over with the next demand and the current supply or vice versa. The current supply might be able to cover this next demand as well, or the current demand has not yet been fully covered.

Rules Concerning Actions for Supply Events

When the planning system performs a top-down calculation in which supply must fulfill demand, the demand is taken as a given, that is, it lies outside the control of the planning system. However, the supply side can be managed. Therefore, the planning system will suggest creating new supply orders, rescheduling existing ones, and/or changing the order quantity. If an existing supply order becoming superfluous, the planning system will suggest that the user cancels it.

If the user wants to exclude an existing supply order from the planning suggestions, he can state that it has no planning flexibility (Planning Flexibility = None). Then, excess supply from that order will be used to cover demand, but no action will be suggested.

In general, all supply has a planning flexibility that is limited by the conditions of each of the suggested actions.

- **Reschedule Out:** The date of an existing supply order can be scheduled out to meet the demand due date unless:
 - It represents inventory (always on day zero).
 - It has an order-to-order linked to another demand.
 - It lies outside the reschedule page defined by the time bucket.
 - There is a closer supply that could be used.
 - On the other hand, the user may decide not to reschedule because:
 - The supply order has already been tied to another demand on a previous date.
 - The needed rescheduling is so minimal that the user finds it negligible.
- **Reschedule In:** The date of an existing supply order can be scheduled in, except in the following conditions:
 - It is linked directly to some other demand.
 - It lies outside the reschedule page defined by the time bucket.

NOTE

When planning an item using a reorder point, the supply order can always be scheduled in if necessary. This is common in forward-scheduled supply orders triggered by a reorder point.

- **Increase Quantity:** The quantity of an existing supply order can be increased to meet the demand unless the supply order is linked directly to a demand by an order-to-order link.

NOTE

Even though it is possible to increase the supply order, it may be limited due to a defined maximum order quantity.

- **Decrease Quantity:** An existing supply order with a surplus compared to an existing demand can be decreased to meet the demand.

NOTE

Even though the quantity could be decreased, there may still be some surplus compared to the demand due to a defined minimum order quantity or order multiple.

- **Cancel:** As a special incident of the decrease quantity action, the supply order could be canceled if it has been decreased to zero.
- **New:** If no supply order already exists, or an existing one cannot be changed to meet the necessary quantity on the demanded due date, a new supply order is suggested.

Determining the Supply Quantity

Planning parameters defined by the user control the suggested quantity of each supply order.

When the planning system calculates the quantity of a new supply order or the quantity change on an existing one, the suggested quantity may be different from what is actually demanded.

If a maximum inventory or fixed order quantity are selected, the suggested quantity may be increased to meet that fixed quantity or the maximum inventory. If a reordering policy uses a reorder point, the quantity may be increased at least to meet the reorder point.

The suggested quantity may be modified in this sequence:

1. Down to the maximum order quantity (if any).
2. Up to the minimum order quantity.
3. Up to meet the nearest order multiple. (In case of erroneous settings, this may violate the maximum order quantity.)

Order Tracking Links during Planning

Concerning order tracking during planning, it is important to mention that the planning system rearranges the dynamically created order tracking links for the item/variant/location combinations.

There are two reasons for this:

- The planning system must be able to justify its suggestions; that all demand has been covered, and that no supply orders are superfluous.
- Dynamically created order tracking links need to be rebalanced regularly.

Over time, dynamic order tracking links become out of balance since the entire order tracking network is not rearranged until a demand or supply event is actually closed.

Before balancing supply by demand, the program deletes all existing order tracking links. Then during the balancing procedure, when a demand or supply event is closed, it establishes new order tracking links between the demand and supply.

NOTE

Even if the item is not set up for dynamic order tracking, the planned system will create balanced order tracking links as explained above.

Closing Demand and Supply

When the supply balancing procedures have been performed, there are three possible end situations:

- The required quantity and date of the demand events have been met and the planning for them can be closed. The supply event is still open and may be able to cover the next demand, so the balancing procedure can start

over with the current supply event and the next demand.

- The supply order cannot be modified to cover all of the demand. The demand event is still open, with some uncovered quantity that may be covered by the next supply event. Thus the current supply event is closed, so the balancing act can start over with the current demand and the next supply event.
- All of the demand has been covered; there is no subsequent demand (or there has been no demand at all). If there is any surplus supply, it may be decreased (or canceled) and then closed. It is possible that additional supply events exist further along in the chain, and they should also be canceled.

Last, the planning system will create an order tracking link between the supply and the demand.

Creating the Planning Line (Suggested Action)

If any action – New, Change Quantity, Reschedule, Reschedule and Change Quantity, or Cancel – is suggested to revise the supply order, the planning system creates a planning line in the planning worksheet. Due to order tracking, the planning line is created not only when the supply event is closed, but also if the demand event is closed, even though the supply event is still open and may be subject to additional changes when the next demand event is processed. This means that when first created, the planning line may be changed again.

To minimize database access when handling production orders, the planning line can be maintained in three levels, while aiming to perform the least demanding maintenance level:

- Create only the planning line with the current due date and quantity but without the routing and components.
- Include routing: the planned routing is laid out including calculation of starting and ending dates and times. This is demanding in terms of database accesses. To determine the ending and due dates, it may be necessary to calculate this even if the supply event has not been closed (in the case of forward scheduling).
- Include BOM explosion: this can wait until just before the supply event is closed.

This concludes the descriptions of how demand and supply is loaded, prioritized, and balanced by the planning system. In integration with this supply planning activity, the system must ensure that the required inventory level of each planned item is maintained according to its reordering policies.

Design Details: Handling Reordering Policies

3/31/2019 • 18 minutes to read

For an item to participate in supply planning, a reorder policy must be defined. The following four reordering policies exist:

- Fixed Reorder Qty.
- Maximum Qty.
- Order
- Lot-for-Lot

Fixed Reorder Qty. and Maximum Qty. policies relate to inventory planning. Although inventory planning is technically simpler than the balancing procedure, these policies must coexist with the step-by-step balancing of supply and order tracking. To control the integration between the two, and to provide visibility into the involved planning logic, strict principles govern how reordering policies are handled.

The Role of the Reorder Point

In addition to the general balancing of supply and demand, the planning system must also monitor inventory levels for the affected items to respect the defined reordering policies.

A reorder point represents demand during lead time. When the projected inventory passes below the inventory level defined by the reorder point, it is time to order more quantity. Meanwhile, the inventory is expected to decrease gradually and possibly reach zero (or the safety stock level), until the replenishment arrives.

Accordingly, the planning system will suggest a forward-scheduled supply order at the point when the projected inventory passes below the reorder point.

The reorder point reflects a certain inventory level. However, inventory levels can move significantly during the time bucket and, therefore, the planning system must constantly monitor the projected available inventory.

Monitoring the Projected Inventory Level and the Reorder Point

Inventory is a type of supply, but for inventory planning, the planning system distinguishes between two inventory levels:

- Projected inventory
- Projected available inventory

Projected Inventory

Initially, projected inventory is the quantity of gross inventory, including supply and demand in the past even if not posted, when starting the planning process. In the future, this becomes a moving projected inventory level that is maintained by gross quantities from future supply and demand because those are introduced along the time line (whether reserved or in other ways allocated).

The projected inventory is used by the planning system to monitor the reorder point and to determine the reorder quantity when using the Maximum Qty. reordering policy.

Projected Available Inventory

The projected available inventory is the part of the projected inventory that at a given point in time is available to fulfill demand. The projected available inventory is used by the planning engine when monitoring the safety stock level.

The projected available inventory is used by the planning system to monitor the safety stock level, since the safety stock must always be available to serve unexpected demand.

Time Buckets

Having a tight control of the projected inventory is crucial to detect when the reorder point is reached or crossed and to calculate the right order quantity when using the Maximum Qty. reordering policy.

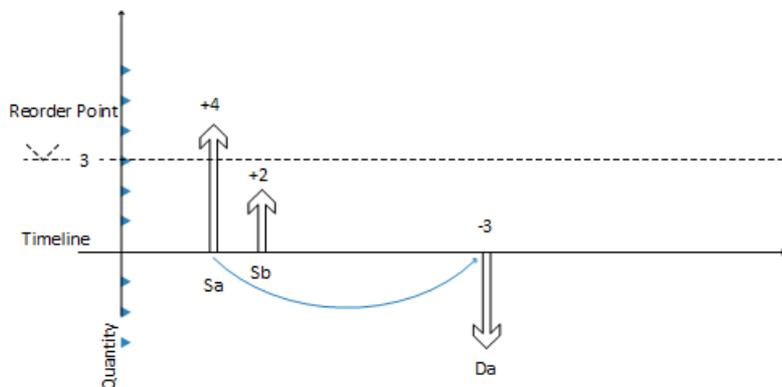

As stated earlier, the projected inventory level is calculated at the start of the planning period. It is a gross level that does not consider reservations and similar allocations. To monitor this inventory level during the planning sequence, the system monitors the aggregated changes over a period of time, a time bucket. The system ensures that the time bucket is at least one day since it is the most precise unit of time for a demand or supply event.

Determining the Projected Inventory Level

The following sequence describes how the projected inventory level is determined:

- When a supply event, such as a purchase order has been totally planned, it will increase the projected inventory on its due date.
- When a demand event has been fully satisfied, it will not decrease the projected inventory right away. Instead, it posts a decrease reminder, which is an internal record that holds the date and quantity of the contribution to the projected inventory.
- When a subsequent supply event is planned and placed on the time line, the posted decrease reminders are investigated one by one up until the planned date of the supply while updating the projected inventory. During this process, the reorder point level of the internal increase reminder may be reached or crossed.
- If a new supply order is introduced, the system checks if it is entered before the current supply. If it is, the new supply becomes current supply and the balancing procedure starts over.

The following shows a graphical illustration of this principle:

1. Supply **Sa** of 4 (fixed) closes Demand **Da** of -3.
2. CloseDemand: Create a decrease reminder of -3 (not shown).
3. Supply **Sa** is closed with a surplus of 1 (no more demand exists).

This increases the projected inventory level to +4, while the projected **available** inventory becomes -1.

4. The next supply **Sb** of 2 (another order) has already been placed on the timeline.
5. System checks if there is any decrease reminder preceding **Sb** (there is not, so no action is taken).
6. System closes supply **Sb** (no more demand exists)—either A: by reducing it to 0 (cancel) or B: by leaving as is.

This increases the projected inventory level (A: +0 => +4 or B: +2 = +6).

7. System makes a final check: Is there any decrease reminder? Yes, there is one on the date of **Da**.

8. System adds the decrease remainder of -3 remainder to the projected inventory level, either A: $+4 -3 = 1$ or B: $+6 -3 = +3$.

9. In case of A, the system creates a forward-scheduled order starting on date **Da**.

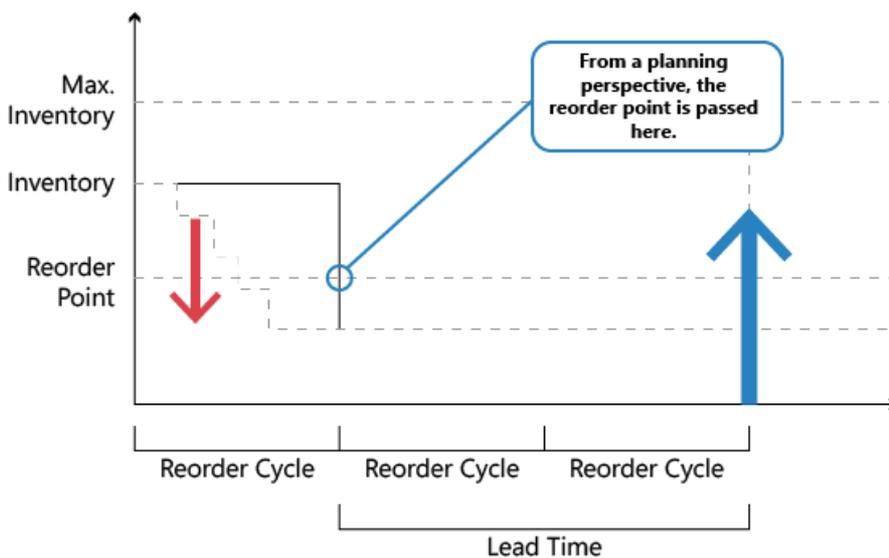

In case of B, the reorder point is reached and a new order is created.

The Role of the Time Bucket

The purpose of the time bucket is to collect demand events within the time page in order to make a joint supply order.

For reordering policies that use a reorder point, you can define a time bucket. This ensures that demand within the same time period is accumulated before checking the impact on the projected inventory and whether the reorder point has been passed. If the reorder point is passed, a new supply order is scheduled forward from the end of the period defined by the time bucket. The time buckets begin on the planning starting date.

The time-bucketed concept reflects the manual process of checking the inventory level on a frequent basis rather than for each transaction. The user needs to define the frequency (the time bucket). For example, the user gathers all item needs from one vendor to place a weekly order.

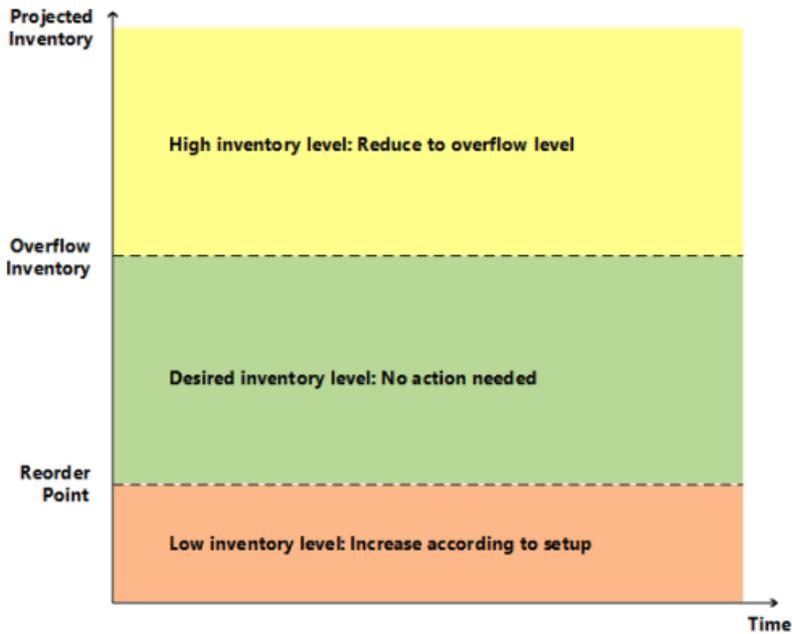

The time bucket is generally used to avoid a cascade effect. For example, a balanced row of demand and supply where an early demand is canceled, or a new one is created. The result would be that every supply order (except the last one) is rescheduled.

Staying under the Overflow Level

When using the Maximum Qty. and Fixed Reorder Qty. policies, the planning system focuses on the projected inventory in the given time-bucket only. This means that the planning system may suggest superfluous supply when negative demand or positive supply changes occur outside of the given time bucket. If, for this reason, a superfluous supply is suggested, the planning system calculates which quantity the supply should be decreased to (or deleted) to avoid the superfluous supply. This quantity is called the "overflow level." The overflow is communicated as a planning line with a **Change Qty. (Decrease)** or **Cancel** action and the following warning message:

Attention: The projected inventory [xx] is higher than the overflow level [xx] on the Due Date [xx].

Calculating the Overflow Level

The overflow level is calculated in different ways depending on planning setup.

Maximum Qty. reordering policy

Overflow level = Maximum Inventory

NOTE

If a minimum order quantity exists, then it will be added as follows: Overflow level = Maximum Inventory + Minimum Order Quantity.

Fixed Reorder Qty. reordering policy

Overflow level = Reorder Quantity + Reorder Point

NOTE

If the minimum order quantity is higher than the reorder point, then it will replace as follows: Overflow Level = Reorder Quantity + Minimum Order Quantity

Order Multiple

If an order multiple exists, then it will adjust the overflow level for both Maximum Qty. and Fixed Reorder Qty. reordering policies.

Creating the Planning Line with Overflow Warning

When an existing supply causes the projected inventory to be higher than the overflow level at the end of a time bucket, a planning line is created. To warn about the potential superfluous supply, the planning line has a warning message, the **Accept Action Message** field is not selected, and the action message is either Cancel or Change Qty.

Calculating the Planning Line Quantity

Planning Line Quantity = Current Supply Quantity – (Projected Inventory – Overflow Level)

NOTE

As with all warning lines, any maximum/minimum order quantity or order multiple will be ignored.

Defining the Action Message Type

- If the planning line quantity is higher than 0, then the action message is Change Qty.
- If the planning line quantity is equal to or lower than 0, then the action message is Cancel

Composing the Warning Message

In case of overflow, the **Untracked Planning Elements** page displays a warning message with the following information:

- The projected inventory level that triggered the warning
- The calculated overflow level
- The due date of the supply event.

Example: "The projected inventory 120 is higher than the overflow level 60 on 28-01-11"

Scenario

In this scenario, a customer changes a sales order from 70 to 40 pieces between two planning runs. The overflow feature sets in to reduce the purchase that was suggested for the initial sales quantity.

Item Setup

REORDERING POLICY	MAXIMUM QTY.
Maximum Order Quantity	100
Reorder Point	50
Inventory	80

Situation Before Sales Decrease

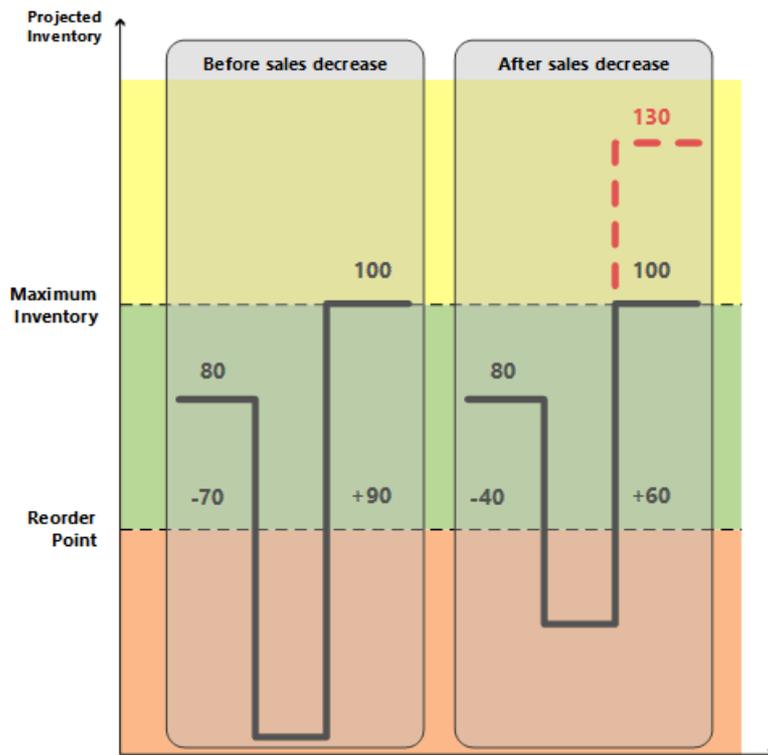

EVENT	CHANGE QTY.	PROJECTED INVENTORY
Day one	None	80
Sale	-70	10
End of time bucket	None	10
Suggest new purchase order	+90	100

Situation After Sales Ddecrease

CHANGE	CHANGE QTY.	PROJECTED INVENTORY
Day one	None	80
Sale	-40	40
Purchase	+90	130
End of time bucket	None	130
Suggest to decrease purchase order from 90 to 60	-30	100

Resulting Planning Lines

One planning line (warning) is created to reduce the purchase with 30 from 90 to 60 to keep the projected inventory on 100 according to the overflow level.

NOTE

Without the Overflow feature, no warning is created if the projected inventory level is above maximum inventory. This could cause a superfluous supply of 30.

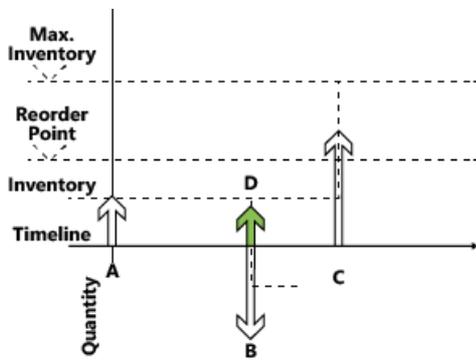

Handling Projected Negative Inventory

The reorder point expresses the anticipated demand during the lead time of the item. When the reorder point is passed, it is time to order more. But the projected inventory must be large enough to cover the demand until the new order is received. Meanwhile, the safety stock should take care of fluctuations in demand up to a targeted service level.

Consequently, the planning system considers it an emergency if a future demand cannot be served from the projected inventory, or expressed in another way, that the projected inventory goes negative. The system deals with such an exception by suggesting a new supply order to meet the part of the demand that cannot be met by inventory or other supply. The order size of the new supply order will not take the maximum inventory or the reorder quantity into consideration, nor will it take into consideration the order modifiers Maximum Order Quantity, Minimum Order Quantity, and Order Multiple. Instead, it will reflect the exact deficiency.

The planning line for this type of supply order will display an Emergency warning icon, and additional information will be provided upon lookup to inform the user of the situation.

In the following illustration, supply D represents an emergency order to adjust for negative inventory.

1. Supply **A**, initial projected inventory, is below reorder point.
2. A new forward-scheduled supply is created (**C**).
(Quantity = Maximum Inventory – Projected Inventory Level)
3. Supply **A** is closed by demand **B**, which is not fully covered.
(Demand **B** could try to schedule Supply **C** in but that will not happen according to the time-bucket concept.)
4. New supply (**D**) is created to cover the remaining quantity on Demand **B**.
5. Demand **B** is closed (creating a reminder to the projected inventory).
6. The new supply **D** is closed.
7. Projected Inventory is checked; reorder point has not been crossed.
8. Supply **C** is closed (no more demand exists).
9. Final check: No outstanding inventory level reminders exist.

NOTE

Step 4 reflects how the system reacts in versions earlier than Microsoft Dynamics NAV 2009 SP1.

This concludes the description of central principles relating to inventory planning based on reordering policies. The following section describes the characteristics of the four supported reordering policies.

Reordering Policies

Reordering policies define how much to order when the item needs to be replenished. Four different reordering policies exist.

Fixed Reorder Qty.

The Fixed Reorder Qty. policy is related to inventory planning of typical C-items (low inventory cost, low risk of obsolescence, and/or many items). This policy is usually used in connection with a reorder point reflecting the anticipated demand during the lead time of the item.

Calculated per Time Bucket

If the planning system detects that the reorder point has been reached or crossed in a given time bucket (reorder cycle) – above or on the reorder point at the start of the period and below or on the reorder point at the end of the period – it will suggest to create a new supply order of the specified reorder quantity and forward schedule it from the first date after the end of the time bucket.

The bucketed reorder point concept reduces the number of supply suggestions. This reflects a manual process of frequently walking through the warehouse to check the actual contents in the various bins.

Creates only Necessary Supply

Before suggesting a new supply order to meet a reorder point, the planning system checks if supply has already been ordered to be received within the item's lead time. If an existing supply order will solve the problem by bringing the projected inventory to or above the reorder point within the lead time, the system will not suggest a new supply order.

Supply orders that are created specifically to meet a reorder point is excluded from ordinary supply balancing, and will not in any way be changed afterwards. Consequently, if an item using reorder point is to be phased out (not replenished), it is advisable to review outstanding supply orders manually or change the reordering policy to Lot-for-Lot, whereby the system will reduce or cancel superfluous supply.

Combines with Order Modifiers

The order modifiers, Minimum Order Quantity, Maximum Order Quantity, and Order Multiple, should not play a big role when the fixed reorder quantity policy is used. However, the planning system still takes these modifiers into account and will decrease the quantity to the specified maximum order quantity (and create two or more supplies in order to reach the total order quantity), increase the order to the specified minimum order quantity, or round the order quantity up to meet a specified order multiple.

Combines with Calendars

Before suggesting a new supply order to meet a reorder point, the planning system checks if the order is scheduled for a non-working day, according to any calendars that are defined in the **Base Calendar Code** field in the **Company Information** and **Location Card** pages.

If the scheduled date is a non-working day, the planning system moves the order forward to the nearest working date. This may result in an order that meets a reorder point but does not meet some specific demand. For such unbalanced demand, the planning system creates an extra supply.

Should Not be Used with Forecast

Because the anticipated demand is already expressed in the reorder point level it is not necessary to include a forecast in the planning of an item using a reorder point. If it is relevant to base the plan on a forecast, use the lot-for-lot policy.

Must Not be Used with Reservations

If the user has reserved a quantity, for instance a quantity in inventory, for some distant demand, the planning foundation will be disturbed. Even if the projected inventory level is acceptable in relation to the reorder point, the quantities might not be available. The system may try to compensate for that by creating exception orders; however, it is recommended that the Reserve field is set to Never on items that are planned using a reorder point.

Maximum Qty.

The Maximum Quantity policy is a way to maintain inventory using a reorder point.

Everything regarding the Fixed Reorder Qty. policy also applies to this policy. The only difference is the quantity of the suggested supply. When using the maximum quantity policy, the reorder quantity will be defined dynamically based on the projected inventory level and will therefore usually differ from order to order.

Calculated per Time Bucket

The reorder quantity is determined at the point of time (the end of a time bucket) when the planning system detects that the reorder point has been crossed. At this time, the system measures the gap from the current projected inventory level up to the specified maximum inventory. This constitutes the quantity that should be reordered. The system then checks if supply has already been ordered elsewhere to be received within the lead time and, if so, reduces the quantity of the new supply order by already ordered quantities.

The system will ensure that the projected inventory at least reaches the reorder point level – in case the user has forgotten to specify a maximum inventory quantity.

Combines with Order Modifiers

Depending on the setup, it may be best to combine the Maximum Quantity policy with order modifiers to ensure

a minimum order quantity or round it to an integer number of purchase units of measure, or split it into more lots as defined by the maximum order quantity.

Combines with Calendars

Before suggesting a new supply order to meet a reorder point, the planning system checks if the order is scheduled for a non-working day, according to any calendars that are defined in the **Base Calendar Code** field in the **Company Information** and **Location Card** pages.

If the scheduled date is a non-working day, the planning system moves the order forward to the nearest working date. This may result in an order that meets a reorder point but does not meet some specific demand. For such unbalanced demand, the planning system creates an extra supply.

Order

In a make-to-order environment, an item is purchased or produced to exclusively cover a specific demand. Typically it relates to A-items, and the motivation for choosing the order reordering policy can be that the demand is infrequent, the lead-time is insignificant, or the required attributes vary.

The program creates an order-to-order link, which acts as a preliminary connection between the supply, a supply order or inventory, and the demand that it is going to fulfill.

Apart from using the Order policy, the order-to-order link can be applied during planning in the following ways:

- When using the Make-to-Order manufacturing policy to create multi-level or project type production orders (producing needed components on the same production order).
- When using the Sales Order Planning feature to create a production order from a sales order.

Even if a manufacturing company considers itself as a make-to-order environment, it might be best to use a Lot-for-Lot reordering policy if the items are pure standard without variation in attributes. As a result, the system will use unplanned inventory and only accumulates sales orders with the same shipment date or within a defined time bucket.

Order-to-Order Links and Past Due Dates

Unlike most supply-demand sets, linked orders with due dates before the planning starting date are fully planned for by the system. The business reason for this exception is that specific demand-supply sets must be synchronized through to execution. For more information about the frozen zone that applies to most demand-supply types, see [Design Details: Dealing with Orders Before the Planning Starting Date](#).

Lot-for-Lot

The lot-for-lot policy is the most flexible because the system only reacts on actual demand, plus it acts on anticipated demand from forecast and blanket orders and then settles the order quantity based on the demand. The lot-for-lot policy is aimed at A- and B-items where inventory can be accepted but should be avoided.

In some ways, the lot-for-lot policy looks like the Order policy, but it has a generic approach to items; it can accept quantities in inventory, and it bundles demand and corresponding supply in time buckets defined by the user.

The time bucket is defined in the **Time Bucket** field. The system works with a minimum time bucket of one day, since this is the smallest time unit of measure on demand and supply events in the system (although, in practice, the time unit of measure on production orders and component needs can be seconds).

The time bucket also sets limits on when an existing supply order should be rescheduled to meet a given demand. If the supply lies within the time bucket, it will be rescheduled in or out to meet the demand. Otherwise, if it lies earlier, it will cause unnecessary build-up of inventory and should be canceled. If it lies later, a new supply order will be created instead.

With this policy, it is also possible to define a safety stock in order to compensate for possible fluctuations in supply, or to meet sudden demand.

Because the supply order quantity is based on the actual demand it can make sense to use the order modifiers: round the order quantity up to meet a specified order multiple (or purchase unit of measure), increase the order to a specified minimum order quantity, or decrease the quantity to the specified maximum quantity (and thus create two or more supplies to reach the total needed quantity).

Design Details: Planning Parameters

3/31/2019 • 7 minutes to read

This topic describes the different planning parameters that you can use in Business Central.

The way in which the planning system controls item supply is determined by various settings on the item card or SKU, and settings in manufacturing setup. The following table shows how these parameters are used for planning.

PURPOSE	PARAMETER
Define if the item is to be planned	Reordering Policy = Blank
Define when to reorder	Time Bucket Reorder Point Safety Lead Time
Define how much to reorder	Safety Stock Quantity Reordering Policy: - Fixed Reorder Qty. plus Reorder Quantity - Maximum Qty. plus Maximum Inventory - Order - Lot-for-Lot
Optimize when and how much to reorder	Rescheduling Period Lot Accumulation Period Dampener Period
Modify the supply orders	Minimum Order Quantity Maximum Order Quantity Order Multiple
Delimit the planned item	Manufacturing Policy: - Make-to-Stock - Make-to-Order

Define If the Item Will Be Planned

To include an item/SKU in the planning process, it must have a reordering policy otherwise it must be planned manually, for example, with the Order Planning feature.

Define When to Reorder

Reorder proposals are generally released only when the projected available quantity has fallen to or below a given quantity. This quantity is defined by the reorder point. Otherwise, it will be zero. Zero can be adjusted by

entering a safety stock quantity. If the user has defined a safety lead time, it will cause the proposal to be delivered in the period prior to the required due date.

The **Time Bucket** field is used by reorder point policies (**Fixed Reorder Qty.** and **Maximum Qty.**), where the inventory level is checked after each time bucket. The first time bucket begins on the planning starting date.

NOTE

When calculating time buckets, the planning system ignores any working calendars that are defined in the **Base Calendar Code** field in the **Company Information** and **Location Card** pages.

The default safety lead time, on the **Manufacturing Setup** page, should be set to at least one day. The due date of the demand may be known, but not the due time. The planning schedules backward to meet gross demand, and, if no safety lead time is defined, the goods may arrive too late to meet the demand.

Three additional reorder period fields, **Rescheduling Period**, **Lot Accumulation Period**, and **Dampener Period**, also play a role in defining when to reorder. For more information, see [Optimize When and How Much to Reorder](#).

Define How Much to Reorder

If the planning system detects the need to reorder, the selected reordering policy is used to determine when and how much to order.

Independent of the reordering policy, the planning system usually follows this logic:

1. The quantity of the order proposal is calculated to meet the specified minimum inventory level of the item, usually the safety stock quantity. If nothing is specified, the minimum inventory level is zero.
2. If the projected available inventory is below the safety stock quantity, a backward-scheduled supply order is suggested. The order quantity will at least fill the safety stock quantity, and can be increased by gross demand within the time bucket, by the reordering policy, and by the order modifiers.
3. If the projected inventory is on or below the reorder point (calculated from aggregated changes within the time bucket) and above the safety stock quantity, a forward-scheduled exception order is suggested. Both the gross demand to be met and the reordering policy will determine the order quantity. At minimum, the order quantity will meet the reorder point.
4. If there is more gross demand due before the ending date of the forward-scheduled order proposal, and this demand brings the currently calculated projected available inventory below the safety stock quantity, the order quantity is increased to make up the deficit. The suggested supply order is then scheduled backward from the due date of the gross demand that would have violated the safety stock quantity.
5. If the **Time Bucket** field is not filled in, only the gross demand on the same due date will be added.

The following reorder period fields also play a role in defining how much to reorder: **Rescheduling Period**, **Lot Accumulation Period**, and **Dampener Period**. For more information, see [Optimize When and How Much to Reorder](#).

Reordering Policies

The following reordering policies affect the quantity that is being reordered.

REORDERING POLICY	DESCRIPTION
-------------------	-------------

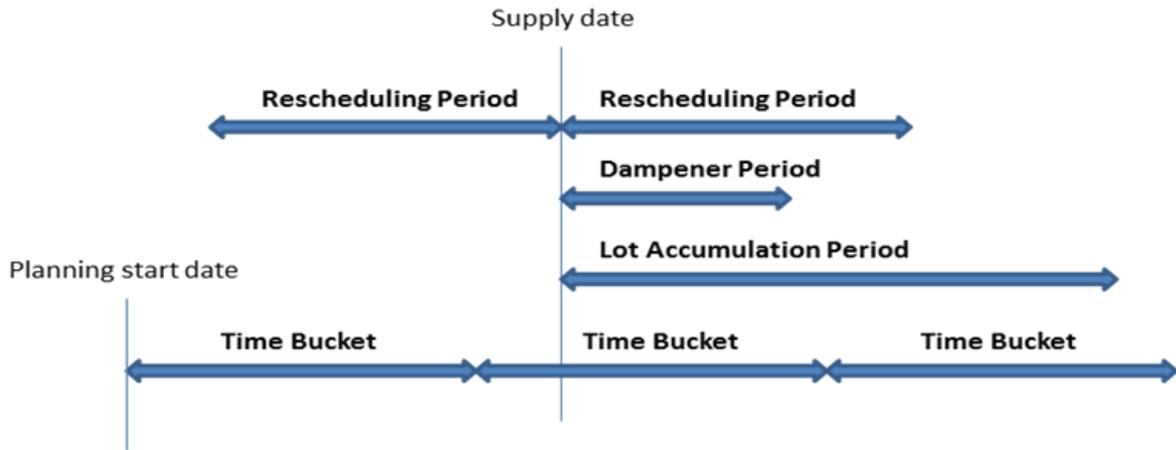

REORDERING POLICY	DESCRIPTION
Fixed Reorder Qty.	At a minimum, the order quantity will be equal to the reorder quantity. It can be increased to meet the demand or the desired inventory level. This reordering policy is usually used with a reorder point.
Maximum Qty.	The order quantity will be calculated to meet the maximum inventory. If quantity modifiers are used, then maximum inventory can be violated. We do not recommend that you use the time bucket together with maximum quantity. The time bucket will usually be overruled. This reordering policy is usually used with a reorder point.
Order	The order quantity will be calculated to meet each single demand event and the demand-supply set will remain linked until execution. No planning parameters are considered.
Lot-for-Lot	The quantity is calculated to meet the sum of the demand that comes due in the time bucket.

Optimize When and How Much to Reorder

To obtain a rational supply plan, a planner will fine-tune planning parameters to limit rescheduling suggestions, accumulate demand (dynamic reorder quantity), or to avoid insignificant planning actions. The following reorder period fields help optimize when and how much to reorder.

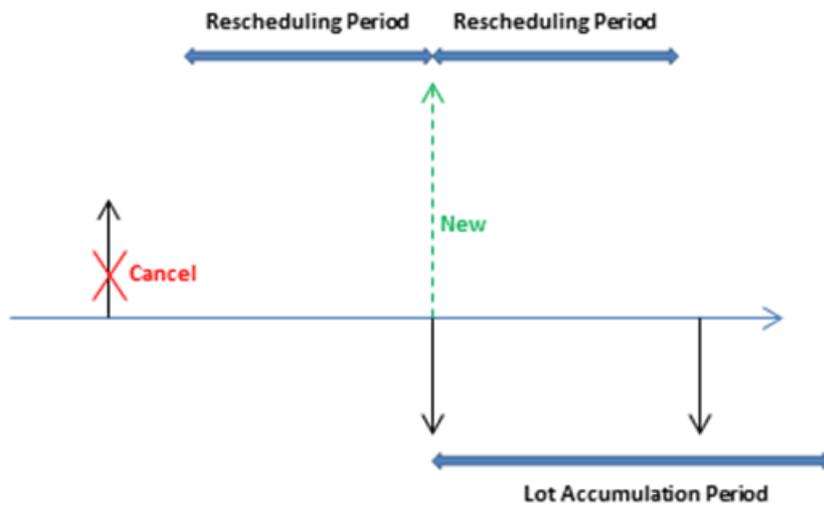

FIELD	DESCRIPTION
Rescheduling Period	This field is used to determine whether the action message should reschedule an existing order or cancel it and create a new order. The existing order will be rescheduled within one rescheduling period before the current supply and until one rescheduling period after the current supply.
Lot Accumulation Period	With reordering policy Lot-for-Lot, this field is used to accumulate multiple supply needs into one supply order. From the first planned supply, the system accumulates all supply needs in the following lot accumulation period into one supply, which is placed on the date of the first supply. Demand outside the lot accumulation period is not covered by this supply.
Dampener Period	<p>This field is used to avoid minor rescheduling of existing supply out in time. Changes from the supply date until one dampener period from the supply date will not generate any action messages.</p> <p>The dampener period specifies a period of time during which you do not want the planning system to propose to reschedule existing supply orders forward. This limits the number of insignificant rescheduling of existing supply to a later date if the rescheduled date is within the dampener period.</p> <p>As a result, a positive delta between the suggested new supply date and the original supply date will always be larger than the dampener period.</p>

The timing of rescheduling period, dampener period, and lot accumulation period is based on a supply date. The time bucket is based on the planning start date, as shown in the following illustration.

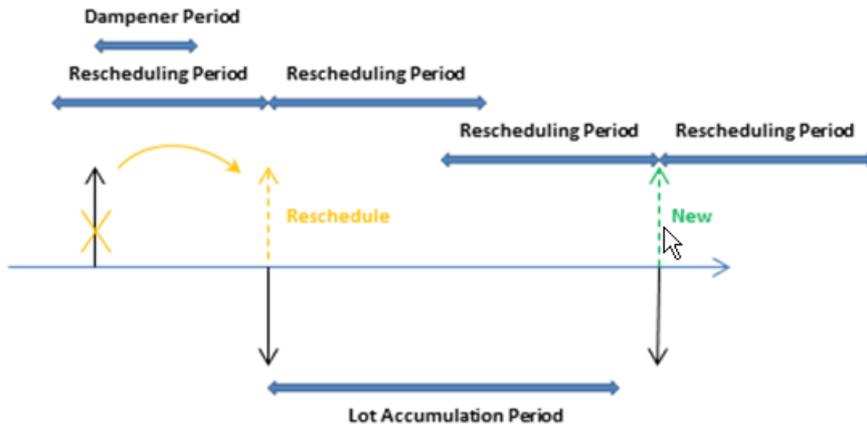

In the following examples, the black arrows represent existing supply (up) and demand (down). Red, green, and orange arrows are planning suggestions.

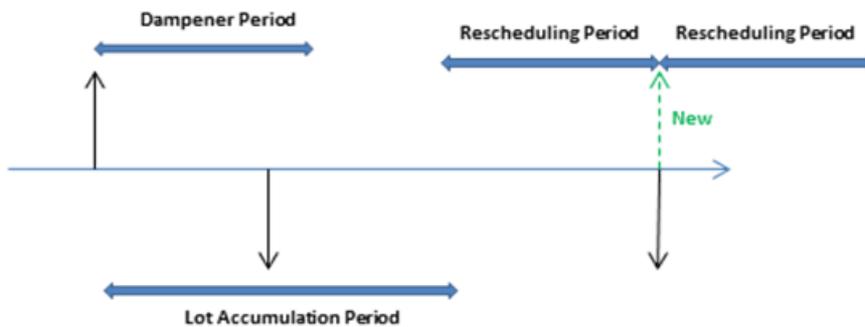

Example 1: The changed date is outside the rescheduling period, which causes the existing supply to be canceled. A new supply is suggested to cover the demand in the lot accumulation period.

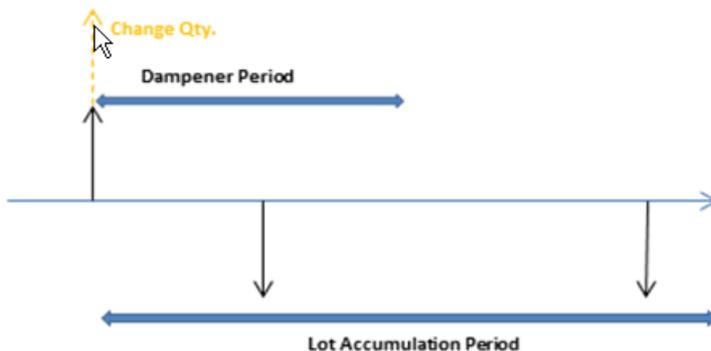

Example 2: The changed date is in the rescheduling period, which causes the existing supply to be rescheduled. A new supply is suggested to cover the demand outside the lot accumulation period.

Example 3: There is a demand in the dampener period and the supply quantity in the lot accumulation period matches the supply quantity. The next demand is uncovered and a new supply is suggested.

Example 4: There is a demand in the dampener period and the supply remains on the same date. However, the current supply quantity is not enough to cover the demand in the lot accumulation period, so a change quantity action for the existing supply order is suggested.

Default values: The default value of the **Time Bucket** field and the three reorder period fields is blank. For all fields, except the **Dampener Period** field, this means 0D (zero days). If the **Dampener Period** field is blank, the global value in the **Default Dampener Period** field on the **Manufacturing Setup** page will be used.

Modify the Supply Orders

When the quantity of the order proposal has been calculated, one or more of the order modifiers can adjust it.

For example, the maximum order quantity is larger than or equal to the minimum order quantity, which is larger than or equal to the order multiple.

The quantity is decreased if it exceeds the maximum order quantity. Then, it is increased if it is below the minimum order quantity. Finally, it is rounded up so that it matches a specified order multiple. Any remaining quantity uses the same adjustments until the total demand has been converted into order proposals.

Delimit the Item

The **Manufacturing Policy** option defines which additional orders the MRP calculation will propose.

If the **Make-to-Stock** option is used, the orders concern only the item in question.

If the **Make-to-Order** option is used, the planning system will analyze the production BOM of the item and create additional linked order proposals for those lower-level items that are also defined as make-to-order. This continues as long as there are make-to-order items in the descending BOM structures.

Design Details: Planning Assignment Table

3/31/2019 • 2 minutes to read

All items should be planned for, however, there is no reason to calculate a plan for an item unless there has been a change in the demand or supply pattern since the last time a plan was calculated.

If the user has entered a new sales order or changed an existing one, there is reason to recalculate the plan. Other reasons include a change in forecast or the desired safety stock quantity. Changing a bill of material by adding or removing a component would most likely indicate a change, but for the component item only.

For multiple locations, the assignment takes place at the level of item per location combination. If, for example, a sales order has been created at only one location, the program will assign the item at that specific location for planning.

The reason for selecting items for planning is a matter of system performance. If no change in an item's demand-supply pattern has occurred, the planning system will not suggest any actions to be taken. Without the planning assignment, the system would have to perform the calculations for all items in order to find out what to plan for, and that would drain system resources.

The **Planning Assignment** table monitors demand and supply events and assigns the appropriate items for planning. The following events are monitored:

- A new sales order, forecast, component, purchase order, production order, assembly order, or transfer order.
- Change of item, quantity, location, variant, or date on a sales order, forecast, component, purchase order, production order, assembly order, or transfer order.
- Cancellation of a sales order, forecast, component, purchase order, production order, assembly order, or transfer order.
- Consumption of items other than planned.
- Output of items other than planned.
- Unplanned changes in inventory.

For these direct supply-demand displacements, the order tracking and action messaging system maintains the Planning Assignment table and states a planning reason as an action message.

The following changes in master data can also cause a planning imbalance:

- Change of status to Certified in the production BOM header (for all items using that header).
- Deleted line (child item).
- Change of status to Certified in the routing header (for all items using that routing).
- Changes in the following item card fields.
- Safety Stock Quantity or Safety Lead Time.
- Lead Time Calculation.
- Reorder Point.
- Production BOM No. (and all children of old BOM reference).
- Routing No.
- Reordering Policy.

In these cases, a new function, Planning Assignment Management, maintains the table and states the planning reason as Net Change.

The following changes do not cause a planning assignment:

- Calendars
- Other planning parameters on the item card

When calculating an MPS or an MRP, the following restrictions apply:

- MPS: The planning system checks that the item carries a demand forecast or a sales order. If not, the item is not included in the plan.
- MRP: If the planning system detects that the item is being replenished by an MPS planning line or MPS supply order, the item will be left out of the planning. However, any demand from relevant components is included.

Design Details: Demand and Supply

3/31/2019 • 2 minutes to read

Demand is the common term used for any kind of gross demand, such as a sales order and component need from a production order. In addition, the program allows more technical types of demand, such as negative inventory and purchase returns.

Supply is the common term used for any kind of positive or inbound quantity, such as inventory, purchases, assembly, production, or inbound transfers. In addition, a sales return may also represent supply.

To sort out the many sources of demand and supply, the planning system organizes them on two time lines called inventory profiles. One profile holds demand events, and the other holds the corresponding supply events. Each event represents one order network entity, such as a sales order line, an item ledger entry, or a production order line.

When inventory profiles are loaded, the different demand-supply sets are balanced to output a supply plan that fulfills the listed goals.

Planning parameters and inventory levels are other types of demand and supply respectively, which undergo integrated balancing to replenish stock items. For more information, see [Design Details: Handling Reordering Policies](#).

Design Details: Transfers in Planning

3/31/2019 • 8 minutes to read

Transfer orders are also a source of supply when working at the SKU level. When using multiple locations (warehouses), the SKU replenishment system can be set to Transfer, implying that the location is replenished by transferring goods from another location. In a situation with more warehouses, companies might have a chain of transfers where supply to GREEN location is transferred from YELLOW, and supply to YELLOW is transferred from RED and so on. In the beginning of the chain, there is a replenishment system of Prod. Order or Purchase.

When comparing the situation where a supply order is directly facing a demand order to a situation where the sales order is supplied through a chain of SKU transfers, it is obvious that the planning task in the latter situation can become very complex. If demand changes, it might cause a ripple effect through the chain, because all transfer orders plus the purchase/production order in the opposite end of the chain will have to be manipulated to reestablish balance between demand and supply.

Why is Transfer a Special Case?

A transfer order looks much like any other order in the program. However, behind the scene it is very different.

One fundamental aspect that makes transfers in planning different from purchase and production orders is that a transfer line represents demand and supply at the same time. The outbound part, which is shipped from the old location, is demand. The inbound part, which is to be received at the new location, is supply at that location.

Item No.	Description	Quantity	Reserved Quantity Inbnd.	Reserved Quantity Shipped	Reserved Quantity Outbnd.	Unit of Measure Code	Qty. to Ship
AAA	Test Transfer 1	17					17

This means that when the system manipulates the supply side of the transfer, it must make a similar change on the demand side.

Transfers are Dependent Demand

The related demand and supply has some resemblance with components of a production order line, but the difference is that components will be on the next planning level and with a different item, whereas the two parts of the transfer is situated on the same level, for the same item.

An important similarity is that just as components are dependent demand, so is the transfer demand. The demand from a transfer line is dictated by the supply side of the transfer in the sense that if the supply is changed, the demand is directly affected.

Unless the planning flexibility is None, a transfer line should never be treated as independent demand in planning.

In the planning procedure, the transfer demand should only be taken into account after the supply side has been processed by the planning system. Before this, the actual demand is not known. The sequence of the changes made is therefore very important when it comes to transfer orders.

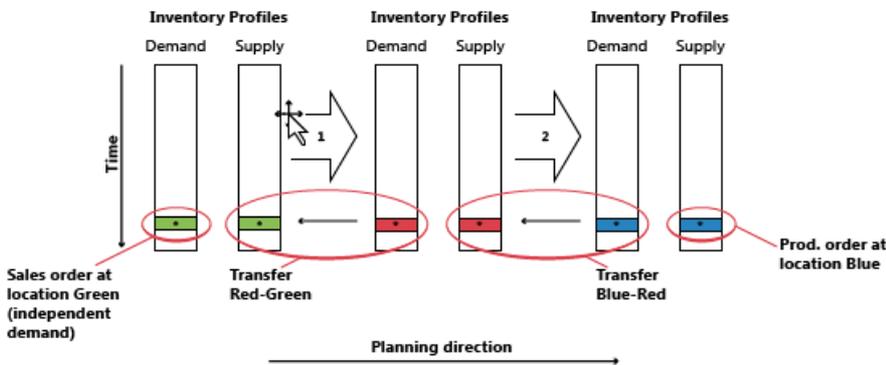

Planning Sequence

The following illustration shows what a string of transfers could look like.

In this example, a customer orders the item at location GREEN. Location GREEN is supplied through transfer from the central warehouse RED. The central warehouse RED is supplied by transfer from production on location BLUE.

In this example, the planning system will start at the customer demand and work its way backwards through the chain. The demands and supplies will be processed one location at a time.

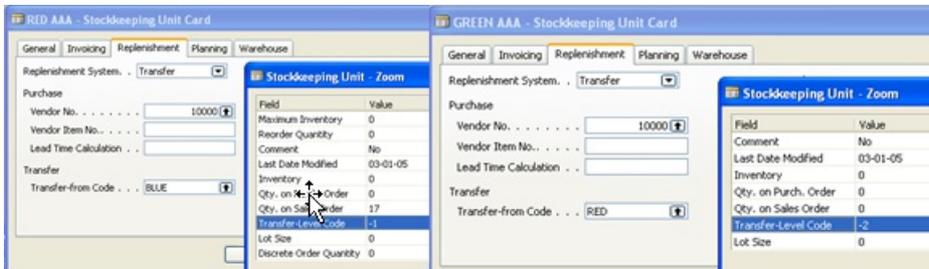

Transfer Level Code

The sequence in which the locations are processed in the planning system is determined by the transfer level code of the SKU.

The transfer level code is an internal field which is automatically calculated and stored on the SKU when SKU is created or modified. The calculation runs across all SKUs for a given combination of Item/Variant and uses the location code and the transfer-from code to determine the route the planning will have to use when traversing through the SKUs to ensure that all demands are processed.

The transfer level code will be 0 for SKUs with replenishment system Purchase or Prod. Order and will be -1 for the first transfer level, -2 for the second and so on. In the transfer chain described above, the levels would therefore be -1 for RED and -2 for GREEN, as shown in the following illustration.

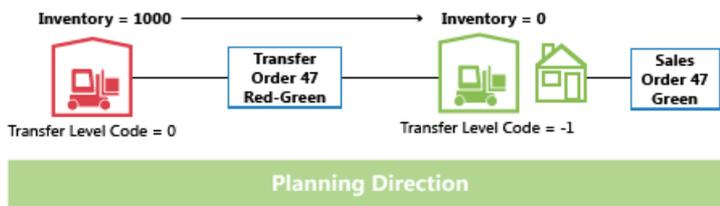

When updating a SKU, the planning system will detect if SKUs with replenishment system Transfer are set up with circular references.

Planning Transfers without SKU

Even if the SKU feature is not used, it is possible to use locations and make manual transfers between locations. For companies with less advanced warehouse setup, the planning system supports scenarios where existing inventory is transferred manually to another location, for example to cover a sales order at that location. At the same time, the planning system should react to changes in the demand.

To support manual transfers, the planning will analyze existing transfer orders and then plan the order in which the locations should be processed. Internally, the planning system will operate with temporary SKUs carrying transfer level codes.

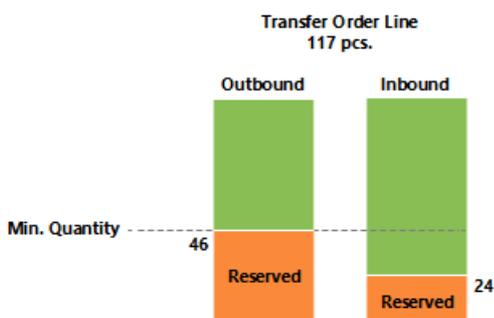

If more transfers to a given location exist, the first transfer order will define the planning direction. Transfers running in the opposite direction will be canceled.

Changing Quantity with Reservations

When changing quantities on existing supply, the planning system takes reservations into account in the sense that the reserved quantity represents the lower limit for how much the supply can be reduced.

When changing the quantity on an existing transfer order line, keep in mind that the lower limit will be defined as the highest reserved quantity of the outbound and inbound transfer line.

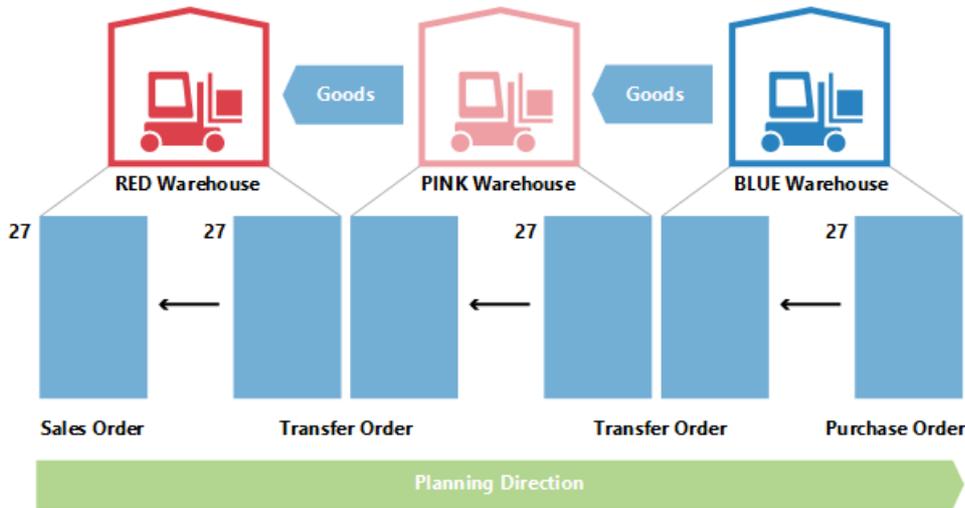

For example, if a transfer order line of 117 pieces is reserved against a sales line of 46 and a purchase line of 24, it is not possible to reduce the transfer line below 46 pieces even though this might represent excess supply on the inbound side.

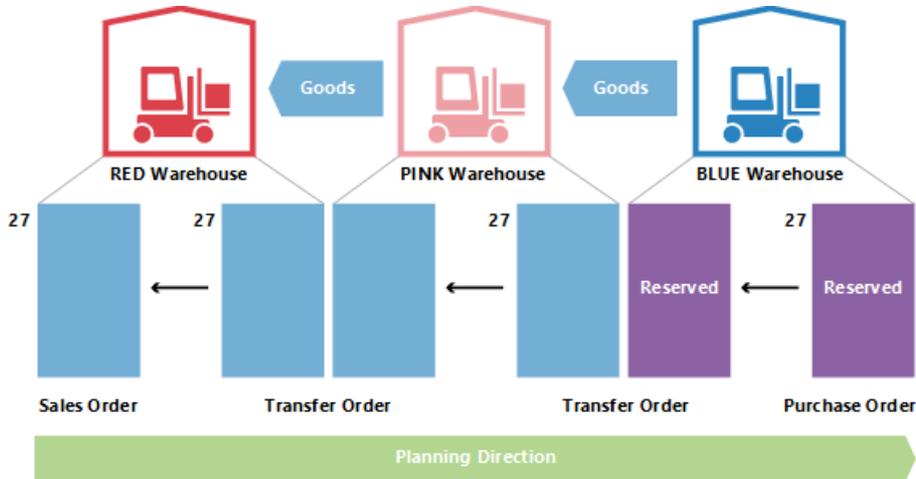

Changing Quantity in a Transfer Chain

In the following example, the starting point is a balanced situation with a transfer chain supplying a sales order of

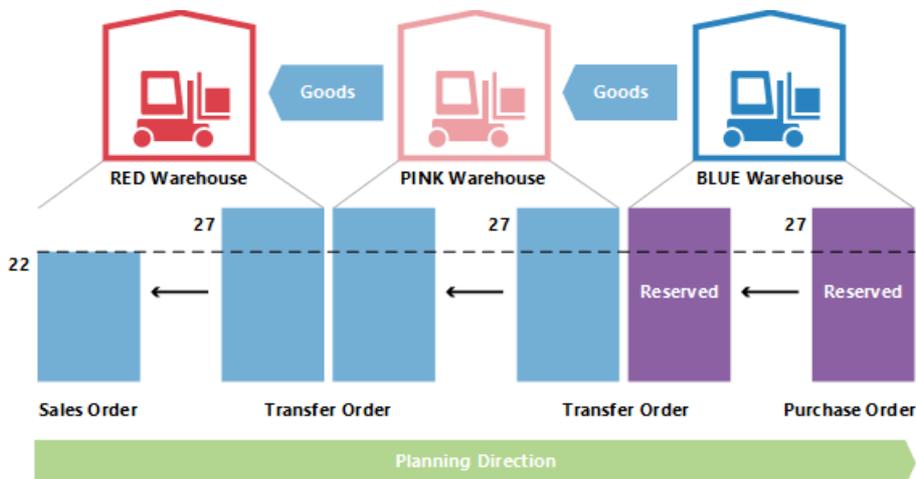

27 on location RED with a corresponding purchase order on location BLUE, transferred via location PINK. Therefore, apart from sales and purchase, there are two transfer orders: BLUE-PINK and PINK-RED.

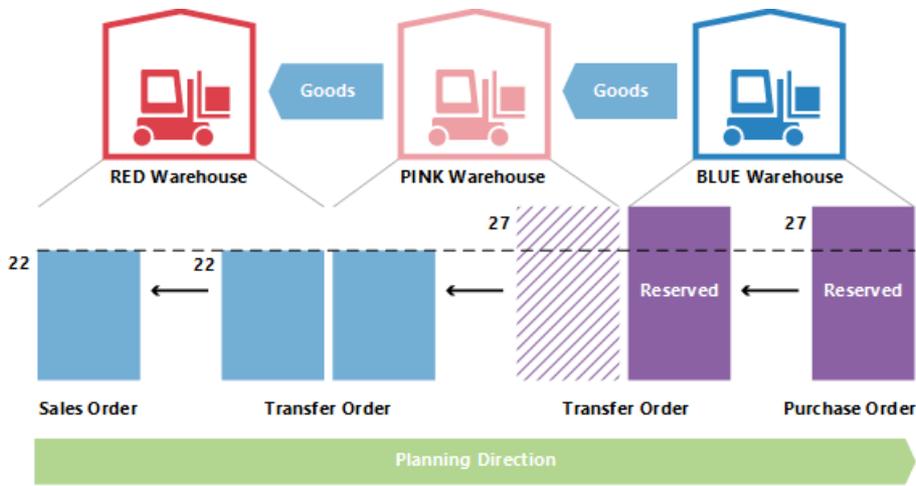

Now the planner at PINK location chooses to reserve against the purchase.

This usually means that the planning system will ignore the purchase order and the transfer demand. As long as there is balance, there is no problem. But what happens when the customer at RED location partly regrets his order and changes it to 22?

When the planning system runs again, it should get rid of excess supply. However, the reservation will lock the purchase and the transfer to a quantity of 27.

The PINK-RED transfer has been reduced to 22. The inbound part of the BLUE-PINK transfer is not reserved, but because the outbound part is reserved it is not possible to reduce the quantity below 27.

Lead Time Calculation

When calculating the due date of a transfer order different kinds of lead time will be taken into account.

The lead times that are active when planning a transfer order are:

- Outbound Warehouse Handling Time
- Shipping Time
- Inbound Warehouse Handling Time
- On the planning line, the following fields are used to provide information about the calculation.
- Transfer Shipment Date
- Starting Date
- Ending Date
- Due Date

The shipment date of the transfer line will be shown in the Transfer Shipment Date field, and the receipt date of the transfer line will be shown in the Due Date field.

The starting and ending dates will be used to describe the actual transportation period.

The following illustration shows the interpretation of the starting date-time and ending date-time on planning lines related to transfer orders.

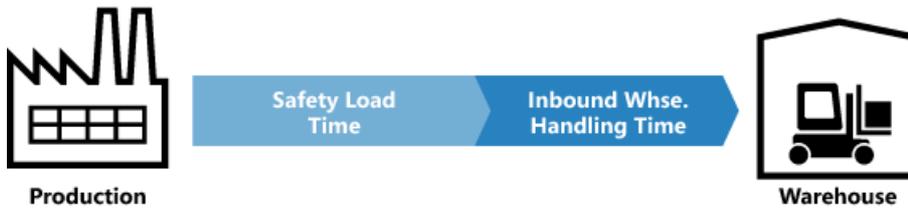

In this example, it means that:

- Shipment date + Outbound handling = Starting Date
- Starting Date + Shipping time = Ending Date
- Ending Date + Inbound Handling = Receipt Date

Safety Lead Time

The Default Safety Lead Time field in the Manufacturing Setup page and the related Safety Lead Time field on the

item card will not be taken into account in the calculation of a transfer order. However, the safety lead time will still influence the total plan like it will affect the replenishment order (purchase or production) in the beginning of the transfer chain when the items are put on the location from which they will be transferred.

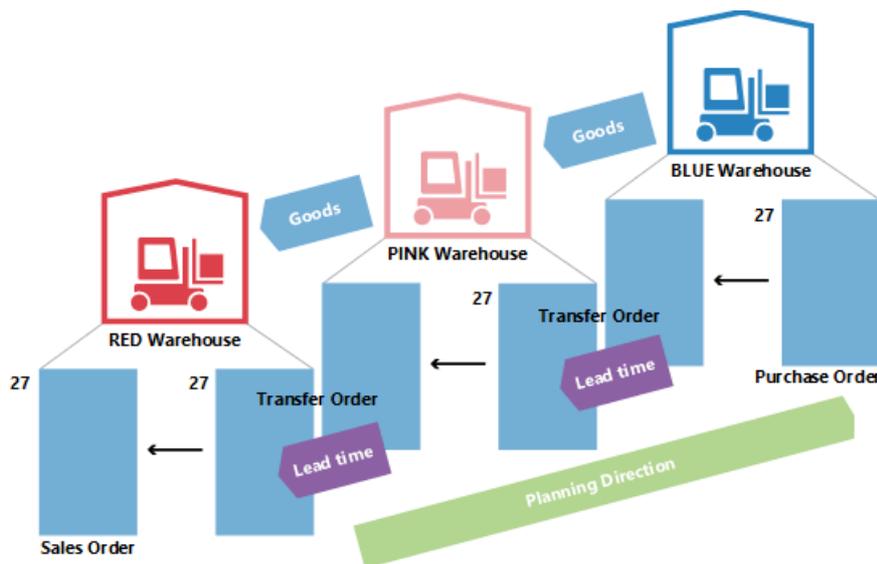

On the production order line, the Ending Date + Safety Lead Time + Inbound Warehouse Handling Time = Due Date.

On the purchase order line, the Planned Receipt Date + Safety Lead Time + Inbound Warehouse Handling Time = Expected Receipt Date.

Reschedule

When rescheduling an existing transfer line, the planning system must look up the outbound part and change the date-time on this. It is important to note that if lead time has been defined, there will be a gap between the shipment and the receipt. As mentioned, the lead time can consist of more elements, such as transportation time and warehouse handling time. On a time line, the planning system will move back in time while it balances the elements.

Therefore, when changing the due date on a transfer line, the lead time must be calculated in order to update the outbound side of the transfer.

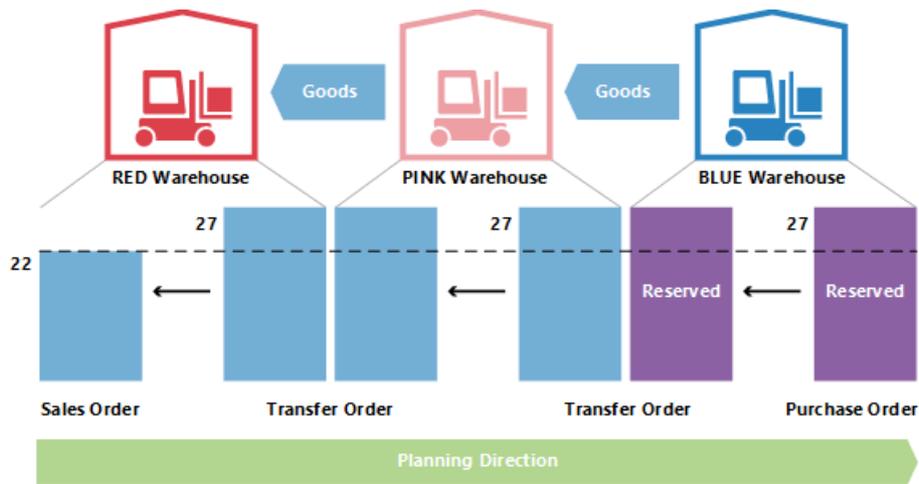

Serial/Lot Numbers in Transfer Chains

If the demand carries serial/lot numbers, and the planning engine is run, it will give rise to some directly created transfer orders. For more information about this concept, see Item Attributes. If, however, serial/lot numbers are removed from the demand, the created transfer orders in the chain will still carry the serial/lot numbers and will therefore be ignored by planning (not deleted).

Order-to-Order Links

In this example, BLUE SKU is set up with the Order reordering policy, while PINK and RED use Lot-for-Lot. When a sales order of 27 is created on location RED, it will lead to a chain of transfers with the last joint at location BLUE being reserved with binding. In this example, the reservations are not hard reservations created by the planner at

PINK location, but bindings created by the planning system. The important difference is that the planning system can change the latter.

If demand is changed from 27 to 22, the system will lower the quantity down through the chain, with the binding reservation also being reduced.

Design Details: Costing Methods

6/6/2019 • 7 minutes to read

The costing method determines if an actual or a budgeted value is capitalized and used in the cost calculation. Together with the posting date and sequence, the costing method also influences how the cost flow is recorded.

NOTE

You cannot change an item's costing method if item ledger entries exist for the item.

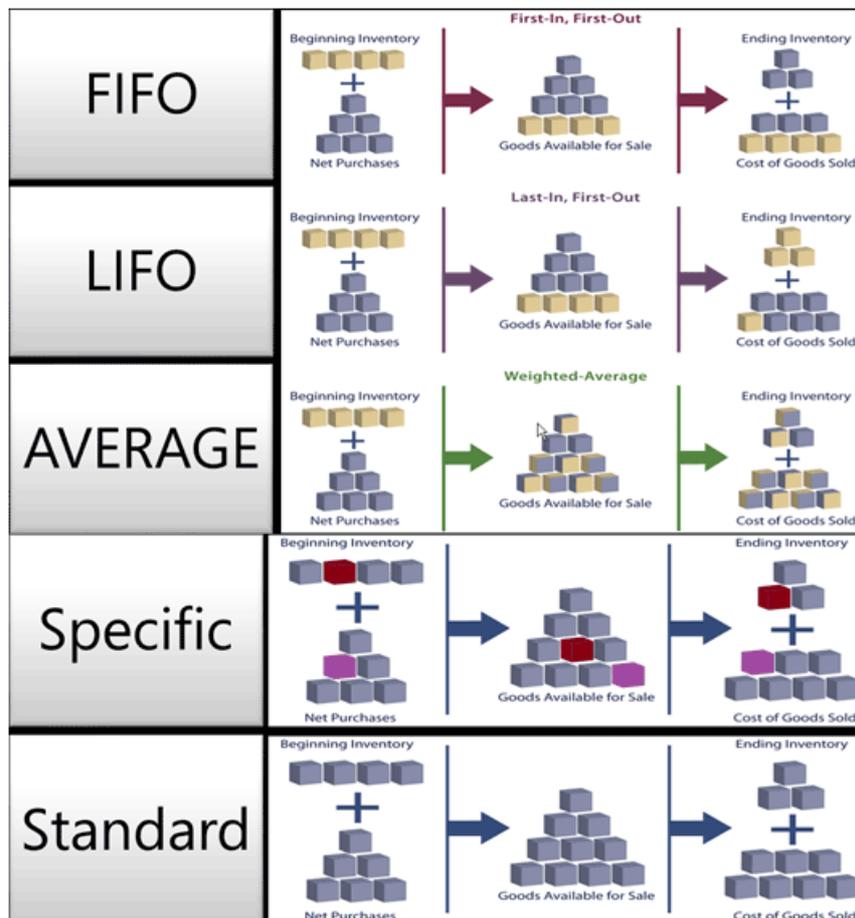

Information will soon be published here about workarounds to changing a costing method in special situations.

The following methods are supported in Business Central:

COSTING METHOD	DESCRIPTION	WHEN TO USE
FIFO	<p>An item's unit cost is the actual value of any receipt of the item, selected by the FIFO rule.</p> <p>In inventory valuation, it is assumed that the first items placed in inventory are sold first.</p>	<p>In business environments where product cost is stable.</p> <p>(When prices are rising, the balance sheet shows greater value. This means that tax liabilities increase, but credit scores and the ability to borrow cash improve.)</p> <p>For items with a limited shelf life, because the oldest goods need to be sold before they pass their sell-by date.</p>
LIFO	<p>An item's unit cost is the actual value of any receipt of the item, selected by the LIFO rule.</p> <p>In inventory valuation, it is assumed that the last items placed in inventory are sold first.</p>	<p>Disallowed in many countries/regions, as it can be used to depress profit.</p> <p>(When prices are rising, the value on the income statement decreases. This means that tax liabilities decrease, but the ability to borrow cash deteriorates.)</p>
Average	<p>An item's unit cost is calculated as the average unit cost at each point in time after a purchase.</p> <p>For inventory valuation, it is assumed that all inventories are sold simultaneously.</p>	<p>In business environments where product cost is unstable.</p> <p>When inventories are piled or mixed together and cannot be differentiated, such as chemicals.</p>

COSTING METHOD	DESCRIPTION	WHEN TO USE
Specific	An item's unit cost is the exact cost at which the particular unit was received.	In production or trade of easily identifiable items with fairly high unit costs. For items that are subject to regulation. For items with serial numbers.
Standard	An item's unit cost is preset based on estimated. When the actual cost is realized later, the standard cost must be adjusted to the actual cost through variance values.	Where cost control is critical. In repetitive manufacturing, to value the costs of direct material, direct labor, and manufacturing overhead. Where there is discipline and staff to maintain standards.

The following image shows how costs flow through the inventory for each costing method.

Costing methods differ in the way that they value inventory decreases and if they use actual cost or standard cost as the valuation base. The following table explains the different characteristics. (The LIFO method is excluded, as it is very similar to the FIFO method.)

	FIFO	AVERAGE	STANDARD	SPECIFIC

	FIFO	AVERAGE	STANDARD	SPECIFIC
General characteristic	Easy to understand	Based on period options: Day/Week/Month/Quarter/Accounting Period. Can be calculated per item or per item/location/variant.	Easy to use, but requires qualified maintenance.	Requires item tracking on both inbound and outbound transaction. Typically used for serialized items.
Application/Adjustment	Application keeps track of the remaining quantity. Adjustment forwards costs according to quantity application.	Application keeps track of the remaining quantity. Costs are calculated and forwarded per the valuation date.	Application keeps track of the remaining quantity. Application is based on FIFO.	All applications are fixed.
Revaluation	Revalues invoiced quantity only. Can be done per item or per item ledger entry. Can be done backward in time.	Revalues invoiced quantity only. Can be done per item only. Can be done backward in time.	Revalues invoiced and un-invoiced quantities. Can be done per item or per item ledger entry. Can be done backward in time.	Revalues invoiced quantity only. Can be done per item or per item ledger entry. Can be done backward in time.
Miscellaneous	If you back-date an inventory decrease, then existing entries are NOT reapplied to provide a correct FIFO cost flow.	If you back-date an inventory increase or decrease, then the average cost is recalculated, and all affected entries are adjusted. If you change the period or calculation type, then all affected entries must be adjusted.	Use the Standard Worksheet page to periodically update and roll up standard costs. Is NOT supported per SKU. No historic records exist for standard costs.	You can use specific item tracking without using the Specific costing method. Then the cost will NOT follow the lot number, but the cost assumption of the selected costing method.

Example

This section gives examples of how different costing methods affect inventory value.

The following table shows the inventory increases and decreases that the examples are based on.

POSTING DATE	QUANTITY	ENTRY NO.
01-01-20	1	1
01-01-20	1	2
01-01-20	1	3

POSTING DATE	QUANTITY	ENTRY NO.
02-01-20	-1	4
03-01-20	-1	5
04-01-20	-1	6

NOTE

The resulting quantity in inventory is zero. Consequently, the inventory value must also be zero, regardless of the costing method.

Effect of Costing Methods on Valuing Inventory Increases

FIFO/LIFO/Average/Specific

For items with costing methods that use actual cost as the valuation base (**FIFO**, **LIFO**, **Average**, or **Specific**), inventory increases are valued at the item's acquisition cost.

The following table shows how inventory increases are valued for all costing methods except **Standard**.

POSTING DATE	QUANTITY	COST AMOUNT (ACTUAL)	ENTRY NO.
01-01-20	1	10.00	1
01-01-20	1	20.00	2
01-01-20	1	30.00	3

Standard

For items using the **Standard** costing method, inventory increases are valued at the item's current standard cost.

The following table shows how inventory increases are valued for the **Standard** costing method.

POSTING DATE	QUANTITY	COST AMOUNT (ACTUAL)	ENTRY NO.
01-01-20	1	15.00	1
01-01-20	1	15.00	2
01-01-20	1	15.00	3

Effect of Costing Methods on Valuing Inventory Decreases

FIFO

For items using the **FIFO** costing method, items that were purchased first are always sold first (entry numbers 3, 2, and 1 in this example). Accordingly, inventory decreases are valued by taking the value of the first inventory increase.

COGS is calculated using the value of the first inventory acquisitions.

The following table shows how inventory decreases are valued for the **FIFO** costing method.

POSTING DATE	QUANTITY	COST AMOUNT (ACTUAL)	ENTRY NO.
02-01-20	-1	-10.00	4
03-01-20	-1	-20.00	5
04-01-20	-1	-30.00	6

LIFO

For items using the **LIFO** costing method, items that were purchased most recently are always sold first (entry numbers 3, 2, and 1 in this example). Accordingly, inventory decreases are valued by taking the value of the last inventory increase.

COGS is calculated using the value of the most recent inventory acquisitions.

The following table shows how inventory decreases are valued for the **LIFO** costing method.

POSTING DATE	QUANTITY	COST AMOUNT (ACTUAL)	ENTRY NO.
02-01-20	-1	-30.00	4
03-01-20	-1	-20.00	5
04-01-20	-1	-10.00	6

Average

For items using the **Average** costing method, inventory decreases are valued by calculating a weighted average of the remaining inventory on the last day of the average cost period in which the inventory decrease was posted. For more information, see [Design Details: Average Cost](#).

The following table shows how inventory decreases are valued for the **Average** costing method.

POSTING DATE	QUANTITY	COST AMOUNT (ACTUAL)	ENTRY NO.
02-01-20	-1	-20.00	4
03-01-20	-1	-20.00	5
04-01-20	-1	-20.00	6

Standard

For items using the **Standard** costing method, inventory decreases are valued similar to the **FIFO** costing method, except valuation is based on a standard cost, not on the actual cost.

The following table shows how inventory decreases are valued for the **Standard** costing method.

POSTING DATE	QUANTITY	COST AMOUNT (ACTUAL)	ENTRY NO.
02-01-20	-1	-15.00	4
03-01-20	-1	-15.00	5

POSTING DATE	QUANTITY	COST AMOUNT (ACTUAL)	ENTRY NO.
04-01-20	-1	-15.00	6

Specific

Costing methods make an assumption about how cost flows from an inventory increase to an inventory decrease. However, if more accurate information about the cost flow exists, then you can override this assumption by creating a fixed application between entries. A fixed application creates a link between an inventory decrease and a specific inventory increase and directs the cost flow accordingly.

For items using the **Specific** costing method, inventory decreases are valued according to the inventory increase that it is linked to by the fixed application.

The following table shows how inventory decreases are valued for the **Specific** costing method.

POSTING DATE	QUANTITY	COST AMOUNT (ACTUAL)	APPLIES-TO ENTRY	ENTRY NO.
02-01-20	-1	-20.00	2	4
03-01-20	-1	-10.00	1	5
04-01-20	-1	-30.00	3	6

Design Details: Item Application

3/31/2019 • 13 minutes to read

When you post an inventory transaction, the quantity posting is recorded in the item ledger entries, the value posting in the value entries. For more information, see [Design Details: Inventory Posting](#).

In addition, an item application is made to link the cost recipient to its cost source to provide cost forwarding according to the costing method. For more information, see [Design Details: Costing Methods](#).

Business Central makes two types of item application.

APPLICATION TYPE	DESCRIPTION
Quantity application	Created for all inventory transactions
Cost application	Created for inbound entries together with a quantity application as a result of user interaction in special processes.

Item applications can be made in the following ways.

METHOD	DESCRIPTION	APPLICATION TYPE
Automatic	Occurs as general cost forwarding according to the costing method	Quantity application
Fixed	Made by the user when: <ul style="list-style-type: none">- Processing returns- Posting corrections- Undoing quantity postings- Creating drop shipments Note: The fixed application can be made either manually by entering an entry number in the Appl.-from Item Entry field or by using a function, such as the Get Posted Document Lines to Reverse.	Quantity application Cost application Note: Cost application only occurs in inbound transactions where the Appl.-from Item Entry field is filled to create a fixed application. See the next table.

Whether quantity applications or cost applications are made depends on the direction of the inventory transaction and whether the item application is made automatically or fixed, in connection with special processes.

The following table shows, based on the central application fields on inventory transaction lines, how costs flow depending on the transaction direction. It also indicates when and why the item application is of type quantity or cost.

	APPL.-TO ITEM ENTRY FIELD	APPL.-FROM ITEM ENTRY FIELD
Application for outbound entry	The outbound entry pulls the cost from the open inbound entry. Quantity application	Not supported

	APPL.-TO ITEM ENTRY FIELD	APPL.-FROM ITEM ENTRY FIELD
Application for inbound entry	<p>The inbound entry pushes the cost onto the open outbound entry.</p> <p>The inbound entry is the cost source.</p> <p>Quantity application</p>	<p>The inbound entry pulls the cost from the outbound entry. Note: When making this fixed application, the inbound transaction is treated as a sales return. Therefore, the applied outbound entry remains open.</p> <p>The inbound entry is NOT the cost source.</p> <p>Cost application</p>

IMPORTANT

A sales return is NOT considered a cost source when fixed applied.

The sales entry remains open until the real source is posted.

An item application entry records the following information.

FIELD	DESCRIPTION
Item Ledger Entry No.	The number of the item ledger entry for the transaction that this application entry is created for.
Inbound Item Entry No.	The item ledger entry number of the inventory increase to which the transaction should be linked, if applicable.
Outbound Item Entry No.	The item ledger entry number of the inventory decrease to which the transaction should be linked, if applicable.
Quantity	The quantity being applied.
Posting Date	The posting date of the transaction.

Inventory Increase

When you post an inventory increase, then a simple item application entry is recorded without an application to an outbound entry.

Example

The following table shows the item application entry that is created when you post a purchase receipt of 10 units.

POSTING DATE	INBOUND ITEM ENTRY NO.	OUTBOUND ITEM ENTRY NO.	QUANTITY	ITEM LEDGER ENTRY NO.
01-01-20	1	0	10	1

Inventory Decrease

When you post an inventory decrease, an item application entry is created that links the inventory decrease to an inventory increase. This link is created by using the item's costing method as a guideline. For items using

FIFO, Standard, and Average costing methods, the linking is based on the first-in-first-out principle. The inventory decrease is applied to the inventory increase with the earliest posting date. For items using the LIFO costing method, the linking is based on the last-in-first-out principle. The inventory decrease is applied to the inventory increase with the most recent posting date.

In the **Item Ledger Entry** table, the **Remaining Quantity** field shows the quantity that has not yet been applied. If the remaining quantity is more than 0, then the **Open** check box is selected.

Example

The following example shows the item application entry that is created when you post a sales shipment of 5 units of the items that were received in the previous example. The first item application entry is the purchase receipt. The second application entry is the sales shipment.

The following table shows the two item application entries that result from the inventory increase and the inventory decrease, respectively.

POSTING DATE	INBOUND ITEM ENTRY NO.	OUTBOUND ITEM ENTRY NO.	QUANTITY	ITEM LEDGER ENTRY NO.
01-01-20	1	0	10	1
01-03-20	1	2	-5	2

Fixed Application

You make a fixed application when you specify that the cost of an inventory increase should apply to a specific inventory decrease, or vice versa. The fixed application affects the remaining quantities of the entries, but the fixed application also reverses the exact cost of the original entry that you are applying to, or from.

To make a fixed application, you use the **Appl.-to Item Entry** field or the **Appl.-from Item Entry** field in the document lines to specify the item ledger entry that you want the transaction line to apply to, or from. For example, you might make a fixed application when you want to create a cost application that specifies that a sales return should apply to a specific sales shipment to reverse the cost of the sales shipment. In this case, Business Central ignores the costing method and applies the inventory decrease, or increase, for a sales return, to the item ledger entry that you specify. The advantage of making a fixed application is that the cost of the original transaction is passed to the new transaction.

Example – Fixed Application in Purchase Return

The following example, which illustrates the effect of fixed application of a purchase return of an item using the FIFO costing method, is based on the following scenario:

1. In entry 1, the user posts a purchase at a cost of LCY 10.00.
2. In entry 2, the user posts a purchase at a cost of LCY 20.00.
3. In entry 3, the user posts a purchase return. The user makes a fixed application to the second purchase by entering the item ledger entry number in the **Appl.-to Item Entry** field on the purchase return order line.

The following table shows item ledger entries resulting from the scenario.

POSTING DATE	ITEM LEDGER ENTRY TYPE	QUANTITY	COST AMOUNT (ACTUAL)	ITEM LEDGER ENTRY NO.
01-04-20	Purchase	10	10.00	1
01-05-20	Purchase	10	20.00	2

POSTING DATE	ITEM LEDGER ENTRY TYPE	QUANTITY	COST AMOUNT (ACTUAL)	ITEM LEDGER ENTRY NO.
01-06-20	Purchase (Return)	-10	-20.00	3

Because a fixed application is made from the purchase return to the second purchase entry, the items are returned at the correct cost. If the user had not performed the fixed application, then the returned item would be incorrectly valued at LCY 10.00 because the return would have been applied to the first purchase entry according to the FIFO principle.

The following table shows the item application entry that results from the fixed application.

POSTING DATE	INBOUND ITEM ENTRY NO.	OUTBOUND ITEM ENTRY NO.	QUANTITY	ITEM LEDGER ENTRY NO.
01-06-20	2	3	10	3

The cost of the second purchase, LCY 20.00, is passed correctly to the purchase return.

Example – Fixed Application with Average Cost

The following example, which illustrates the effect of fixed application, is based on the following scenario for an item that uses the Average costing method:

1. In entry numbers 1 and 2, the user posts two purchase invoices. The second invoice has the incorrect direct unit cost of LCY 1000.00.
2. In entry number 3, the user posts a purchase credit memo, with a fixed application applied to the purchase entry with the wrong direct unit cost. The sum of the **Cost Amount (Actual)** field for the two fixed applied value entries becomes 0.00
3. In entry number 4, the user posts another purchase invoice with the correct direct unit cost of LCY 100.00
4. In entry number 5, the user posts a sales invoice.
5. The inventory quantity is 0, and the inventory value is also 0.00

The following table shows the result of the scenario on the item's value entries.

POSTING DATE	ITEM LEDGER ENTRY TYPE	VALUED QUANTITY	COST AMOUNT (ACTUAL)	APPL.-TO ITEM ENTRY	VALUED BY AVERAGE COST	ITEM LEDGER ENTRY NO.	ENTRY NO.
01-01-20	Purchase	1	200.00		No	1	1
01-01-20	Purchase	1	1000.00		No	2	2
01-01-20	Purchase	-1	-1000	2	No	3	3
01-01-20	Purchase	1	100.00		No	4	4
01-01-20	Sale	-2	-300.00		Yes	5	5

If the user had not made the fixed application between the purchase credit memo and the purchase with the incorrect direct unit cost (step 2 in the previous scenario), then the cost would have been adjusted differently.

The following table shows the result on the item's value entries if step 2 in the previous scenario is performed without a fixed application.

POSTING DATE	ITEM LEDGER ENTRY TYPE	VALUED QUANTITY	COST AMOUNT (ACTUAL)	APPL.-TO ITEM ENTRY	VALUED BY AVERAGE COST	ITEM LEDGER ENTRY NO.	ENTRY NO.
01-01-20	Purchase	1	200.00		No	1	1
01-01-20	Purchase	1	1000.00		No	2	2
01-01-20	Purchase	-1	433,33		Yes	3	3
01-01-20	Purchase	1	100.00		No	4	4
01-01-20	Sale	-2	866,67		Yes	5	5

In entry number 3, the value in the **Cost Amount (Actual)** field is valued by average and therefore includes the erroneous posting of 1000.00. Accordingly, it becomes -433,33, which is an inflated cost amount. The calculation is $1300 / 3 = .433,33$.

In entry number 5, the value of the **Cost Amount (Actual)** field for this entry is also inaccurate for the same reason.

NOTE

If you create a fixed application for an inventory decrease for an item that uses the Average costing method, then the decrease will not receive the average cost for the item as usual, but will instead receive the cost of the inventory increase that you specified. That inventory decrease is then no longer part of the average cost calculation.

Example – Fixed Application in Sales Return

Fixed applications are also a very good means of reversing cost exactly, such as with sales returns.

The following example, which illustrates how a fixed application ensures exact cost reversal, is based on the following scenario:

1. The user posts a purchase invoice.
2. The user posts a sales invoice.
3. The user posts a sales credit memo for the returned item, which applies to the sales entry, to reverse the cost correctly.
4. A freight cost, related to the purchase order that was posted earlier, arrives. The user posts it as an item charge.

The following table shows the result of scenario steps 1 through 3 on the item's value entries.

POSTING DATE	ITEM LEDGER ENTRY TYPE	VALUED QUANTITY	COST AMOUNT (ACTUAL)	APPL.-FROM ITEM ENTRY	ITEM LEDGER ENTRY NO.	ENTRY NO.
01-01-20	Purchase	1	1000.00		1	1
02-01-20	Sale	-1	1000.00		2	2
03-01-20	Sale (Credit Memo)	1	1000	2	3	3

The following table shows the value entry resulting from scenario step 4, posting the item charge.

POSTING DATE	ITEM LEDGER ENTRY TYPE	VALUED QUANTITY	COST AMOUNT (ACTUAL)	APPL.-FROM ITEM ENTRY	ITEM LEDGER ENTRY NO.	ENTRY NO.
04-01-20	(Item Charge)	1	100.00		1	4

The following table shows the effect of the exact cost reversal on the item's value entries.

POSTING DATE	ITEM LEDGER ENTRY TYPE	VALUED QUANTITY	COST AMOUNT (ACTUAL)	APPL.-FROM ITEM ENTRY	ITEM LEDGER ENTRY NO.	ENTRY NO.
01-01-20	Purchase	1	1000.00		1	1
02-01-20	Sale	-1	1100.00		2	2
03-01-20	Sale (Credit Memo)	1	1100.00	2	3	3
04-01-20	(Item Charge)	1	100.00		1	4

When you run the **Adjust Cost - Item Entries** batch job, the increased cost of the purchase entry, due to the item charge, is forwarded to the sales entry (entry number 2). The sales entry then forwards this increased cost to the sales credit entry (entry number 3). The final result is that the cost is correctly reversed.

NOTE

If you are working with returns or credit memos and you have set up the **Exact Cost Reversing Mandatory** field in either the **Purchases & Payables Setup** page or the **Sales & Receivables Setup** page, as appropriate for your situation, then Business Central automatically fills the various application entry fields when you use the **Copy Document** function. If you use the **Get Posted Document Lines to Reverse** function, then the fields are always filled automatically.

NOTE

If you post a transaction with a fixed application, and the item ledger entry that you are applying to is closed, meaning that the remaining quantity is zero, then the old application is automatically undone and reapplies the item ledger entry using the fixed application that you specified.

Transfer Application

When an item is transferred from one location to another, inside the company inventory, then an application is created between the two transfer entries. Valuing a transfer entry depends on the costing method. For items using the Average costing method, valuation is made using the average cost in the average cost period in which the valuation date of the transfer occurs. For items using other costing methods, valuation is made by tracing back to the cost of the original inventory increase.

Example – Average Costing Method

The following example, which illustrates how transfer entries are applied, is based on the following scenario for an item using Average costing method and an average cost period of Day.

1. The user purchases the item at a cost of LCY 10.00.
2. The user purchases the item again at a cost of LCY 20.00.
3. The user transfers the item from BLUE to RED location.

The following table shows the effect of the transfer on the item's value entries.

POSTING DATE	ITEM LEDGER ENTRY TYPE	LOCATION CODE	VALUED QUANTITY	COST AMOUNT (ACTUAL)	ENTRY NO.
01-01-20	Purchase	BLUE	1	10.00	1
01-01-20	Purchase	BLUE	1	20.00	2
02-01-20	Transfer	BLUE	-1	15.00	3
02-01-20	Transfer	RED	1	15.00	4

Example – Standard Costing Method

The following example, which illustrates how transfer entries are applied, is based on the following scenario for an item using Standard costing method and an average cost period of Day.

1. The user purchases the item at a standard cost of LCY 10.00.
2. The user transfers the item from BLUE to RED location at a standard cost of LCY 12.00.

The following table shows the effect of the transfer on the item's value entries.

POSTING DATE	ITEM LEDGER ENTRY TYPE	LOCATION CODE	VALUED QUANTITY	COST AMOUNT (ACTUAL)	ENTRY NO.
01-01-20	Purchase	BLUE	1	10.00	1
02-01-20	Transfer	BLUE	-1	10.00	2
02-01-20	Transfer	RED	1	10.00	3

Since the value of the original inventory increase is LCY 10.00, the transfer is valued at that cost, not at LCY 12.00.

Reapplication

Because of the way an item's unit cost is calculated, an incorrect item application could lead to a skewed average cost and unit cost. The following scenarios may cause incorrect item applications, which require that you undo item applications and reapply item ledger entries:

- You have forgotten to make a fixed application.
- You have made an incorrect fixed application.
- You want to overrule the application created automatically when posting, according to the item's costing method.
- You have to return an item to which a sale has already been manually applied, without using the **Get Posted Document Lines to Reverse** function, and you must therefore undo the application.

Business Central offers a feature for analyzing and correcting item applications. This work is performed on the **Application Worksheet** page.

Design Details: Known Item Application Issue

3/31/2019 • 6 minutes to read

This article addresses an issue where the inventory level is zero although open item ledger entries exist in Business Central.

The article starts by listing typical symptoms of the issue, followed by the basics of item application to support the described reasons for this issue. At the end of the article is a workaround to address such open item ledger entries.

Symptoms of the Issue

Typical symptoms of the issue with zero inventory although open item ledger entries exist are the following:

- The following message when you try to close an inventory period: "The inventory cannot be closed because there is negative inventory for one or more items."
- An item ledger entry situation where both an outbound item ledger entry and its related inbound item ledger entry are open.

See the following example of an item ledger entry situation.

ENTR Y NO.	POSTI NG DATE	ENTR Y TYPE	DOCU MENT TYPE	DOCU MENT NO.	ITEM NO.	LOCA TION CODE	QUAN TITY	COST AMO UNT (ACTU AL)	INVOI CED QUAN TITY	REMA INING QUAN TITY	OPEN
333	01/28/2018	Sale	Sales Ship ment	102043	TEST	BLUE	-1	-10	-1	-1	Yes
334	01/28/2018	Sale	Sales Ship ment	102043	TEST	BLUE	1	10	1	1	Yes

Basics of Item Application

An item application entry is created for every inventory transaction to link the cost recipient to its cost source so that the cost can be forwarded according to the costing method. For more information, see [Design Details: Item Application](#).

- For an inbound item ledger entry, the item application entry is created when the item ledger entry is created.
- For an outbound item ledger entry, the item application entry is created when the item ledger entry is posted, IF there is an open inbound item ledger entry with available quantity that it can apply to. If there is no open inbound item ledger entry that it can apply to, then the outbound item ledger entry remains open until an inbound item ledger entry that it can apply to is posted.

There are two types of item application:

- Quantity Application
- Cost Application

Quantity Application

Quantity applications are made for all inventory transactions and are created automatically, or manually in special processes. When made manually, quantity applications are referred to as fixed application.

The following diagram shows how quantity applications are made.

Notice above that item ledger entry 1 (Purchase) is both the supplier of the item and the cost source to the applied item ledger entry, item ledger entry 2 (Sale).

NOTE

If the outbound item ledger entry is valued by average cost, then the applied inbound item ledger entry is not the unique cost source. It merely plays a part in the calculation of the average cost of the period.

Cost Application

Cost applications are only created for inbound transactions where the **Appl.-from Item Entry** field is filled to provide a fixed application. This typically happens in connection with a sales credit memo or an undo shipment scenario. The cost application ensures that the item re-enters inventory with the same cost as when it was shipped.

The following diagram shows how cost applications are made.

ENTRY NO.	POSTING DATE	ENTRY TYPE	DOCUMENT TYPE	DOCUMENT NO.	ITEM NO.	LOCATION CODE	QUANTITY	COST AMOUNT (ACTUAL)	INVOICED QUANTITY	REMAINING QUANTITY	OPEN
333	01/28 /2018	Sale	Sales Shipment	10204 3	TEST	BLUE	-1	-10	-1	-1	Yes
334	01/28 /2018	Sale	Sales Shipment	10204 3	TEST	BLUE	1	10	1	1	Yes

Notice above that inbound item ledger 3 (Sales Return) is a cost recipient for the original outbound item ledger entry 2 (Sale).

Illustration of a Basic Cost Flow

Assume a complete cost flow where an item is received, is shipped and invoiced, is returned with exact-cost reversal, and is shipped again.

The following diagram illustrates the cost flow.

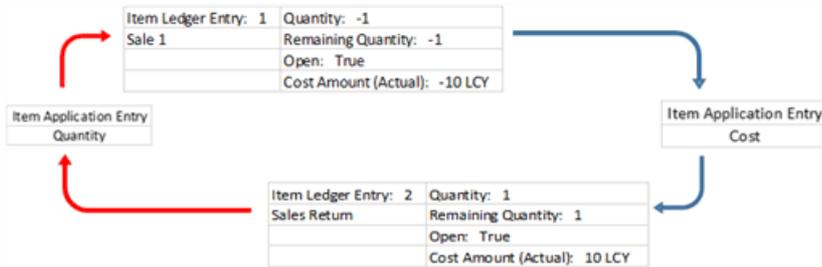

Notice above that the cost is forwarded to item ledger entry 2 (Sale), then to item ledger entry 3 (Sales Return), and finally to item ledger entry 4 (Sale 2).

Reasons for the Issue

The issue with zero inventory although open item ledger entries exist can be caused by the following scenarios:

- Scenario 1: A shipment and invoice is posted although the item is not available. The posting is then exact-cost reversed with a sales credit memo.
- Scenario 2: A shipment is posted although the item is not available. The posting is then undone with the Undo Shipment function.

The following diagram illustrates how item applications are made in both scenarios.

Notice above that a cost application is made (represented by the blue arrows) to ensure that item ledger entry 2 (Sales Return) is assigned the same costs as the item ledger entry that it reverses, item ledger entry 1 (Sale 1). However, a quantity application (represented by the red arrows) is not made.

Item ledger entry 2 (Sales Return) cannot be both a cost recipient of the original item ledger entry and at the same time be a supplier of items and their source of costs. Therefore, the original item ledger entry 1 (Sale 1) remains open until a valid source appears.

Identifying the Issue

To find out if the open item ledger entries are created, do as follows for the respective scenario:

For scenario 1, identify the issue as follows:

- In the **Posted Sales Credit Memo** or **Posted Return Receipt** page, look up from the **Appl.-from Item Entry** field to see if the field is populated, and in that case to which item ledger entry the return receipt is cost applied.

For scenario 2, identify the issue in either of the following ways:

- Look for an open outbound item ledger entry and an inbound item ledger entry with same number in the **Document No.** field, and Yes in the **Correction** field. See the following example of such an item ledger entry situation.

ENTR Y NO.	POSTI NG DATE	ENTR Y TYPE	DOCU MENT TYPE	DOCU MENT NO.	ITEM NO.	LOCA TION CODE	QUAN TITY	COST AMO UNT (ACTU AL)	INVOI CED QUAN TITY	REMA INING QUAN TITY	OPEN	CORR ECTIO N
333	01/28/2018	Sale	Sales Shipment	102043	TEST	BLUE	-1	-10	-1	-1	Yes	No
334	01/28/2018	Sale	Sales Shipment	102043	TEST	BLUE	1	10	1	1	Yes	Yes

- On the **Posted Sales Shipment** page, look up from the **Appl.-from Item Entry** field to see if the field is populated, and in that case to which item ledger entry the return receipt is cost applied.

NOTE

Cost applications cannot be identified on the **Applied Item Entries** page because that page only shows quantity applications.

For both scenarios, identify the involved cost application as follows:

1. Open the **Item Application Entry** table.
2. Filter on the **Item Ledger Entry No.** field using the number of the Sales Return item ledger entry.
3. Analyze the item application entry, taking note of the following:

If the **Outbound Item Entry No.** field is populated for an inbound item ledger entry (positive quantity), then it means that the inbound item ledger entry is the cost recipient of the outbound item ledger entry.

See the following example of an item application entry.

ENTRY NO.	ITEM LEDGER ENTRY NO.	INBOUND ITEM ENTRY NO.	OUTBOUND ITEM ENTRY NO.	QUANTITY	POSTING DATE	COST APPLICATION
299	334	334	333	1	01/28/2018	Yes

Notice above that inbound item ledger entry 334 is cost applied to outbound item ledger entry 333.

Workaround for the Issue

On the **Item Journal** page, post the following lines for the item in question:

- A positive adjustment to close the open outbound item ledger entry.
- A negative adjustment with the same quantity.

This adjustment balances the inventory increase caused by the positive adjustment and closes the open inbound item ledger entry.

The result is that inventory is zero and all item ledger entries are closed.

Design Details: Cost Adjustment

3/31/2019 • 8 minutes to read

The main purpose of cost adjustment is to forward cost changes from cost sources to cost recipients, according to an item's costing method, to provide correct inventory valuation.

An item can be sales invoiced before it has been purchase invoiced, so that the recorded inventory value of the sale does not match the actual purchase cost. Cost adjustment updates the cost of goods sold (COGS) for historic sales entries to ensure that they match the costs of the inbound transactions to which they are applied. For more information, see [Design Details: Item Application](#).

The following are secondary purposes, or functions, of cost adjustment:

- Invoice finished production orders:
 - Change the status of value entries from **Expected** to **Actual**.
 - Clear WIP accounts. For more information, see [Design Details: Production Order Posting](#).
 - Post variance. For more information, see [Design Details: Variance](#).
- Update the unit cost on the item card.

Inventory costs must be adjusted before the related value entries can be reconciled with the general ledger. For more information, see [Design Details: Reconciliation with the General Ledger](#).

Detecting the Adjustment

The task of detecting if cost adjustment should occur is primarily performed by the Item Jnl.-Post Line routine, while the task of calculating and generating cost adjustment entries is performed by the **Adjust Cost – Item Entries** batch job.

To be able to forward costs, the detection mechanism determines which sources have changed in costs and to which destination these costs should be forwarded. The following three detection functions exist in Business Central:

- Item Application Entry
- Average Cost Adjustment Entry Point
- Order Level

Item Application Entry

This detection function is used for items that use FIFO, LIFO, Standard, and Specific costing methods and for fixed applications scenarios. The function works as follows:

- Cost adjustment is detected by marking the source item ledger entries as *Applied Entry to Adjust* whenever an item ledger entry or value entry is posted.
- Cost is forwarded according to the cost chains that are recorded in the **Item Application Entry** table.

Average Cost Adjustment Entry Point

This detection function is used for items that use the Average costing method. The function works as follows:

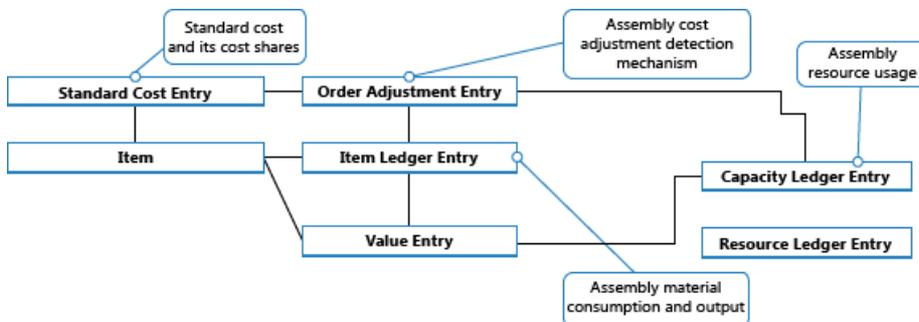

- Cost adjustment is detected by marking a record in the **Avg. Cost Adjmt. Entry Point** table whenever a value entry is posted.
- Cost is forwarded by applying the costs to value entries with a later valuation date.

Order Level

This detection function is used in conversion scenarios, production and assembly. The function works as follows:

- Cost adjustment is detected by marking the order whenever a material/resource is posted as consumed/used.
- Cost is forwarding by applying the costs from material/resource to the output entries associated with the same order.

The Order Level function is used to detect adjustments in assembly posting. The following graphic shows the adjustment entry structure:

For more information, see [Design Details: Assembly Order Posting](#).

Manual versus Automatic Cost Adjustment

Cost adjustment can be performed in two ways:

- Manually, by running the **Adjust Cost - Item Entries** batch job. You can run this batch job either for all items or for only certain items or item categories. This batch job runs a cost adjustment for the items in inventory for which an inbound transaction has been made, such as a purchase. For items that use the average costing method, the batch job also makes an adjustment if any outbound transactions are created.
- Automatically, by adjusting costs every time that you post an inventory transaction, and when you finish a production order. The cost adjustment is only run for the specific item or items affected by the posting. This is set up when you select the **Automatic Cost Adjustment** check box on the **Inventory Setup** page.

It is good practice to run the cost adjustment automatically when you post because unit costs are more frequently updated and therefore more accurate. The disadvantage is that the performance of the database can be affected by running the cost adjustment so often.

Because it is important to keep the unit cost of an item up to date, it is recommend that you run the **Adjust Cost - Item Entries** batch job as often as possible, during nonworking hours. Alternatively, use automatic cost adjustment. This ensures that the unit cost is updated for items daily.

Regardless if you run the cost adjustment manually or automatically, the adjustment process and its consequences are the same. Business Central calculates the value of the inbound transaction and forwards that cost to any outbound transactions, such as sales or consumptions, which have been applied to the inbound transaction. The cost adjustment creates value entries that contain adjustment amounts and amounts that compensate for rounding.

The new adjustment and rounding value entries have the posting date of the related invoice. Exceptions are if the value entries fall in a closed accounting period or inventory period or if the posting date is earlier than the date in the **Allow Posting From** field on the **General Ledger Setup** page. If this occurs, the batch job assigns the posting date as the first date of the next open period.

Adjust Cost - Item Entries Batch Job

When you run the **Adjust Cost - Item Entries** batch job, you have the option to run the batch job for all items or for only certain items or categories.

NOTE

We recommend that you always run the batch job for all items and only use the filtering option to reduce the runtime of the batch job, or to fix the cost of a certain item.

Example

The following example shows if you post a purchased item as received and invoiced on 01-01-20. You later post the sold item as shipped and invoiced on 01-15-20. Then, you run the **Adjust Cost - Item Entries** and **Post Inventory Cost to G/L** batch jobs. The following entries are created.

Value Entries

POSTING DATE	ITEM LEDGER ENTRY TYPE	COST AMOUNT (ACTUAL)	COST POSTED TO G/L	INVOICED QUANTITY	ENTRY NO.
01-01-20	Purchase	10.00	10.00	1	1
01-15-20	Sale	-10.00	-10.00	-1	2

Relation Entries in the G/L – Item Ledger Relation Table

G/L ENTRY NO.	VALUE ENTRY NO.	G/L REGISTER NO.
1	1	1
2	1	1
3	2	1
4	2	1

General Ledger Entries

POSTING DATE	G/L ACCOUNT	ACCOUNT NO. (EN-US DEMO)	AMOUNT	ENTRY NO.
01-01-20	[Inventory Account]	2130	10.00	1
01-01-20	[Direct Cost Applied Account]	7291	-10.00	2
01-15-20	[Inventory Account]	2130	-10.00	3
01-15-20	[COGS Account]	7290	10.00	4

Later, you post a related purchase item charge for 2.00 LCY invoiced on 02-10-20. You run the **Adjust Cost - Item Entries** batch job and then run the **Post Inventory Cost to G/L** batch job. The cost adjustment batch job adjusts the cost of the sale by -2.00 LCY accordingly, and the **Post Inventory Cost to G/L** batch job posts the new value entries to the general ledger. The result is as follows.

Value Entries

POSTING DATE	ITEM LEDGER ENTRY TYPE	COST AMOUNT (ACTUAL)	COST POSTED TO G/L	INVOICED QUANTITY	ADJUSTMENT	ENTRY NO.
02-10-20	Purchase	2.00	2.00	0	No	3
01-15-20	Sale	-2.00	-2.00	0	Yes	4

Relation Entries in the G/L – Item Ledger Relation Table

G/L ENTRY NO.	VALUE ENTRY NO.	G/L REGISTER NO.
5	3	2
6	3	2
7	4	2
8	4	2

General Ledger Entries

POSTING DATE	G/L ACCOUNT	ACCOUNT NO. (EN-US DEMO)	AMOUNT	ENTRY NO.
02-10-20	[Inventory Account]	2130	2.00	5
02-10-20	[Direct Cost Applied Account]	7291	-2.00	6
01-15-20	[Inventory Account]	2130	-2.00	7
01-15-20	[COGS Account]	7290	2.00	8

Automatic Cost Adjustment

To set up cost adjustment to run automatically when you post an inventory transaction, use the **Automatic Cost Adjustment** field on the **Inventory Setup** page. This field enables you to select how far back in time from the current work date that you want automatic cost adjustment to be performed. The following options exist.

OPTION	DESCRIPTION
Never	Costs are not adjusted when you post.
Day	Costs are adjusted if posting occurs within one day from the work date.
Week	Costs are adjusted if posting occurs within one week from the work date.
Month	Costs are adjusted if posting occurs within one month from the work date.

OPTION	DESCRIPTION
Quarter	Costs are adjusted if posting occurs within one quarter from the work date.
Year	Costs are adjusted if posting occurs within one year from the work date.
Always	Costs are always adjusted when you post, regardless of the posting date.

The selection that you make in the **Automatic Cost Adjustment** field is important for performance and the accuracy of your costs. Shorter time periods, such as **Day** or **Week**, affect system performance less, because they provide the stricter requirement that only costs posted in the last day or week can be automatically adjusted. This means that the automatic cost adjustment does not run as frequently and therefore affects system performance less. However, it also means that unit costs may be less accurate.

Example

The following example shows an automatic cost adjustment scenario:

- On January 10, you post a purchased item as received and invoiced.
- On January 15, you post a sales order for the item as shipped and invoiced.
- On February 5, you receive an invoice for a freight charge on the original purchase. You post this freight charge, applying it to the original purchase invoice, which increases the cost of the original purchase.

If you have set up the automatic cost adjustment to apply to postings that occur within a month or a quarter from the current work date, then the automatic cost adjustment runs and forwards the cost of the purchase to the sale.

If you have set up the automatic cost adjustment to apply to postings that occur within a day or a week from the current work date, then the automatic cost adjustment does not run, and the cost of the purchase is not forwarded to the sale until you run the **Adjust Cost - Item Entries** batch job.

Design Details: Posting Date on Adjustment Value Entry

3/31/2019 • 12 minutes to read

This article provides guidance for users of the Inventory Costing functionality in Business Central. The specific article is providing guidance in how the **Adjust Cost - Item Entries** batch job identifies and assigns a posting date to the value entries that the batch job is about to create.

First the concept of the process is reviewed, how the batch job identifies and assigns the Posting Date to the Value Entry to be created. Thereafter there are some scenarios shared that we in the support team come across from time to time and finally there is a summary of the concepts used from version 3.0.

The Concept

From version 5.0, the **Adjust Cost – Item Entries** batch job assigns a posting date to the value entry it is about to create in the following steps:

1. Initially the Posting Date of the entry to be created is the same date as the entry it adjusts.
2. The Posting Date is validated against Inventory Periods and/or General Ledger Setup.
3. Assignment of Posting Date; If the initial Posting Date is not within allowed posting date range the batch job will assign an allowed Posting Date from either General Ledger Setup or Inventory Period. If both Inventory Periods and allowed posting dates in General Ledger Setup are defined, the later date of the two will be assigned to the Adjustment Value Entry.

Let's review this process more in practice. Assume we have an Item Ledger Entry of Sale. The item was shipped on September 5th, 2013 and it was invoiced the day after.

Item Ledger Entry:
Date format: YYYY-MM-DD

Entry No.	Item No.	Posting Date	Entry Type	Document No.	Location Code	Quantity	Cost Amount (Actual)	Invoiced Quantity	Remaining Quantity
319	A	2013-09-05	Sale	102033	BLUE	-1	-11	-1	0

Below, the first Value Entry (379) represents the shipment and carry the same Posting Date as the parent Item ledger Entry.

The second Value Entry (381) represents the invoice.

The third Value Entry (391) is an Adjustment of the invoicing Value Entry (381)

Entry No.	Item No.	Posting Date	Item Ledger Entry Type	Document No.	Item Ledger Entry No.	Location Code	Item Ledger Entry Quantity	Invoiced Quantity	Cost Amount (Actual)	Cost Amount (Expected)	Adjustment	Applies to Entry	Source Code	
379	A	2013-09-05	Sale	Direct Cost	102033	319	BLUE	-1	0	0	-10	No	0	SALES
381	A	2013-09-06	Sale	Direct Cost	103022	319	BLUE	0	-3	-10	10	No	0	SALES
391	A	2013-09-06	Sale	Direct Cost	103022	319	BLUE	0	0	-1	0	Yes	381	INVTADJMT

Posting Date on Adjustment entry is initially set to the same Posting date of the entry it adjusts.

Step 1: Adjustment Value Entry to be created is assigned same Posting Date as the entry it adjusts, illustrated above by Value entry 391.

Step 2: Validation of initial assigned Posting Date.

The **Adjust Cost – Item Entries** batch job determines if the initial Posting Date of the Adjustment Value Entry is within allowed posting date range based upon Inventory Periods and/or General Ledger Setup.

Let's review the above mentioned Sale by adding setup of allowed posting date ranges.

Inventory Periods:

Inventory Periods ▾

Sorting: Ending Date ▾ ↕

Ending Date	Name	Closed
2013-01-31	January 2013	<input checked="" type="checkbox"/>
2013-02-28	February 2013	<input checked="" type="checkbox"/>
2013-03-31	March 2013	<input checked="" type="checkbox"/>
2013-04-30	April 2013	<input checked="" type="checkbox"/>
2013-05-31	May 2013	<input checked="" type="checkbox"/>
2013-06-30	June 2013	<input checked="" type="checkbox"/>
2013-07-31	July 2013	<input checked="" type="checkbox"/>
2013-08-31	August 2013	<input checked="" type="checkbox"/>
2013-09-30	September 2013	<input type="checkbox"/>
2013-10-31	October 2013	<input type="checkbox"/>
2013-11-30	November 2013	<input type="checkbox"/>
2013-12-31	December 2013	<input type="checkbox"/>

First allowed posting date is the first day in the first open period. September 1st, 2013.

General Ledger Setup:

General Ledger Setup

General

Allow Posting From: 2013-09-10 ▾

Allow Posting To: 2013-09-30 ▾

Register Time:

Local Address Format: Post Code+Ci... ▾

First allowed posting date is the date stated in field Allow Posting From: September 10th, 2013.

If both Inventory Periods and allowed posting dates in General Ledger Setup are defined, the later date of the two will define the allowed posting date range.

Step 3: Assignment of an allowed posting date;

The initial assigned Posting Date was September 6th as illustrated in step 1. However, in the 2nd step the Adjust Cost – Item entries batch job identifies that earliest allowed Posting Date is September 10th and thereby assigns September 10th to the Adjustment Value Entry, below.

Entry No.	Item No.	Posting Date	Item Ledger Entry Type	Document No.	Item Ledger Entry No.	Location Code	Item Ledger Entry Quantity	Invoiced Quantity	Cost Amount (Actual)	Cost Amount (Expected)	Adjustment	Applies to Entry	Source Code
379	A	2013-09-05	Sale	Direct Cost	109023	319 BLUE	-1	0	0	-10	No		SALES
381	A	2013-09-06	Sale	Direct Cost	109022	319 BLUE	0	-1	-10	10	No		SALES
391	A	2013-09-10	Sale	Direct Cost	109022	319 BLUE	0	0	-3	0	Yes	381	INVTADJMT

We have now reviewed the concept for assigning Posting Dates to Value Entries created by the Adjust Cost - Item entries batch job.

Let's continue to review some scenarios that we in the support team comes across from time to time in relation to

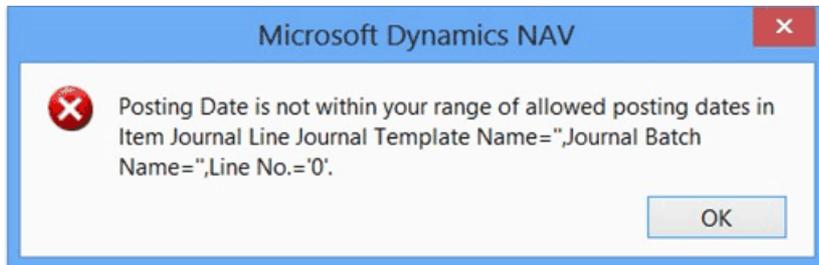

assigned Posting Dates in the Adjust Cost – Item entries batch job and related setups.

Scenarios

Scenario I: "Posting Date is not within your range of allowed posting dates..."

This is a scenario where a user is experiencing mentioned error message when the Adjust Cost – Item entries batch job is run.

In the previous section, describing the concept of assigning posting dates, the intention of the Adjust Cost – Item entries batch job is to create a Value Entry with Posting Date September 10th.

We follow up on the User Setup:

User Setup ▾

Sorting: User ID ▾ A Z ↓

User ID	Allow Posting From	Allow Posting To
EUROPE\HHO...	2013-09-11	2013-09-30

The user in this case has an allowed posting date range from September 11th to September 30th and is thereby not allowed to post the Adjustment Value Entry with Posting Date September 10th.

Ending Date	Name	Closed
2013-01-31	January 2013	<input checked="" type="checkbox"/>
2013-02-28	February 2013	<input checked="" type="checkbox"/>
2013-03-31	March 2013	<input checked="" type="checkbox"/>
2013-04-30	April 2013	<input checked="" type="checkbox"/>
2013-05-31	May 2013	<input checked="" type="checkbox"/>
2013-06-30	June 2013	<input checked="" type="checkbox"/>
2013-07-31	July 2013	<input checked="" type="checkbox"/>
2013-08-31	August 2013	<input checked="" type="checkbox"/>
2013-09-30	September 2013	<input type="checkbox"/>
2013-10-31	October 2013	<input type="checkbox"/>
2013-11-30	November 2013	<input type="checkbox"/>
2013-12-31	December 2013	<input type="checkbox"/>

User Setup ▾

User ID	Allow Posting From	Allow Posting To
HHO-NAV-...	2013-09-01	2013-09-30

Assigning the user a wider (or same) allowed posting date range as in Inventory Period or General Ledger Setup, mentioned conflict will be avoided.

The Adjustment Value Entry with Posting Date September 10th will with this setup be posted successfully.

General	
Allow Posting From:	2013-09-10
Allow Posting To:	2013-09-30
Register Time:	<input type="checkbox"/>
Local Address Format:	Post Code+Cl...

Knowledge Base article [952996](#) discusses additional scenarios related to mentioned error message.

Scenario II: Posting Date on Adjustment Value Entry versus Posting Date on entry causing the adjustment such as Revaluation or Item charge.

Revaluation scenario:

Prerequisites:

Inventory setup:

- Automatic Cost Posting = Yes

- Automatic Cost Adjustment=Always
- Average Cost Calc. Type=item
- Average Cost Period=Day

General Ledger Setup:

- Allow Posting From = January 1st, 2014
- Allow Posting To = empty

User Setup:

- Allow Posting From = December 1st, 2013.
- Allow Posting to = empty

To test the scenario

1. Create item TEST:

Base unit of measure = PCS

Costing Method = Average

Select optional posting groups.

2. Open Item Journal, create and post a line as follows:

Posting Date = December 15th, 2013

Item = TEST

Entry Type = Purchase

Quantity = 100

Unit Amount = 10

3. Open Item Journal, create and post a line as follows:

Date = December 20th, 2013

Item = TEST

Entry Type = Negative Adjustment

Quantity = 2

4. Open Item Journal, create and post a line as follows:

Date = January 15th, 2014

Item = TEST

Entry Type = Negative Adjustment

Quantity = 3

5. Open Revaluation Journal, create and post a line as follows:

Item = TEST

Applies-to Entry = select Purchase entry posted at step 2. The Posting Date of the revaluation will be the same as the entry it adjusts.

Unit Cost Revalued = 40

The following Item Ledger and Value Entries have been posted:

Item Ledger Entry – Purchase:

Date format: YYYY-MM-DD

Entry No.	Item No.	Posting Date	Entry Type	Document No.	Quantity	Cost Amount (Actual)	Remaining Quantity
317	TEST	2013-12-15	Purchase	T00001	100	4 000	95

Value Entries:

Entry No.	Item No.	Posting Date	Item Ledger Entry No.	Item Ledger Entry Type	Entry Type	Document No.	Item Ledger Entry Quantity	Cost Amount (Actual)	Cost Posted to G/L	Adjustment	Applies to Entry	Source Code
376	TEST	2013-12-15	317	Purchase	Direct Cost	T00001	100	1 000,00	1 000,00	No	0	ITEMINL
379	TEST	2013-12-15	317	Purchase	Revaluation	T04002	0	3 000,00	3 000,00	No	0	REVALINL

Item Ledger Entry - Negative Adjustment, step 3:

Entry No.	Item No.	Posting Date	Entry Type	Document No.	Quantity	Cost Amount (Actual)	Remaining Quantity
318	TEST	2013-12-20	Negative Adjmt.	T00002	-2	-80	0

Value Entries:

Entry No.	Item No.	Posting Date	Item Ledger Entry No.	Item Ledger Entry Type	Entry Type	Document No.	Item Ledger Entry Quantity	Cost Amount (Actual)	Cost Posted to G/L	Adjustment	Applies to Entry	Source Code
377	TEST	2013-12-20	318	Negative Adjmt.	Direct Cost	T00002	-2	-20	-20	No	0	ITEMINL
380	TEST	2014-01-01	318	Negative Adjmt.	Direct Cost	T00002	0	-60	-60	Yes	377	INVTADJMT

Item Ledger Entry - Negative Adjustment, step 4:

Entry No.	Item No.	Posting Date	Entry Type	Document No.	Quantity	Cost Amount (Actual)	Remaining Quantity
319	TEST	2014-01-15	Negative Adjmt.	T00003	-3	-120	0

Value Entries:

Entry No.	Item No.	Posting Date	Item Ledger Entry No.	Item Ledger Entry Type	Entry Type	Document No.	Item Ledger Entry Quantity	Cost Amount (Actual)	Cost Posted to G/L	Adjustment	Applies to Entry	Source Code
378	TEST	2014-01-15	319	Negative Adjmt.	Direct Cost	T00003	-3	-30	-30	No	0	ITEMINL
381	TEST	2014-01-15	319	Negative Adjmt.	Direct Cost	T00003	0	-90	-90	Yes	378	INVTADJMT

The Adjust Cost – Item entries batch job has recognized a change in cost and adjusted the Negative Adjustments.

Review of Posting Dates on created Adjustment Value Entries: The earliest allowed Posting Date the Adjust Cost - Item Entries batch job has to relate to is January 1st, 2014 as stated in the General Ledger Setup.

Negative Adjustment in step 3: assigned Posting Date is January 1st, provided by General Ledger Setup. The Posting Date of the Value Entry in scope for adjustment is December 20, 2013. According to General Ledger Setup the date is not within allowed posting date range. Therefore the Posting Date stated in the Allow Posting From field in the General Ledger Setup is assigned to the Adjustment Value Entry.

Negative Adjustment in step 4: assigned Posting Date is January 15th. The Value Entry in scope of adjustment has Posting Date January 15th, which is within the allowed posting date range according to General Ledger Setup.

The adjustment made for the Negative Adjustment in step 3 causes discussion. The favorable Posting Date for the Adjustment Value Entry would have been December 20th or at least within December as the revaluation causing the change in COGS was posted in December.

To achieve adjustment in December of the Negative Adjustment in step 3, the General Ledger Setup, Allow Posting From field, need to state a date in December.

Conclusion:

With the experiences from this scenario, considering most suitable setup of allowed posting date range for a company, the following might be useful: As long as changes in inventory value is allowed to be posted in a period, December in this case, the setup the company uses for allowed posting date ranges should be aligned with this decision. The Allow Posting From in the General Ledger Setup, stating December 1st would allow the revaluation made in December to be forwarded to affected outbound entries in the same period.

User groups not allowed to post in December but in January, which was probably intended to be limited by the General Ledger Setup in this scenario, should instead be addressed via the User setup.

Item charge scenario:

Prerequisites:

Inventory setup:

- Automatic Cost Posting = Yes
- Automatic Cost Adjustment=Always
- Average Cost Calc. Type=item
- Average Cost Period=Day

General Ledger Setup:

- Allow Posting From = December 1st, 2013.
- Allow Posting To = empty

User Setup:

- Allow Posting From = December 1st, 2013.
- Allow Posting to = empty

To test the scenario

1. Create item charge:

Base unit of measure = PCS

Costing Method = Average

Select optional posting groups.

2. Create new purchase order

Buy-from Vendor No.: 10000

Posting Date = December 15th, 2013

Vendor Invoice No.: 1234

On the purchase order line:

Item = CHARGE

Quantity = 1

Direct Unit Cost = 100

Post Receive and Invoice.

3. Create new sales order:

Sell-to Customer No.: 10000

Posting Date = December 16th, 2013

On the sales order line:

Item = CHARGE

Quantity = 1

Unit Price = 135

Post Ship and Invoice.

4. General Ledger Setup:

Allow Posting From = January 1st, 2014

Allow Posting To = blank

5. Create new purchase order:

Buy-from Vendor No.: 10000

Posting Date = January 2nd, 2014

Vendor Invoice No.: 2345

On the purchase order line:

Item Charge = JB-FREIGHT

Quantity = 1

Direct Unit Cost = 3

Assign Item Charge to Purchase Receipt from step 2.

Post Receipt and Invoice.

Status Item Ledger entry of Purchase step 2:

Entry No.	Item No.	Posting Date	Entry Type	Document No.	Quantity	Cost Amount (Actual)	Remaining Quantity
324	CHARGE	2013-12-15	Purchase	107030	1	103	0

Value entries:

Entry No.	Item No.	Posting Date	Item Ledger Entry No.	Item Ledger Entry Type	Entry Type	Document No.	Item Charge No.	Item Ledger Entry Quantity	Cost Amount (Actual)	Cost Posted to G/L	Adjustment	Applies-to Entry
397	CHARGE	2013-12-15	324	Purchase	Direct Cost	108029		1	100	100	No	0
399	CHARGE	2014-01-02	324	Purchase	Direct Cost	108030	JB-FREIGHT	0	3	3	No	0

Status Item Ledger entry Sale:

Entry No.	Item No.	Posting Date	Entry Type	Document No.	Quantity	Cost Amount (Actual)	Remaining Quantity
325	CHARGE	2013-12-16	Sale	102035	-1	-103	0

Value entries:

Entry No.	Item No.	Posting Date	Item Ledger Entry No.	Item Ledger Entry Type	Entry Type	Document No.	Item Charge No.	Item Ledger Entry Quantity	Cost Amount (Actual)	Cost Posted to G/L	Adjustment	Applies-to Entry
398	CHARGE	2013-12-16	325	Sale	Direct Cost	103024		-1	-100	-100	No	0
400	CHARGE	2014-01-01	325	Sale	Direct Cost	103024		0	-3	-3	Yes	398

6. On work date January 3rd a purchase invoice arrives, containing an additional item charge to the purchase made in step 2. This invoice has document date December 30th and is therefore posted with Posting Date December 30th, 2013.

Create new purchase order:

Buy-from Vendor No.: 10000

Posting Date = December 30th, 2013

Vendor Invoice No.: 3456

On the purchase order line:

Item Charge = JB-FREIGHT

Quantity = 1

Direct Unit Cost = 2

Assign Item Charge to Purchase Receipt from step 2

Post Receipt and Invoice.

Status Item Ledger entry of Purchase:

Entry No.	Item No.	Posting Date	Entry Type	Document No.	Quantity	Cost Amount (Actual)	Remaining Quantity
324	CHARGE	2013-12-15	Purchase	107030	1	105	0

Value entries:

Entry No.	Item No.	Posting Date	Item Ledger Entry No.	Item Ledger Entry Type	Entry Type	Document No.	Item Charge No.	Item Ledger Entry Quantity	Cost Amount (Actual)	Cost Posted to G/L	Adjustment	Applies-to Entry
397	CHARGE	2013-12-15	324	Purchase	Direct Cost	108029		1	100	100	No	0
399	CHARGE	2014-01-02	324	Purchase	Direct Cost	108030	JB-FREIGHT	0	3	3	No	0

Inventory Valuation report is printed as of Date December 31st , 2013

Inventory Posting Group Name											
Item No.	Description	Base Unit	As of	Increases (LCY)		Decreases (LCY)		As of 13-12-31		Cost Posted to G/L	
			Quantity	Value	Quantity	Value	Quantity	Value	Quantity	Value	
RESALE	CHARGE	PCS	0	0.00	1	102.00	1	100.00	0	2.00	2.00
RESALE				0.00		102.00		100.00		2.00	2.00
Total				0.00		102.00		100.00		2.00	2.00

Summary of scenario:

The described scenario ends up with an Inventory Valuation report demonstrating Quantity = 0 while the Value = 2. The Item charge posted in step 11 is part of the Inventory Increase value of December while the Inventory Decrease of the same period is not affected.

Having the General Ledger Setup stating Allow Posting From January 1st was a good thing for the first Item charge. The costs of the Inventory Increase and Decrease was recorded in the same period. For the second Item charge however, the General Ledger Setup causes the change in COGS to be recognized in the period after.

Conclusion:

It's a challenge to have the Inventory Valuation report to demonstrate Quantity = 0 while the Value > 0. In this case it's also more difficult to express the optimal settings, having purchase invoices arriving the same day but addressing different periods or even fiscal years. Crossing to a new fiscal year usually requires some planning and as part of that the insight of Adjust Cost – Item entries process, recognizing COGS, is to be considered.

In this scenario one option could have been to have the General Ledger Setup, field Allow Posting From, stating a date in December for a couple of more days and the posting of the first item charge postponed to allow all costs for the previous period/fiscal year to be recognized for the period they belong to first, having the Adjust Cost – Item entries batch job run and thereafter move the allowed posting date to the new period/fiscal year. The first item charge with posting date January 2nd could then be posted.

History of Adjust Cost – Item entries batch job

Below is a summary of the concept assigning Posting Dates to Adjustment Value Entries by the Adjust Cost – Item entries batch job since version 3.0.

From version 3.0..3.70.A

In the request form of the Adjust Cost - Item Entries batch job there is a Posting Date to be entered by the user. The batch job runs through all necessary changes and creates value entries with the posting date entered in the

request form. Suggested posting date to use is today's date.

Version 3.70.B..4.0

In the request form of the Adjust Cost - Item Entries batch job there is a Closed Period Entry Posting Date to be entered by the user. The batch job runs through all necessary changes and creates value entries with the posting date of the parent item ledger entry (shipment date of the sale that the adjustment address). If the posting date of the parent item ledger entry is not within allowed posting date range the posting date stated as Closed Period Entry Posting Date will be assigned the Adjustment Value Entry. A date is considered to be in a closed period when it is earlier than the date in the Allow Posting From field in the General Ledger Setup.

From version 5.0:

There is no longer a posting date to be stated in the request form of the Adjust Cost - Item entries batch job. The batch job runs through all necessary changes and creates value entries with the posting date of the value entry it adjusts. If the posting date is not within allowed posting date range the posting date in the Allow Posting From field in the General Ledger Setup, OR if the Inventory periods are used, the later date of the two will be used. See described concept above.

History of Post Inventory cost to G/L batch job

The Post Inventory Cost to G/L batch job is closely related to the Adjust Cost – Item entries batch job why the history of this batch job is summarized and shared here as well.

From version 3.0..3.70.A

In the request form of the Post Inventory Cost to G/L there is a Posting Date to be entered by the user. The batch job runs through all value entries within the filter, if any, and creates General Ledger Entries with Posting Date entered in the request form.

Version 3.70.B..4.0

In the request form of the Post Inventory Cost to G/L the Closed Period Entry Posting Date field is available. The program uses the date you enter in this field as the posting date for the general ledger entries it creates for value entries whose posting dates are in closed accounting periods. Otherwise, the general ledger entries will have the same posting date as the original value entries. A date is considered to be in a closed period when it is earlier than the date in the Allow Posting From field in the General Ledger Setup. If posting to G/L Per Posting Group, the general ledger entries will have the posting date that is specified in the Posting Date field in the request form.

In version 3 and 4 the batch job scans all value entries to detect if there are any value entries where Cost Amount (Actual) differs from Cost Posted to G/L. If there is a difference detected the differing amount will be posted in a G/L entry. If expected cost posting is used corresponding fields are processed in the same way.

Value entry

Entry No.	Item No.	Posting Date	Item Ledger Entry Type	Source No.	Document No.	Cost Amount (Actual)	Cost Posted to G/L	Cost Amount (Expected)	Expected Cost Posted to G/L
521	B	2011-09-10	Sale	10000	103024	-1	0	0	0

From version 5.0:

There is no longer a posting date to be stated in the request form of the Post Inventory Cost to G/L batch job. The G/L entry is created with the same Posting Date as the related value entry. In order to complete the batch job the allowed posting date range must allow the Posting Date of the created G/L entry. If not, the allowed posting date range must be temporarily re-opened by changing or removing the dates in the Allow Posting From and To fields in the General Ledger Setup. To avoid reconciliation issues it is required that Posting Date of the G/L Entry corresponds to the Posting Date of the Value Entry.

The batch job scans Table 5811 - Post Value Entry to G/L, to identify the Value Entries in scope for posting to General Ledger. After successful run the table is emptied.

Design Details: Expected Cost Posting

3/31/2019 • 2 minutes to read

Expected costs represent the estimation of, for example, a purchased item's cost that you record before you receive the invoice for the item.

You can post expected cost to inventory and to the general ledger. When you post a quantity that is only received or shipped but not invoiced, then a value entry is created with the expected cost. This expected cost affects the inventory value, but is not posted to the general ledger unless you set up the system up to do so.

NOTE

Expected costs are only managed for item transactions. Expected costs are not for immaterial transaction types, such as capacity and item charges.

If only the quantity part of an inventory increase has been posted, then the inventory value in the general ledger does not change unless you have selected the **Expected Cost Posting to G/L** check box on the **Inventory Setup** page. In that case, the expected cost is posted to interim accounts at the time of receipt. After the receipt has been fully invoiced, the interim accounts are then balanced and the actual cost is posted to the inventory account.

To support reconciliation and traceability work, the invoiced value entry shows the expected cost amount that has been posted to balance the interim accounts.

Example

The following example shows expected cost if the **Automatic Cost Posting** check box and the **Expected Cost Posting to G/L** check box are selected on the **Inventory Setup** page.

You post a purchase order as received. The expected cost is LCY 95.00.

Value Entries

POSTING DATE	ENTRY TYPE	COST AMOUNT (EXPECTED)	EXPECTED COST POSTED TO G/L	EXPECTED COST	ITEM LEDGER ENTRY NO.	ENTRY NO.
01-01-20	Direct Cost	95.00	95.00	Yes	1	1

Relation Entries in the G/L – Item Ledger Relation Table

G/L ENTRY NO.	VALUE ENTRY NO.	G/L REGISTER NO.
1	1	1
2	1	1

General Ledger Entries

POSTING DATE	G/L ACCOUNT	ACCOUNT NO. (EN-US DEMO)	AMOUNT	ENTRY NO.
01-01-20	Inventory Accrual Account (Interim)	5530	-95.00	2
01-01-20	Inventory Account (Interim)	2131	95.00	1

At a later date, you post the purchase order as invoiced. The invoiced cost is LCY 100.00.

Value Entries

POSTING DATE	COST AMOUNT (ACTUAL)	COST AMOUNT (EXPECTED)	COST POSTED TO G/L	EXPECTED COST	ITEM LEDGER ENTRY NO.	ENTRY NO.
01-15-20	100.00	-95.00	100.00	No	1	2

Relation Entries in the G/L – Item Ledger Relation Table

G/L ENTRY NO.	VALUE ENTRY NO.	G/L REGISTER NO.
3	2	2
4	2	2
5	2	2
6	2	2

General Ledger Entries

Design Details: Average Cost

3/31/2019 • 10 minutes to read

The average cost of an item is calculated with a periodic weighted average, based on the average cost period that is set up in Business Central.

The valuation date is set automatically.

Setting Up Average Cost Calculation

The following table describes the two fields on the **Inventory Setup** page that must be filled to enable average cost calculation.

FIELD	DESCRIPTION
Average Cost Period	<p>Specifies which period the average cost is calculated in. The following options exist:</p> <ul style="list-style-type: none">- Day- Week- Month- Accounting Period <p>All inventory decreases that are posted in the average cost period receive the average cost calculated for that period.</p>
Average Cost Calc. Type	<p>Specifies how the average cost is calculated. The following options exist:</p> <ul style="list-style-type: none">- Item- Item, Variant, and Location <p>With this option, the average cost is calculated for each item, for each location, and for each variant of the item. This means that the average cost of this item depends on where it is stored and which variant of the item that you have selected, such as color.</p>

NOTE

You can only use one average cost period and one average cost calculation type in a fiscal year.

The **Accounting Periods** page shows which average cost period and which average cost calculation type is in effect during that period, for each accounting period.

Calculating Average Cost

When you post a transaction for an item that uses the Average costing method, an entry is created in the **Avg. Cost Adjmt. Entry Point** table. This entry contains the transaction's item number, variant code, and location code. The entry also contains the **Valuation Date** field, which specifies the last date of the average cost period in which the transaction was posted.

NOTE

This field should not be confused with the **Valuation Date** field in the **Value Entry** table, which shows the date when the value takes effect and is used to determine the average cost period in which the value entry belongs.

The average cost of a transaction is calculated when the item's cost is adjusted. For more information, see [Design Details: Cost Adjustment](#). A cost adjustment uses the entries in the **Avg. Cost Adjmt. Entry Point** table to identify which items (or items, locations, and variants) to calculate average costs for. For each entry with a cost that has not been adjusted, the cost adjustment uses the following to determine the average cost:

- Determines the cost of the item at the start of the average cost period.
- Adds the sum of the inbound costs that were posted during the average cost period. These include purchases, sales returns, positive adjustments, and production and assembly outputs.
- Subtracts the sum of the costs of any outbound transactions that were fixed-applied to receipts in the average cost period. These typically include purchase returns and negative outputs.
- Divides by the total inventory quantity for the end of the average cost period, excluding inventory decreases that are being valued.

The calculated average cost is then applied to the inventory decreases for the item (or item, location, and variant) with posting dates in the average cost period. If any inventory increases exist that were fixed applied to inventory decreases in the average cost period, then the calculated average cost is forwarded from the increase to the decrease.

Example: Average Cost Period = Day

The following example shows the effect of calculating the average cost based on an average cost period of one day. The **Average Cost Calc. Type** field on the **Inventory Setup** page is set to **Item**.

The following table shows item ledger entries for the sample average-cost item, ITEM1, before the **Adjust Cost - Item Entries** batch job has been run.

POSTING DATE	ITEM LEDGER ENTRY TYPE	QUANTITY	COST AMOUNT (ACTUAL)	ENTRY NO.
01-01-20	Purchase	1	20.00	1
01-01-20	Purchase	1	40.00	2
01-01-20	Sale	-1	-20.00	3
02-01-20	Sale	-1	-40.00	4
02-02-20	Purchase	1	100.00	5
02-03-20	Sale	-1	-100.00	6

NOTE

Because cost adjustment has not yet occurred, the values in the **Cost Amount (Actual)** field of the inventory decreases corresponding to the inventory increases that they are applied to.

The following table shows the entries in the **Avg. Cost Adjmt. Entry Point** table that apply to value entries resulting from the item ledger entries in the preceding table.

ITEM NO.	VARIANT CODE	LOCATION CODE	VALUATION DATE	COST IS ADJUSTED
ITEM1		BLUE	01-01-20	No
ITEM1		BLUE	02-01-20	No
ITEM1		BLUE	02-02-20	No
ITEM1		BLUE	02-03-20	No

The following table shows the same item ledger entries after the **Adjust Cost - Item Entries** batch job has been run. The average cost per day is calculated and applied to the inventory decreases.

POSTING DATE	ITEM LEDGER ENTRY TYPE	QUANTITY	COST AMOUNT (ACTUAL)	ENTRY NO.
01-01-20	Purchase	1	20.00	1
01-01-20	Purchase	1	40.00	2
01-01-20	Sale	-1	-30.00	3
02-01-20	Sale	-1	-30.00	4
02-02-20	Purchase	1	100.00	5
02-03-20	Sale	-1	-100.00	6

Example: Average Cost Period = Month

The following example shows the effect of calculating the average cost based on an average cost period of one month. The **Average Cost Calc. Type** field on the **Inventory Setup** page is set to **Item**.

If the average cost period is one month, then only one entry is created for each combination of item number, variant code, location code, and valuation date.

The following table shows item ledger entries for the sample average-cost item, ITEM1, before the **Adjust Cost - Item Entries** batch job has been run.

POSTING DATE	ITEM LEDGER ENTRY TYPE	QUANTITY	COST AMOUNT (ACTUAL)	ENTRY NO.
01-01-20	Purchase	1	20.00	1
01-01-20	Purchase	1	40.00	2
01-01-20	Sale	-1	-20.00	3
02-01-20	Sale	-1	-40.00	4
02-02-20	Purchase	1	100.00	5
02-03-20	Sale	-1	-100.00	6

NOTE

Because cost adjustment has not occurred yet, the values in the **Cost Amount (Actual)** field of the inventory decreases corresponding to the inventory increases that they are applied to.

The following table shows the entries in the **Avg. Cost Adjmt. Entry Point** table that apply to value entries resulting from the item ledger entries in the preceding table.

ITEM NO.	VARIANT CODE	LOCATION CODE	VALUATION DATE	COST IS ADJUSTED
ITEM1		BLUE	01-31-20	No
ITEM1		BLUE	02-28-20	No

NOTE

The valuation date is set to the last day in the average cost period, which in this case is the last day of the month.

The following table shows the same item ledger entries after the **Adjust Cost - Item Entries** batch job has been run. The average cost per month is calculated and applied to the inventory decreases.

POSTING DATE	ITEM LEDGER ENTRY TYPE	QUANTITY	COST AMOUNT (ACTUAL)	ENTRY NO.
01-01-20	Purchase	1	20.00	1
01-01-20	Purchase	1	40.00	2
01-01-20	Sale	-1	-30.00	3
02-01-20	Sale	-1	-65.00	4
02-02-20	Purchase	1	100.00	5
02-03-20	Sale	-1	-65.00	6

The average cost of entry number 3 is calculated in the average cost period for January, and the average cost for entries 4 and 6 is calculated in the average cost period for February.

To get the average cost for February, the average cost of the piece received in inventory (100.00) is added to the average cost at the beginning of the period (30.00). The sum of the two (130.00) is then divided by the total quantity in inventory (2). This gives the resulting average cost of the item in the February period (65.00). The average cost is assigned to the inventory decreases in the period (entries 4 and 6).

Setting the Valuation Date

The **Valuation Date** field in the **Value Entry** table is used to determine in which average cost period an inventory decrease entry belongs. This also applies to work in process (WIP) inventory.

The following table shows the criteria that are used to set the valuation date.

SCENARIO	POSTING DATE	VALUED QUANTITY	REVALUATION	VALUATION DATE
1		Positive	No	Posting date of item ledger entry
2	Later than the latest valuation date of applied value entries	Negative	No	Posting date of item ledger entry
3	Earlier than the latest valuation date of applied value entries	Positive	No	Latest valuation date of the applied value entries
4		Negative	Yes	Posting date of the revaluation value entry

Example

The following table of value entries illustrates the different scenarios.

SCENARIO	POSTING DATE	ITEM LEDGER ENTRY TYPE	VALUATION DATE	VALUED QUANTITY	COST AMOUNT (ACTUAL)	ITEM LEDGER ENTRY NO.	ENTRY NO.
1	01-01-20	Purchase	01-01-20	2	20.00	1	1
2	01-15-20	(Item Charge)	01-01-20	2	8.00	1	2
3	02-01-20	Sale	02-01-20	-1	-14.00	2	3
4	03-01-20	(Revaluation)	03-01-20	1	-4.00	1	4
5	02-01-20	Sale	03-01-20	-1	-10.00	3	5

NOTE

In entry number 5 in the preceding table, the user has entered a sales order with a posting date (02-01-20) that comes before the latest valuation date of applied value entries (03-01-20). If the corresponding value in the **Cost Amount (Actual)** field for this date (02-01-20) were used for this entry, then it would be 14.00. This would give a situation where the quantity on inventory is zero, but the inventory value is -4.00.

To avoid such a quantity-value mismatch, the valuation date is set to equal the latest valuation date of the applied value entries (03-01-20). The value in the **Cost Amount (Actual)** field becomes 10.00 (after revaluation), which means that the quantity on inventory is zero, and the inventory value is also zero.

Caution

Because the **Inventory Valuation** report is based on posting date, the report will reflect any quantity-value mismatches in scenarios as in the above example. For more information, see [Design Details: Inventory Valuation](#).

If the quantity on inventory is less than zero after posting the inventory decrease, then the valuation date is first set to the posting date of the inventory decrease. This date may be changed later, according to the rules described in the note earlier in this section, when the inventory increase is applied.

Recalculating Average Cost

Valuing inventory decreases as a weighted average would be straightforward if purchases were always invoiced before sales are invoiced, postings were never backdated, and you never made mistakes. However, the reality is somewhat different from this ideal.

As illustrated in the examples in this topic, the valuation date is defined as the date from which the value entry is included in the average cost calculation. This gives you the flexibility to do the following for items using the Average costing method:

- Invoice the sale of an item before the purchase of the item has been invoiced.
- Backdate a posting.
- Recover an incorrect posting.

NOTE

Another reason for this flexibility is fixed application. For more information about fixed application, see [Design Details: Item Application](#).

Because of this flexibility, you may have to recalculate the average cost after the related posting has occurred. For example, if you post an inventory increase or decrease with a valuation date that comes before one or more inventory decreases. The recalculation of the average cost will occur automatically when you run the **Adjust Cost - Item Entries** batch job, manually or automatically.

It is possible to change the inventory valuation base within an accounting period by changing the **Average Cost Period** field and the **Average Cost Calc. Type** field. However, this should be done with care and in agreement with an auditor.

Example

The following example illustrates how the average cost is recalculated when a late posting is introduced on a date that comes before one or more inventory decreases. The example is based on an average cost period of **Day**.

The following table shows the value entries that exist for the item before the posting is introduced.

VALUATION DATE	QUANTITY	COST AMOUNT (ACTUAL)	ENTRY NO.
01-01-20	1	10.00	1
01-02-20	1	20.00	2
02-15-20	-1	-15.00	3
02-16-20	-1	-15.00	4

The user posts an inventory increase (entry number 5) with a valuation date (01-03-20) that comes before one or more inventory decreases. To balance the inventory, the average cost must be recalculated and adjusted to 17.00.

The following table shows the value entries that exist for the item after entry number 5 is introduced.

VALUATION DATE	QUANTITY	COST AMOUNT (ACTUAL)	ENTRY NO.
01-01-20	1	10.00	1
01-02-20	1	20.00	2

VALUATION DATE	QUANTITY	COST AMOUNT (ACTUAL)	ENTRY NO.
01-03-20	1	21.00	5
02-15-20	-1	-17.00	3
02-16-20	-1	-17.00	4

Design Details: Variance

3/31/2019 • 2 minutes to read

Variance is defined as the difference between the actual cost and the standard cost, as described in the following formula.

$$\text{actual cost} - \text{standard cost} = \text{variance}$$

If the actual cost changes, for example, because you post an item charge on a later date, then the variance is updated accordingly.

NOTE

Revaluation does not affect the variance calculation, because revaluation only changes the inventory value.

Example

The following example illustrates how variance is calculated for purchased items. It is based on the following scenario:

1. The user purchases an item at LCY 90.00, but the standard cost is LCY 100.00. Accordingly, the purchase variance is LCY -10.00.
2. LCY 10.00 is credited to the purchase variance account.
3. The user posts an item charge of LCY 20.00. Accordingly, the actual cost is increased to LCY 110.00, and the value of the purchase variance becomes LCY 10.00.
4. LCY 20.00 is debited to the purchase variance account. Accordingly, the net purchase variance becomes LCY 10.00.
5. The user revalues the item from LCY 100.00 to LCY 70.00. This does not affect the variance calculation, only the inventory value.

The following table shows the resulting value entries.

	Inventory		Direct Cost		Purchase Variance		Inventory Adjustment	
Purchase	100			90		10		
Item Charge				20	20			
Total before revaluation	100			110	10			
Revaluation		30					30	
Total after revaluation	70			110	10		30	

Determining the Standard Cost

The standard cost is used when calculating variance and the amount to capitalize. Since the standard cost can be changed over time because of manual update calculation, you need a point in time when the standard cost is fixed for variance calculation. This point is when the inventory increase is invoiced. For produced or assembled items, the point when standard cost is determined is when the cost is adjusted.

The following table shows how different cost shares are calculated for produced and assembled items when you

use the Calculate Standard Cost function.

COST SHARE	PURCHASED ITEM	PRODUCED/ASSEMBLED ITEM
Standard Cost		Single-Level Material Cost + Single-Level Capacity Cost + Single-Level Subcontrd. Cost + Single-Level Cap. Ovhd. Cost + Single-Level Mfg. Ovhd. Cost
Single-Level Material Cost	Unit Cost	$\sum_{\text{components}} \text{standard cost}$
Single-Level Capacity Cost	Not applicable	$\sum_{\text{operations(not subcontrd)}} \text{direct unit cost}$
Single-Level Subcontrd. Cost	Not applicable	$\sum_{\text{operations(subcontrd)}} \text{direct unit cost}$
Single-Level Cap. Ovhd Cost	Not applicable	$\sum_{\text{Operations}} \text{direct unit cost} \times \text{indirect cost \%} / 100 + \text{overhead rate}$
Single-Level Mfg. Ovhd Cost	Not applicable	(Single-Level Material Cost + Single-Level Capacity Cost + Single-Level Subcontrd. Cost) * Indirect Cost % / 100 + Overhead Rate
Rolled-up Material Cost	Unit Cost	$\sum_{\text{components}} \text{rolled - up material cost}$
Rolled-up Capacity Cost	Not applicable	$\sum_{\text{components}} \text{rolled - up capacity cost} + \text{single - level capacity cost}$
Rolled-Up Subcontracted Cost	Not applicable	$\sum_{\text{components}} \text{rolled - up cap. overhead cost} + \text{single - level ovhd cost}$
Rolled-up Capacity Ovhd. Cost	Not applicable	$\sum_{\text{components}} \text{rolled - up cap. overhead cost} + \text{single - level ovhd cost}$
Rolled-up Mfg. Ovhd. Cost	Not applicable	$\sum_{\text{components}} \text{rolled - up mfg. ovhd cost} + \text{single - level mfg. ovhd cost}$

Design Details: Rounding

3/31/2019 • 2 minutes to read

Rounding residuals can occur when you value the cost of an inventory decrease that is measured in a different quantity than the corresponding inventory increase. Rounding residuals are calculated for all costing methods when you run the **Adjust Cost - Item Entries** batch job.

When you use the average costing method, the rounding residual is calculated and recorded on a cumulative, entry-by-entry basis.

When you use a costing method other than Average, the rounding residual is calculated when the inventory increase has been fully applied, that is when the remaining quantity for the inventory increase is equal to zero. A separate entry is then created for the rounding residual, and the posting date on this rounding entry is the posting date of the last invoiced value entry of the inventory increase.

Example

The following example illustrates how different rounding residuals are handled for the average costing method and non-Average costing method, respectively. In both cases, the **Adjust Cost - Item Entries** batch job has been run.

The following table shows the item ledger entries that the example is based on.

POSTING DATE	QUANTITY	ENTRY NO.
01-01-20	3	1
02-01-20	-1	2
03-01-20	-1	3
04-01-20	-1	4

For an item using the Average costing method, the rounding residual (1/300) is calculated with the first decrease (entry number 2) and is carried forward to entry number 3. Therefore, entry number 3 is valued at -3.34.

The following table shows the resulting value entries.

POSTING DATE	QUANTITY	COST AMOUNT (ACTUAL)	ITEM LEDGER ENTRY NO.	ENTRY NO.
01-01-20	3	10	1	1
02-01-20	-1	-3.33	2	2
03-01-20	-1	-3.34	3	3
04-01-20	-1	-3.33	4	4

For an item using a costing method other than Average, the rounding residual (0.01) is calculated when the remaining quantity for the inventory increase is zero. The rounding residual has a separate entry (number 5).

The following table shows the resulting value entries.

POSTING DATE	QUANTITY	COST AMOUNT (ACTUAL)	ITEM LEDGER ENTRY NO.	ENTRY NO.
01-01-20	3	10	1	1
02-01-20	-1	-3.33	2	2
03-01-20	-1	-3.33	3	3
04-01-20	-1	-3.33	4	4
01-01-20	0	-0.01	1	5

Design Details: Cost Components

3/31/2019 • 2 minutes to read

Cost components are different types of costs that make up the value of an inventory increase or decrease.

The following table shows the different cost components and any subordinate cost components that they consist of.

COST COMPONENT	SUBORDINATE COST COMPONENT	DESCRIPTION
Direct cost	Unit cost (direct purchase price)	Cost that can be traced to a cost object.
Direct cost	Freight cost (item charge)	Cost that can be traced to a cost object.
Direct cost	Insurance cost (item charge)	Cost that can be traced to a cost object.
Indirect cost		Cost that cannot be traced to a cost object.
Variance	Purchase variance	The difference between actual and standard costs, which is only posted for items using the Standard costing method.
Variance	Material variance	The difference between actual and standard costs, which is only posted for items using the Standard costing method.
Variance	Capacity variance	The difference between actual and standard costs, which is only posted for items using the Standard costing method.
Variance	Subcontracted variance	The difference between actual and standard costs, which is only posted for items using the Standard costing method.
Variance	Capacity overhead variance	The difference between actual and standard costs, which is only posted for items using the Standard costing method.
Variance	Manufacturing overhead variance	The difference between actual and standard costs, which is only posted for items using the Standard costing method.
Revaluation		A depreciation or appreciation of the current inventory value.

COST COMPONENT	SUBORDINATE COST COMPONENT	DESCRIPTION
Rounding		Residuals caused by the way in which valuation of inventory decreases are calculated.

NOTE

Freight and insurance costs are item charges that can be added to an item's cost at any time. When you run the **Adjust Cost - Item Entries** batch job, the value of any related inventory decreases are updated accordingly.

Design Details: Inventory Periods

3/31/2019 • 2 minutes to read

Backdated transactions or cost adjustments often affect balances and stock valuations for accounting periods that may be considered closed. This can have adverse effects on accurate reporting, especially within global corporations. The Inventory Periods feature can be used to avoid such problems by opening or closing inventory periods to limit posting in a set period of time.

An inventory period is a period of time, defined by an ending date, in which you post inventory transactions. When you close an inventory period, no value changes can be posted in the closed period. This includes new value postings, expected or invoiced postings, changes to existing values, and cost adjustments. However, you can still apply to an open item ledger entry that falls in the closed period. For more information, see [Design Details: Item Application](#).

To make sure that all transaction entries in a closed period are final, the following conditions must be met before an inventory period can close:

- All outbound item ledger entries in the period must be closed (no negative inventory).
- All item costs in the period must be adjusted.
- All released and finished production orders in the period must be cost adjusted.

When you close an inventory period, an inventory period entry is created by using the number of the last item register that falls in the inventory period. In addition, the time, date, and user code of the user closing the period are recorded in the inventory period entry. By using this information with the last item register for the previous period, you can see which inventory transactions were posted in the inventory period. It is also possible to reopen inventory periods if you need to post in a closed period. When you reopen an inventory period, an inventory period entry is created.

Design Details: Inventory Posting

3/31/2019 • 3 minutes to read

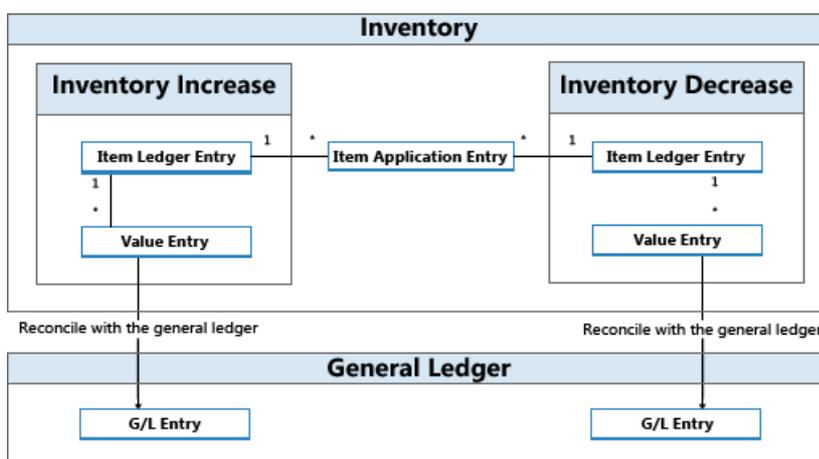

Each inventory transaction, such as a purchase receipt or a sales shipment, posts two entries of different types.

ENTRY TYPE	DESCRIPTION
Quantity	Reflects the change of quantity in inventory. This information is stored in item ledger entries. Accompanied by item application entries.
Value	Reflects the change of inventory value. This information is stored in value entries. One or more value entries can exist for each item ledger entry or capacity ledger entry. For information about capacity value entries related to the use of production or assembly resources, see Design Details: Production Order Posting .

In relation to quantity postings, item application entries exist to link inventory increase with inventory decrease. This enables the costing engine to forward costs from increases to the related decreases and vice versa. For more information, see [Design Details: Item Application](#).

Item ledger entries, value entries, and item application entries are created as a result of posting an item journal line, either indirectly by posting an order line or directly in the Item Journal page.

At regular intervals, value entries that are created in the inventory ledger are posted to the general ledger to reconcile the two ledgers for financial control reasons. For more information, see [Design Details: Reconciliation with the General Ledger](#).

Example

The following example shows how item ledger entries, value entries, and item application entries result in general ledger entries.

You post a purchase order as received and invoiced for 10 items with a direct unit cost of LCY 7 and an overhead rate of LCY 1. The posting date is 01-01-20. The following entries are created.

Item Ledger Entries

POSTING DATE	ENTRY TYPE	COST AMOUNT (ACTUAL)	QUANTITY	ENTRY NO.
01-01-20	Purchase	80.00	10	1

Value Entries

POSTING DATE	ENTRY TYPE	COST AMOUNT (ACTUAL)	ITEM LEDGER ENTRY NO.	ENTRY NO.
01-01-20	Direct Cost	70.00	1	1
01-01-20	Indirect Cost	10.00	1	2

Item Application Entries

ENTRY NO.	ITEM LEDGER ENTRY NO.	INBOUND ITEM ENTRY NO.	OUTBOUND ITEM ENTRY NO.	QUANTITY
1	1	1	0	10

Next, you post a sale of 10 units of the item with a posting date of 01-15-20.

Item Ledger Entries

POSTING DATE	ENTRY TYPE	COST AMOUNT (ACTUAL)	QUANTITY	ENTRY NO.
01-15-20	Sale	-80.00	-10	2

Value Entries

POSTING DATE	ENTRY TYPE	COST AMOUNT (ACTUAL)	ITEM LEDGER ENTRY NO.	ENTRY NO.
01-15-20	Direct Cost	-80.00	2	3

Item Application Entries

ENTRY NO.	ITEM LEDGER ENTRY NO.	INBOUND ITEM ENTRY NO.	OUTBOUND ITEM ENTRY NO.	QUANTITY
2	2	1	2	-10

At the end of the accounting period, you run the **Post Inventory Cost to G/L** batch job to reconcile these inventory transactions with the general ledger.

For more information, see [Design Details: Accounts in the General Ledger](#).

The following tables show the result of reconciling the inventory transactions in this example with the general ledger.

Value Entries

POSTING DATE	ENTRY TYPE	COST AMOUNT (ACTUAL)	COST POSTED TO G/L	ITEM LEDGER ENTRY NO.	ENTRY NO.
01-01-20	Direct Cost	70.00	70.00	1	1
01-01-20	Indirect Cost	10.00	10.00	1	2
01-15-20	Direct Cost	-80.00	-80.00	2	3

General Ledger Entries

POSTING DATE	G/L ACCOUNT	ACCOUNT NO. (EN-US DEMO)	AMOUNT	ENTRY NO.
01-01-20	[Inventory Account]	2130	70.00	1
01-01-20	[Direct Cost Applied Account]	7291	-70.00	2
01-01-20	[Inventory Account]	2130	10.00	3
01-01-07	[Overhead Applied Account]	7292	-10.00	4
01-15-20	[Inventory Account]	2130	-80.00	5
01-15-20	[COGS Account]	7290	80.00	6

NOTE

The posting date of the general ledger entries is the same as for the related value entries.

The **Cost Posted to G/L** field in the **Value Entry** table is filled.

The relation between value entries and general ledger entries is stored in the **G/L - Item Ledger Relation** table.

Relation Entries in the G/L – Item Ledger Relation table

G/L ENTRY NO.	VALUE ENTRY NO.	G/L REGISTER NO.
1	1	1
2	1	1
3	2	1
4	2	1
5	3	1
6	3	1

Assembly and Production Posting

Capacity and resource ledger entries represent the time that is posted as consumed in production or assembly. These process costs are posted as value entries to the general ledger along with the involved material costs in a similar structure as described for item ledger entries in this topic.

For more information, see [Design Details: Assembly Order Posting](#).

Design Details: Production Order Posting

3/31/2019 • 5 minutes to read

Similar to assembly order posting, the consumed components and the used machine time are converted and output as the produced item when the production order is finished. For more information, see [Design Details: Assembly Order Posting](#). However, the cost flow for assembly orders is less complex, especially because assembly cost posting only occurs once and therefore does not generate work-in-process inventory.

Transactions that occur during the manufacturing process can be tracked through the following stages:

1. Purchase of materials and other manufacturing inputs.
2. Conversion into work in process.
3. Conversion into finished goods inventory.
4. Sale of finished goods.

Therefore, apart from regular inventory accounts, a manufacturing company must establish three separate inventory accounts to record transactions at various stages of production.

INVENTORY ACCOUNT	DESCRIPTION
Raw Materials account	<p>Includes the cost of raw materials that are purchased but not yet transferred to production. The balance in the Raw Materials account indicates the cost of raw materials on hand.</p> <p>When raw materials move into the production department, the cost of the materials is transferred from the Raw Materials account to the WIP account.</p>
Work in Process (WIP) account	<p>Accumulates the costs that are incurred during production in the accounting period. The WIP account is debited for the cost of raw materials that are transferred from the raw materials warehouse, the cost of direct labor performed, and the manufacturing overhead costs that are incurred.</p> <p>The WIP account is credited for the total manufacturing cost of units that are completed in the factory and transferred to the finished goods warehouse.</p>
Finished Goods account	<p>This account includes the total manufacturing cost of units that are completed but not yet sold. At the time of sale, the cost of units sold is transferred from the Finished Goods account to the Cost of Goods Sold account.</p>

The inventory value is calculated by tracking the costs of all increases and decreases, as expressed by the following equation:

- $\text{inventory value} = \text{beginning balance of inventory} + \text{value of all increases} - \text{value of all decreases}$

Depending on the type of inventory, increases and decreases are represented by different transactions.

	INCREASES	DECREASES
--	-----------	-----------

	INCREASES	DECREASES
Raw material inventory	<ul style="list-style-type: none"> - Net purchases of material - Output of subassemblies - Negative consumption 	Material consumption
WIP inventory	<ul style="list-style-type: none"> - Material consumption - Capacity consumption - Manufacturing overhead 	Output of end items (cost of goods manufactured)
Finished goods inventory	Output of end items (cost of goods manufactured)	<ul style="list-style-type: none"> - Sales (cost of goods sold) - Negative output
Raw material inventory	<ul style="list-style-type: none"> - Net purchases of material - Output of subassemblies - Negative consumption 	Material consumption

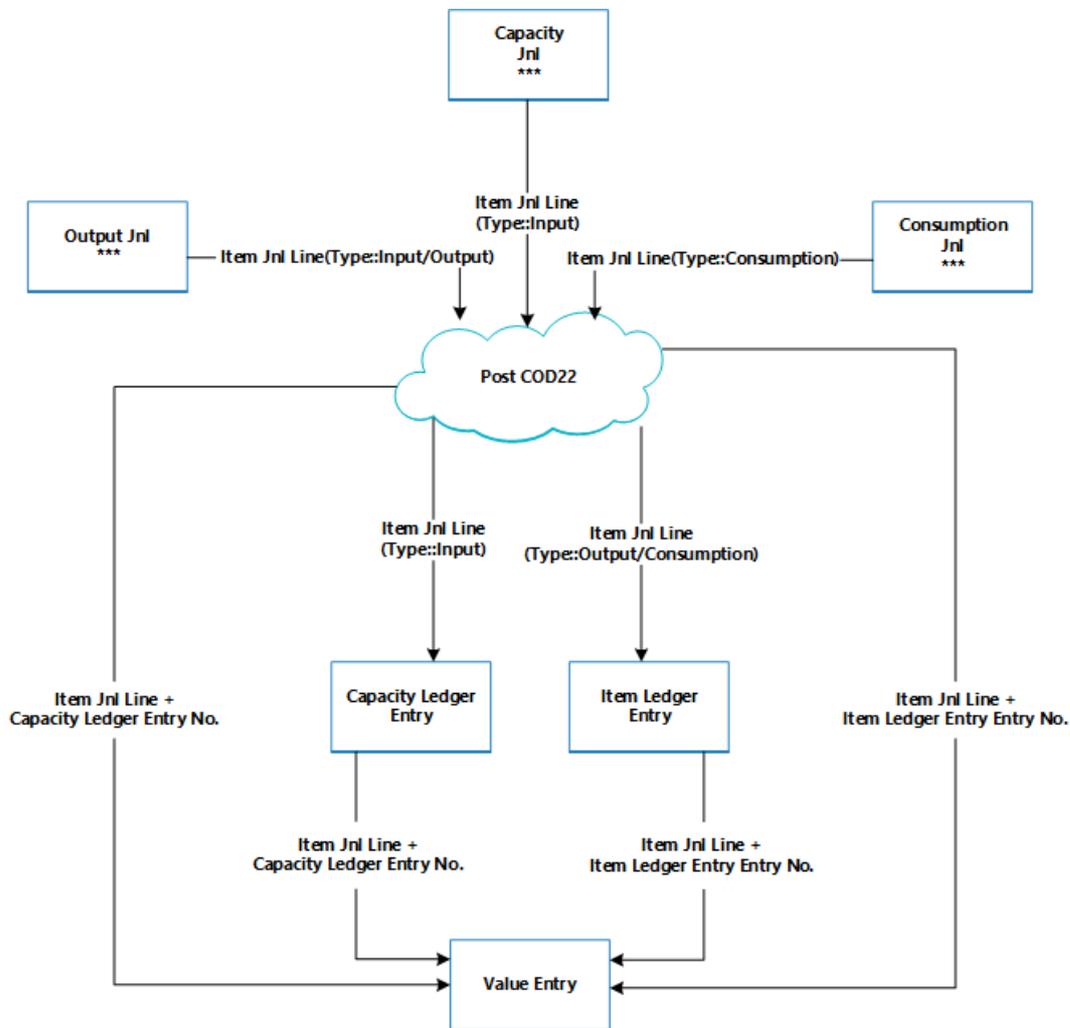

The values of increases and decreases are recorded in the different types of manufactured inventory in the same way as for purchased inventory. Every time a transaction of inventory increase or decrease takes place, an item ledger entry and a corresponding general ledger entry are created for the amount. For more information, see [Design Details: Inventory Posting](#).

Although values of transactions that are related to purchased goods are posted only as item ledger entries with related value entries, transactions that are related to produced items are posted as capacity ledger entries with related value entries, in addition to the item ledger entries.

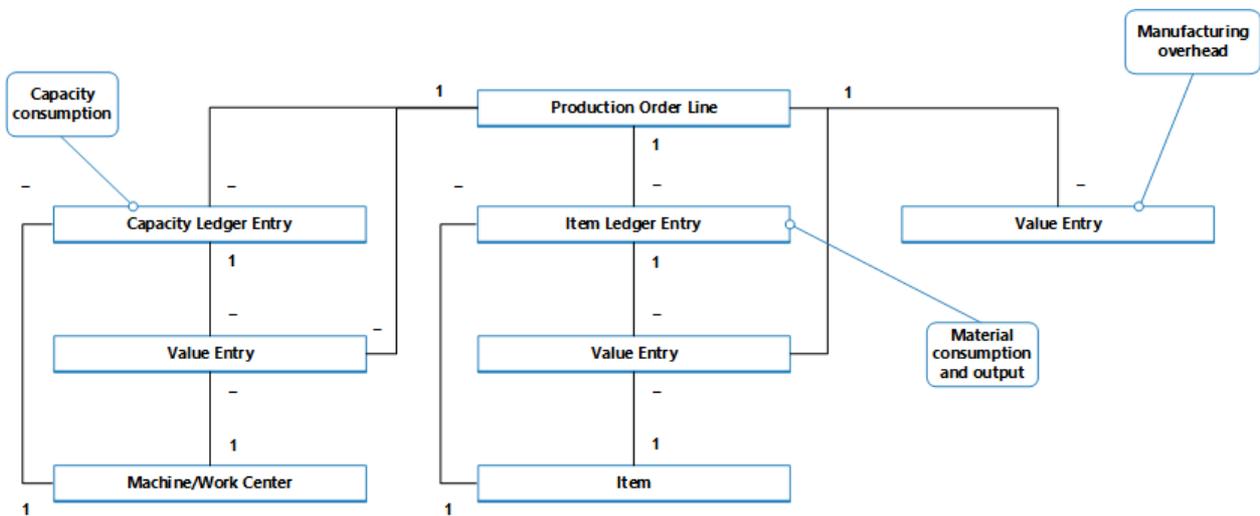

Posting Structure

Posting production orders to WIP inventory involves output, consumption, and capacity.

The following diagram shows the involved posting routines in codeunit 22.

The following diagram shows the associations between the resulting entries and the cost objects.

The capacity ledger entry describes the capacity consumption in terms of time units, whereas the related value entry describes the value of the specific capacity consumption.

The item ledger entry describes the material consumption or output in terms of quantities, whereas the related value entry describes the value of this specific material consumption or output.

A value entry that describes WIP inventory value can be associated with one of the following combinations of cost objects:

- A production order line, a work or machine center, and a capacity ledger entry.
- A production order line, an item, and an item ledger entry.

- Only a production order line

For more information about how costs from production and assembly are posted to the general ledger, see [Design Details: Inventory Posting](#).

Capacity Posting

Posting output from the last production order routing line results in a capacity ledger entry for the end item, in addition to its inventory increase.

The capacity ledger entry is a record of the time that was spent to produce the item. The related value entry describes the increase of the WIP inventory value, which is the value of the conversion cost. For more information, see "From the Capacity Ledger" in [Design Details: Accounts in the General Ledger](#).

Production Order Costing

To control inventory and production costs, a manufacturing company must measure the cost of production orders, because the predetermined standard cost of each produced item is capitalized in the balance sheet. For information about why produced items use the Standard costing method, see [Design Details: Costing Methods](#).

NOTE

In environments that do not use the Standard costing method, the actual rather than the standard cost of produced items is capitalized on the balance sheet.

The actual cost of a production order consists of the following cost components:

- Actual material cost
- Actual capacity cost or subcontractor cost
- Manufacturing overhead

These actual costs are posted to the production order and compared to the standard cost to calculate variances. Variances are calculated for each of the item cost components: raw materials, capacity, subcontractor, capacity overhead, and manufacturing overhead. The variances can be analyzed to determine problems, such as excessive waste in processing.

In standard-cost environments, the costing of a production order is based on the following mechanism:

1. When the last routing operation is posted, the production order cost is posted to the item ledger and set to the expected cost.

This cost equals the output quantity that is posted in the output journal multiplied by the standard cost that is copied from the item card. The cost is treated as expected cost until the production order is finished. For more information, see [Design Details: Expected Cost Posting](#).

NOTE

This differs from assembly order posting, which always posts actual costs. For more information, see [Design Details: Assembly Order Posting](#).

2. When the production order is set to **Finished**, the order is invoiced by running the **Adjust Cost-Item Entries** batch job. As a result, the total cost of the order is calculated based on the standard cost of the consumed materials and capacity. The variances between the calculated standard costs and the actual production costs are calculated and posted.

Design Details: Assembly Order Posting

3/31/2019 • 5 minutes to read

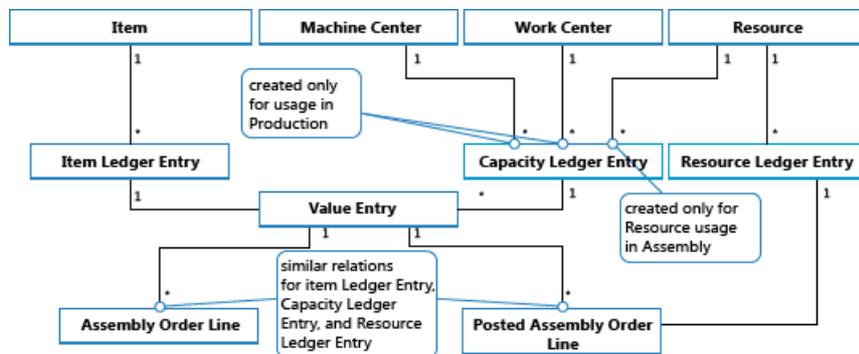

Assembly order posting is based on the same principles as when posting the similar activities of sales orders and production consumption/output. However, the principles are combined in that assembly orders have their own posting UI, like that for sales orders, while the actual entry posting happens in the background as direct item and resource journal postings, like that for production consumption, output, and capacity.

Similarly to production order posting, the consumed components and the used resources are converted and output as the assembly item when the assembly order is posted. For more information, see [Design Details: Production Order Posting](#). However, the cost flow for assembly orders is less complex, especially because assembly cost posting only occurs once and therefore does not generate work-in-process inventory.

The following journal postings occur during assembly order posting:

- The item journal posts positive item ledger entries, representing output of the assembly item, from the assembly order header
- The item journal posts negative item ledger entries, representing consumption of assembly components, from the assembly order lines.
- The resource journal posts usage of assembly resources (time units), from the assembly order lines.
- The capacity journal posts value entries relating to the resource usage, from the assembly order lines.

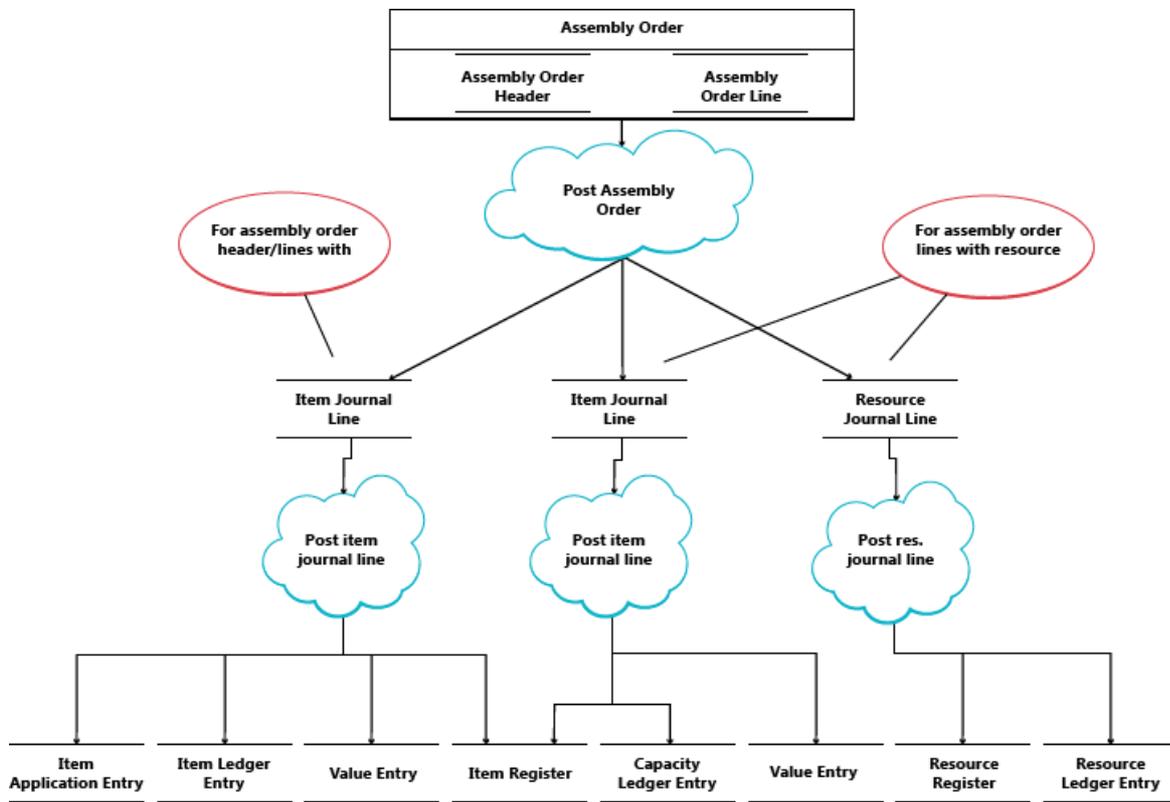

The following diagram shows the structure of item and resource ledger entries that result from assembly order posting.

NOTE

Machine and work centers are included to illustrate that capacity ledger entries are created from both production and assembly.

The following diagram shows how assembly data flows into ledger entries during posting:

Posting Sequence

The posting of an assembly order occurs in the following order:

1. The assembly order lines are posted.
2. The assembly order header is posted.

The following table outlines the sequence of actions.

ACTION	DESCRIPTION
Initialize Posting	<ol style="list-style-type: none"> 1. Make preliminary checks. 2. Add posting number and modify the assembly order header. 3. Release the assembly order.

ACTION	DESCRIPTION
Post	<ol style="list-style-type: none"> 1. Create the posted assembly order header. 2. Copy comment lines. 3. Post assembly order lines (consumption): <ol style="list-style-type: none"> a. Create a status page to calculate assembly consumption. b. Get the remaining quantity on which the item journal line will be based. c. Reset the consumed and remaining quantities. d. For assembly order lines of type Item: <ol style="list-style-type: none"> a. Populate fields on the item journal line. b. Transfer reservations to the item journal line. c. Post the item journal line to create the item ledger entries. d. Create warehouse journal lines and post them. e. For assembly order lines of type Resource: <ol style="list-style-type: none"> a. Populate fields on the item journal line. b. Post the item journal line. This creates capacity ledger entries. c. Create and post resource journal line. f. Transfer field values from the assembly order line into a newly created posted assembly order line. 4. Post the assembly order header (output): <ol style="list-style-type: none"> a. Populate fields on the item journal line. b. Transfer reservations to the item journal line. c. Post the item journal line to create the item ledger entries. d. Create warehouse journal lines and post them. e. Reset the assembly quantities and remaining quantities.

IMPORTANT

Unlike for production output, which is posted at expected cost, assembly output is posted at actual cost.

Cost Adjustment

Once an assembly order is posted, meaning that components (material) and resources are assembled into a new item, then it should be possible to determine the actual cost of that assembly item, and the actual inventory cost of the components involved. This is achieved by forwarding costs from the posted entries of the source (the components and resources) to the posted entries of the destination (the assembly item). The forwarding of costs is done by calculating and generating new entries, called adjustment entries that become associated with the destination entries.

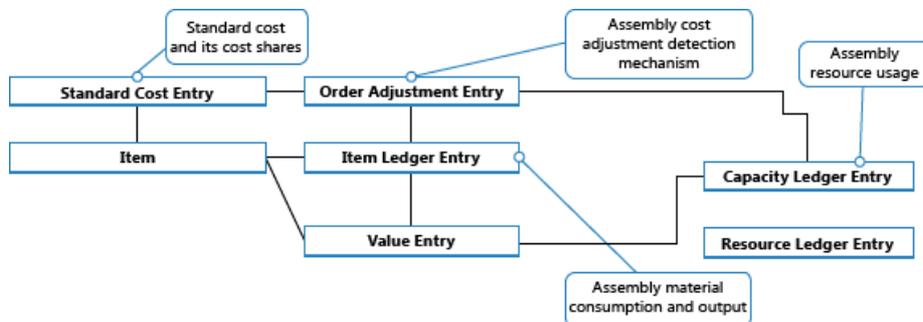

The assembly costs to be forwarded are detected with the Order Level detection mechanism. For information about other adjustment detection mechanisms, see [Design Details: Cost Adjustment](#).

Detecting the Adjustment

The order Level detection function is used in conversion scenarios, production and assembly. The function works as follows:

- Cost adjustment is detected by marking the order whenever a material/resource is posted as consumed/used.
- Cost is forwarding by applying the costs from material/resource to the output entries associated with the same order.

The following graphic shows the adjustment entry structure and how assembly costs are adjusted.

Performing the Adjustment

The spreading of detected adjustments from material and resource costs onto the assembly output entries is performed by the **Adjust Cost – Item Entries** batch job. It contains the Make Multilevel Adjustment function, which consists of the following two elements:

- Make Assembly Order Adjustment – which forwards cost from material and resource usage to the assembly output entry. Lines 5 and 6 in the algorithm below are responsible for that.
- Make Single Level Adjustments – which forwards costs for individual items using their costing method. Lines 9 and 10 in the algorithm below are responsible for that.

```

Make MultiLevel Adjustment
1.   While not Done do
2.     case TRUE of
3.       LevelExceeded:
4.         Done := TRUE;
5.       Assembly To Adjust Exists(TempOrderAdjmtEntry):
6.         Make Assembly Order Adjustments(TempOrderAdjmtEntry);
7.       WIP To Adjust Exists(TempProdOrderLine):
8.         Make WIP Adjustments(TempProdOrderLine);
9.       Inventory To Adjust Exist(TempItem):
10.        Make Single Level Adjustments(TempItem);
11.     ELSE
12.       Done := TRUE;
13.   end case

```

NOTE

The Make WIP Adjustments element, in lines 7 and 8, is responsible for forwarding production material and capacity usage to the output of unfinished production orders. This is not used when adjusting assembly order costs as the concept of WIP does not apply to assembly.

For information about how costs from assembly and production are posted to the general ledger, see [Design Details: Inventory Posting](#).

Assembly Costs are Always Actual

The concept of work in process (WIP) does not apply in assembly order posting. Assembly costs are only posted as actual cost, never as expected cost. For more information, see [Design Details: Expected Cost Posting](#).

This is enabled by the following data structure.

- In the **Type** field on item journal lines, in the **Capacity Ledger Entry** and **Value Entry** tables, *Resource* is used to identify assembly resource entries.
- In the **Item Ledger Entry Type** field on item journal lines, in the **Capacity Ledger Entry** and **Value Entry** tables, *Assembly Output* and *Assembly Consumption* are used to identify the output assembly item entries and the consumed assembly component entries respectively.

In addition, posting group fields on the assembly order header and assembly order lines are populated by default as follows.

ENTITY	TYPE	POSTING GROUP	GEN. PROD. POSTING GROUP
Assembly Order Header	Item	Inventory Posting Group	Gen. Prod. Posting Group
Assembly Order Line	Item	Inventory Posting Group	Gen. Prod. Posting Group
Assembly Order Line	Resource		Gen. Prod. Posting Group

Accordingly, only actual costs are posted to the general ledger, and no interim accounts are populated from assembly order posting. For more information, see [Design Details: Accounts in the General Ledger](#)

Assemble to Order

The item ledger entry that results from posting an assemble-to-order sale is fixed applied to the related item ledger entry for the assembly output. Accordingly, the cost of an assemble-to-order sale is derived from the assembly order that it was linked to.

Item ledger entries of type Sale that result from posting assemble-to-order quantities are marked with **Yes** in the **Assemble to Order** field.

Posting sales order lines where a part is inventory quantity and another part is assemble-to-order quantity results in separate item ledger entries, one for the inventory quantity and one for the assemble-to-order quantity.

Design Details: Reconciliation with the General Ledger

3/31/2019 • 5 minutes to read

When you post inventory transactions, such as sales shipments, production output, or negative adjustments, the quantity and value changes to the inventory are recorded in the item ledger entries and the value entries, respectively. The next step in the process is to post the inventory values to the inventory accounts in the general ledger.

There are two ways to reconcile the inventory ledger with the general ledger:

- Manually, by running the **Post Inventory Cost to G/L** batch job.
- Automatically, every time that you post an inventory transaction.

Post Inventory Cost to G/L Batch Job

When you run the **Post Inventory Cost to G/L** batch job, the general ledger entries are created based on value entries. You have the option to summarize general ledger entries for each value entry, or create general ledger entries for each combination of posting date, location code, inventory posting group, general business posting group, and general product posting group.

The posting dates of the general ledger entries are set to the posting date of the corresponding value entry, except when the value entry falls in a closed accounting period. In this case, the value entry is skipped, and you must change either the general ledger setup or the user setup to enable posting in the date range.

When you run the **Post Inventory Cost to G/L** batch job, you might receive errors because of missing setup or incompatible dimension setup. If the batch job encounters errors in the dimension setup, it overrides these errors and uses the dimensions of the value entry. For other errors, the batch job does not post the value entries and lists them at the end of the report in a section titled, **Skipped Entries**. To post these entries, you must first fix the errors. To see a list of errors before you run the batch job, you can run the **Post Invt. Cost to G/L - Test** report. This report lists all of the errors that are encountered during a test posting. You can fix the errors, and then run the inventory cost posting batch job without skipping any entries.

Automatic Cost Posting

To set up cost posting to the general ledger to run automatically when you post an inventory transaction, select the **Automatic Cost Posting** check box on the **Inventory Setup** page. The posting date of the general ledger entry is the same as the posting date of the item ledger entry.

Account Types

During reconciliation, inventory values are posted to the inventory account in the balance sheet. The same amount, but with the reverse sign, is posted to the relevant balancing account. Usually the balancing account is an income statement account. However, when you post direct cost related to consumption or output, the balancing account is a balance sheet account. The type of the item ledger entry and value entry determines which general ledger account to post to.

The entry type indicates which general ledger account to post to. This is determined either by the sign of the quantity on the item ledger entry or the valued quantity on the value entry, since the quantities always have the same sign. For example, a sales entry with a positive quantity describes an inventory decrease caused by a sale,

and a sales entry with a negative quantity describes an inventory increase caused by a sales return.

Example

The following example shows a bike chain that is manufactured from purchased links. This example shows how the various general ledger account types are used in a typical scenario.

The **Expected Cost Posting to G/L** check box on the **Inventory Setup** page is selected, and the following setup is defined.

The following table shows how the link is set up on the item card.

SETUP FIELD	VALUE
Costing Method	Standard
Standard Cost	LCY 1.00
Overhead Rate	LCY 0.02

The following table shows how the chain is set up on the item card.

SETUP FIELD	VALUE
Costing Method	Standard
Standard Cost	LCY 150.00
Overhead Rate	LCY 25.00

The following table shows how the work center is set up on the work center card.

SETUP FIELD	VALUE
Direct Unit Cost	LCY 2.00
Indirect Cost Percentage	10

Scenario

1. The user purchases 150 links and posts the purchase order as received. (Purchase)
2. The user posts the purchase order as invoiced. This creates an overhead amount of LCY 3.00 to be allocated and a variance amount of LCY 18.00. (Purchase)
 - a. The interim accounts are cleared. (Purchase)
 - b. The direct cost is posted. (Purchase)
 - c. The indirect cost is calculated and posted. (Purchase)
 - d. The purchase variance is calculated and posted (only for standard-cost items). (Purchase)
3. The user sells one chain and posts the sales order as shipped. (Sale)
4. The user posts the sales order as invoiced. (Sale)
 - a. The interim accounts are cleared. (Sale)
 - b. Cost of goods sold (COGS) is posted. (Sale)

	Inventory Interim		COGS Interim		Inventory		COGS	
3.		150	150					
4a.	150			150				12
4b.					150	150		

5. The user posts consumption of 150 links, which is the number of links used to produce one chain. (Consumption, Material)

	Inventory		Direct Cost	
5.		150	150	

6. The work center used 60 minutes to produce the chain. The user posts the conversion cost. (Consumption, Capacity)

- a. The direct costs are posted. (Consumption, Capacity)
- b. The indirect costs are calculated and posted. (Consumption, Capacity)

	Direct Cost		WIP		Indirect Cost	
6a.		120	120			
6b.			12			12

7. The user posts the expected cost of one chain. (Output)
8. The user finishes the production order and runs the **Adjust Cost - Item Entries** batch job. (Output)
- a. The interim accounts are cleared. (Output)
- b. The direct cost is transferred from the WIP account to the inventory account. (Output)
- c. The indirect cost (overhead) is transferred from the indirect cost account to the inventory account. (Output)
- d. This results in a variance amount of LCY 157.00. Variances are only calculated for standard-cost items. (Output)

	Inventory		Direct Cost	
7.		150	150	
8a.	150			150

	WIP		Inventory		Indirect Cost		Variance	
8a.		282	282					
8a.			25	157		25		
8a.							157	

NOTE

For the sake of simplicity, only one variance account is shown. In reality, five different accounts exist:

- Material Variance
- Capacity Variance
- Capacity Overhead Variance
- Subcontracting Variance
- Manufacturing Overhead Variance

9. The user revalues the chain from LCY 150.00 to LCY 140.00. (Adjustment/Revaluation/Rounding/Transfer)

	Inventory	Inventory/Adjustment	
9.	10	10	

For more information about the relationship between the account types and the different types of value entries, see [Design Details: Accounts in the General Ledger](#).

Design Details: Accounts in the General Ledger

3/31/2019 • 3 minutes to read

To reconcile inventory and capacity ledger entries with the general ledger, the related value entries are posted to different accounts in the general ledger. For more information, see [Design Details: Reconciliation with the General Ledger](#).

From the Inventory Ledger

The following table shows the relationship between different types of inventory value entries and the accounts and balancing accounts in the general ledger.

ITEM LEDGER ENTRY TYPE	VALUE ENTRY TTYPE	VARIANCE TYPE	EXPECTED COST	ACCOUNT	BALANCING ACCOUNT
Purchase	Direct Cost		Yes	Inventory (Interim)	Invt. Accrual Acc. (Interim)
Purchase	Direct Cost		No	Inventory	Direct Cost Applied
Purchase	Indirect Cost		No	Inventory	Overhead Applied
Purchase	Variance	Purchase	No	Inventory	Purchase Variance
Purchase	Revaluation		No	Inventory	Inventory Adjmt.
Purchase	Rounding		No	Inventory	Inventory Adjmt.
Sale	Direct Cost		Yes	Inventory (Interim)	COGS (Interim)
Sale	Direct Cost		No	Inventory	COGS
Sale	Revaluation		No	Inventory	Inventory Adjmt.
Sale	Rounding		No	Inventory	Inventory Adjmt.
Positive Adjmt., Negative Adjmt., Transfer	Direct Cost		No	Inventory	Inventory Adjmt.
Positive Adjmt., Negative Adjmt., Transfer	Revaluation		No	Inventory	Inventory Adjmt.
Positive Adjmt., Negative Adjmt., Transfer	Rounding		No	Inventory	Inventory Adjmt.

ITEM LEDGER ENTRY TYPE	VALUE ENTRY TYPE	VARIANCE TYPE	EXPECTED COST	ACCOUNT	BALANCING ACCOUNT
(Production) Consumption	Direct Cost		No	Inventory	WIP
(Production) Consumption	Revaluation		No	Inventory	Inventory Adjmt.
(Production) Consumption	Rounding		No	Inventory	Inventory Adjmt.
Assembly Consumption	Direct Cost		No	Inventory	Inventory Adjmt.
Assembly Consumption	Direct Cost		No	Direct Cost Applied	Inventory Adjmt.
Assembly Consumption	Indirect Cost		No	Overhead Applied	Inventory Adjmt.
(Production) Output	Direct Cost		Yes	Inventory (Interim)	WIP
(Production) Output	Direct Cost		No	Inventory	WIP
(Production) Output	Indirect Cost		No	Inventory	Overhead Applied
(Production) Output	Variance	Material	No	Inventory	Material Variance
(Production) Output	Variance	Capacity	No	Inventory	Capacity Variance
(Production) Output	Variance	Subcontracted	No	Inventory	Subcontracted Variance
(Production) Output	Variance	Capacity Overhead	No	Inventory	Cap. Overhead Variance
(Production) Output	Variance	Manufacturing Overhead	No	Inventory	Mfg. Overhead Variance
(Production) Output	Revaluation		No	Inventory	Inventory Adjmt.
(Production) Output	Rounding		No	Inventory	Inventory Adjmt.
Assembly Output	Direct Cost		No	Inventory	Inventory Adjmt.
Assembly Output	Revaluation		No	Inventory	Inventory Adjmt.

ITEM LEDGER ENTRY TYPE	VALUE ENTRY TYPE	VARIANCE TYPE	EXPECTED COST	ACCOUNT	BALANCING ACCOUNT
Assembly Output	Indirect Cost		No	Inventory	Overhead Applied
Assembly Output	Variance	Material	No	Inventory	Material Variance
Assembly Output	Variance	Capacity	No	Inventory	Capacity Variance
Assembly Output	Variance	Capacity Overhead	No	Inventory	Cap. Overhead Variance
Assembly Output	Variance	Manufacturing Overhead	No	Inventory	Mfg. Overhead Variance
Assembly Output	Rounding		No	Inventory	Inventory Adjmt.

From the Capacity Ledger

The following table shows the relationship between different types of capacity value entries and the accounts and balancing accounts in the general ledger. Capacity ledger entries represent labor time consumed in assembly or production work.

WORK TYPE	CAPACITY LEDGER ENTRY TYPE	VALUE ENTRY TYPE	ACCOUNT	BALANCING ACCOUNT
Assembly	Resource	Direct Cost	Direct Cost Applied	Inventory Adjmt.
Assembly	Resource	Indirect Cost	Overhead Applied	Inventory Adjmt.
Production	Machine Center/Work Center	Direct Cost	WIP Account	Direct Cost Applied
Production	Machine Center/Work Center	Indirect Cost	WIP Account	Overhead Applied

Assembly Costs are Always Actual

As shown in the table above, assembly postings are not represented in interim accounts. This is because the concept of work in process (WIP) does not apply in assembly output posting, unlike in production output posting. Assembly costs are only posted as actual cost, never as expected cost.

For more information, see [Design Details: Assembly Order Posting](#).

Calculating the Amount to Post to the General Ledger

The following fields in the **Value Entry** table are used to calculate the expected cost amount that is posted to the general ledger:

- Cost Amount (Actual)
- Cost Posted to G/L

- Cost Amount (Expected)
- Expected Cost Posted to G/L

The following table shows how the amounts to post to the general ledger are calculated for the two different cost types.

COST TYPE	CALCULATION
Actual Cost	Cost Amount (Actual) – Cost Posted to G/L
Expected Cost	Cost Amount (Expected) – Expected Cost Posted to G/L

Design Details: Inventory Valuation

3/31/2019 • 2 minutes to read

Inventory valuation XE "Inventory Valuation" is the determination of the cost that is assigned to an inventory item, as expressed by the following equation.

$$\text{Ending inventory} = \text{beginning inventory} + \text{net purchases} - \text{cost of goods sold}$$

The calculation of inventory valuation uses the **Cost Amount (Actual)** field of the value entries for the item. The entries are classified according to the entry type XE "Entry Type" that corresponds to the cost components, direct cost, indirect cost, variance, revaluation, and rounding. For more information, see [Design Details: Cost Components](#).

Entries are applied against each other, either by the fixed application XE "Application; Fixed" , or according to the general cost-flow assumption defined by the costing method XE "Method; Costing" XE "Costing Method" . One entry of inventory decrease can be applied to more than one increase entry with different posting dates and possibly different acquisition cost XE "Acquisition Cost" s. For more information, see [Design Details: Item Application](#). Therefore, calculation of the inventory value XE "Inventory Value" for a given date is based on summing up positive and negative value entries.

Inventory Valuation report

To calculate the inventory value in the **Inventory Valuation** report, the report begins by calculating the value of the item's inventory at a given starting date. It then adds the value of inventory increases and subtracts the value of inventory decreases up to a given ending date. The end result is the inventory value on the ending date. The report calculates these values by summing the values in the **Cost Amount (Actual)** field in the value entries, using the posting dates as filters.

The printed report always shows actual amounts, that is, the cost of entries that have been posted as invoiced. The report will also print the expected cost of entries that have posted as received or shipped, if you select the Include Expected Cost field on the Options FastTab.

IMPORTANT

Values in the **Inventory Valuation** report is reconciled with the Inventory account in the general ledger, meaning the value entries in question have been posted to the general ledger.

IMPORTANT

Amounts in the **Value** columns of the report are based on the posting date of transactions for an item.

Inventory Valuation - WIP report

A manufacturing company needs to determine the value of three types of inventory:

- Raw Materials inventory
- WIP inventory
- Finished Goods inventory

The value of WIP inventory is determined by the following equation:

- Ending WIP inventory = Beginning WIP inventory + manufacturing costs – cost of goods manufactured

As for purchased inventory, the value entries provide the basis of the inventory valuation. The calculation is made using the values in the **Cost Amount (Actual)** field of the item and capacity value entries associated with a production order.

The purpose of WIP inventory valuation is to determine the value of the items whose manufacturing has not yet been completed on a given date. Therefore the WIP inventory value is based on the value entries related to the consumption and capacity ledger entries. Consumption ledger entries must be completely invoiced at the date of the valuation. Therefore, the **Inventory Valuation – WIP** report shows the costs representing the WIP inventory value in two categories: consumption and capacity.

[Working with Business Central](#)

Design Details: Revaluation

3/31/2019 • 8 minutes to read

You can revalue the inventory based on the valuation base that most accurately reflects the inventory value. You can also backdate a revaluation, so that the cost of goods sold (COGS) is correctly updated for items that have already been sold. Items using the Standard costing method that have not been completely invoiced can also be revalued.

In Business Central, the following flexibility is supported regarding revaluation:

- The revaluable quantity can be calculated for any date, also back in time.
- For items using Standard costing method, expected cost entries are included in revaluation.
- Inventory decreases affected by revaluation are detected.

Calculating the Revaluable Quantity

The revaluable quantity is the remaining quantity on inventory that is available for revaluation on a given date. It is calculated as the sum total of the quantities of completely invoiced item ledger entries that have a posting date equal to or earlier than the revaluation posting date.

NOTE

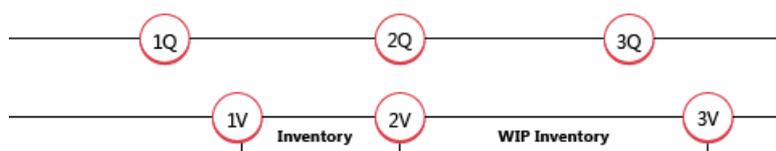

Items using the Standard costing method are treated differently when calculating the revaluable quantity per item, location, and variant. The quantities and values of item ledger entries that are not completely invoiced are included in the revaluable quantity.

After a revaluation has been posted, you can post an inventory increase or decrease with a posting date that comes before the revaluation posting date. However, this quantity will not be affected by the revaluation. To balance the inventory, only the original revaluable quantity is considered.

Because revaluation can be made on any date, you must have conventions for when an item is considered part of inventory from a financial point of view. For example, when the item is on inventory and when the item is work in process (WIP).

Example

The following example illustrates when a WIP item transitions to become part of inventory. The example is based on the production of a chain with 150 links.

1Q: The user posts the purchased links as received. The following table shows the resulting item ledger entry.

POSTING DATE	ITEM	ENTRY TYPE	QUANTITY	ENTRY NO.
01-01-20	LINK	Purchase	150	1

NOTE

Now an item using the Standard costing method is available for revaluation.

1V: The user posts the purchased links as invoiced and the links become part of inventory, from a financial point of view. The following table shows the resulting value entries.

POSTING DATE	ENTRY TYPE	VALUATION DATE	COST AMOUNT (ACTUAL)	ITEM LEDGER ENTRY NO.	ENTRY NO.
01-15-20	Direct Cost	01-01-20	150.00	1	1

2Q + 2V: The user posts the purchased links as consumed for the production of the iron chain. From a financial point of view, the links become part of WIP inventory. The following table shows the resulting item ledger entry.

POSTING DATE	ITEM	ENTRY TYPE	QUANTITY	ENTRY NO.
02-01-20	LINK	Consumption	-150	1

The following table shows the resulting value entry.

POSTING DATE	ENTRY TYPE	VALUATION DATE	COST AMOUNT (ACTUAL)	ITEM LEDGER ENTRY NO.	ENTRY NO.
02-01-20	Direct Cost	02-01-20	-150.00	2	2

The valuation date is set to the date of the consumption posting (02-01-20), as a regular inventory decrease.

3Q: The user posts the chain as output and finishes the production order. The following table shows the resulting item ledger entry.

POSTING DATE	ITEM	ENTRY TYPE	QUANTITY	ENTRY NO.
02-15-20	CHAIN	Output	1	3

3V: The user runs the **Adjust Cost - Item Entries** batch job, which posts the chain as invoiced to indicate that all material consumption has been completely invoiced. From a financial point of view, the links are no longer part of WIP inventory when the output is completely invoiced and adjusted. The following table shows the resulting value entries.

POSTING DATE	ENTRY TYPE	VALUATION DATE	COST AMOUNT (ACTUAL)	ITEM LEDGER ENTRY NO.	ENTRY NO.
01-15-20	Direct Cost	01-01-20	150.00	2	2
02-01-20	Direct Cost	02-01-20	-150.00	2	2
02-15-20	Direct Cost	02-15-20	150.00	3	3

Expected Cost in Revaluation

The revaluable quantity XE "Revaluable Quantity" XE "Quantity;Revaluable" is calculated as the sum of quantity XE "quantity" for completely invoiced XE "Invoice" item ledger XE "Item Ledger" entries with a posting date equal to or earlier than the revaluation XE "Revaluation" date. This means that when some items are received/shipped

but not invoiced, their inventory value cannot be calculated XE "Inventory Value" . Items using the Standard costing method are not limited in this respect. XE "Value"

NOTE

Another type of expected cost that can be revalued is WIP inventory, within certain rules. For more information, see the "WIP Inventory Revaluation" section in this topic.

When calculating the revaluable quantity for items using the Standard costing method, item ledger entries that have not been completely invoiced are included in the calculation. These entries are then revalued when you post the revaluation. When you invoice the revalued entry, the following value entries are created:

- The usual invoiced value entry with an entry type of **Direct Cost**. The cost amount on this entry is the direct cost from the source line.
- A value entry with an entry type of **Variance**. This entry records the difference between the invoiced cost and the revalued standard cost.
- A value entry with an entry type of **Revaluation**. This entry records the reversal of the revaluation of the expected cost.

Example

The following example, which is based on the production of the chain in the previous example, illustrates how the three types of entries are created. It is based on the following scenario:

1. The user posts the purchased links as received with a unit cost of LCY 2.00.
2. The user then posts a revaluation of the links with a new unit cost of LCY 3.00, updating the standard cost to LCY 3.00.
3. The user posts the original purchase of the links as invoiced, which creates the following:
 - a. An invoiced value entry with an entry type of **Direct Cost**.
 - b. A value entry with an entry type of **Revaluation** to record the reversal of the revaluation of the expected cost.
 - c. A value entry with an entry type of Variance, recording the difference between the invoiced cost and the revalued standard cost.

The following table shows the resulting value entries.

STEP	POSTING DATE	ENTRY TYPE	VALUATION DATE	COST AMOUNT (EXPECTED)	COST AMOUNT (ACTUAL)	ITEM LEDGER ENTRY NO.	ENTRY NO.
1.	01-15-20	Direct Cost	01-15-20	300.00	0.00	1	1
2.	01-20-20	Revaluation	01-20-20	150.00	0.00	1	2
3.a.	01-15-20	Direct Cost	01-15-20	-300.00	0.00	1	3
3.b.	01-15-20	Revaluation	01-20-20	-150.00	0.00	1	4
3.c.	01-15-20	Variance	01-15-20	0.00	450.00	1	5

Determining if an Inventory Decrease Is Affected by Revaluation

The date of the posting or the revaluation is used to determine if an inventory decrease is affected by a revaluation.

The following table shows the criteria that is used for an item that does not use the Average costing method.

SCENARIO	ENTRY NO.	TIMING	AFFECTED BY REVALUATION
A	Earlier than revaluation entry number	Earlier than revaluation posting date	No
B	Earlier than revaluation entry no.	Equal to revaluation posting date	No
C	Earlier than revaluation entry no.	Later than revaluation posting date	Yes
D	Later than revaluation entry no.	Earlier than revaluation posting date	Yes
E	Later than revaluation entry no.	Equal to revaluation posting date	Yes
F	Later than revaluation entry no.	Later than revaluation posting date	Yes

Example

The following example, which illustrates revaluation of an item that uses the FIFO costing method, is based on the following scenario:

1. On 01-01-20, the user posts a purchase of 6 units.
2. On 02-01-20, the user posts a sale of 1 unit.
3. On 03-01-20, the user posts a sale of 1 unit.
4. On 04-01-20, the user posts a sale of 1 unit.
5. On 03-01-20, the user calculates the inventory value for the item, and posts a revaluation of the item's unit cost from LCY 10.00 to LCY 8.00.
6. On 02-01-20, the user posts a sale of 1 unit.
7. On 03-01-20, the user posts a sale of 1 unit.
8. On 04-01-20, the user posts a sale of 1 unit.
9. The user runs the **Adjust Cost - Item Entries** batch job.

The following table shows the resulting value entries.

SCENARIO	POSTING DATE	ENTRY TYPE	VALUATION DATE	VALUED QUANTITY	COST AMOUNT (ACTUAL)	ITEM LEDGER ENTRY NO.	ENTRY NO.
	01-01-20	Purchase	01-01-20	6	60.00	1	1
	03-01-20	Revaluation	03-01-20	4	-8.00	1	5
A	02-01-20	Sale	02-01-20	-1	-10.00	2	2
B	03-01-20	Sale	03-01-20	-1	-10.00	3	3
C	04-01-20	Sale	04-01-20	-1	-10.00	4	4
	04-01-20	Sale	04-01-20	-1	2.00	4	9

SCENARIO	POSTING DATE	ENTRY TYPE	VALUATION DATE	VALUED QUANTITY	COST AMOUNT (ACTUAL)	ITEM LEDGER ENTRY NO.	ENTRY NO.
D	02-01-20	Sale	03-01-20	-1	-10.00	5	6
	02-01-20	Sale	03-01-20	-1	2.00	5	10
E	03-01-20	Sale	03-01-20	-1	-10.00	6	7
	03-01-20	Sale	03-01-20	-1	2.00	6	11
F	04-01-20	Sale	04-01-20	-1	-10.00	7	8
	04-01-20	Sale	04-01-20	-1	2.00	7	12

WIP Inventory Revaluation

Revaluation of WIP inventory implies revaluing components that are registered as part of WIP inventory at the time of the revaluation.

With this in mind, it is important to establish conventions as to when an item is considered part of the WIP inventory from a financial point of view. In Business Central, the following conventions exist:

- A purchased component becomes part of the raw material inventory from the time of posting a purchase as invoiced.
- A purchased/subassembled component becomes part of the WIP inventory from the time of posting its consumption in connection with a production order.
- A purchased/subassembled component remains part of the WIP inventory until the time when a production order (manufactured item) is invoiced.

The way the valuation date for the value entry of consumption is set, follows the same rules as for non-WIP inventory. For more information, see the "Determining if an Inventory Decrease Is Affected by Revaluation" section in this topic.

WIP inventory can be revalued as long as the revaluation date is not later than the posting date of the corresponding item ledger entries of type Consumption and as long as the corresponding production order has not been invoiced yet.

Caution

The **Inventory Valuation - WIP** report shows the value of posted production order entries and may therefore be a little confusing for WIP items that have been revalued.

Design Details: Warehouse Management

3/31/2019 • 2 minutes to read

This documentation gives an overview of the concepts and principles that are used in the Warehouse Management features in Business Central. It explains the design behind central warehouse features and how warehousing integrates with other supply chain features.

To differentiate the different complexity levels of the warehousing, this documentation is divided into two general groups, Basic and Advanced warehouse configurations, indicated by section titles. This simple differentiation covers different complexity levels as defined by product granules and location setup. For more information, see [Design Details: Warehouse Setup](#).

In This Section

Design Details: Warehouse Overview

3/31/2019 • 2 minutes to read

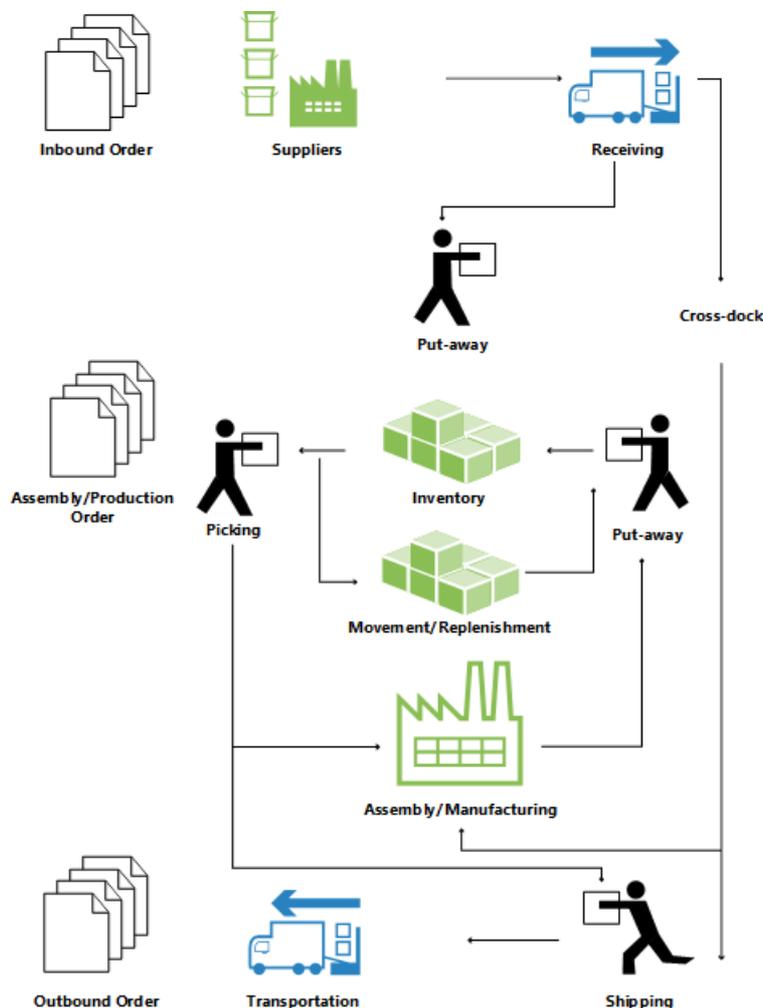

To support the physical handling of items on the zone and bin level, all information must be traced for each transaction or movement in the warehouse. This is managed in the **Warehouse Entry** table. Each transaction is stored in a warehouse register.

Warehouse documents and a warehouse journal are used to register item movements in the warehouse. Every time that an item in the warehouse is moved, received, put away, picked, shipped, or adjusted, warehouse entries are registered to store the physical information about zone, bin, and quantity.

The **Bin Content** table is used to handle all the different dimensions of the contents of a bin per item, such as unit of measure, maximum quantity, and minimum quantity. The **Bin Content** table also contains flow fields to the warehouse entries, warehouse instructions, and warehouse journal lines, which ensures that the availability of an item per bin and a bin for an item can be calculated quickly. For more information, see [Design Details: Availability in the Warehouse](#).

When item postings occur outside the warehouse module, a default adjustment bin per location is used to synchronize warehouse entries with inventory entries. During physical inventory of the warehouse, any differences between the calculated and counted quantities are recorded in the adjustment bin and then posted as correcting item ledger entries. For more information, see [Design Details: Integration with Inventory](#).

The following illustration outlines typical warehouse flows.

Basic or Advanced Warehousing

Warehouse functionality in Business Central can be implemented in different complexity levels, depending on a company's processes and order volume. The main difference is that activities are performed order-by-order in basic warehousing when they are consolidated for multiple orders in advanced warehousing.

To differentiate between the different complexity levels, this documentation refers to two general denominations, Basic and Advanced Warehousing. This simple differentiation covers several different complexity levels as defined by product granules and location setup, each supported by different UI documents. For more information, see [Design Details: Warehouse Setup](#).

NOTE

The most advanced level of warehousing is referred to as "WMS installations" in this documentation, since this level requires the most advanced granule, Warehouse Management Systems.

The following different UI documents are used in basic and advanced warehousing.

Basic UI Documents

- **Inventory Put-away**
- **Inventory Pick**
- **Inventory Movement**
- **Item Journal**
- **Item Reclassification Journal**
- (Various reports)

Advanced UI Documents

- **Warehouse Receipt**
- **Put-away Worksheet**
- **Warehouse Put-away**
- **Pick Worksheet**
- **Warehouse Pick**
- **Movement Worksheet**
- **Warehouse Movement**
- **Internal Whse. Pick**
- **Internal Whse. Put-away**
- **Bin Creation Worksheet**
- **Bin Content Creation Worksheet**
- **Whse. Item Journal**
- **Whse. Item Reclass. Journal**
- (Various reports)

For more information about each document, see the respective page topics.

Terminology

To align with the financial concepts of purchases and sales, Business Central warehouse documentation refers to the following terms for item flow in the warehouse.

TERM	DESCRIPTION
Inbound flow	Items moving into the warehouse location, such as purchases and inbound transfers.
Internal flow	Items moving inside the warehouse location, such as production components and output.
Outbound flow	Items moving out of the warehouse location, such as sales and outbound transfers.

Design Details: Warehouse Setup

3/31/2019 • 10 minutes to read

Warehouse functionality in Business Central contains different levels of complexity, as defined by license permissions in the offered granules. The level of complexity in a warehouse solution is largely defined by the bin setup on location cards, which in turn is license-controlled so that access to bin setup fields is defined by the license. In addition, the application objects in the license govern which UI document to use for the supported warehouse activities.

The following warehouse-related granules exist:

- Basic Inventory (4010)
- Bin (4170)
- Put Away (4180)
- Warehouse Receipt (4190)
- Pick (4200)
- Warehouse Shipment (4210)
- Warehouse Management Systems (4620)
- Internal Picks and Put-aways (4630)
- Automated Data Capture System (4640)
- Bin Setup (4660)

For more information about each granule, see [Business Central Price Sheets](#) (requires PartnerSource account).

The following table shows which granules are required to define different warehouse complexity levels, which UI documents support each level, and which location codes reflect these levels in the Business Central demonstration database.

COMPLEXITY LEVEL	DESCRIPTION	UI DOCUMENT	CRONUS LOCATION	MINIMUM GRANULE REQUIREMENT
1	No dedicated warehouse activity. Receive/ship posting from orders.	Order	BLUE	Basic Inventory
2	No dedicated warehouse activity. Receive/ship posting from orders. Bin code is required.	Order, with bin code	SILVER	Basic Inventory/Bin

For examples of how the UI documents are used per warehouse complexity level, see [Design Details: Inbound Warehouse Flow](#).

Bin and Bin Content

A bin is a storage device designed to contain discrete parts. It is the smallest container unit in Business Central. Item quantities in bins are referred to as bin content. A lookup from the **Item** field or **Bin Code** field on any warehouse-related document line displays the calculated availability of the item in the bin.

A bin content can be given a property of Fixed, Dedicated, or Default to define how the bin content can be used. Bins with none of these properties are referred to as floating bins.

A fixed bin holds items that are assigned to the bin code in question. The Fixed bin property ensures that even if the bin content is momentarily emptied, the bin content does not disappear, and the bin is therefore selected again as soon as it has been replenished.

A dedicated bin holds bin content that can only be picked for the dedicated resource, such as a machine center, that uses the bin in question. Other non-pick content, such as quantities outbound on a shipment posting, can still be consumed from a dedicated bin. Only bin content considered by the **Create Pick** algorithm is protected in a dedicated bin.

The Default bin property is used by the system to suggest bins for warehouse activities. At WMS locations, the Default bin property is not used. At locations where bins are required, the property is used in inbound flows to specify where to place items. In outbound flows, the property is used to specify where to take items from.

NOTE

If the outbound items are placed in several bins, then items are first taken from the non-default bins, to empty that bin content, and then the remaining items are taken from the default bin.

There can only be one default bin per item per location.

Bin Type

In WMS installations, you can restrict the warehouse activities that are allowed for a bin by assigning a bin type to it. The following bin types exist:

BIN TYPE	DESCRIPTION
RECEIVE	Items posted as received but not yet put away.
SHIP	Items picked for warehouse shipment lines but not yet posted as shipped.
PUT AWAY	Typically, items to be stored in large units of measure but that you do not want to access for picking purposes. Because these bins are not used for picking, either for production orders or shipments, your use of a Put Away type bin might be limited, but this bin type could be useful if you have purchased a large quantity of items. Bins of this type should always have a low bin-ranking, so that when received items are put away, other higher-ranking PUTPICK bins fixed to the item are put away first. If you are using this type of bin, you must regularly perform bin replenishment so that the items stored in these bins are also available in PUTPICK or PICK type bins.
PICK	Items to be used for picking only. The replenishment of these bins can only be made by movement, not by put-away.
PUTPICK	Items in bins that are suggested for both the put-away and pick functions. Bins of this type probably have different bin rankings. You can set up your bulk storage bins as this type of bin with low bin rankings compared to your ordinary pick bins or forward picking area bins.
QC	This bin is used for inventory adjustments if you specify this bin on the location card in the Adjustment Bin Code field. You can also set up bins of this type for defective items and items being inspected. You can move items to this type of bin if you want to make them inaccessible to the usual item flow. Note: Unlike all other bin types, the QC bin type has none of the item handling check boxes selected by default. This indicates that any content you place in a QC bin is excluded from item flows.

For all bin types, except PICK, PUTPICK, and PUTAWAY, no other activity is allowed for the bin than what is defined by its bin type. For example, a bin of type **Receive** can only be used to receive items into or pick items from.

NOTE

Only movement can be made to bins of type RECEIVE and QC. Similarly, only movements can be made from bins of type SHIP and QC.

Bin Ranking

In advanced warehousing, you can automate and optimize how items are collected in put-away and pick worksheets by ranking bins so that items are suggested taken or placed according to rank criteria to use warehouse space optimally.

Put-away processes are optimized according to bin ranking by suggesting higher-ranking bins before lower-ranking bins. Similarly, pick processes are optimized by first suggesting items from bin content with high bin ranking. Furthermore, bin replenishments are suggested from lower-ranking bins to higher-ranking bins.

Bin ranking together with bin content information are the basic properties that allow users to slot items in the warehouse.

Bin Setup

In advanced warehousing, bins can be set up with capacity values, such as quantity, total cubage, and weight to control which and how items are stored in the bin.

On each item card, you can assign a unit of measure (UOM) for the item, such as pieces, pallets, liters, grams, or boxes. You can also have a base UOM for an item and specify larger UOMs that are based on it. For example, you can define a pallet to equal 16 pieces, the latter being the base UOM.

If you want to set a maximum quantity of a specific item to be stored in an individual bin and the item has more than one UOM, then you must set the maximum quantity for every UOM that exists on the item card. Accordingly, if an item has been set up to be handled in pieces and pallets, then the **Max. Qty.** field on the **Bin Content** page for that item must also be in pieces and pallets. Otherwise, the allowed quantity for that bin is not calculated correctly.

Before you set capacity restrictions for bin contents on a bin, you must first make sure that the UOM and dimensions of the item have been set up on the item card.

NOTE

It is only possible to operate with multiple UOMs in WMS installations. In all other configurations, bin contents can only be in the base UOM. In all transactions with a UOM higher than the item's base UOM, the quantity is converted to the base UOM.

Zone

In advanced warehousing, bins can be grouped in zones to manage how the workflow of warehouse activities is directed.

A zone could be a receiving zone or a stocking zone, and each zone can consist of one or several bins.

Most properties assigned to a zone will by default be assigned to the bin that is created from that zone.

Class

In advanced warehousing, you can assign warehouse class codes to items, bins, and zones to control where different item classes are stored, such as frozen goods. You can divide a zone into several warehouse classes. For example, items in the receiving zone can be stored as frozen, hazardous, or other class.

When you work with warehouse classes and a default receiving/shipping bin, you must manually fill in the appropriate bins in the warehouse receipt and shipment lines.

In inbound flows, the class code is only highlighted on inbound lines where the item class code does not match the default receiving bin. If the correct default bins are not assigned, then the quantity cannot be received.

Location

A location is a physical structure or place where inventory is received, stored, and shipped, potentially organized in bins. A location can be a warehouse, service car, showroom, plant, or an area in a plant.

First Expired First Out

If you select the **Pick According to FEFO** check box on the **Bin Policies** FastTab on the location card, then item-tracked items are picked according to their expiration date. The items with the earliest expiration dates are picked first.

Warehouse activities in all pick and movement documents are sorted according to FEFO, unless the items in question already have serial/lot numbers assigned. If only a part of the quantity on the line already has serial/lot numbers assigned, then the remaining quantity to be picked is sorted according to FEFO.

When picking by FEFO, the available items that expire first are gathered in a temporary item tracking list based on the expiration date. If two items have the same expiration date, then the item with the lowest lot or serial number is picked first. If the lot or serial numbers are the same, then the item that was registered first is selected first. Standard criteria for selecting items in pick bins, such as Bin Ranking and Break Bulk, are applied to this temporary FEFO item tracking list.

Put-away Template

The put-away template can be assigned to an item and to a location. The put-away template specifies a set of prioritized rules that must be respected when creating put-aways. For example, a put-away template may require that the item is placed in a bin with bin content that matches the UOM, and if a similar bin with enough capacity cannot be found, then the item must be placed in an empty bin.

Design Details: Inbound Warehouse Flow

3/31/2019 • 6 minutes to read

The inbound flow in a warehouse begins when items arrive in the warehouse of the company location, either received from external sources or from another company location. An employee registers the items, typically by scanning a bar code. From the receiving dock, warehouse activities are performed at different complexity levels to bring the items into the storage area.

Each item is identified and matched to a corresponding inbound source document. The following inbound source documents exist:

- Purchase order
- Inbound transfer order
- Sales return order

In addition, the following internal source documents exist that function like inbound sources:

- Production order with output posting
- Assembly order with output posting

The last two represent inbound flows to the warehouse from internal operation areas. For more information about warehouse handling for internal inbound and outbound processes, see [Design Details: Internal Warehouse Flows](#).

Processes and UI documents in inbound warehouse flows are different for basic and advanced warehouse configurations. The main difference is that activities are performed order-by-order in basic warehouse configurations, and they are consolidated for multiple orders in advanced warehouse configurations. For more information about different warehouse complexity levels, see [Design Details: Warehouse Overview](#).

In Business Central, the inbound processes of receiving and putting away can be performed in four ways using different functionalities depending on the warehouse complexity level.

METHOD	INBOUND PROCESS	BINS	RECEIPTS	PUT-AWAYS	COMPLEXITY LEVEL (SEE DESIGN DETAILS: WAREHOUSE SETUP)
A	Post receipt and put-away from the order line	X			2
B	Post receipt and put-away from an inventory put-away document			X	3
C	Post receipt and put-away from a warehouse receipt document		X		4/5/6

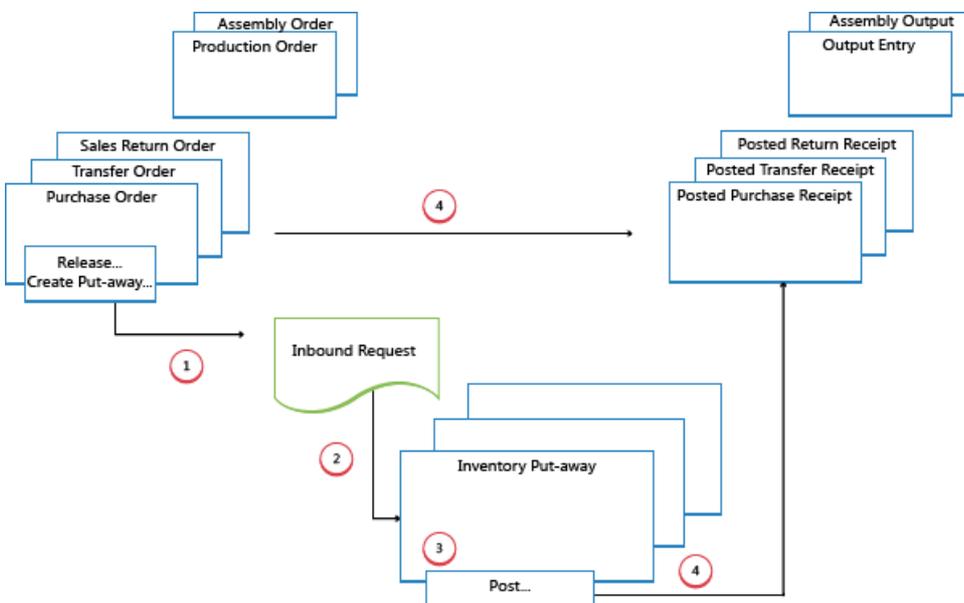

METHOD	INBOUND PROCESS	BINS	RECEIPTS	PUT-AWAYS	COMPLEXITY LEVEL (SEE DESIGN DETAILS: WAREHOUSE SETUP)
D	Post receipt from a warehouse receipt document and post put-away from a warehouse put-away document		X	X	4/5/6

Selecting an approach depends on the company's accepted practices and the level of their organizational complexity. In an order-by-order warehouse environment, where most of the warehouse staff works directly with order documents, a company might decide to use method A. An order-by-order warehouse that has a more complex put-away process, or where there are dedicated warehouse staff to perform warehousing functions, might decide to separate their put-away functions from the order document, method B. Additionally, companies that need to plan the handling of multiple orders may find it helpful to use warehouse receipt documents, methods C and D.

In methods A, B, and C, the actions of receiving and putting away are combined in one step when posting the corresponding documents as received. In method D, the receipt is posted first to recognize the increase of inventory and that items are available for sale. The warehouse worker then registers the put-away to make items available to pick.

Basic Warehouse Configurations

The following diagram illustrates the inbound warehouse flows by document type in basic warehouse configurations. The numbers in the diagram correspond with the steps in the sections following the diagram.

1: Release Source Document / Create Inventory Put-Away

When items are received in the warehouse, the user who is responsible for receiving releases the source document, such as a purchase order or an inbound transfer order, to signal to warehouse workers that the received items can be put away in inventory. Alternatively, the user creates inventory put-away documents for individual order lines, in a push fashion, based on specified bins and quantities to handle.

2: Create Inbound Request

When the inbound source document is released, an inbound warehouse request is created automatically. It

contains references to the source document type and number and is not visible to the user.

3: Create Inventory Put-Away

On the **Inventory Put-away** page, the warehouse worker retrieves, in a pull fashion, the pending source document lines based on inbound warehouse requests. Alternatively, the inventory put-away lines are already created, in a push fashion, by the user who is responsible for the source document.

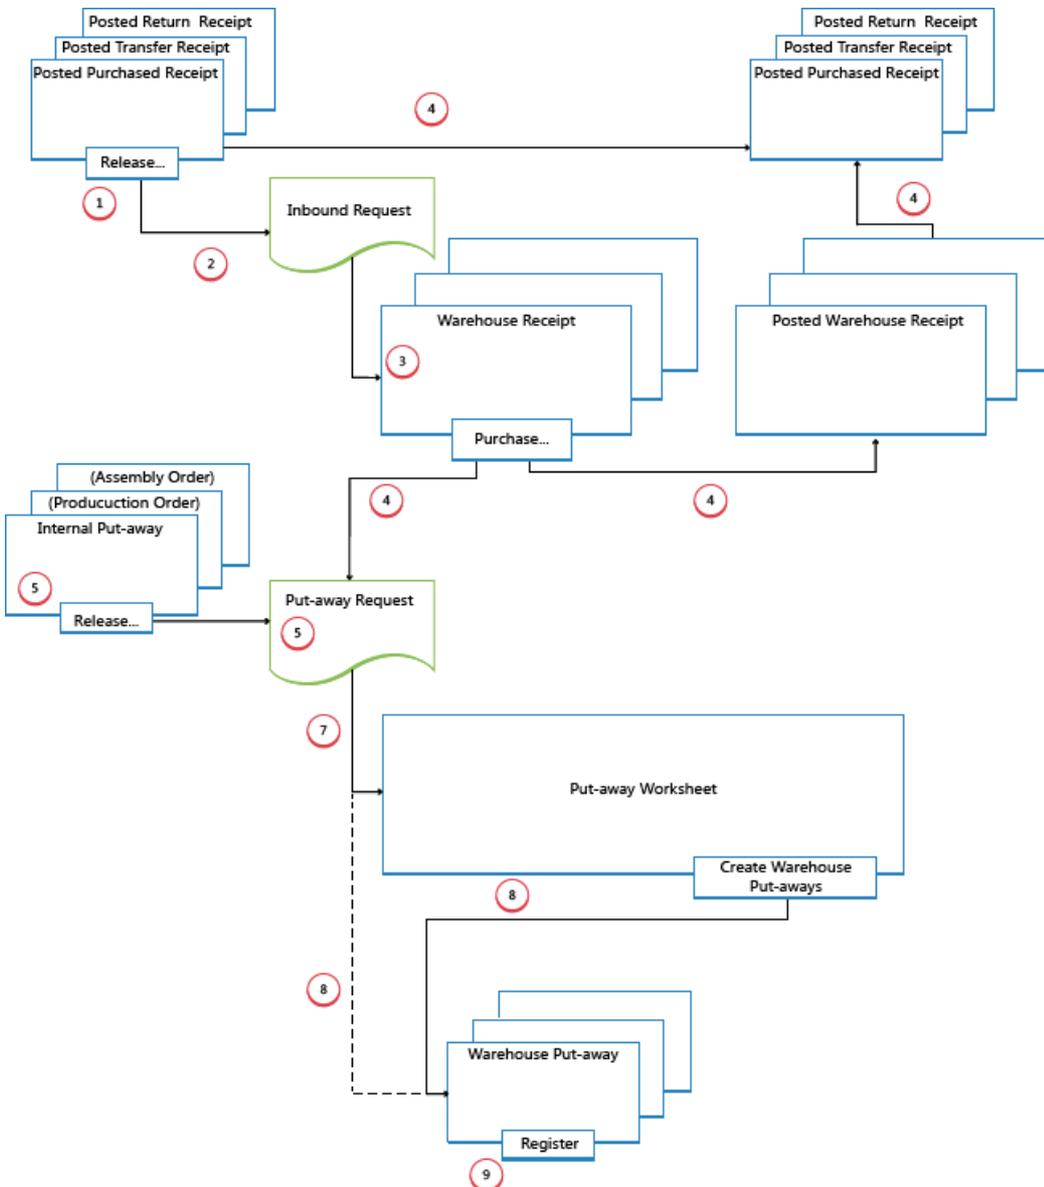

4: Post Inventory Put-Away

On each line for items that have been put away, partially or fully, the warehouse worker fills in the **Quantity** field, and then posts the inventory put-away. Source documents that are related to the inventory put-away are posted as received.

Positive item ledger entries are created, warehouse entries are created, and the put-away request is deleted, if fully handled. For example, the **Quantity Received** field on the inbound source document line is updated. A posted receipt document is created that reflects the purchase order, for example, and the received items.

Advanced warehouse configurations

The following diagram illustrates the inbound warehouse flow by document type in advanced warehouse configurations. The numbers in the diagram correspond with the steps in the sections following the diagram.

1: Release Source Document

When items are received in the warehouse, the user who is responsible for receiving releases the source

document, such as a purchase order or an inbound transfer order, to signal to warehouse workers that the received items can be put away in inventory.

2: Create Inbound Request

When the inbound source document is released, an inbound warehouse request is created automatically. It contains references to the source document type and number and is not visible to the user.

3: Create Warehouse Receipt

On the **Warehouse Receipt** page, the user who is responsible for receiving items retrieves the pending source document lines based on the inbound warehouse request. Several source document lines can be combined in one warehouse receipt document.

The user fills in the **Qty. to Handle** field and selects the receiving zone and bin, if required.

4: Post Warehouse Receipt

The user posts the warehouse receipt. Positive item ledger entries are created. For example, the **Quantity Received** field on the inbound source document line is updated.

5: Create Warehouse Internal Put-Away

The user who is responsible for putting away from internal operations creates a warehouse internal put-away for items that have to be put away in the warehouse, such as production or assembly output. The user specifies quantity, zone, and bin from where the items should be put away, potentially with the **Get Bin Content** function. The user releases the warehouse internal put-away, which creates an inbound warehouse request so that the task can be retrieved in warehouse put-away documents or in the put-away worksheet.

6: Create Put-away Request

When the inbound source document is posted, a warehouse put-away request is created automatically. It contains references to the source document type and number and is not visible to the user. Depending on the setup, output from a production order also creates a put-away request to put the finished items away in inventory.

7: Generate Put-away Worksheet Lines (Optional)

The user who is responsible for coordinating put-aways retrieves warehouse put-away lines in the **Put-away Worksheet** based on posted warehouse receipts or internal operations with output. The user selects the lines to be put-away and prepares the put-aways by specifying which bins to take from, which bins to place in, and how many units to handle. The bins may be predefined by the setup of the warehouse location or operation resource.

When all put-aways are planned and assigned to warehouse workers, the user generates the warehouse put-away documents. Fully assigned put-away lines are deleted from the **Put-away Worksheet**.

NOTE

If the **Use Put-away Worksheet** field is not selected on the location card, then warehouse put-away documents are created directly based on posted warehouse receipts. In that case, step 7 is omitted.

8: Create Warehouse Put-away Document

The warehouse worker who performs put-aways creates a warehouse put-away document in a pull fashion, based on the posted warehouse receipt. Alternatively, the warehouse put-away document is created and assigned to a warehouse worker in a push fashion.

9: Register Warehouse Put-Away

On each line for items that have been put away, partially or fully, the warehouse worker fills in the **Quantity** field on the **Warehouse Put-away** page, and then registers the warehouse put-away.

Warehouse entries are created, and the warehouse put-away lines are deleted, if fully handled. The warehouse

put-away document remains open until the full quantity of the related posted warehouse receipt is registered. The **Qty. Put Away** field on the warehouse receipt order lines is updated.

Design Details: Internal Warehouse Flows

3/31/2019 • 7 minutes to read

The flow of items between bins at a company location centers on picking components and putting away end items for assembly or production orders and ad-hoc movements, such as bin replenishments, without a relation to source documents. The scope and nature of the involved activities vary between basic and advanced warehousing.

Some internal flows overlap with inbound or outbound flows. Some of this overlap is shown as steps 4 and 5 in the graphical diagrams for advanced inbound and outbound flows respectively. For more information, see [Design Details: Inbound Warehouse Flow](#).

Internal Flows in Basic Warehousing

In basic warehouse configuration, the flow of items between bins inside the company centers on picking component and putting away end items for production or assembly orders and ad-hoc movements, such as bin replenishments, without relation to source documents.

Flows to and from Production

The main integration between production orders and basic warehouse activities is represented by the ability to pick production components with the **Inventory Pick** or the **Inventory Movement** pages.

NOTE

On the **Inventory Pick** page, the component consumption is posted together with the pick posting. By using the **Inventory Movement** page, only bin adjustments are registered, no item ledger posting occurs.

In addition to component handling, the integration is represented by the ability to put produced items away with the **Inventory Put-away** page.

The **To-Production Bin Code**, **From-Production Bin Code**, and **Open Shop Floor Bin Code** fields on the location card or the machine/work center cards define default flows to and from production areas.

For more information about how component consumption is flushed from the To-Production or Open Shop Floor bins, see the "Flushing Production Components in the Warehouse" section in this topic.

Flows to and from Assembly

The main integration between assembly orders and basic warehouse activities is represented by the ability to move assembly components to the assembly area.

While no specific warehouse functionality exists for putting assembly items away, the bin code on the assembly order header may be set to a default put-away bin. Posting the assembly order then functions like posting a put-away. The warehouse activity to move assembly items into the warehouse can be managed on the **Internal Movement** page, with no relation to the assembly order.

The following assembly flows exist.

FLOW	DESCRIPTION
------	-------------

FLOW	DESCRIPTION
Assemble-to-stock	<p>The components are needed on an assembly order where the output is stored in the warehouse.</p> <p>This warehouse flow is managed on the Inventory Movement page. One take line specifies where to take the components. One place line specifies where to place the components.</p>
Assemble-to-order	<p>The components are needed on an assembly order that is linked to a sales order that is shipped when the sold item is assembled.</p>

NOTE

If items are assembled to order, then the inventory pick of the linked sales order triggers an inventory movement for all the involved assembly components, not just for the sold item as when shipping inventory items.

The **To-Assembly Bin Code**, **From-Assembly Bin Code**, and **Asm.-to-Order Shpt. Bin Code** fields on the location card define default flows to and from assembly areas.

NOTE

The **Asm.-to-Order Shpt. Bin Code** field functions as the from-assembly bin in assemble-to-order scenarios.

Ad-Hoc Movements

In basic warehousing, the movement of items from bin to bin without relation to source documents is performed on the **Internal Movement** page, which functions together with the **Inventory Movement** page.

Another way to move items ad hoc between bins is to post positive entries in the **New Bin Code** field on the **Item Reclass. Journal** page.

Internal Flows in Advanced Warehousing

In advanced warehouse configurations, the flow of items between bins inside the company centers on picking component and putting away end items for production orders and picking components for assembly orders. In addition, internal flows occur as ad-hoc movements, such as bin replenishments, without relation to source documents.

Flows To and From Production

The main integration between production orders and advanced warehouse activities is represented by the ability to pick production components, on the **Warehouse Pick** page and the **Pick Worksheet** page, and the ability to put produced items away with the **Whse. Internal-Put-away** page.

Another integration point in production is provided with the **Warehouse Movement** page, together with the **Movement Worksheet** page, which enables you to place components and take produced items for released production orders.

The **To-Production Bin Code**, **From-Production Bin Code**, and **Open Shop Floor Bin Code** fields on the location card or the machine/work center cards define default flows to and from production areas.

For more information about how component consumption is flushed from the To-Production or Open Shop Floor Bins, see the "Flushing Production Components in the Warehouse" section in this topic.

Flows to and from Assembly

The main integration between assembly orders and advanced warehouse activities is represented by the ability to pick assembly components, both with the **Warehouse Pick** page and the **Pick Worksheet** page. This functionality works just like when picking components for production orders.

While no specific warehouse functionality exists for putting assembly items away, the bin code on the assembly order header may be set to a default put-away bin. Posting the assembly order then functions like posting a put-away. The warehouse activity to move assembly items into the warehouse can be managed on the **Movement Worksheet** page or the **Whse. Internal Put-away** page, with no relation to the assembly order.

NOTE

If items are assembled to order, then the warehouse shipment of the linked sales order triggers a warehouse pick for all the involved assembly components, not just for the sold item as when shipping inventory items.

The **To-Assembly Bin Code** and **From-Assembly Bin Code** fields on the location card define default flows to and from assembly areas.

Ad-Hoc Movements

In advanced warehousing, the movement of items from bin to bin without relation to source documents is managed on the **Movement Worksheet** page and registered in the Warehouse Movement page.

Flushing Production Components in the Warehouse

If set up on the item card, components picked with warehouse picks are posted as consumed by the production order when the warehouse pick is registered. By using the **Pick + Forward** method and the **Pick + Backward** flushing method, the pick registration triggers the related consumption posting when the first operation starts or when the last operation finishes, respectively.

Consider the following scenario based on the Business Central demonstration database, WHITE location.

A production order for 15 PCS of item LS-100 exists. Some of the items on the component list must be flushed manually in a consumption journal, and other items on the list can be picked and flushed automatically using the **Pick + Backward** flushing method.

NOTE

Pick + Forward only works if the second production routing line operation uses a routing link code. Releasing a planned production order initiates forward flushing of components set to **Pick + Forward**. However, the flushing cannot take place until the pick of the components is registered, which again can only take place when the order is released.

The following steps describe the involved actions by different users and the related response:

1. The shop floor supervisor releases the production order. Items with **Forward** flushing method and no routing link code are deducted from the open shop floor bin.
2. The shop floor supervisor chooses the **Create Warehouse Pick** button on the production order. A warehouse pick document is created pick for items with **Manual**, **Pick + Backward**, and **Pick + Forward** flushing methods. These items are placed in the To-Production bin.
3. The warehouse manager assigns the picks to a warehouse worker.
4. The warehouse worker picks the items from appropriate bins and places them in the To-Production bin or in the bin specified on the warehouse pick, which may be a work center or machine center bin.
5. The warehouse worker registers the pick. The quantity is subtracted from the pick bins and added to the

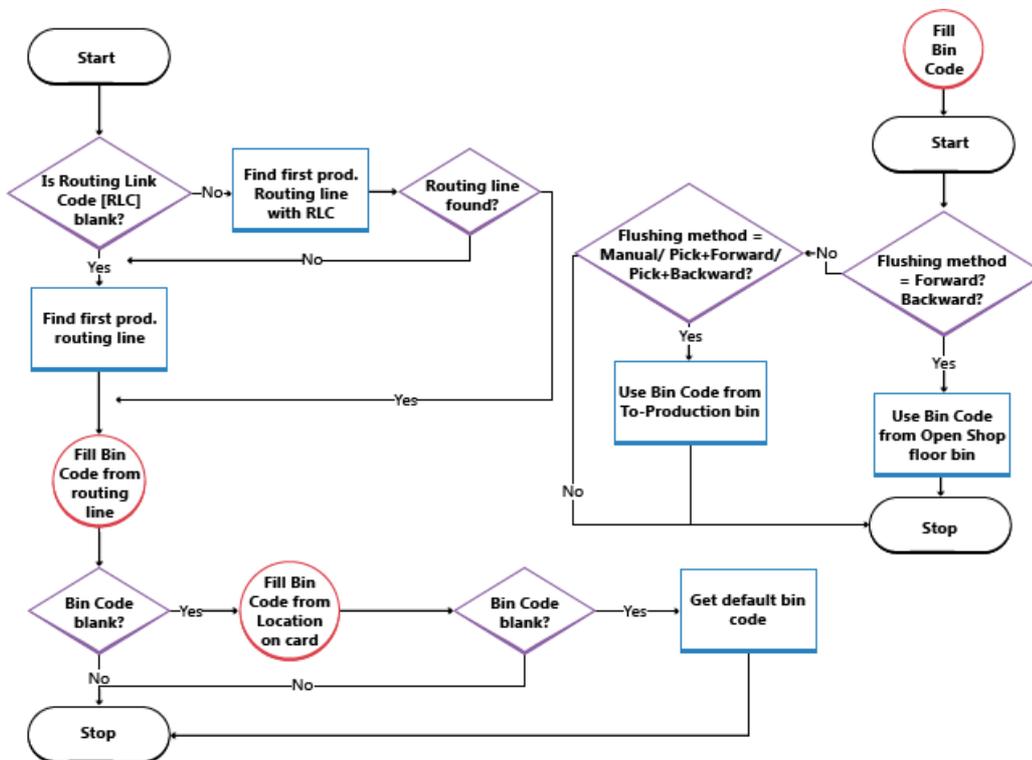

consumption bin. The **Qty. Picked** field on the component list for all picked items is updated.

NOTE

Only the quantity that is picked can be consumed.

6. The machine operator informs the production manager that the end items are finished.
7. The shop floor supervisor uses the consumption journal or production journal to post the consumption of component items that use either **Manual** flushing method or **Forward** or **Pick + Forward** flushing methods together with routing link codes.
8. The production manager posts the output of the production order and changes status to **Finished**. The quantity of component items that use **Backward** flushing method is deducted from the open shop floor bin, and the quantity of component items that use **Pick + Backward** flushing method is deducted from the To-Production bin.

The following illustration shows when the **Bin Code** field on the component list is filled according to your location or machine/work center setup.

Design Details: Availability in the Warehouse

6/6/2019 • 3 minutes to read

The system must keep a constant control of item availability in the warehouse, so that outbound orders can flow efficiently and provide optimal deliveries.

Availability varies depending on allocations at the bin level when warehouse activities such as picks and movements occur and when the inventory reservation system imposes restrictions to comply with. A rather complex algorithm verifies that all conditions are met before allocating quantities to picks for outbound flows.

If one or more conditions are not met, different error messages can be shown, including the generic "Nothing to handle." message. The "Nothing to handle." message can occur for many different reasons, both in outbound and inbound flows, where a directly or indirectly involved document line contains the **Qty. to Handle** field.

NOTE

Information will soon be published here about possible reasons and solutions for the "Nothing to handle." message.

Bin Content and Reservations

In any installation of warehouse management, item quantities exist both as warehouse entries, in the Warehouse application area, and as item ledger entries, in the Inventory application area. These two entry types contain different information about where items exist and whether they are available. Warehouse entries define an item's availability by bin and bin type, which is called bin content. Item ledger entries define an item's availability by its reservation to outbound documents.

Special functionality in the picking algorithm exists to calculate the quantity that is available to pick when bin content is coupled with reservations.

Quantity Available to Pick

If, for example, the picking algorithm does not consider item quantities that are reserved for a pending sales order shipment, then those items might be picked for another sales order that is shipped earlier, which prevents the first sales from being fulfilled. To avoid this situation, the picking algorithm subtracts quantities that are reserved for other outbound documents, quantities on existing pick documents, and quantities that are picked but not yet shipped or consumed.

The result is displayed in the **Available Qty. to Pick** field on the **Pick Worksheet** page, where the field is calculated dynamically. The value is also calculated when users create warehouse picks directly for outbound documents. Such outbound documents could be sales orders, production consumption, or outbound transfers, where the result is reflected in the related quantity fields, such as **Qty. to Handle**.

NOTE

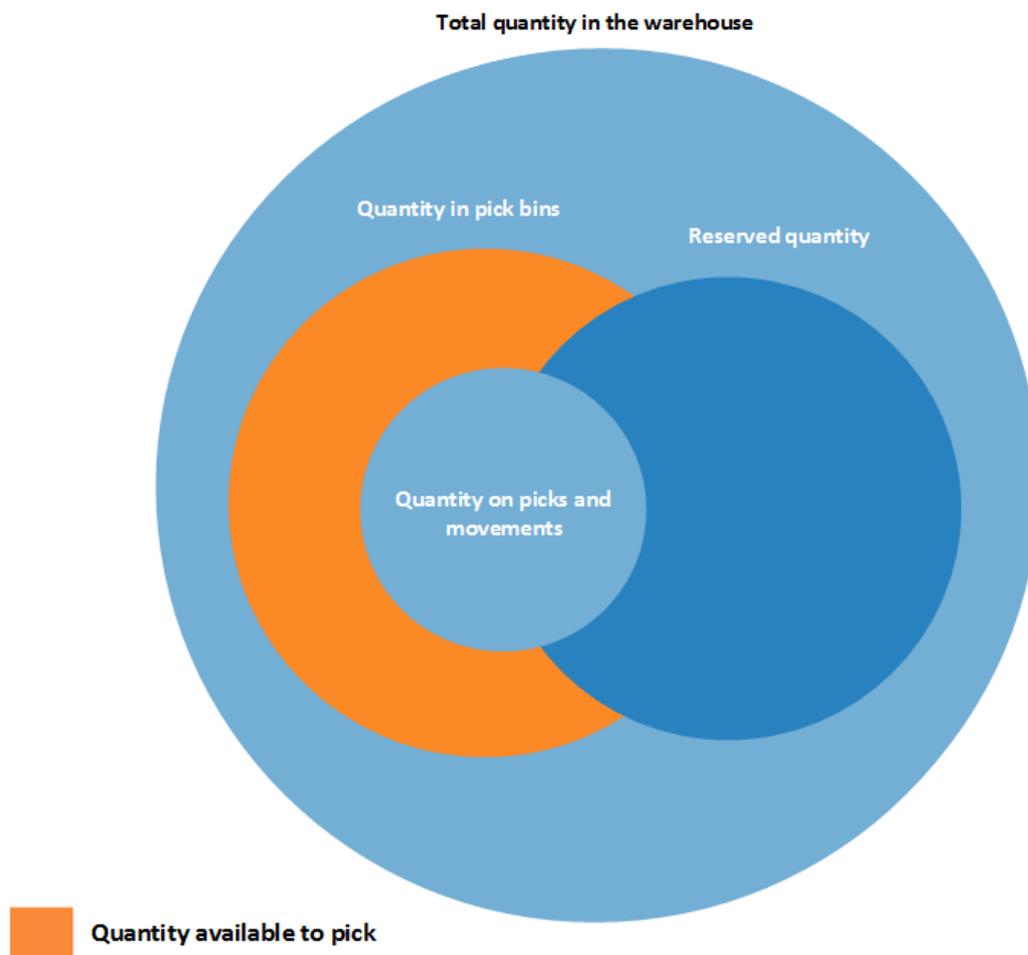

Concerning the priority of reservations, the quantity to reserve is subtracted from the quantity available to pick. For example, if the quantity available in pick bins is 5 units, but 100 units are in put-away bins, then when you try to reserve more than 5 units for another order, an error message is displayed because the additional quantity must be available in pick bins.

Calculating the Quantity Available to Pick

The quantity available to pick is calculated as follows:

quantity available to pick = quantity in pick bins - quantity on picks and movements – (reserved quantity in pick bins + reserved quantity on picks and movements)

The following diagram shows the different elements of the calculation.

Quantity Available to Reserve

Because the concepts of bin content and reservation co-exist, the quantity of items that are available to reserve must be aligned with allocations to outbound warehouse documents.

It should be possible to reserve all items in inventory, except those that have started outbound processing. Accordingly, the quantity that is available to reserve is defined as the quantity on all documents and all bin types, except the following outbound quantities:

- Quantity on unregistered pick documents
- Quantity in shipment bins
- Quantity in to-production bins
- Quantity in open shop floor bins
- Quantity in to-assembly bins
- Quantity in adjustment bins

The result is displayed in the **Total Available Quantity** field on the **Reservation** page.

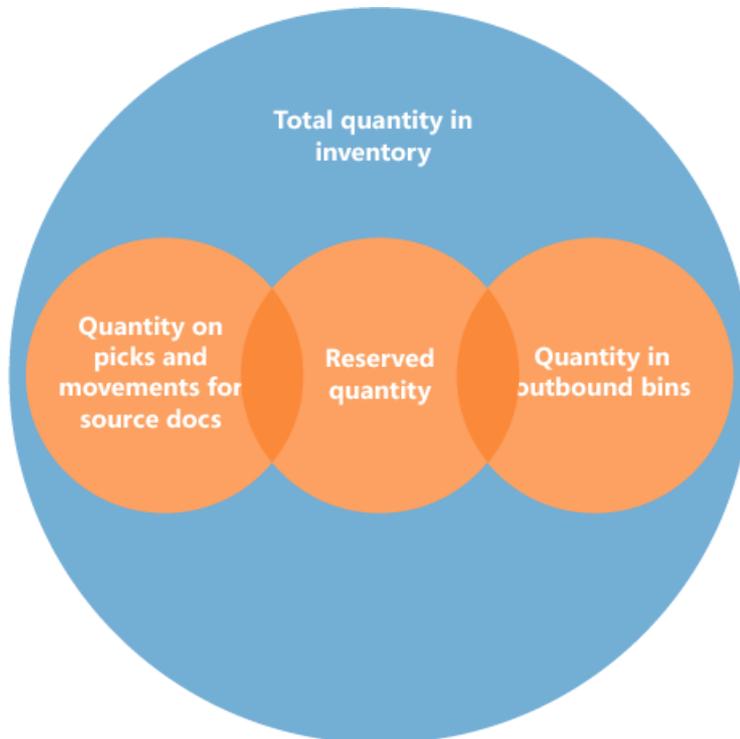

On a reservation line, the quantity that cannot be reserved, because it is allocated in the warehouse, is displayed in the **Qty. Allocated in Warehouse** field on the **Reservation** page.

Calculating the Quantity Available to Reserve

The quantity available to reserve is calculated as follows:

quantity available to reserve = total quantity in inventory - quantity on picks and movements for source documents - reserved quantity - quantity in outbound bins

The following diagram shows the different elements of the calculation.

 **Quantity available to reserve**

[View the Availability of Items](#)

Design Details: Outbound Warehouse Flow

3/31/2019 • 7 minutes to read

The outbound flow in the warehouse begins with a request from released source documents to bring the items out of the warehouse location, either to be shipped to an external party or to another company location. From the storage area, warehouse activities are performed at different complexity levels to bring the items out to the shipping docks.

Each item is identified and matched to a corresponding inbound source document. The following outbound source documents exist:

- Sales order
- Outbound transfer order
- Purchase return order
- Service order

In addition, the following internal source documents exist that function like outbound sources:

- Production order with component need
- Assembly order with component need

The last two documents represent outbound flows from the warehouse to internal operation areas. For more information about warehouse handling for internal inbound and outbound processes, see [Design Details: Internal Warehouse Flows](#).

Processes and UI documents in outbound warehouse flows are different for basic and advanced warehouse configurations. The main difference is that activities are performed order-by-order in basic warehouse configurations, and they are consolidated for multiple orders in advanced warehouse configurations. For more information about different warehouse complexity levels, see [Design Details: Warehouse Overview](#).

In Business Central, the outbound processes of picking and shipping can be performed in four ways using different functionalities depending on the warehouse complexity level.

METHOD	INBOUND PROCESS	BINS	PICKS	SHIPMENTS	COMPLEXITY LEVEL (SEE DESIGN DETAILS: WAREHOUSE SETUP)
A	Post pick and shipment from the order line	X			2
B	Post pick and shipment from an inventory pick document		X		3
C	Post pick and shipment from a warehouse shipment document			X	4/5/6

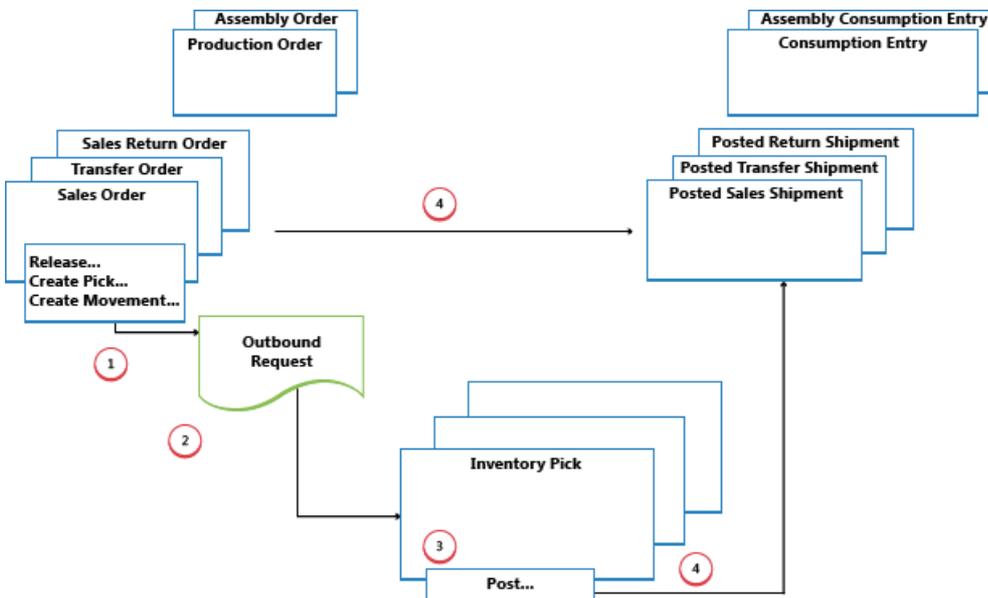

METHOD	INBOUND PROCESS	BINS	PICKS	SHIPMENTS	COMPLEXITY LEVEL (SEE DESIGN DETAILS: WAREHOUSE SETUP)
D	Post pick from a warehouse pick document and post shipment from a warehouse shipment document		X	X	4/5/6

Selecting an approach depends on the company's accepted practices and the level of their organizational complexity. In an order-by-order environment with straightforward processes and simple bin structure, method A, picking and shipping from the order line is appropriate. In other order-by-order companies where items for one order line might come from more than one bin or where warehouse workers cannot work with order documents, the use of separate pick documents is appropriate, method B. Where a company's picking and shipping processes involve multiple order handling and therefore require greater control and overview, the company might choose to use a warehouse shipment document and warehouse pick document to separate the picking and shipping tasks, methods C and D.

In methods A, B, and C, the actions of picking and shipping are combined in one step when posting the corresponding document as shipped. In method D, the pick is first registered, and then the shipment is posted at a later time from a different document.

Basic Warehouse Configurations

The following diagram illustrates the outbound warehouse flows by document type in basic warehouse configurations. The numbers in the diagram correspond with the steps in the sections following the diagram.

1: Release Source Document / Create Inventory Pick or Movement

When a user who is responsible for source documents, such as a sales order processor or production planner, is ready for the outbound warehouse activity, he or she releases the source document to signal to warehouse workers that sold items or components can be picked and placed in the specified bins. Alternatively, the user creates inventory pick or movement documents for the individual order lines, in a push fashion, based on specified bins and quantities to handle.

NOTE

Inventory movements are used to move items to internal operation areas in basic warehouse configurations, based on source documents or on an ad hoc basis.

2: Create Outbound Request

When the outbound source document is released, an outbound warehouse request is created automatically. It contains references to the source document type and number and is not visible to the user.

3: Create Inventory Pick or Movement

In the **Inventory Pick** or **Inventory Movement** page, the warehouse worker retrieves, in a pull fashion, the pending source document lines based on outbound warehouse requests. Alternatively, the inventory pick lines are already created, in a push fashion, by the user who is responsible for the source document.

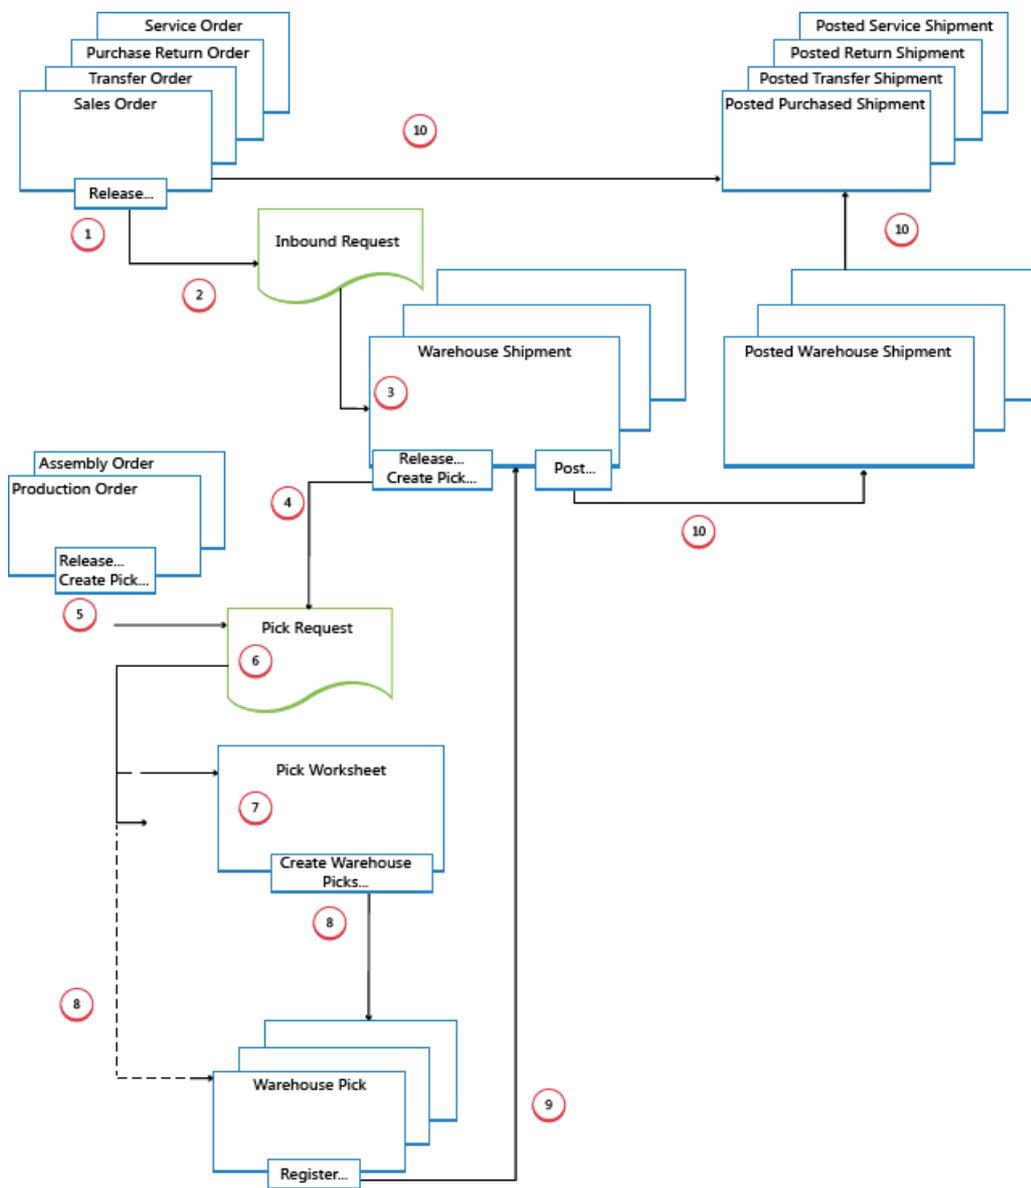

4: Post Inventory Pick or Register Inventory Movement

On each line for items that have been picked or moved, partially or fully, the warehouse worker fills in the **Quantity** field, and then posts the inventory pick or registers the inventory movement. Source documents related to the inventory pick are posted as shipped or consumed. Source documents related to inventory movements are not posted.

For inventory picks, negative item ledger entries are created, warehouse entries are created, and the pick request is deleted, if fully handled. For example, the **Quantity Shipped** field on the outbound source document line is updated. A posted shipment document is created that reflects the sales order, for example, and the shipped items.

advanced warehouse configurations

The following diagram illustrates the outbound warehouse flow by document type in advanced warehouse configurations. The numbers in the diagram correspond with the steps in the sections following the diagram.

1: Release Source Document

When a user who is responsible for source documents, such as a sales order processor or production planner, is ready for the outbound warehouse activity, he or she releases the source document to signal to warehouse workers that sold items or components can be picked and placed in the specified bins.

2: Create Outbound Request

When the inbound source document is released, an outbound warehouse request is created automatically. It contains references to the source document type and number and is not visible to the user.

3: Create Warehouse Shipment

On the **Warehouse Shipment** page, the shipping worker who is responsible retrieves pending source document lines based on the outbound warehouse request. Several source document lines can be combined in one warehouse shipment document.

4: Release Shipment / Create Warehouse Pick

The shipping worker who is responsible releases the warehouse shipment, so that warehouse workers can create or coordinate warehouse picks for the shipment in question.

Alternatively, the user creates warehouse pick document for individual shipment lines, in a push fashion, based on specified bins and quantities to handle.

5: Release Internal Operation / Create Warehouse Pick

The user who is responsible for internal operations releases an internal source document, such as a production

and assembly order, so that warehouse workers can create or coordinate warehouse picks for the internal operation in question.

Alternatively, the user creates warehouse pick documents for the individual production or assembly order, in a push fashion, based on specified bins and quantities to handle.

6: Create Pick Request

When the outbound source document is released, a warehouse pick request is created automatically. It contains references to the source document type and number and is not visible to the user. Depending on the setup, consumption from a production and assembly order also creates a pick request to pick the needed components from inventory.

7: Generate Pick Worksheet Lines

The user who is responsible for coordinating picks, retrieves warehouse pick lines in the **Pick Worksheet** based on pick requests from warehouse shipments or internal operations with component consumption. The user selects the lines to be picked and prepares the picks by specifying which bins to take from, which bins to place in, and how many units to handle. The bins may be predefined by setup of the warehouse location or operation resource.

The user specifies picking methods for optimized warehouse handling and then uses a function to create the corresponding warehouse pick documents, which are assigned to different warehouse workers who perform warehouse picks. When the warehouse picks are fully assigned, the lines in the **Pick Worksheet** are deleted.

8: Create Warehouse Pick Documents

The warehouse worker who perform picks create a warehouse pick document, in a pull fashion, based on the released source document. Alternatively, the warehouse pick document is created and assigned to the warehouse worker in a push fashion.

9: Register Warehouse Pick

On each line for items that have been picked, partially or fully, the warehouse worker fills in the **Quantity** field on the **Warehouse Pick** page and then registers the warehouse pick.

Warehouse entries are created, and the warehouse pick lines are deleted, if fully handled. The warehouse pick document remains open until the full quantity of the related warehouse shipment is registered. The **Qty. Picked** field on the warehouse shipment lines is updated accordingly.

10: Post Warehouse Shipment

When all items on the warehouse shipment document are registered as picked to the specified shipment bins, the shipping worker who is responsible posts the warehouse shipment. Negative item ledger entries are created. For example, the **Quantity Shipped** field on the outbound source document line is updated.

[Design Details: Warehouse Management](#)

Design Details: Integration with Inventory

3/31/2019 • 2 minutes to read

The Warehouse Management application area and the Inventory application area interact with one another in physical inventory and in inventory or warehouse adjustment.

Physical Inventory

The **Whse. Phys. Inventory Journal** page is used with the **Phys. Inventory Journal** page for all advanced warehouse locations. The inventory on bin level is calculated, and a printed list is provided for the warehouse employee. The list shows which items in which bins must be counted.

The warehouse employee enters the counted quantity on the **Whse. Phys. Inventory Journal** page and then posts the journal.

If the counted quantity is greater than the quantity on the journal line, a movement is posted for this difference from the default adjustment bin to the counted bin. This increases the quantity in the counted bin and decreases the quantity in the default adjustment bin.

If the quantity counted is less than the quantity on the journal line, a movement for this difference is posted from the counted bin to the default adjustment bin. This decreases the quantity in the counted bin and increases the quantity in the default adjustment bin.

In advanced warehouse configurations, the value in the **Quantity (Calculated)** field is retrieved from item ledger entries and the value in the **Quantity (Phys. Inventory)** field is retrieved from warehouse entries, excluding the adjustment bin content. The **Quantity** field specifies the difference between the first two fields, which should be equal to the contents of the adjustment bin.

When you post the physical inventory journal, the inventory and the default adjustment bin are updated.

Warehouse Adjustments to the Item Ledger

You use the **Item Journal** page and the **Calculate Whse. Adjustment** function to adjust inventory on the item ledger in accordance with an adjustment that has been made to the item quantity in a warehouse bin. To create a link between the inventory and the warehouse, you must define a default adjustment bin per location.

The default adjustment bin registers items in the warehouse when you post an increase for the inventory. However, if you post a decrease, the quantity on the default bin is also decreased. In both cases, item ledger entries and warehouse entries are created.

NOTE

The adjustment bin is not included in the availability calculation.

If you want to adjust the bin content, you can use the warehouse item journal, from which you can enter the item number, zone code, bin code, and quantity that you want to adjust.

If you enter a positive quantity and post the line, then the inventory stored in the bin increases, and the quantity of the default adjustment bin decreases correspondingly.

Design Details: Item Tracking

3/31/2019 • 2 minutes to read

As the flow of goods in today's supply chain becomes more and more complex, the ability to keep track of items is increasingly important to the companies involved. Monitoring an item's transaction flow is a legal requirement in the business of medical and chemical supply, but other businesses may want to monitor products with warranties or expiration dates for customer service reasons.

An item tracking system should provide a company with easy handling of serial and lot numbers, considering each unique piece of merchandise: when and where received, where stored, when and where sold. Business Central has gradually expanded its coverage of this business requirement and today provides application-wide functionality and a solid core on which to develop extensions.

Design Details: Item Tracking Design

3/31/2019 • 2 minutes to read

In the first version of Item Tracking in Business Central 2.60, serial numbers or lot numbers were recorded directly on item ledger entries. This design provided full availability information and simple tracking of historic entries, but it lacked flexibility and functionality.

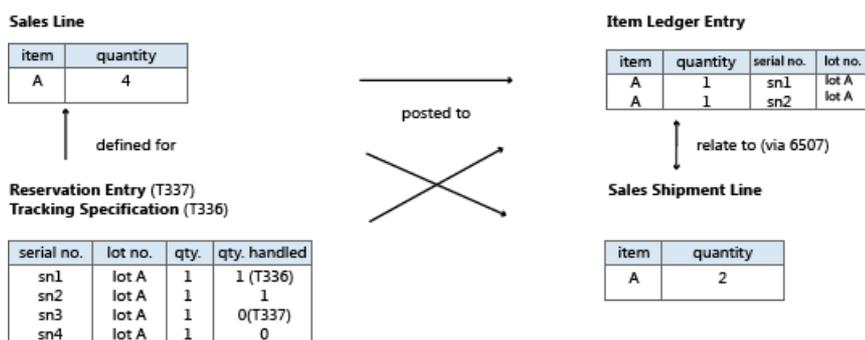

From Business Central 3.00, item tracking functionality was in a separate object structure with intricate links to posted documents and item ledger entries. This design was flexible and rich in functionality, but item tracking entries were not fully involved in availability calculations.

Since Business Central 3.60, item tracking functionality is integrated with the reservation system, which handles reservation, order tracking, and action messaging. For more information, see "Design Details: Reservation, Order Tracking, and Action Messaging" in "Design Details: Supply Planning".

This latest design incorporates item tracking entries in total availability calculations throughout the system, including planning, manufacturing, and warehousing. The old concept of carrying serial and lot numbers on the item ledger entries is reintroduced to ensure simple access to historical data for item tracking purposes. In connection with item tracking improvements in Business Central 3.60, the reservation system was expanded to non-order network entities, such as journals, invoices, and credit memos.

With the addition of serial or lot numbers, the reservation system handles permanent item attributes while also handling intermittent links between supply and demand in the form of order tracking entries and reservation entries. Another different characteristic of serial or lot numbers compared to the conventional reservation data is the fact that they can be posted, either partially or fully. Therefore, the **Reservation Entry** table (T337) now works with a related table, the **Tracking Specification** table (T336), which manages and displays summing across active and posted item tracking quantities. For more information, see [Design Details: Active versus Historic Item Tracking Entries](#).

The following diagram outlines the design of item tracking functionality in Business Central.

The central posting object is redesigned to handle the unique subclassification of a document line in the form of serial or lot numbers, and special relation tables are added to create the one-to-many relations between posted documents and their split item ledger entries and value ledger entries.

Codeunit 22, **Item Jnl. – Post Line**, now splits the posting according to the item tracking numbers that are specified on the document line. Each unique item tracking number on the line creates its own item ledger entry for the item. This means that the link from the posted document line to the associated item ledger entries is now a one-to-many relation. This relation is handled by the following item tracking relation tables.

FIELD	DESCRIPTION
Item Entry Relation (T6507)	Relates shipped or received lines to item ledger entries
Value Entry Relation (T6508)	Relates invoiced lines to value entries

For more information, see [Design Details: Item Tracking Posting Structure](#).

Design Details: Item Tracking Posting Structure

3/31/2019 • 3 minutes to read

To align with inventory costing functionality and to obtain a simpler and more robust solution, item ledger entries are used as the primary carrier of item tracking numbers.

Item tracking numbers on order network entities and non-order network entities are specified in the **Reservation Entry** table (T337). Item tracking numbers that are related to historical information are retrieved directly from the item ledger entries that are related to the transaction in question. This means that item ledger entries reflect the item tracking specification of the posted order line.

The **Item Tracking Lines** page retrieves the information from T337 and the item ledger entries and shows it through the temporary table, **Tracking Specification** (T336). T336 also hold the temporary data in the **Item Tracking Lines page** for item tracking quantities that remain to be invoiced.

One-to-Many Relation

The **Item Entry Relation** table, which is used to link a posted document line with its related item ledger entries, consists of two main parts:

- A pointer to the posted document line, the **Order Line No.** field.
- An entry number pointing to an item ledger entry, the **Item Entry No.** field.

The functionality of the existing **Entry No.** field, which relates an item ledger entry to a posted document line, handles the typical one-to-one relation when no item tracking numbers exist on the posted document line. If item tracking numbers exist, then the **Entry No.** field is left blank, and the one-to-many relation is handled by the **Item Entry Relation** table. If the posted document line carries item tracking numbers but only relates to a single item ledger entry, then the **Entry No.** field handles the relation, and the no record is created in the **Item Entry Relation** table.

Codeunits 80 and 90

To split the item ledger entries during posting, the code in codeunit 80 and codeunit 90, is encircled by loops that run through global temporary record variables. This code calls codeunit 22 with an item journal line. These variables are initialized when item tracking numbers exist for the document line. To keep the code simple, this looping structure is always used. If no item tracking numbers exist for the document line, then a single record is inserted, and the loop runs only once.

Posting the Item Journal

Item tracking numbers are transferred via the reservation entries that relate to the item ledger entry, and the looping through item tracking numbers occurs in codeunit 22. This concept works in the same way when an item journal line is used indirectly to post a sale or purchase order as when an item journal line is used directly. When the item journal is used directly, the **Source Row ID** field points to the item journal line itself.

Code Unit 22

Codeunits 80 and 90 loop the call of codeunit 22 during the invoice posting of item tracking numbers and during the invoicing of existing shipments or receipts.

During quantity posting of item tracking numbers, codeunit 22 retrieves item tracking numbers from the entries in

T337 that relate to the posting. These entries are placed directly on the item journal line.

Codeunit 22 loops through the item tracking numbers and splits the posting into the respective item ledger entries that carry the item tracking numbers. Information about which item ledger entries are created is returned to T337 by using a temporary T336 record, which is called by a procedure in codeunit 22. This procedure is triggered when codeunit 22 has finished its run because at that point, the codeunit 22 object contains the information. When the temporary T336 record is retrieved, codeunits 80 and 90 create records in the **Item Entry Relation** table to link the created item ledger entries to the created shipment or receipt line. Codeunits 80 or codeunit 90 then converts the temporary T336 records to real T336 records that are related to the line in question. However, this conversion occurs only if the posted document line is not deleted, because it is only partially posted.

Design Details: Active versus Historic Item Tracking Entries

3/31/2019 • 2 minutes to read

When parts of a document line quantity are posted, only that particular quantity is transferred to the item ledger entries and its item tracking numbers. However, you will want to access all relevant item tracking information directly from the active document line. That is, not only will you want to see the entries that are related to the remaining quantity, you will also want information about the units that have been posted. When you view or modify the **Item Tracking Lines** page, the collective contents of the **Tracking Specification** table (T336) and **Reservation Entry** table (T337) are presented in a temporary version of T336. This ensures that historic and active item tracking data is accessed as one.

The following table shows how T336 and T337 are used in a purchase scenario. The bold figures represent values that the user manually enters on the **Item Tracking Lines** page.

Step 1: Create a purchase order line of seven pieces with item tracking numbers.

	QUANTITY (BASE)	QTY. TO HANDLE	QTY. TO INVOICE (BASE)	QUANTITY HANDLED (BASE)	QUANTITY INVOICED (BASE)
T337	7	0	0	0	0
T336	0	0	0	0	0

Step 2: Receive four pieces.

	QUANTITY (BASE)	QTY. TO HANDLE	QTY. TO INVOICE (BASE)	QUANTITY HANDLED (BASE)	QUANTITY INVOICED (BASE)
Item Tracking Lines page	7	4	0	0	0
T337	3	0	0	0	0
T336	4	0	0	4	0

Step 3: Receive two pieces and invoice two pieces.

	QUANTITY (BASE)	QTY. TO HANDLE	QTY. TO INVOICE (BASE)	QUANTITY HANDLED (BASE)	QUANTITY INVOICED (BASE)
Item Tracking Lines page	7	2	2	4	0
T337	1	0	0	0	0
T336	6	0	0	6	2

Step 4: Receive one piece.

	QUANTITY (BASE)	QTY. TO HANDLE	QTY. TO INVOICE (BASE)	QUANTITY HANDLED (BASE)	QUANTITY INVOICED (BASE)
Item Tracking Lines page	7	1	0	6	2
T336	7	0	0	7	2

Invoice 5 pieces.

	QUANTITY (BASE)	QTY. TO HANDLE	QTY. TO INVOICE (BASE)	QUANTITY HANDLED (BASE)	QUANTITY INVOICED (BASE)
Item Tracking Lines page	7	0	5	7	2
T336	7	0	0	7	7

Design Details: Item Tracking Lines Page

3/31/2019 • 2 minutes to read

Item tracking records and reservation records are created in the reservation system, and their availability is calculated dynamically. Data that is entered on the **Item Tracking Lines** page is managed in a temporary version of the **Tracking Specification** table. When the page is closed, the active data is committed to the **Reservation Entry** table and the historic data is committed to the **Tracking Specification** table. For more information, see [Design Details: Active versus Historic Item Tracking Entries](#).

Lookups from the **Serial No.** and **Lot No.** fields show availability based on both the **Item Ledger Entry** table and the **Reservation Entry** table, with no date filter. The matrix of quantity fields on the header of the **Item Tracking Lines** page dynamically displays the quantities and sums of item tracking numbers that are being entered on the lines of the page. The quantities must correspond to those of the document line, which is indicated by **0** in the **Undefined** fields in the header of the page.

To coordinate the flow of serial and lot numbers through inventory, the following rules exist for entering data on the **Item Tracking Lines** page:

- For both inbound and outbound item tracking lines, you cannot enter a serial number, with or without a lot number, more than once in the same instance of the **Item Tracking Lines** page. If you try to enter any combination of serial or lot numbers that is already present on the page, then an error message blocks the data entry.
- For inbound item tracking lines, you cannot post the related document if an item of the same variant and with the same serial number is already in inventory. If you try to post a positive line for an inventory item with the same variant and serial number, then an error message blocks the posting. However, for both inbound and outbound item tracking lines on open documents, you can have the same combination of serial or lot numbers that relate to different source document lines, that is, existing in different instances of the **Item Tracking Lines** page until the related document is posted.
- If the item is set up for serial number-specific tracking or lot number-specific tracking, then you cannot post an outbound document line unless an item with the defined serial or lot number exists in inventory. If you try to post an outbound document line for an item with a serial lot number that is not in inventory, then an error message blocks the posting.

The rules for entering data on the **Item Tracking Lines** page also support the coupling principles that govern order tracking, planning, and reservation. For more information, see [Design Details: Item Tracking and Planning](#).

Design Details: Item Tracking Availability

3/31/2019 • 2 minutes to read

The **Item Tracking Lines** and **Item Tracking Summary** pages provide dynamic availability information for serial or lot numbers. The purpose of this is to increase transparency for users on outbound documents, such as sales orders, by showing them which serial numbers or how many units of a lot number are currently assigned on other open documents. This reduces uncertainty that is caused by double allocation and instills confidence in order processors that the item tracking numbers and dates that they are promising on unposted sales orders can be fulfilled. For more information, see [Design Details: Item Tracking Lines Page](#).

When you open the **Item Tracking Lines** page, availability data is retrieved from the **Item Ledger Entry** table and the **Reservation Entry** table, with no date filter. When you choose the **Serial No.** field or the **Lot No.** field, the **Item Tracking Summary** page opens and shows a summary of the item tracking information in the **Reservation Entry** table. The summary contains the following information about each serial or lot number on the item tracking line:

FIELD	DESCRIPTION
Total Quantity	The total quantity of the serial or lot number that is currently in inventory.
Total Requested Quantity	The total quantity of the serial or lot number that is currently requested in all documents.
Current Pending Quantity	The quantity that is entered in the current instance of the Item Tracking Lines page but is not yet committed to the database.
Total Available Quantity	<p>The quantity of the serial or lot number that is available for the user to request.</p> <p>This quantity is calculated from other fields on the page as follows:</p> <p>total quantity – (total requested quantity + current pending quantity).</p>

NOTE

You can also see the information in the preceding table by using the **Select Entries** function on the **Item Tracking Lines** page.

To preserve database performance, availability data is only retrieved once from the database when you open the **Item Tracking Lines** page and when you use the **Refresh Availability** function on the page.

Calculation Formula

As described in the preceding table, the availability of a given serial or lot number is calculated as follows.

total available quantity = quantity in inventory – (all demands + quantity not yet committed to the database)

IMPORTANT

This formula implies that the serial or lot number availability calculation considers only inventory and ignores projected receipts. Accordingly, supply that is not yet posted to inventory does not affect item tracking availability, as opposed to regular item availability where projected receipts are included.

Design Details: Item Application

3/31/2019 • 12 minutes to read

When you post an inventory transaction, the quantity posting is recorded in the item ledger entries, the value posting in the value entries. For more information, see [Design Details: Inventory Posting](#).

In addition, an item application is made to link the cost recipient to its cost source to provide cost forwarding according to the costing method. For more information, see [Design Details: Costing Methods](#).

Business Central makes two types of item application.

APPLICATION TYPE	DESCRIPTION
Quantity application	Created for all inventory transactions
Cost application	Created for inbound entries together with a quantity application as a result of user interaction in special processes.

Item applications can be made in the following ways.

METHOD	DESCRIPTION	APPLICATION TYPE
Automatic	Occurs as general cost forwarding according to the costing method	Quantity application
Fixed	Made by the user when: <ul style="list-style-type: none">- Processing returns- Posting corrections- Undoing quantity postings- Creating drop shipments Note: The fixed application can be made either manually by entering an entry number in the Appl.-from Item Entry field or by using a function, such as the Get Posted Document Lines to Reverse .	Quantity application Cost application Note: Cost application only occurs in inbound transactions where the Appl.-from Item Entry field is filled to create a fixed application. See the next table.

Whether quantity applications or cost applications are made depends on the direction of the inventory transaction and whether the item application is made automatically or fixed, in connection with special processes.

The following table shows, based on the central application fields on inventory transaction lines, how costs flow depending on the transaction direction. It also indicates when and why the item application is of type quantity or cost.

	APPL.-TO ITEM ENTRY FIELD	APPL.-FROM ITEM ENTRY FIELD
Application for outbound entry	The outbound entry pulls the cost from the open inbound entry. Quantity application	Not supported

	APPL.-TO ITEM ENTRY FIELD	APPL.-FROM ITEM ENTRY FIELD
Application for inbound entry	<p>The inbound entry pushes the cost onto the open outbound entry.</p> <p>The inbound entry is the cost source.</p> <p>Quantity application</p>	<p>The inbound entry pulls the cost from the outbound entry. Note: When making this fixed application, the inbound transaction is treated as a sales return. Therefore, the applied outbound entry remains open.</p> <p>The inbound entry is NOT the cost source.</p> <p>Cost application</p>

IMPORTANT

A sales return is NOT considered a cost source when fixed applied.

The sales entry remains open until the real source is posted.

An item application entry records the following information.

FIELD	DESCRIPTION
Item Ledger Entry No.	The number of the item ledger entry for the transaction that this application entry is created for.
Inbound Item Entry No.	The item ledger entry number of the inventory increase to which the transaction should be linked, if applicable.
Outbound Item Entry No.	The item ledger entry number of the inventory decrease to which the transaction should be linked, if applicable.
Quantity	The quantity being applied.
Posting Date	The posting date of the transaction.

Inventory Increase

When you post an inventory increase, then a simple item application entry is recorded without an application to an outbound entry.

Example

The following table shows the item application entry that is created when you post a purchase receipt of 10 units.

POSTING DATE	INBOUND ITEM ENTRY NO.	OUTBOUND ITEM ENTRY NO.	QUANTITY	ITEM LEDGER ENTRY NO.
01-01-20	1	0	10	1

Inventory Decrease

When you post an inventory decrease, an item application entry is created that links the inventory decrease to an inventory increase. This link is created by using the item's costing method as a guideline. For items using FIFO, Standard, and Average costing methods, the linking is based on the first-in-first-out principle. The inventory

decrease is applied to the inventory increase with the earliest posting date. For items using the LIFO costing method, the linking is based on the last-in-first-out principle. The inventory decrease is applied to the inventory increase with the most recent posting date.

In the **Item Ledger Entry** table, the **Remaining Quantity** field shows the quantity that has not yet been applied. If the remaining quantity is more than 0, then the **Open** check box is selected.

Example

The following example shows the item application entry that is created when you post a sales shipment of 5 units of the items that were received in the previous example. The first item application entry is the purchase receipt. The second application entry is the sales shipment.

The following table shows the two item application entries that result from the inventory increase and the inventory decrease, respectively.

POSTING DATE	INBOUND ITEM ENTRY NO.	OUTBOUND ITEM ENTRY NO.	QUANTITY	ITEM LEDGER ENTRY NO.
01-01-20	1	0	10	1
01-03-20	1	2	-5	2

Fixed Application

You make a fixed application when you specify that the cost of an inventory increase should apply to a specific inventory decrease, or vice versa. The fixed application affects the remaining quantities of the entries, but the fixed application also reverses the exact cost of the original entry that you are applying to, or from.

To make a fixed application, you use the **Appl.-to Item Entry** field or the **Appl.-from Item Entry** field in the document lines to specify the item ledger entry that you want the transaction line to apply to, or from. For example, you might make a fixed application when you want to create a cost application that specifies that a sales return should apply to a specific sales shipment to reverse the cost of the sales shipment. In this case, Business Central ignores the costing method and applies the inventory decrease, or increase, for a sales return, to the item ledger entry that you specify. The advantage of making a fixed application is that the cost of the original transaction is passed to the new transaction.

Example – Fixed Application in Purchase Return

The following example, which illustrates the effect of fixed application of a purchase return of an item using the FIFO costing method, is based on the following scenario:

1. In entry number 1, the user posts a purchase at a cost of LCY 10.00.
2. In entry number 2, the user posts a purchase at a cost of LCY 20.00.
3. In entry number 3, the user posts a purchase return. The user makes a fixed application to the second purchase by entering the item ledger entry number in the **Appl.-to Item Entry** field on the purchase return order line.

The following table shows item ledger entries resulting from the scenario.

POSTING DATE	ITEM LEDGER ENTRY TYPE	QUANTITY	COST AMOUNT (ACTUAL)	ITEM LEDGER ENTRY NO.
01-04-20	Purchase	10	10.00	1
01-05-20	Purchase	10	20.00	2
01-06-20	Purchase (Return)	-10	-20.00	3

Because a fixed application is made from the purchase return to the second purchase entry, the items are returned at the correct cost. If the user had not performed the fixed application, then the returned item would be incorrectly valued at LCY 10.00 because the return would have been applied to the first purchase entry according to the FIFO principle.

The following table shows the item application entry that results from the fixed application.

POSTING DATE	INBOUND ITEM ENTRY NO.	OUTBOUND ITEM ENTRY NO.	QUANTITY	ITEM LEDGER ENTRY NO.
01-06-20	1	3	10	3

The cost of the second purchase, LCY 20.00, is passed correctly to the purchase return.

Example – Fixed Application with Average Cost

The following example, which illustrates the effect of fixed application, is based on the following scenario for an item that uses the Average costing method:

1. In entry numbers 1 and 2, the user posts two purchase invoices. The second invoice has the incorrect direct unit cost of LCY 1000.00.
2. In entry number 3, the user posts a purchase credit memo, with a fixed application applied to the purchase entry with the wrong direct unit cost. The sum of the **Cost Amount (Actual)** field for the two fixed applied value entries becomes 0.00
3. In entry number 4, the user posts another purchase invoice with the correct direct unit cost of LCY 100.00
4. In entry number 5, the user posts a sales invoice.
5. The inventory quantity is 0, and the inventory value is also 0.00

The following table shows the result of the scenario on the item's value entries.

POSTING DATE	ITEM LEDGER ENTRY TYPE	VALUED QUANTITY	COST AMOUNT (ACTUAL)	APPL.-TO ITEM ENTRY	VALUED BY AVERAGE COST	ITEM LEDGER ENTRY NO.	ENTRY NO.
01-01-20	Purchase	1	200.00		No	1	1
01-01-20	Purchase	1	1000.00		No	2	2
01-01-20	Purchase	-1	-1000	2	No	3	3
01-01-20	Purchase	1	100.00		No	4	4
01-01-20	Sale	-2	-300.00		Yes	5	5

If the user had not made the fixed application between the purchase credit memo and the purchase with the incorrect direct unit cost (step 2 in the previous scenario), then the cost would have been adjusted differently.

The following table shows the result on the item's value entries if step 2 in the previous scenario is performed without a fixed application.

POSTING DATE	ITEM LEDGER ENTRY TYPE	VALUED QUANTITY	COST AMOUNT (ACTUAL)	APPL.-TO ITEM ENTRY	VALUED BY AVERAGE COST	ITEM LEDGER ENTRY NO.	ENTRY NO.
01-01-20	Purchase	1	200.00		No	1	1

POSTING DATE	ITEM LEDGER ENTRY TYPE	VALUED QUANTITY	COST AMOUNT (ACTUAL)	APPL.-TO ITEM ENTRY	VALUED BY AVERAGE COST	ITEM LEDGER ENTRY NO.	ENTRY NO.
01-01-20	Purchase	1	1000.00		No	2	2
01-01-20	Purchase	-1	433,33		Yes	3	3
01-01-20	Purchase	1	100.00		No	4	4
01-01-20	Sale	-2	866,67		Yes	5	5

In entry number 3, the value in the **Cost Amount (Actual)** field is valued by average and therefore includes the erroneous posting of 1000.00. Accordingly, it becomes -433,33, which is an inflated cost amount. The calculation is $1300 / 3 = -.433,33$.

In entry number 5, the value of the **Cost Amount (Actual)** field for this entry is also inaccurate for the same reason.

NOTE

If you create a fixed application for an inventory decrease for an item that uses the Average costing method, then the decrease will not receive the average cost for the item as usual, but will instead receive the cost of the inventory increase that you specified. That inventory decrease is then no longer part of the average cost calculation.

Example – Fixed Application in Sales Return

Fixed applications are also a very good means of reversing cost exactly, such as with sales returns.

The following example, which illustrates how a fixed application ensures exact cost reversal, is based on the following scenario:

1. The user posts a purchase invoice.
2. The user posts a sales invoice.
3. The user posts a sales credit memo for the returned item, which applies to the sales entry, to reverse the cost correctly.
4. A freight cost, related to the purchase order that was posted earlier, arrives. The user posts it as an item charge.

The following table shows the result of scenario steps 1 through 3 on the item's value entries.

POSTING DATE	ITEM LEDGER ENTRY TYPE	VALUED QUANTITY	COST AMOUNT (ACTUAL)	APPL.-FROM ITEM ENTRY	ITEM LEDGER ENTRY NO.	ENTRY NO.
01-01-20	Purchase	1	1000.00		1	1
02-01-20	Sale	-1	1000.00		2	2
03-01-20	Sale (Credit Memo)	1	1000	2	3	3

The following table shows the value entry resulting from scenario step 4, posting the item charge.

POSTING DATE	ITEM LEDGER ENTRY TYPE	VALUED QUANTITY	COST AMOUNT (ACTUAL)	APPL.-FROM ITEM ENTRY	ITEM LEDGER ENTRY NO.	ENTRY NO.
04-01-20	(Item Charge)	1	100.00		1	4

The following table shows the effect of the exact cost reversal on the item's value entries.

POSTING DATE	ITEM LEDGER ENTRY TYPE	VALUED QUANTITY	COST AMOUNT (ACTUAL)	APPL.-FROM ITEM ENTRY	ITEM LEDGER ENTRY NO.	ENTRY NO.
01-01-20	Purchase	1	1000.00		1	1
02-01-20	Sale	-1	1100.00		2	2
03-01-20	Sale (Credit Memo)	1	1100.00	2	3	3
04-01-20	(Item Charge)	1	100.00		1	4

When you run the **Adjust Cost - Item Entries** batch job, the increased cost of the purchase entry, due to the item charge, is forwarded to the sales entry (entry number 2). The sales entry then forwards this increased cost to the sales credit entry (entry number 3). The final result is that the cost is correctly reversed.

NOTE

If you are working with returns or credit memos and you have set up the **Exact Cost Reversing Mandatory** field in either the **Purchases & Payables Setup** page or the **Sales & Receivables Setup** page, as appropriate for your situation, then Business Central automatically fills the various application entry fields when you use the **Copy Document** function. If you use the **Get Posted Document Lines to Reverse** function, then the fields are always filled automatically.

NOTE

If you post a transaction with a fixed application, and the item ledger entry that you are applying to is closed, meaning that the remaining quantity is zero, then the old application is automatically undone and reapplies the item ledger entry using the fixed application that you specified.

Transfer Application

When an item is transferred from one location to another, inside the company inventory, then an application is created between the two transfer entries. Valuing a transfer entry depends on the costing method. For items using the Average costing method, valuation is made using the average cost in the average cost period in which the valuation date of the transfer occurs. For items using other costing methods, valuation is made by tracing back to the cost of the original inventory increase.

Example – Average Costing Method

The following example, which illustrates how transfer entries are applied, is based on the following scenario for an item using Average costing method and an average cost period of Day.

1. The user purchases the item at a cost of LCY 10.00.
2. The user purchases the item again at a cost of LCY 20.00.
3. The user transfers the item from BLUE to RED location.

The following table shows the effect of the transfer on the item's value entries.

POSTING DATE	ITEM LEDGER ENTRY TYPE	LOCATION CODE	VALUED QUANTITY	COST AMOUNT (ACTUAL)	ENTRY NO.
01-01-20	Purchase	BLUE	1	10.00	1

POSTING DATE	ITEM LEDGER ENTRY TYPE	LOCATION CODE	VALUED QUANTITY	COST AMOUNT (ACTUAL)	ENTRY NO.
01-01-20	Purchase	BLUE	1	20.00	2
02-01-20	Transfer	BLUE	-1	15.00	3
02-01-20	Transfer	RED	1	15.00	4

Example – Standard Costing Method

The following example, which illustrates how transfer entries are applied, is based on the following scenario for an item using Standard costing method and an average cost period of Day.

1. The user purchases the item at a standard cost of LCY 10.00.
2. The user transfers the item from BLUE to RED location at a standard cost of LCY 12.00.

The following table shows the effect of the transfer on the item's value entries.

POSTING DATE	ITEM LEDGER ENTRY TYPE	LOCATION CODE	VALUED QUANTITY	COST AMOUNT (ACTUAL)	ENTRY NO.
01-01-20	Purchase	BLUE	1	10.00	1
02-01-20	Transfer	BLUE	-1	10.00	2
02-01-20	Transfer	RED	1	10.00	3

Since the value of the original inventory increase is LCY 10.00, the transfer is valued at that cost, not at LCY 12.00.

Reapplication

Because of the way an item's unit cost is calculated, an incorrect item application could lead to a skewed average cost and unit cost. The following scenarios may cause incorrect item applications, which require that you undo item applications and reapply item ledger entries:

- You have forgotten to make a fixed application.
- You have made an incorrect fixed application.
- You want to overrule the application created automatically when posting, according to the item's costing method.
- You have to return an item to which a sale has already been manually applied, without using the **Get Posted Document Lines to Reverse** function, and you must therefore undo the application.

Business Central offers a feature for analyzing and correcting item applications. This work is performed on the **Application Worksheet** page.

Design Details: Item Tracking and Reservations

3/31/2019 • 6 minutes to read

Simultaneous use of reservation and specific item tracking is uncommon, because they both create a coupling between supply and demand. Except for situations where a customer or production planner requests a specific lot, it rarely makes sense to reserve inventory items that already carry item tracking numbers for specific application. Although it is possible to reserve items that require specific item tracking, special functionality is needed to avoid availability conflicts between order processors that request the same item-tracked items.

The concept of Late Binding ensures that a nonspecific reservation of a serial number or a lot number remains loosely coupled until posting. At posting time, the reservation system can reshuffle nonspecific reservations to ensure that fixed application is possible against the serial or lot number that is actually picked. Meanwhile, the serial or lot number is made available for specific reservation in other documents that request that particular serial or lot number.

A nonspecific reservation is one in which the user does not care which specific item is picked, and a specific reservation is one in which the user does care.

NOTE

The Late Binding functionality relates only to items that are set up with specific item tracking, and it applies only to reservations against inventory, not against inbound supply orders.

Reservation of item tracking numbers falls into two categories, as shown in the following table.

RESERVATION	DESCRIPTION
Specific	<p>You select a specific serial or lot number when you reserve the inventory item from a demand, such as a sales order.</p> <p>This is a regular reservation. It is a rigid link between supply and demand that both carry serial or lot numbers. Note: The demand carries serial or lot numbers.</p> <p>For example, you want to reserve a can of blue paint from Lot A, because the customer requests it. A can of blue paint from Lot A is shipped to the customer.</p>
Nonspecific	<p>You do not select a specific serial or lot number when you reserve the inventory item from a demand, such as a sales order.</p> <p>This is a state that is imposed on a reservation entry for serial or lot numbers that are not selected specifically. Note: The demand does not carry serial or lot numbers.</p> <p>For example, you want to reserve a can of blue paint from any lot for your sales order. A can of blue paint from a random serial or lot number is shipped to the customer.</p>

The main difference between specific and nonspecific reservation is defined by the existence of serial or lot numbers on the demand side, as shown in the following table.

	Supply	Demand
Specific	Serial or lot number.	Serial or lot number.
Nonspecific	Serial or lot number.	No serial or lot number.

When you reserve inventory quantities from an outbound document line for an item that has item tracking numbers assigned and is set up for specific item tracking, the **Reservation** page leads you through different workflows depending on your need for the serial or lot numbers.

Specific Reservation

When you choose **Reserve** from the outbound document line, a dialog box appears that asks you if you want to reserve specific serial or lot numbers. If you choose **Yes**, then a list is displayed with all the serial or lot numbers that are assigned to the document line. The **Reservation** page opens after you select one of the serial or lot numbers, and you can then reserve among the selected serial or lot numbers in a typical fashion.

If some of the specific item tracking numbers that you are trying to reserve are held in nonspecific reservations, then a message at the bottom of the **Reservation** page informs you how many of the total reserved quantity are held in nonspecific reservations and whether they are still available.

Nonspecific Reservation

If you choose **No** in the dialog box that appears, the **Reservation** page opens and allows you to reserve among all serial or lot numbers in inventory.

Because of the structure of the reservation system, when you place a nonspecific reservation on an item-tracked item, the system must select specific item ledger entries to reserve against. Because the item ledger entries carry the item tracking numbers, the reservation indirectly reserves specific serial or lot numbers, even though you did not intend to. To handle this situation, the reservation system tries to reshuffle nonspecific reservation entries before posting.

The system actually still reserves against specific entries, but then it uses a reshuffling mechanism whenever there is specific demand for the lot or serial number in the nonspecific reservation. This can be the case when you post a demand transaction, such as a sales order, consumption journal, or transfer order, for the serial or lot number, or when you try to specifically reserve the serial or lot number. The system reshuffles the reservations to make the lot or serial number available to the demand or to the specific reservation, thereby placing a different lot or serial number in the nonspecific reservation. If there is insufficient quantity in inventory, the system reshuffles as much as possible, and you receive an availability error if there is still insufficient quantity at the time of posting.

NOTE

On a nonspecific reservation the lot number or serial number field is blank in the reservation entry that points at the demand, such as the sale.

Reshuffle

When a user posts an outbound document after picking the wrong serial or lot number, other nonspecific reservations are reshuffled to reflect the actual serial or lot number that is picked. This satisfies the posting engine with a fixed application between supply and demand.

For all supported business scenarios, reshuffling is possible only against positive item ledger entries that carry

reservation and serial or lot numbers but without defined serial or lot numbers on the demand side.

Supported Business Scenarios

The Late Binding functionality supports the following business scenarios:

- Entering a specific serial or lot number on an outbound document with nonspecific reservation of a wrong serial or lot number.
- Reserving a specific serial or lot number.
- Posting an outbound document with nonspecific reservation of a serial or lot number.

Entering Serial or Lot Numbers on an Outbound Document with Wrong Nonspecific Reservation

This is the most common of the three supported scenarios. In this case, the Late Binding functionality ensures that a user can enter a serial or lot number, which is actually picked, on an outbound document that already has a nonspecific reservation of another serial or lot number.

For example, the need arises when an order processor has first made a nonspecific reservation of any serial or lot number. Later when the item is actually picked from inventory, the picked serial or lot number must be entered on the order before it is posted. The nonspecific reservation is reshuffled at posting time to ensure that the picked serial or lot number can be entered without losing the reservation and to ensure that the picked serial or lot number can be fully applied and posted.

Reserve Specific Serial or Lot Numbers

In this business scenario, Late Binding functionality ensures that a user who is trying to reserve a particular serial or lot number that is currently nonspecifically reserved can do so. A nonspecific reservation is reshuffled at the time of reservation to free the serial or lot number for the specific request.

The reshuffle happens automatically, but embedded Help is displayed at the bottom of the **Reservation** page and shows the following text:

XX of the Total Reserved Quantity are nonspecific and may be available.

In addition, the **Nonspecific Reserved Qty.** field shows how many reservation entries are nonspecific. By default, this field is not visible to users.

Posting an Outbound Document with Nonspecific Reservation of Serial or Lot Numbers

This business scenario is supported with Late Binding functionality that enables fixed application and outbound posting of what is actually picked by reshuffling another nonspecific reservation of a serial or lot number. If reshuffling is not possible, then the following standard error message appears when the user tries to post the shipment:

Item XX cannot be fully applied.

Design Details: Item Tracking in the Warehouse

3/31/2019 • 2 minutes to read

Serial number and lot number handling is primarily a warehouse task and therefore all inbound and outbound warehouse documents have standard functionality for assigning and selecting item tracking numbers.

However, because the reservation system is based on item ledger entries, warehouse activity documents that register only warehouse entries are not fully supported. Because reservations and item tracking numbers can be handled only at the location level, not at the bin and zone level, the **Item Tracking Lines** page cannot be opened from warehouse activity documents. The same applies to the **Reservation** page.

After a serial or lot number has been added to an item at a warehouse location, it can be moved and reclassified freely within the warehouse by using an independent item tracking structure that is unrelated to the reservation system. **Serial No.** and **Lot No.** fields are accessed directly on warehouse document lines. When the serial or lot number later partakes in outbound posting, it is synchronized with the reservation system as a part of ordinary bin adjustment. For more information, see [Design Details: Integration with Inventory](#).

However, the reservation system does take warehouse activities into consideration when it calculates availability. For example, items that are allocated to picks, or registered as picked, cannot be reserved. For more information, see [Design Details: Warehouse Availability](#).

Design Details: General Journal Post Line

3/31/2019 • 2 minutes to read

This documentation provides detailed technical insight into the concepts and principles that are used to redesign the general journal posting line feature in Business Central. The redesign makes codeunit 12 simpler and more maintainable. The documentation starts by describing conceptual overviews of the redesign. Then it explains the technical architecture to show the changes that result from the redesign.

General Journal Post Line Overview

3/31/2019 • 2 minutes to read

Codeunit 12, **Gen. Jnl.-Post Line**, is the major application object for general ledger posting and is the only place to insert general ledger, VAT, and customer and vendor ledger entries. This codeunit is also used for all Apply, Unapply and Reverse operations.

While the codeunit has been improved in each release over the last ten years, its architecture remained essentially unchanged. The codeunit became very large, with approximately 7,600 code lines. With this release of Business Central, the architecture is changed and the codeunit has been made simpler and more maintainable. This documentation introduces the changes and provides information that you will need for upgrade.

Old Architecture

The old architecture had the following features:

- There was extensive use of global variables, which increased the possibility of hidden errors due to use of variables with the wrong scope.
- There were many long procedures (with more than 100 code lines) that also had high cyclomatic complexity (that is, a lot of CASE, REPEAT, IF nested statements), which made the code very difficult to read and maintain.
- Several procedures that were only used locally and were only meant to be used locally were not marked as local.
- Most procedures had no parameters and used global variables. Some used parameters and overrode global variables with locals.
- Code patterns for searching the general ledger accounts and creating general ledger and VAT entries was not standardized and varied from place to place. In addition, there was a lot of code duplication and broken symmetry between customer and vendor code.
- A large part of the code in codeunit 12, approximately 30 percent, related to payment discount and tolerance calculations, although these features are not needed in many countries or regions.
- Posting, Apply, Unapply, Reverse, Payment Discount and Tolerance, and Exchange Rate Adjustment were married together in codeunit 12 using a long list of global variables.

New Architecture

In Business Central, codeunit 12 has had the following improvements:

- Codeunit 12 has been refactored into smaller procedures (all less than 100 code lines).
- Standardized patterns for the search of general ledger accounts have been implemented by using helper functions from Posting Group tables.
- A Posting Engine Framework has been implemented to manage the start and finish of transactions and to isolate the creation to general ledger and VAT entries, the collection of VAT adjustment, and the calculation of additional currency amounts.
- Code duplication has been eliminated.
- Many helper functions have been transferred to corresponding customer and vendor ledger entry tables.
- The use of global variables has been minimized, so that each procedure uses parameters and encapsulates its own application logic.

Design Details: Posting Interface Structure

3/31/2019 • 2 minutes to read

In the Business Central posting interface structure, there are several global procedures that use the same structure:

- RunWithCheck and RunWithoutCheck call procedure Code – generic posting interface for Gen. Jnl Line.
- CustPostApplyCustLedgEntry – post customer application, called from codeunit 226 CustEntry-Apply Posted Entries.
- VendPostApplyVendLedgEntry – post vendor application, called from codeunit 227 VendEntry-Apply Posted Entries.
- UnapplyCustLedgEntry – post unapply of customer application, called from codeunit 226 CustEntry-Apply Posted Entries
- UnapplyVendLedgEntry – post unapply of vendor application, called from codeunit 227 VendEntry-Apply Posted Entries

Design Details: Posting Engine Structure

3/31/2019 • 2 minutes to read

Posting interface and some other functions in codeunit 12 use posting engine functions to prepare and insert general ledger entry and VAT entry records. The posting engine is also responsible for general ledger register creation.

The functions in the following table provide a standard framework for designing posting procedures (such as Code, CustPostApplyCustLedgEntry, VendPostApplyVendLedgEntry, UnapplyCustLedgEntry, UnapplyVendLedgEntry, and Reverse) and exclusive access to table 17, G/L Entry.

ROUTINE	DESCRIPTION
StartPosting	Initializes posting buffer TempGLEntryBuf, locks G/L Entry and VAT Entry tables, and initializes Accounting Period, G/L Register, and Exchange Rate. Should be called only once, then NextEntryNo is 0.
ContinuePosting	Checks and posts unrealized VAT for previous transaction increment NextTransactionNo and prepares post of next line.
FinishPosting	Completes posting by inserting G/L entries from temporary buffer into database table. Always used together with StartPosting. Checks for inconsistencies.
InitGLEntry	Used to initialize new G/L entry for Gen. Jnl Line. Returns GLEntry as parameter.
InitGLEntryVAT	Same as InitGLEntry, but also assigns Bal. Account No. and SummarizeVAT.
InitGLEntryVATCopy	Similar to InitGLEntryVAT, but also copies posting groups data from VAT Entry before SummarizeVAT.
InsertGLEntry	The only function that inserts G/L entry into global TempGLEntryBuf table. Always use this function for insert.
CreateGLEntry	Performs an InitGLEntry, assigns Additional Currency Amount, and then performs InsertGLEntry. Replaces several lines of code with a single function call.
CreateGLEntryBalAcc	Same as CreateGLEntry, but also assigns Bal. Account Type and Bal. Account No.
CreateGLEntryVAT	Same as CreateGLEntry, but with additional processing for posting groups and saving to temporary VAT buffer: <pre>GLEntry.CopyPostingGroupsFromDtldCVBuf(DtldCVLedgEntryBuf, GenJnlLinePosting Type);</pre> <pre>InsertVATEntriesFromTemp(DtldCVLedgEntryBuf, GLEntry);</pre>
CreateGLEntryVATCollectAdj	Same as CreateGLEntry, but with additional collection of adjustments and saving to temporary VAT buffer: <pre>CollectAdjustment(AdjAmount, GLEntry.Amount, GLEntry."Additional-Currency Amount", OriginalDateSet);</pre> <pre>InsertVATEntriesFromTemp(DtldCVLedgEntryBuf, GLEntry);</pre>
CreateGLEntryFromVATEntry	Same as CreateGLEntry, but also copies posting groups from VAT entry.

Design Details: Dimension Set Entries

3/31/2019 • 2 minutes to read

This documentation provides detailed technical insight into the concepts and principles of the dimension-entry storing and posting functionality in Business Central. The documentation starts by describing conceptual overviews. Then it explains the technical architecture. Finally, it provides code examples to prepare you for dimension code migration and upgrade from versions earlier than Dynamics NAV 2013R2.

In This Section

Dimension Set Entries Overview

3/31/2019 • 2 minutes to read

This topic describes how dimension set entries are stored and posted in Business Central.

Dimension Sets

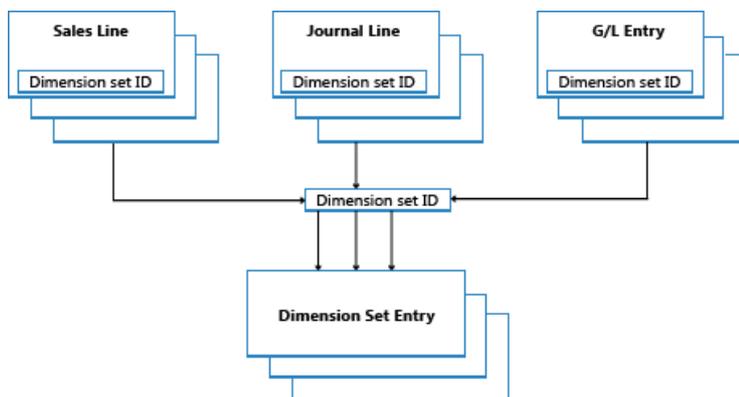

A dimension set is a unique combination of dimension values. It is stored as dimension set entries in the database. Each dimension set entry represents a single dimension value. The dimension set is identified by a common dimension set ID that is assigned to each dimension set entry that belongs to the dimension set.

The following example shows a dimension set that has three dimension set entries. The dimension set is identified by a dimension set ID, which is 108.

DIMENSION SET ID	DIMENSION CODE	DIMENSION VALUE CODE	DIMENSION VALUE NAME
108	AREA	70	America North
108	BUSINESSGROUP	HOME	Home
108	DEPARTMENT	SALES	Sales

Dimension Set Entries

Dimension sets are stored in the **Dimension Set Entry** table as dimension set entries with the same dimension set ID.

When you create a new journal line, document header, or document line, you can specify a combination of dimension values. Instead of explicitly storing each dimension value in the database, a dimension set ID is assigned to the journal line, document header, or document line to specify the dimension set.

When you edit and close the **Edit Dimension Set Entries** page, a check is performed to see whether the combination of dimension values exists as a dimension set in the table. If the combination occurs in the table, then the corresponding dimension set ID is assigned to the journal line, document header, or document line. Otherwise, a new dimension set is added to the table, and the new dimension set ID is assigned to the journal line, document header, or document line.

Performance Improvement

By storing dimension sets once in the database, database space is preserved and overall performance is improved.

Design Details: Searching for Dimension Combinations

3/31/2019 • 2 minutes to read

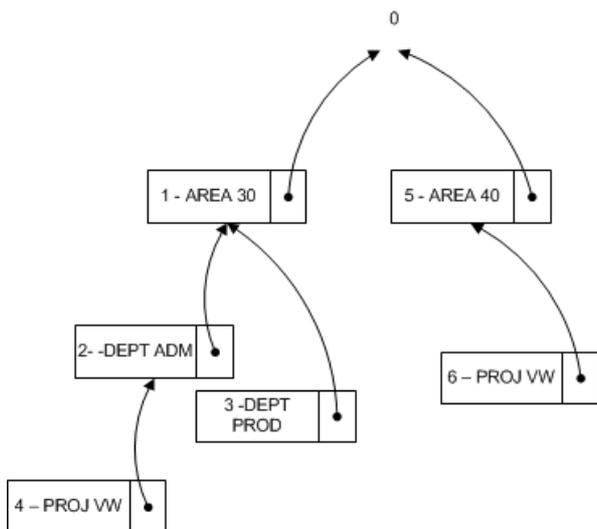

When you close a page after you edit a set of dimensions, Business Central evaluates whether the edited set of dimensions exists. If the set does not exist, a new set is created and the dimension combination ID is returned.

Building Search Tree

Table 481 **Dimension Set Tree Node** is used when Business Central evaluates whether a set of dimensions already exists in table 480 **Dimension Set Entry** table. The evaluation is performed by recursively traversing the search tree starting at the top level numbered 0. The top level 0 represents a dimension set with no dimension set entries. The children of this dimension set represent dimension sets with only one dimension set entry. The children of these dimension sets represent dimension sets with two children, and so on.

Example 1

The following diagram represents a search tree with six dimension sets. Only the distinguishing dimension set entry is displayed in the diagram.

The following table describes a complete list of dimension set entries that make up each dimension set.

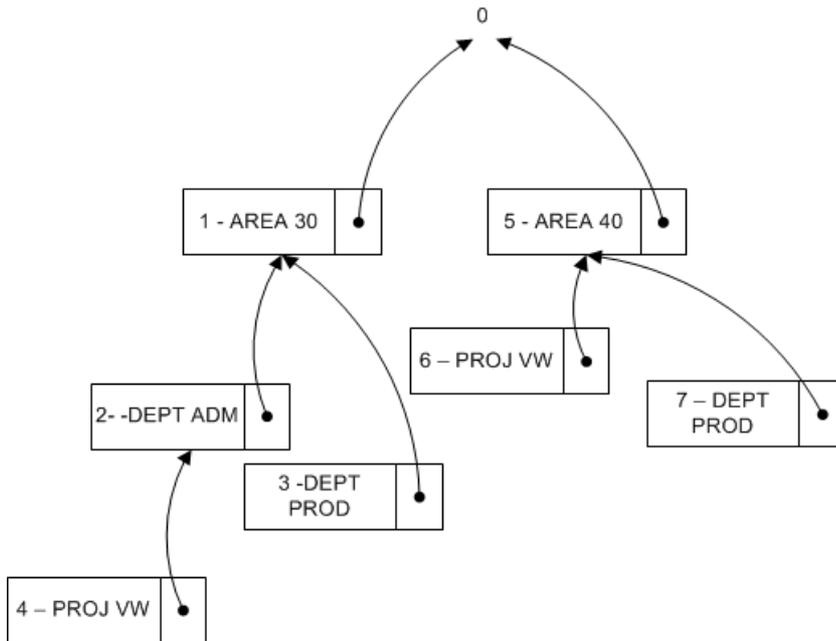

DIMENSION SETS	DIMENSION SET ENTRIES
Set 0	None
Set 1	AREA 30
Set 2	AREA 30, DEPT ADM
Set 3	AREA 30, DEPT PROD
Set 4	AREA 30, DEPT ADM, PROJ VW
Set 5	AREA 40

DIMENSION SETS	DIMENSION SET ENTRIES
Set 6	AREA 40, PROJ VW

Example 2

This example shows how Business Central evaluates whether a dimension set that consists of the dimension set entries AREA 40, DEPT PROD exists.

First, Business Central also updates the **Dimension Set Tree Node** table to make sure that the search tree looks like the following diagram. Thus dimension set 7 becomes a child of the dimension set 5.

Finding Dimension Set ID

At a conceptual level, **Parent ID**, **Dimension**, and **Dimension Value**, in the search tree, are combined and used as the primary key because Business Central traverses the tree in the same order as the dimension entries. The GET function (record) is used to search for dimension set ID. The following code example shows how to find the dimension set ID when there are three dimension values.

```

DimSet."Parent ID" := 0; // 'root'
IF UserDim.FINDSET THEN
  REPEAT
    DimSet.GET(DimSet."Parent ID",UserDim.DimCode,UserDim.DimValueCode);
  UNTIL UserDim.NEXT = 0;
EXIT(DimSet.ID);

```

However, to preserve the ability of Business Central to rename both a dimension and a dimension value, table 349, **Dimension Value**, is extended with an integer field, **Dimension Value ID**. This table converts the field pair, **Dimension** and **Dimension Value**, to an integer value. When you rename the dimension and dimension value, the integer value is not changed.

```

DimSet."Parent ID" := 0; // 'root'
IF UserDim.FINDSET THEN
  REPEAT
    DimSet.GET(DimSet.ParentID,UserDim."Dimension Value ID");
  UNTIL UserDim.NEXT = 0;
EXIT(DimSet.ID);

```

Design Details: Table Structure

3/31/2019 • 4 minutes to read

To understand how dimension entries are stored and posted, it is important to understand the table structure.

Table 480, Dimension Set Entry

You cannot change this table. After data has been written to the table, you cannot delete or edit it.

FIELD NO.	FIELD NAME	DATA TYPE	COMMENT
1	ID	Integer	>0.0 is reserved for the empty dimension set. References field 3 in table 481.
2	Dimension Code	Code 20	Table relation to table 348.
3	Dimension Value Code	Code 20	Table relation to table 349.
4	Dimension Value ID	Integer	References field 12 in table 349. It is the secondary key that is used when traversing table 481.
5	Dimension Name	Text 30	CalcField. Lookup to table 348.
6	Dimension Value Name	Text 30	CalcField. Lookup to table 349.

Table 481, Dimension Set Tree Node

You cannot change this table. It is used to search for a dimension set. If the dimension set is not found, a new set is created.

FIELD NO.	FIELD NAME	DATA TYPE	COMMENT
1	Parent Dimension Set ID	Integer	0 for top level node.
2	Dimension Value ID	Integer	Table relation to field 12 in table 349.
3	Dimension Set ID	Integer	AutoIncrement. Used in field 1 in table 480.
4	In Use	Boolean	False if not in use.

Table 482 Reclas. Dimension Set Buffer

This table is used when you change a dimension value code, for example, on an item ledger entry by using the

Item Reclassification Journal page.

FIELD NO.	FIELD NAME	DATA TYPE	COMMENT
1	Dimension Code	Code 20	Table relation to table 348.
2	Dimension Value Code	Code 20	Table relation to table 349.
3	Dimension Value ID	Integer	References field 12 in table 349.
4	New Dimension Value Code	Code 20	Table relation to table 349.
5	New Dimension Value ID	Integer	References field 12 in table 349.
6	Dimension Name	Text 30	CalcField. Lookup to table 348.
7	Dimension Value Name	Text 30	CalcField. Lookup to table 349.
8	New Dimension Value Name	Text 30	CalcField. Lookup to table 349.

Transaction and Budget Tables

In addition to other dimension fields in the table, this field is important:

FIELD NO.	FIELD NAME	DATA TYPE	COMMENT
480	Dimension Set ID	Integer	References field 1 in table 480.

Table 83, Item Journal Line

In addition to other dimension fields in the table, these fields are important.

FIELD NO.	FIELD NAME	DATA TYPE	COMMENT
480	Dimension Set ID	Integer	References field 1 in table 480.
481	New Dimension Set ID	Integer	References field 1 in table 480.

Table 349, Dimension Value

In addition to other dimension fields in the table, these fields are important.

FIELD NO.	FIELD NAME	DATA TYPE	COMMENT
12	Dimension Value ID	Integer	AutoIncrement. Used for references in table 480 and table 481.

Tables That Contain the Dimension Set ID Field

The **Dimension Set ID** field (480) exists in the following tables. For the tables that store posted data, the field only provides a non-editable display of dimensions, which is marked as Drill-down. For the tables that store working documents, the field is editable. The buffer tables that are used internally do not need editable or non-editable capabilities.

Field 480 is non-editable in the following tables.

TABLE NO.	TABLE NAME
17	G/L Entry
21	Cust. Ledger Entry
25	Vendor Ledger Entry
32	Item Ledger Entry
110	Sales Shipment Header
111	Sales Shipment Line

Local Functionality in Dynamics 365 Business Central

3/31/2019 • 2 minutes to read

Business Central has a combined localization strategy inclusive of both Microsoft-led and partner-led models. In this section, you can see descriptions of functionality that applies to the countries where Microsoft provides the regulatory compliance and other local functionality.

For a list of currently supported markets, see the [International availability of Microsoft Dynamics 365](#) deck.

Local Functionality

To learn about the local functionality for each country, choose the related link:

Withholding Tax

3/31/2019 • 2 minutes to read

Withholding Tax (WHT) is tax withheld by a company when making a payment to a vendor, in which the full amount owed to that vendor is reduced by the tax withheld. The withheld tax is then remitted to the Australian Taxation Office (ATO) during the next Business Activity Statement (BAS) submission.

The Australian government requires taxes to be withheld from payment to vendors under the following circumstances:

- The vendor is a local supplier who has not supplied an Australian Business Number (ABN) before the payment is processed, and the individual transaction amount is greater than the specified threshold amount.
- The vendor is a non-resident supplier and the payment is to be made to this non-resident entity in the form of interest, royalty, or dividend payments. Currently, there is no minimum threshold amount. Withholding rates may vary due to payment, or international tax treaties existing between Australia and the vendor's country.

Fields within **WHT Business Posting Groups** and **WHT Product Posting Groups** must be set up on the **WHT Posting Setup** page so that the correct WHT calculations are made for each vendor.

- **WHT Calculation Rule** – This field controls how calculation applies to the **WHT Minimum Invoice Amount**, or the invoice threshold amount. The following options exist:
 - **Less than**
 - **Less than or equal to**
 - **Equal to**
 - **Greater than**
 - **Greater than or equal to**

In Australia, WHT is not calculated if the individual invoice amount is less than or equal to the threshold amount. Australian companies should select **Less than or equal to**.

- **WHT Minimum Invoice Amount** – Enter the invoice threshold amount.
- **WHT %** – Enter the relevant WHT rate for the particular combination of **WHT Business Posting Group** and **WHT Product Posting Group**. If you do not wish to calculate any withholding amount, enter 0.00.
- **Realised WHT Type** – Select **Payment** to calculate only the withholding amount at the time of payment. The other options of **Invoice** and **Earliest** do not apply to Australia.
- **Payable WHT Account Code** – Enter the number of the G/L account to which you want to post **Purchase WHT** for the particular combination of **WHT Business Posting Group** and **WHT Product Posting Group**.
- **Purch. WHT Adjustment Account No.** – Select an account number for **Purchase CR/Adj Note** adjustments.
- **Revenue Types** – Drill down to the **WHT Revenue Types** page. These values determine how the combination of **WHT Business Posting Group** and **WHT Product Posting Group** are displayed in reports. You must enter a value in order for this combination to appear in the WHT reports.

WHT for Suppliers Without an ABN

Ensure that there is a valid combination of **General Business** and **General Product Posting Groups** with the correct threshold. For example, in Australia today the minimum threshold is \$75 with a rate of 46.50%.

The percentage withheld is specified in **WHT Posting Setup**. The amount to be withheld is calculated automatically at the time of payment. The WHT certificate is printed automatically, and then sent to the vendor with payment. The WHT certificate explains the reasons for not sending the full invoiced amount.

WHT for Foreign Suppliers

Ensure that a valid combination of **General Business** and **General Product Posting Groups** has been established for vendors for whom you need to withhold tax, other than for non-ABN.

Set Up Withholding Tax

3/31/2019 • 3 minutes to read

Withholding tax (WHT) is the tax withheld by a company when it makes a payment to a vendor, in which the full amount owed to the vendor is reduced by the tax withheld. The withheld tax is then remitted to the Australian Taxation Office (ATO) when the next Business Activity Statement (BAS) is submitted.

If a supplier without an Australian Business Number (ABN) provides an invoice, a withholding tax amount must be withheld if the total amount of the invoice is more than the threshold amount.

To use withholding tax, you must set up the business posting groups and product posting groups for withholding tax so that the correct WHT calculations are made for each vendor.

NOTE

As a prerequisite, you need to set up source codes for WHT settlement on the **Source Code Setup** page.

The following procedure describes how to set up product posting groups for WHT, but the same steps also apply to setting up business posting groups for WHT.

To set up a product posting group for withholding tax

1. Choose the  icon, enter **WHT Product Posting Group**, and then choose the related link.
2. Fill in the fields as described in the following table.

FIELD	DESCRIPTION
Code	Specify the code for the product posting group. You can enter a maximum of 10 alphanumeric characters.
Description	Specify the description for the product posting group. You can enter a maximum of 50 alphanumeric characters.

3. Choose the **OK** button.

To set up posting for withholding tax

1. Choose the  icon, enter **WHT Posting Setup**, and then choose the related link.
2. Fill in the fields as described in the following table.

FIELD	DESCRIPTION
WHT Business Posting Group	Specifies the business posting group code for withholding tax.
WHT Product Posting Group	Specifies the product posting group code for withholding tax.

FIELD	DESCRIPTION
WHT Calculation Rule	<p>Specifies the calculation rule for WHT, which is used with the amount specified in the WHT Minimum Invoice Amount field. This will help identify the transactions for which WHT will not be deducted.</p> <p>For example, if you select the Less than option here and enter 100 in the WHT Minimum Invoice Amount field, then WHT will not be deducted for those transactions with an amount less than 100.</p>
WHT Minimum Invoice Amount	Specifies the threshold amount that is below which WHT will not be deducted.
WHT %	Specifies the WHT rate. You must enter the rate without the percent sign.
Realized WHT Type	Specifies the mode of WHT calculation for purchases or sales of items.
Prepaid WHT Account Code	Specifies the general ledger account number to which sales WHT is to be posted.
Payable WHT Account Code	Specifies the general ledger account number to which purchase WHT is to be posted.
WHT Report	Specifies the withholding tax report type.
Bal. Prepaid Account Type	Specifies the type of balancing account for sales WHT transactions.
Bal. Prepaid Account No.	Specifies the account number or bank name for sales WHT transactions, based on the type selected in the Bal. Prepaid Account Type field.
Bal. Payable Account Type	Specifies the type of balancing account for purchase WHT transactions.
Bal. Payable Account No.	Specifies the account number or bank name for purchase WHT transactions. This is based on the type selected in the Bal. Payable Account Type field.
WHT Report Line No. Series	Specifies the number series for the WHT report line.
Revenue Type	Specifies the revenue type. For more information, see Set Up Revenue Types for Withholding Tax .
Purch. WHT Adj. Account No.	Specifies the account number which to post purchase credit memo adjustments.
Sales WHT Adj. Account No.	Specifies the account number to post sales credit memo adjustments.
Sequence	Specifies the sequence in which the withholding tax posting setup information must be displayed in reports.

3. Choose the **OK** button.

Set Up Revenue Types for Withholding Tax

3/31/2019 • 2 minutes to read

Revenue types are used to categorize withholding tax (WHT) entries and are used for WHT certificates.

You can use the **WHT Revenue Types** page to set up the revenue types for withholding tax.

To set up revenue types for withholding tax

1. Choose the  icon, enter **WHT Revenue Types**, and then choose the related link.
2. Fill in the fields as described in the following table.

FIELD	DESCRIPTION
Code	Specifies the unique code for the revenue type. You can enter a maximum of 10 alphanumeric characters.
Description	Specifies the description for the WHT revenue type.
Sequence	Specifies the sequence in which you want to group the revenue types. For example, a revenue type with sequence 0 will be displayed before sequence 1.

3. Choose the **OK** button.

Set Up Vendors Without ABN for Calculating the Withholding Tax

3/31/2019 • 2 minutes to read

Withholding Tax (WHT) is calculated for local vendors who do not have an Australian Business Number (ABN), as required by tax law.

To set up vendors without ABN for calculating the withholding tax

1. Choose the  icon, enter **Vendors**, and then choose the related link.
2. Choose the required vendor, and then choose the **Edit** action.
3. On the **Vendor Card** page, on the **Registration** FastTab, make sure the **ABN** field and the **Foreign Vend** field must be empty.
4. Choose the **OK** button.

NOTE

The WHT percentage is automatically withheld in accordance with what was specified on the **WHT Posting Setup** page. The WHT certificate is produced for submission to the vendor. For more information, see [Withholding Tax](#).

Calculate and Post Withholding Tax Settlements

3/31/2019 • 2 minutes to read

You can use the **Calc. and Post WHT Settlement** page to calculate and post the withholding tax (WHT).

You can close WHT entries that are open or not settled and transfer the corresponding amount to the WHT settlement account.

The sum of all withheld amounts is reported as a truncated whole number to the Australian tax authorities.

NOTE

The truncated cents are accounted for in a rounding account.

To calculate and post withholding tax settlements

1. Choose the  icon, enter **Calc. and Post WHT Settlement**, and then choose the related link.
2. On the **Options** FastTab, fill in the fields as described in the following table.

FIELD	DESCRIPTION
Starting Date	The start date of the period for which WHT has to be settled.
Ending Date	The end date of the period for which WHT has to be settled.
Posting Date	The posting date of the WHT settlement entries.
Document No.	The document number of the WHT settlement entries.
Description	The WHT settlement description.
Settlement Account Type	The settlement account type.
Settlement Account	The account number based on the account type selected in the Settlement Account Type field.
Rounding G/L Account	The account to which the truncated amount is to be posted.
Show WHT Entries	Select to view the withholding tax entries for the specified period.
Post	Select to post the WHT settlement entries.

3. Choose the **Print** button to print the report or choose the **Preview** button to view it on the screen.

Set Up Goods and Service Tax Posting

3/31/2019 • 2 minutes to read

Goods and services tax (GST) is the tax that is applied on most goods and services. The GST that is paid and received during a period is reported in the Business Activity Statement (BAS) that has to be submitted to the Australian Taxation Office (ATO).

To set up posting details for GST, you must define the posting groups, rate of GST, and the accounts to which GST is to be posted. You can set up this information for a particular combination business posting groups and product posting groups.

You must set up GST posting before you generate the BAS report.

To set up goods and sales tax posting

1. Choose the  icon, enter **VAT Posting Setup**, and then choose the related link.
2. Fill in the fields as described in the following table.

FIELD	DESCRIPTION
VAT Bus. Posting Group	Specifies the VAT business posting group code.
VAT Prod. Posting Group	Specifies the VAT product posting group code.
VAT Identifier	Specifies the code that is used to group similar VAT setups with similar attributes. For example, you can group a number of VAT posting setups that have a common VAT percentage.
VAT %	Specifies the VAT rate.
VAT Calculation Type	Specifies the method that is used to calculate the purchase or sale of items.
Sales VAT Account	Specifies the number of the general ledger account to which you want to post the sales VAT. If you have selected the Reverse Charge VAT option in the VAT Calculation Type field, then do not enter a value in this field.
Purchase VAT Account	Specifies the number of the general ledger account to which you want to post the purchase VAT.
Reverse Chrg. VAT Acc.	Specifies the number of the general ledger account to which you want to post the reverse charge VAT. You can enter a value in this field only if you have selected the Reverse Charge VAT option in the VAT Calculation Type field.

3. Choose the **OK** button.

Calculate Goods and Services Tax on Prepayments

3/31/2019 • 2 minutes to read

When a partial payment or prepayment is made, you must calculate Goods and Services Tax (GST) for that partial payment or prepayment based on the total invoice amount, instead of on a partial amount. If you account for GST on a non-cash basis, you must report and pay GST on payments during the period in which you receive partial payment or issue a tax invoice for payment.

To calculate GST on prepayments

1. Choose the  icon, enter **General Ledger Setup**, and then choose the related link.
2. On the **Local Functionalities** FastTab, select the **Full GST on Prepayment** check box to calculate GST for the total invoice amount when a prepayment invoice is posted.
3. Choose the **OK** button.

Adjust Settlement Exchange Rates for VAT Entries

3/31/2019 • 2 minutes to read

You can use the **Adjust Settlement Exch. Rates** batch job to settle VAT entries according to the government exchange rate as defined in the **Currency Exchange Rate** table.

To adjust settlement exchange rates for VAT

1. Choose the  icon, enter **Adjust Settlement Exch. Rates**, and then choose the related link.
2. On the **Options** FastTab, fill in the fields as described in the following table.

FIELD	DESCRIPTION
Settlement Period	Specifies the start date of the settlement period.
Ending Date	Specifies the end date of the settlement period.
Posting Description	Specifies the posting description.
Document No.	Specifies the document number for which you want to settle VAT entries.
Posting Date	Specifies the posting date of the document.
Use Daily Settlement Exch. Rate	Select if you want to use the daily settlement exchange rate.

3. Choose the **OK** button.

The VAT entries are adjusted and you can view them in the **VAT Register** report.

Print Goods and Service Tax Settlement Reports

3/31/2019 • 2 minutes to read

You must submit a periodic report of goods and services tax (GST) settlement. You can create this settlement from the **BAS Calc. Schedule List** page.

To print a goods and service tax settlement

1. Choose the  icon, enter **Calculate GST Statement**, and then choose the related link.
2. On the **Options** FastTab, fill in the fields as described in the following table.

FIELD	DESCRIPTION
Settlement Account Type	The settlement account type.
Settlement Account No.	The general ledger account number or vendor number, based on the type selected in the Settlement Account Type field.
Rounding G/L Account No.	The account to which the truncated cents will be posted.
Posting Date	The posting date for the settlement entries.
Document No.	The document number of the settlement entries.
Description	The settlement description.
Post	Select to post the withholding tax settlement entries.
Inter Company	Select if the posting is inter company.

3. On the **BAS Calculation Sheet** FastTab, select the appropriate filters.
4. Choose the **Print** button to print the report, or choose the **Preview** button to view it on the screen.

Create Check Installments

3/31/2019 • 2 minutes to read

You can create check installments for post-dated checks. You can define the number of installments that a payment will be divided into, the percent of interest, and the period in which the checks will be created.

To create a check installment

1. Choose the  icon, enter **Post Dated checks-Purchases**, and then choose the relevant link.
2. Choose the relevant check, and then, on the **Home** tab, choose **Edit**.
3. On the **Post Dated Checks-Purchase** page, on the **Home** tab, choose **Create Check Installments**.
4. On the **Options** FastTab, fill in the fields as described in the following table.
- 5.

FIELD	DESCRIPTION
No. of Installments	Specifies the number of installments into which the post-dated check will be divided.
Interest %	Specifies the percent of interest.
Period Length	Specifies the period for which the installments will be created. For example, if you want to divide the check into monthly installments, enter 1M .
Start Document No.	Specifies the starting number of the document. Based on the number of installments specified, the consecutive numbers are allocated to the documents created.

6. Choose the **OK** button.

The installment checks are created and displayed on the **Post Dated Checks-Purchases** page.

Electronic Funds Transfer (EFT)

3/31/2019 • 2 minutes to read

You can pay vendors using the electronic funds transfer (EFT) system in Australia.

Setting up Electronic Funds Transfer in Business Central

Business Central can export EFT files that you can then upload to your bank's website for additional processing. To submit EFT files, you must set up the following information:

- You must add EFT information to the bank account or bank accounts that you will use to pay vendors electronically. The EFT-specific fields are on the **Transfer** FastTab on the **Bank Account** page.
- For those vendors that you want to pay electronically, you must select the **EFT Payment** check box and specify the vendor bank account in the **EFT Vendor Bank Account Code** field on the **Vendor** page.

When you have set up bank accounts and vendors, you can create EFT file that are based on entries in the payment journal. When you create an EFT file, an entry is made in the **EFT Register** table. On the EFT Register page you can drill down to see the vendor ledger entries for the EFT file. On the Payment Journal page, you can also import existing EFT register entries to the payment journal by using the **Transfer EFT Register** batch job.

NOTE

Electronic Funds Transfer (EFT) uses posted and non-posted payments as the basis to calculate withholding tax amounts for applied invoices. Payments that are not applied to an invoice can only be exported to an EFT file if the **Skip WHT** check box is selected. During export of the EFT file, the payment journal lines are not deleted and cannot be deleted as long as they have a reference to an EFT register. To remove the link between the EFT register and payment journal lines, choose the **Cancel Export** action either on the **EFT Register** page or the **Payment Journal** page.

Set Up Business Units for Business Activity Statements

3/31/2019 • 2 minutes to read

In Business Central, you can consolidate the financial statements of various companies into one financial statement.

You must set up a consolidation company to perform the consolidation. In this company, the total amounts for all accounts in the group, from both the parent company and subsidiaries are added together. You must also indicate the general ledger accounts in the consolidated company to which the total should be transferred.

You can use the **BAS Business Units** page to set up the following:

- Parent company
- Subsidiaries
- Affiliates

You must set up information on the **General Ledger Setup** page before you can set up business units.

To set up general ledger for a business activity statement

1. Choose the  icon, enter **General Ledger Setup**, and then choose the related link.
2. Fill in the required fields as described in the following table.

FIELD	DESCRIPTION
BAS to be Lodged as a Group	Select if you are logging a business activity statement for a group of companies.
BAS Group Company	Select if this company is the main company in the group of companies for which you are lodging a group business activity statement.

3. Choose the **OK** button.

To set a business unit for a business activity statement

1. Choose the  icon, enter **BAS Business Units**, and then choose the related link.
2. Fill in the fields as described in the following table.

FIELD	DESCRIPTION
Company Name	Specify the name of the company which will be added to the group company's business activity statement.
Document No.	Specify the BAS document number that has to be consolidated. This field is associated with the BAS Version field.
BAS Version	Specify the BAS version number in which the transaction was included. This field is associated with the Document No. field.

3. Choose the **OK** button.

Calculating Distribution Amounts

3/31/2019 • 2 minutes to read

You can reallocate the amount in one general ledger account to other general ledger accounts so that the balances of your accounts remain proportionate to one another.

Use the **Calculate Distribution Amount** function to calculate the allocation percentage based on the balances of the accounts, or the net changes between the accounts. Run the **Calculate Distribution Amount** function from the **Allocation** page for the Standard Balance and Reverse Balance recurring methods in the **Recurring Journal**.

The net changes or balances of the accounts on the **Allocation** page determine the allocation percentage calculated.

[Australia Local Functionality](#)

Addresses

3/31/2019 • 2 minutes to read

A single postal code can include multiple cities in the same region.

At the same time, cities with the same name are sometimes located in different states.

For example, Australian postal code 4069 covers the cities of Chapel Hill and Kenmore in the state of Queensland. However, there is also a city named Chapel Hill in the state of South Australia, located in postal code 5153.

To avoid confusion and improve address accuracy, available options display when you enter data in address fields. For example, when you enter a postal code on a customer card, you can select from a list of all available cities for that postal code in the **City** field drop-down list. Likewise, when you enter a city name, you can select from a list of all available states in the **State** field drop-down list.

To enable this functionality, you must enter the data into the **Post Code** table. You can do this manually, or you can download a copy of the Australian postal codes from the Australian Post Office website.

To increase postal efficiency in Australia, the postal department has introduced an address bar coding system in which every address is assigned a unique identifier called a Delivery Point Identifier (DPID). From the DPID, a bar code is generated and printed for each address. Companies can receive discounts on bulk mailings if they use these bar codes. To retrieve a DPID, you must connect to the local postal database that uses authorized Address Matching Approval System (AMAS) software. You can reduce your number of postal returns by validating customer addresses using the AMAS database.

When you print an address that has a DPID, a bar code will be printed together with the address. If you cannot print bar codes, the DPID will be printed together with the address.

Contact your Microsoft partner for information on how to obtain AMAS software.

Determine Sales Price by Cost Plus Percentage

3/31/2019 • 2 minutes to read

Use the cost plus percentage function to set a sales price based on the cost of an item. The cost of the item can be calculated along with cost plus calculation. The discount will be based on this calculation. This functionality eliminates the need for the use of spreadsheets in determining percentage discounts as they correspond to cost plus percentage.

To determine sales tax by cost plus percentage

1. Choose the **Receivables** action.
2. Choose the **Customers** action.
3. Open the card for a relevant customer.

–or–

Choose the **New** action.

NOTE

For a new customer, in the **No.** field, enter the customer number.

4. To open the **Sales Prices** page, choose the **Prices** action.
5. In the **General** section, fill in the fields as described in the following table.

FIELD	DESCRIPTION
Sales Type Filter	Select one of the following options: <ul style="list-style-type: none">- Customer- Customer Price Group- All Customers- Campaign- None
Sales Code Filter	The sales code.
Item No. Filter	The item number.
Starting Date Filter	The starting date.
Currency Code Filter	The currency code.

6. Enter information into the relevant fields.
7. To send the details to a recipient, choose the **Send To** action, and then select one of the following formats:
 - **Recipient as Attachment**
 - **Microsoft Word**
 - **Microsoft Excel**

8. Choose the **OK** button.

Australian Business Numbers and Adjustment Notes

3/31/2019 • 2 minutes to read

An Australian Business Number (ABN) is a single identifier for all business dealings with the tax office, and for dealings with other government departments and agencies.

ABNs and adjustment notes—or credit memos—are used to satisfy tax requirements.

ABN

All companies must register and apply for an ABN to report the details of payment summaries issued to their payees during the financial year. The payment summary includes the Tax File Numbers (TFN) or business numbers of the payees.

Adjustment Notes

Adjustment notes are issued by suppliers to a business when the amount of consideration for taxable supplies changes. The recipient needs an adjustment note to claim more or less GST credits than previously claimed.

Section 19-10 of A New Tax System (Goods and Services Tax) Act 1999 defines an adjustment event as any event that has the effect of:

- Canceling a supply or acquisition.
- Changing the consideration for a supply or acquisition.
- Causing a supply or acquisition to start or stop being a taxable supply or creditable acquisition.

An adjustment event may result in an increase or decrease to your net amount for the tax period.

Adjustment notes—or credit memos—should be connected to an invoice.

Because credit memos are used for adjustment notes, each credit memo should satisfy all of the legal requirements for an adjustment note. Each credit memo should have an original invoice number, date, and reason code assigned to it. The following fields are included in the adjustment note:

- **Adjustment Applies to:** The number of the document to which the adjustment note applies. If you use the **Copy Document** function, this field populates automatically. You must enter a reason code before the transaction can be posted. You can use this field to create an adjustment note for a paid or closed transaction.
- **Adjustment Reference No:** The number of the adjustment note. For **Sales & Receivables**, the number assigned to the posted document populates automatically in this field.
- **Adjustment Note Date:** Automatically populated from the document date.
- **Adjustment** and **BAS Adjustment:** These entries populate automatically. Some credit memos are Business Activity Statement (BAS) adjustments. Adjustment notes can only be applied against a single document.

Create a VAT Statement

3/31/2019 • 2 minutes to read

Business Central allows you to submit a periodic report of VAT transactions. The VAT statement is submitted as a FDF file that corresponds with an editable PDF file from the tax authorities.

IMPORTANT

You must fill in detailed information about your company address in the Company Information page before you create the VAT statement. This includes information about street, building, floor, and room number. This information is included in the FDF file.

To create a VAT statement

1. Choose the  icon, enter **VAT Statement AT**, and then choose the related link.
2. On the **Options** FastTab, fill in the fields as described in the following table.

FIELD	DESCRIPTION
Starting Date	Specifies the start date of the VAT period.
Ending Date	Specifies the end date of the VAT period.
Include VAT Entries	Specifies if you want to include VAT entries that are either open or closed, or both open and closed entries.
Include VAT Entries	Specifies if you want to include VAT entries that are from the specified period or also include entries from before the period.
Reporting Type	Select if this VAT statement is the quarterly report, monthly report, or if it applies to another period.
Check Positions	Select to verify the positions of the VAT statement during the export.
Round to Whole Numbers	Select to round amounts to whole numbers.
Surplus Used to Pay Dues	Select to use a potential surplus to cover other charges.
Additional Invoices sent via Mail	Select if you will send additional information.
Number §6 Abs. 1	Specify the number according to §6 section 1 if you want to claim tax-free revenues without input tax reduction.

3. Choose the **OK** button.
4. When prompted, choose to save or open the generated XML file and FDF file.

If your VAT statement does not contain errors, you can now submit the FDF file to the tax authorities. For more

information, see the [Finanz-Online portal](#).

VAT Reporting

3/31/2019 • 2 minutes to read

VAT Information Exchange System (VIES) reporting is required throughout the European Union (EU) and must follow local requirements, such as specific formats and files. Paper reports and XML files are created for Austrian VIES reporting.

You can print the following local VAT reports.

REPORT	DESCRIPTION
VAT Statement AT	The Austrian VAT statement serves as the basis for VAT registration for a selected period, and is printed according to the VAT statement in the VAT Statement Line table. You can generate the report in three different formats. For more information, see VAT Statement AT.
VAT-VIES Declaration XML Report	Shows the VAT-VIES declaration for sales in other countries/regions of the EU. This data is written to an XML file, which you can submit to the Austrian tax authorities by uploading it to the Finanz Online Portal. The report is based on information in the VAT Entry table.

Print Vendor Payments List Reports

3/31/2019 • 2 minutes to read

The **Vendor Payments List** report provides a list of payments for each vendor. The report can sort payments chronologically or grouped by vendor.

To print the vendor payments list report

1. Choose the  icon, enter **Vendor Payments List**, and then choose the related link.
2. On the **Options** FastTab, fill in the fields as described in the following table.

FIELD	DESCRIPTION
Sorting	Specifies the sort order. You can sort by vendor or chronologically. If you sort by vendor, you will see a subtotal for each vendor. If you sort chronologically, you will not see subtotals.
Layout	<p>Specifies the layout of the report.</p> <p>The results can be displayed in the following layouts:</p> <p>Standard Displays the vendor number and vendor name, together with posting details, such as the document number and the amount in local currency.</p> <p>FCY Amounts Displays the vendor number, vendor name, document number, payment status (O for open, PP for partial payment, and C for closed), and payment amount.</p> <p>Posting Info Displays the vendor number, vendor name, cost center, cost object, user ID, and payment amount.</p>

At the end of the report, the number of processed payments is displayed.

Delivery Reminders

3/31/2019 • 2 minutes to read

Delivery reminders are used to track overdue vendor shipments, and to remind vendors about overdue deliveries. To create delivery reminders, you must set up the following:

- Delivery reminder terms

Delivery reminder terms are identified by a code that must be assigned to vendors. To use more than one combination of settings, you must set up a code for each setting separately. You can set up any number of delivery reminder terms.

- Delivery reminder levels

For every delivery reminder term, you must set up delivery reminder levels. These levels determine how often delivery reminders can be created for a specific term. Level 1 is the first delivery reminder that you create for an overdue delivery. Level 2 is the second delivery reminder, and so on. When delivery reminders are created, the number of reminders that were created previously is considered, and the current number is used to apply terms.

- Delivery reminder text messages

You must set up delivery reminder text messages for every delivery reminder level. There are two types of delivery reminder text messages: beginning and ending. The beginning text message is printed under the header section, before the list of entries that are marked for reminder. The ending text message is printed after this list.

For more information, see [Set Up Delivery Reminder Terms, Levels, and Text](#).

After you have set up the delivery terms, you must assign the delivery reminder term codes to vendors. For more information, see [Assign Delivery Reminder Codes to Vendors](#).

You can create delivery reminders manually or automatically. You can use the **Create Delivery Reminder** batch job to create delivery reminders automatically. This batch job allows you to select the purchase orders for which delivery reminders must be created. For more information, see [Generate Delivery Reminders](#).

You can also track documents in relation to purchase order lines and sales order lines.

Business Central provides the following reports:

- **Issued Delivery Reminder** - To view the delivery reminders for vendors.
- **Delivery Reminder - Test** - To verify the delivery reminders before you issue them.

For more information, see [Print Test Reports for Delivery Reminders](#).

Set Up Delivery Reminders

3/31/2019 • 2 minutes to read

In Business Central, you can use purchase delivery reminders to remind vendors about overdue deliveries. To create delivery reminders for vendors, you must set up base data for delivery reminder creation and number series for the delivery reminders on the **Purchases & Payables Setup** page.

To set up delivery reminders

1. Choose the  icon, enter **Purchases & Payables Setup**, and then choose the related link.
2. On the **General** FastTab, in the **Default Del. Rem. Date Field** field, specify one of the following options as described in the following table.

OPTION	DESCRIPTION
Requested Receipt Date	To specify that the date value in the Requested Receipt Date field on the purchase order line will be used as the default date for creating delivery reminders.
Promised Receipt Date	To specify that the date value in the Promised Receipt Date field on the purchase order line will be used as the default date for creating delivery reminders.
Expected Receipt Date	To specify that the date value in the Expected Receipt Date field on the purchase order line will be used as the default date for creating delivery reminders.

3. On the **Numbering** FastTab, fill in the fields as described in the following table.

FIELD	DESCRIPTION
Delivery Reminder Nos.	The number series code for delivery reminders.
Issued Delivery Reminder Nos.	The number series code for issued delivery reminders.

4. Choose the **OK** button.

Set Up Delivery Reminder Terms, Levels, and Text

3/31/2019 • 2 minutes to read

To create delivery reminders, you must set up the following:

- Delivery reminder terms
- Delivery reminder levels
- Delivery reminder text messages

Each delivery reminder term has two or more delivery reminder levels, and for each delivery reminder level, you can specify text that will be part of the delivery reminder.

For more information, see [Delivery Reminders](#).

To set up delivery reminder terms

1. Choose the  icon, enter **Delivery Reminder Terms**, and then choose the related link.
2. Choose the **New** action.
3. Fill in the fields as described in the following table.

FIELD	DESCRIPTION
Code	The code for the delivery reminder term. You can enter a maximum of 10 alphanumeric characters.
Description	The description for the delivery reminder term. You can enter a maximum of 30 alphanumeric characters.
Max. No. of Delivery Reminders	The maximum number of delivery reminders that can be created for an order. NOTE: This is the maximum number across all reminder levels for this reminder term. For example, if you have set up three levels, and you set Max. No. of Delivery Reminders to 5, the first reminder is created at level 1, the second at level 2, and the last three at level 3.

4. Choose the **OK** button.

To add delivery reminder levels to a delivery reminder term

1. On the **Delivery Reminder Terms** page, select the delivery reminder term for which you want to set up levels, and then choose the **Levels** action.
2. Choose the **New** action.
3. Fill in the fields as described in the following table.

FIELD	DESCRIPTION
No.	The delivery reminder level number. This field is filled in automatically.

FIELD	DESCRIPTION
Due Date Calculation	The formula for the due date calculation for the delivery reminder. You can enter a combination of numbers from 0 to 9999, and date codes (D for day, WD for weekday, W for week, M for month, Q for quarter, or Y for year). The date codes denote the calculation for the delivery reminder due date. You can enter a maximum of 20 characters for the due date calculation formula.

4. Choose the **OK** button.

For each delivery reminder level, you can define text messages that are added to the delivery reminder. You can define beginning text that is added before the description of the overdue purchase order, and ending text that is added after the description of the overdue purchase order.

The following procedure describes how to set up beginning text messages, but the same steps apply for setting up ending text messages.

To set up delivery reminder text messages

1. On the **Delivery Reminder Levels** page, select a level, and then choose the **Beginning Text** action.
2. Choose the **New** action.
3. In the **Description** field, enter the beginning text message for the delivery reminder.
4. Choose the **OK** button.

Generate Delivery Reminders

3/31/2019 • 2 minutes to read

In Business Central, you can create delivery reminders when a purchase has not been delivered as expected. You can generate delivery reminders for all overdue deliveries, or you can create a single delivery reminder manually. For more information, see [Create Delivery Reminders Manually](#).

NOTE

To create delivery reminders, you must set up the delivery reminder properties. For more information, see [Set Up Delivery Reminders](#).

To generate delivery reminders for all overdue deliveries

1. Choose the  icon, enter **Delivery Reminder**, and then choose the related link.
2. Choose the **New** action.
3. On the **Delivery Reminder** page, choose the **Create Delivery Reminder** action.
4. On the **Purchase Header** FastTab and the **Purchase Line** FastTab, select the appropriate filters.
5. Choose the **OK** button.

If there are overdue deliveries that match the filters that you have set, delivery reminders are created. You can now issue and print the delivery reminders.

Create Delivery Reminders Manually

3/31/2019 • 2 minutes to read

In Business Central, you can create delivery reminders when a purchase has not been delivered as expected. You can create a single delivery reminder manually, or you can generate delivery reminders for all overdue deliveries. For more information, see [Generate Delivery Reminders](#).

NOTE

To create delivery reminders, you must set up the delivery reminder properties. For more information, see [Set Up Delivery Reminders](#).

To create a delivery reminder manually

1. Choose the  icon, enter **Delivery Reminder**, and then choose the related link.
2. Choose the **New** action.
3. On the **Delivery Reminder** page, on the **General** FastTab, fill in the fields as described in the following table.

FIELD	DESCRIPTION
No.	The unique identification number for the delivery reminder.
Vendor No.	The number of the vendor for whom you want to post the delivery reminder. When you select the vendor number, the Name , Address , Post Code/City , and Contact fields are filled in automatically.
Posting Date	The posting date for the delivery reminder. This date is copied to all of the delivery reminder ledger entries.
Document Date	The document date for the delivery reminder. This date is also used to calculate the due date for the delivery reminder. You can modify the posting date if required.
Reminder Level	The delivery reminder level. This value is based on the number of delivery reminders that have already been sent. For more information, see Set Up Delivery Reminder Terms, Levels, and Text .
Reminder Terms Code	Specify the delivery reminder terms code that is set up for the vendor.
Due Date	The due date for the delivery reminder.

4. Choose the **Suggest Reminder Lines** action

If there are overdue deliveries from the specified vendor, these are added to the deliver reminder.

5. Choose the **OK** button.

The delivery reminder is created. You can now issue and print the delivery reminder.

Issue Delivery Reminders

3/31/2019 • 2 minutes to read

After you have created delivery reminders, you must issue and print them so that you can send reminders to vendors. Before you issue the delivery reminders, you can print a test report. For more information, see [Print Test Reports for Delivery Reminders](#).

When you issue the delivery reminders, delivery reminder ledger entries are created. You can view the created ledger entries on the **Deliv. Reminder Ledger Entries** page.

To issue delivery reminders

1. Choose the  icon, enter **Delivery Reminder**, and then choose the related link.
2. On the **Delivery Reminder** page, select the delivery reminder that you want to issue, and then choose the **Edit** action.
3. Choose the **Issue** action.
4. On the **Issue Delivery Reminder** page, on the **Options** FastTab, fill in the fields as described in the following table.

FIELD	DESCRIPTION
Print	Select to print the delivery reminders when they are issued.
Replace Posting Date	Select to replace the existing posting date for the delivery reminder.
Posting Date	The posting date for the delivery reminder. This posting date is used for all delivery reminders if you have selected the Replace Posting Date check box. If the Replace Posting Date check box is cleared, this date will be used for only those delivery reminders for which a posting date is not available.

5. Optionally, on the **Delivery Reminder Header** FastTab, select the appropriate filters.

NOTE

You can remove filters and issue all delivery reminders at the same time.

6. Choose the **OK** button.

You can view the issued reminders on the **Issued Delivery Reminder** page. Optionally, you can now print a delivery reminder.

To view delivery reminder ledger entries

1. Choose the  icon, enter **Purchase Orders**, and then choose the related link.
2. Select the purchase order for which you want to view the reminder status, and then choose the **Edit** action.

3. Choose the **Deliv. Reminder Ledger Entries** action.

In the Deliv. Reminder Ledger Entries page, you can view the delivery reminder ledger entries for the selected purchase order.

Copy Existing Items to New Items

3/31/2019 • 2 minutes to read

You can group items with similar settings in an item catalog. When you add a new item, to save time, you can use the **Copy Item** function to copy an existing item to use as a template for a new item.

To copy existing items to new items

1. Choose the  icon, enter **Items**, and then choose the related link.
2. Select the item that you want to copy, and then choose the **Copy Item** action.
3. On the **Item Copy** page, fill in the fields as described in the following table.

FIELD	DESCRIPTION
Source Item No.	Sets the item number from which the data is to be copied.
Target Item No.	Sets the item number for the item to which the data is to be copied.
Target No. Series	Sets the item number series to which the data is to be copied.

NOTE

You can specify an item number in the **Target Item No.** field or in the **Target No. Series** field. The copy item will be assigned to the next available number in that number series.

4. Select the appropriate check boxes for the data that you want to copy.
5. To copy your selections to the new item, choose the **OK** button.

Print General Ledger Setup Information

3/31/2019 • 2 minutes to read

Before you use Business Central in the daily business, you can run the **G/L Setup Information** report to display the master data that you have set up. You can look over this master data so that you have a baseline to compare to, and then verify that you have set up posting groups correctly, for example.

To print general ledger setup information

1. Choose the  icon, enter **G/L Setup Information**, and then choose the related link.
2. On the **Options** FastTab, in the **Setup Information** field, select the master data area as described in the following table.

OPTION	DESCRIPTION
G/L Setup - Company Data - Consolidation	Displays tables for general ledger setup, company information, and business units.
Posting Groups	Displays customer posting group tables, vendor posting group tables, inventory posting group tables, and bank account posting group tables.
Posting Matrix	Displays general business posting group tables, general product posting group tables, and general posting group tables.
VAT Setup	Displays VAT business posting group tables, VAT product posting group tables, and VAT posting setup tables.
Source Code - Reason Code	Displays source tables, source code setup tables, and reason codes tables.
Check Number Series	Select to provide an overview of the use of number series so that you can identify number series that are problematic for the data export for the Grundsätze zum Datenzugriff und zur Prüfbarkeit digitaler Unterlagen (GDPdU). The report will show number series with one of the following issues: <ul style="list-style-type: none">- The number series allows manual document numbers.- The number series is not chronological.- The number series is used in more than one table or field.

3. Choose the **Print** button to print the report or choose the **Preview** button to view it on the screen.

Belgian VAT

3/31/2019 • 2 minutes to read

Business Central includes Belgium enhancements to VAT reporting feature that enables you to print VAT transaction details. You must send the following reports to the Belgian tax authorities:

- Monthly/Quarterly declaration - This report is used to create monthly or quarterly VAT declarations, depending on your company revenue.
- VAT annual listing (on paper/disk) - This report is used to annually report all amounts invoiced for both goods and services to all Belgian companies with a registered VAT number.
- VAT-VIES listing (on paper/disk) - This report is used to report the sales of goods to other countries.

You are also required to provide a printed statement detailing the VAT transactions to the Belgian tax authorities. For more information, see [VAT Statement](#).

Non-Deductible VAT

In Belgium, VAT can be fully or partially deductible. Expenses such as representation cost or purchases of cars are only partially deductible, and the transaction must specify how much of the VAT is non-deductible. For example, you create a general ledger account for fixed assets such as cars, and another account for representation cost. For each account, you specify how much of the reported VAT is non-deductible by setting the Percentage Non deductible VAT field. Then, when you post a transaction, the deductible VAT will post to the corresponding VAT account, and the non-deductible VAT will be added to the base amount and posted to the same account as the tangible or intangible asset.

For fixed assets, the non-deductible VAT depreciates just like the base acquisition cost of the fixed asset. You must set up separate fixed asset posting groups for each percentage of non-deductible VAT since each fixed asset posting group posts to a general ledger account where the Percentage Non deductible VAT field specifies how much VAT must post to the same account as the fixed asset.

If you select the Incl. Non Deductible VAT field in a VAT statement line, non-deductible VAT is included in the VAT amount. The **Calc. and Post VAT Settlement** report adds the non-deductible part of that amount to the **Non Ded. VAT Amount** and **Non Ded. Source Curr. VAT Amt.** fields in the resulting VAT entries.

[Print Periodic VAT Reports](#)

[Set Up Non-Deductible VAT](#)

Set Up Non-Deductible VAT

3/31/2019 • 2 minutes to read

You can calculate VAT amounts for specific types of expenses which can be partially declared as VAT. For example, on the **G/L Account Card** page, if you enter 75 percent in the **% Non-Deductible VAT** field, then 75 percent of the regular VAT amount is considered an additional cost and will be added to the net amount during posting. The remaining 25 percent will be posted as regular VAT.

NOTE

If no value is entered in the **% Non-Deductible VAT** field, the VAT amount is 100 percent deductible.

To set up the non-deductible VAT percentage

1. Choose the  icon, enter **Chart of Accounts**, and then choose the related link.
2. Select a general ledger expense account that requires the partial deduction, and then choose the **Edit** action.
3. On the **Posting** FastTab, enter the amount in **% Non deductible VAT** field.
4. Choose the **OK** button.

Make Manual Corrections to VAT

3/31/2019 • 2 minutes to read

You can make corrections to posted VAT entries without posting the correction into the VAT or general ledger entries. This is useful if you need to make a change to the total sales or purchases VAT amounts without changing the VAT base. For example, you can manually correct VAT if you receive an invoice from a vendor who has calculated VAT incorrectly.

To make manual corrections to VAT

1. Choose the  icon, enter **VAT Statement Preview**, and then choose the related link.
2. Select the line that needs to be corrected. You can make the VAT correction on both the **Row Totaling** and **VAT Entry Totaling** row **Type**.
3. To make the correction, choose the **Correction Amount** field. The **Manual VAT Correction List** page opens.
4. Choose the **Edit List** action. On the **Manual VAT Correction List** page, fill in the fields as described in the following table.

FIELD	DESCRIPTION
Posting Date	Enter the posting date of the VAT correction.
Amount	Enter the amount of the VAT correction. You must enter the correction amount, not the new amount. For example, if the amount is 1000.00 and should be 1200.00, enter 200.00.
Additional-Currency Amount	This field displays the amount of the VAT correction in the additional reporting currency. The field is automatically calculated, based on the contents of the Amount field and the current exchange rate.

5. Choose the **OK** button.
6. Refresh the **VAT Statement Preview** page to see your corrections.
7. To view a report related to the preview of the VAT information, choose one of the following actions:

ACTION	DESCRIPTION
Detailed Report	Opens the VAT Statement report. For more information, see VAT Statement.

ACTION	DESCRIPTION
<p>Form/Intervat Declaration</p>	<p>Opens the VAT –Form report. For more information, see VAT - Form.</p> <p>The Form/Intervat Declaration report is based on the VAT Statement template that is defined in the general ledger setup. Therefore, it may export data that is not the same as what is shown on the VAT Statement Preview page.</p>
<p>Declaration Summary Report</p>	<p>Opens the VAT Statement Summary report. For more information, see VAT Statement Summary.</p>

[Set Up Non-Deductible VAT](#)

Print Periodic VAT Reports

3/31/2019 • 3 minutes to read

The VAT reporting feature enables you to print VAT transaction details. You must send the following VAT reports to the Belgian tax authorities:

- Monthly/Quarterly declaration
- VAT annual listing (on paper/disk)
- VAT-VIES listing (on paper/disk)

To print the monthly/quarterly declaration

1. Choose the  icon, enter **Form/Intervat Declaration**, and then choose the related link.
2. On the **VAT – Form** page, fill in the fields.

FIELD	DESCRIPTION
Wrong Enterprise No.	Specifies if you want to print the report that has erroneous enterprise numbers.
VAT Annual Listing	Specifies if you want to print the VAT Annual Listing report.
Year	Enter the year of the period for which you want to print the report. You should enter the year as a 4 digit code. For example, to print a declaration for 2013, you should enter "2013" (instead of "13").
Minimum Amount	Enter the customer's minimum year balance to be included in the report. If the yearly balance of the customer is less than the minimum amount, the customer will not be included in the declaration.
Include Customers From	Select to include customers from all countries/regions or from a specific country/region in the report.
Country/Region	Select the country/region to include in the report.

3. Choose the **Print** button to print the report or choose the **Preview** button to view it on the screen. Choose the **Cancel** button to save the information without printing the report.

To print the VAT annual listing on disk

1. Choose the  icon, enter **Annual Listing – Disk**, and then enter the related link.
2. On the **VAT Annual Listing – Disk** page, fill in the fields as described in the following table.

FIELD	DESCRIPTION
-------	-------------

FIELD	DESCRIPTION
Year	Enter the year of the VAT declaration. You should enter the year as a four digit code. For example, to print a declaration for 2013, you should enter "2013" (instead of "13").
Minimum	Enter the customer's minimum year balance to be included in the report. If the yearly balance of the customer is less than the minimum amount, the customer will not be included in the declaration.
Test Declaration	Specifies if you want to create a test declaration. If selected, an attribute test is written to the file that uses value 1, which indicates that this is a test file. If you want to test the XML file before sending it, you can upload this file to the Intervat site. The file is then validated without being stored on the server and you receive a notification if the file is valid. Also the unique sequence number in the XML file is not increased when a test declaration is created, which means that you can create as many internal test declarations as you want.
Add Representative	Specifies if you want to include the VAT declaration representative. A representative is a person or an agency that has license to make a VAT declaration for your company.
ID	Enter the ID of the representative who is responsible for making the VAT declaration.
File Name	Enter the path and name of the file to which you want to create the declaration.

3. Choose the **Print** button to print the report or choose the **Preview** button to view it on the screen. Choose the **Cancel** button to save the information without printing the report.

To print the VAT-VIES declaration report to disk

1. Choose the  icon, enter the **VAT – Vies Declaration Disk**, and then choose the related link.
2. Enter the required information, and choose the **OK** button to start the batch job, which will create an xml file. For more information, see VAT- VIES Declaration Disk.
3. If you have to make a correction, Choose the  icon, enter **VAT – VIES Correction**, and then choose the related link.
4. Choose the **Edit List** action, and then enter the information that has to be adjusted. Choose the **OK** button.

Belgian Intrastat Reporting

3/31/2019 • 2 minutes to read

Companies in the European Union (EU) are required to report trade with other countries in the EU. This reporting process is through Intrastat reporting or VIES (VAT Information Exchange System). There are two types of Intrastat declarations:

- Simplified declaration
- Extended declaration

To determine the type of declaration that you should use, visit the [National Bank of Belgium](#) web site.

Submitting the Intrastat Report

In Business Central, you can export the Intrastat declarations to a file that you can then submit to the OneGate portal. For more information, see [Export Intrastat Third-Party Declarations](#).

Print the Intrastat Form Report

3/31/2019 • 2 minutes to read

The **Intrastat - Form** report must be used for reporting to Intrastat. In Belgium, you must report the movement of goods to the statistics authorities every month, and the report must be sent to the tax authorities.

Before you print the **Intrastat - Form** report, you can also print the **Intrastat Checklist** report to verify the contents of the report.

To print the Intrastat form report

1. Choose the  icon, enter **Intrastat – Form**, and then choose the related link.
2. On the **Options** FastTab, fill in the fields as described in the following table.

FIELD	DESCRIPTION
Name	Enter the company name.
Address	Enter the address.
Post Code + City	Enter the postal code and the city.
Contact	Enter the name of the contact person.
Telephone	Enter the telephone number of the contact person.
Telefax	Enter the telefax number.
International VAT number	Enter the international VAT registration number.
Nihil declaration	Select if you do not have any trade transactions with EU countries and want to send an empty declaration. When selected, the message "NIHIL" displays in the Message field.
Message	Enter a message to be printed on the Intrastat declaration, such as "regular declaration" or "replacement declaration".

3. Choose the **Print** button to print the report or choose the **Preview** button to view it on the screen.

Set Up Declaration Types

3/31/2019 • 2 minutes to read

In Business Central, there are two types of declaration:

- Simplified declaration
- Extended declaration

The type of declaration depends on the amount of shipped or received goods. To determine the type of declaration that you should use, visit the [National Bank of Belgium](#) web site.

When using the extended declaration, you will also need to set up an Incoterm in Intrastat Declaration for each shipping method. If you do not see the **Incoterm in Intrastat Decl.** on the **Shipment Method** page, you may need to customize the page and add the field.

To set up declaration types

1. Choose the  icon, enter **General Ledger Setup**, and then choose the related link.
2. On the **General** FastTab, select the **Simplified Intrastat Decl.** check box to set up a simplified declaration type. Clear this field to use extended declaration.
3. Choose the **OK** button.

Export Intrastat Third-Party Declarations

3/31/2019 • 2 minutes to read

In Belgium, you must have a third-party declarant fill out the Intrastat declaration. The third-party declarant must be an external person or company.

To export the third-party declaration

Before you export the file, it's a good idea to preview the report. For more information, see [Print the Intrastat Form Report](#).

1. Choose the  icon, enter **Intrastat Journals**, and then choose the related link.
2. Choose the **Create File** action.
3. Fill in the fields as described in the following table.

FIELD	DESCRIPTION
Nihil declaration	Select if you do not have any trade transactions with European Union (EU) countries/regions and want to send an empty declaration.
Counter party info	Check this field to include counter party information in the Intrastat file (new requirement from 2019). The counter party information added to the file is taken from the Country/Region of Origin Code and Partner ID from the Intrastat Journal.
Enterprise No./VAT Reg. No.	Enter the enterprise or VAT registration number.

4. Choose the **OK** button.

Next, submit the declaration to the OneGate portal.

Set Up Bank Accounts for CODA

3/31/2019 • 2 minutes to read

Before you can start to use the electronic banking functionality for CODA statements, you must set up the following codes:

- Protocol number
- Version code
- IBLC/BLWI codes - For more information, see [Set Up IBLC-BLWI Transaction Codes](#).

To set up protocol numbers and version codes

1. Choose the  icon, enter **Bank Accounts**, and then choose the related link.
2. Choose the **Edit** action.
3. On the **Posting** FastTab, fill in the fields as described in the following table.

FIELD	DESCRIPTION
Protocol No.	Enter the protocol number that is used by the CODA system to import coded bank account statements.
Version Code	Enter the version code used by the CODA system to import coded bank account statements.

4. Choose the **OK** button.

Apply CODA Statements

3/31/2019 • 2 minutes to read

After a CODA statement has been imported, the statement lines can be accessed from the **Bank Account Card** page. The application status on each line will be blank because the statement amounts have not been applied to outstanding ledger entries.

Statement amounts can be applied to outstanding ledger entries by:

- Manually applying CODA statement lines.
- Automatically applying CODA statement amounts to the appropriate ledger entries and accounts. Automatic processing of CODA statement lines is recommended.

To manually apply the CODA statement lines

1. Choose the  icon, enter **Bank Accounts**, and then choose the related link.
2. Select the bank account, and then choose the **CODA Statements** action.
3. Select the CODA statement, and then choose the **Edit** action.
4. In the **CODA Statement Lines** FastTab, for each statement line, fill in the fields as described in the following table.

FIELD	DESCRIPTION
Account No.	Enter the number of the general ledger account, bank, customer, vendor, or fixed asset, which the bank account statement line is linked to.
Description	Business Central automatically retrieves the description from the imported CODA file, but you can modify the contents of this field.

5. Choose the **OK** button.

To automatically apply the CODA statement lines

1. Choose the  icon, enter **Bank Accounts**, and then choose the related link.
2. Select the bank account, and then choose the **CODA Statements** action.
3. Select the CODA statement, and then choose the **Edit** action.
4. Choose the **Process CODA Statement Lines** action.
5. Fill in the fields as described in the following table.

FIELD	DESCRIPTION
Default Posting	Select if you want the batch job to post statement amounts that cannot be linked to existing ledger entries. For more information, see Transaction Coding.

FIELD	DESCRIPTION
Print List	Select to print a list of statement amounts that cannot be linked automatically.

6. Choose the **OK** button.

When you start the batch job, statement amounts will be applied to existing ledger entries based on the transaction codes. For more information, see [Set Up Bank Accounts for CODA](#).

Automatically Transfer and Post CODA Statements

3/31/2019 • 2 minutes to read

After you have applied and processed all CODA statement lines, you can transfer the CODA statement lines to a financial journal.

After transferring the statement lines, you can post the lines in a corresponding general journal. If no such general journal exists, you cannot transfer the lines. You can create a journal to handle CODA statements. For more information, see [Create Financial Journals](#).

Alternatively, you can manually transfer and post CODA statements. For information, see [Manually Transfer and Post CODA Statements](#).

To automatically transfer statement lines

1. Choose the  icon, enter **Bank Accounts**, and then choose the related link.
2. Select the bank account, and then choose **CODA Statements** action.
3. Select the CODA statement, and then choose the **Edit** action.
4. Choose the **Transfer to General Ledger** action.
5. Choose the **Yes** button.

The batch job will now transfer the CODA statement lines to the financial journal.

After transferring the statement lines to the journal, you can post the statement lines in the corresponding financial journal.

CODA Bank Statements

3/31/2019 • 2 minutes to read

The Coded Statement of Account (CODA) is a national banking standard, designed by the Belgian Banker's Association, which allows you to automatically process electronic bank statements.

Each type of transaction in a CODA statement is assigned a unique code. Business Central uses this code to interpret transactions and apply them to the corresponding ledger entries.

Applying Statement Lines

When you have imported a CODA statement, you can apply the statement lines to existing ledger entries, based on the information in the **Transaction Coding** table.

If the transaction coding of the statement line is not found, Business Central will stop processing and continue with the next statement line. If you select the **Default Posting** field, the statement line will be used as a default posting.

If the transaction coding of the statement line is found, the statement lines will be matched to the following account types and corresponding account numbers:

- General ledger - If the account type is general ledger account, the statement line is posted on the corresponding general ledger account.
- Customer or vendor - If the account type is customer or vendor, a matching customer or vendor ledger entry is found based on the following criteria:
 - If a ledger entry is found using the standard format, the ledger entry will be matched to the statement line and the application status will be set to **Applied**. If the ledger entry does not use the standard format, the bank account number of the customer or vendor is used to find the customer or vendor.
 - If no ledger entry with a matching remaining amount is found, the customer or vendor account is used and the application status will be set to **Partly Applied**.
 - If the bank account number is used to find the customer or vendor, a matching ledger entry is found based on the amount of the statement line. If the amount is found, the statement line is matched to the corresponding ledger entry and the application status will be set to **Applied**.
 - If the bank account number cannot be used to find the customer or vendor, Business Central will either stop processing the current line or use the line as a default posting, before continuing with the next statement line.

You can run the process as many times as you like. Only statement lines with a blank application status will be applied.

When you have applied all statement lines to a general ledger account or to a matching customer ledger entry or vendor ledger entry, you are ready to post the CODA statement lines. For more information, see [Automatically Transfer and Post CODA Statements](#).

Download CODA Files from an Isabel Server

3/31/2019 • 2 minutes to read

NOTE

The Isabel features are available only for on-premises deployments.

CODA files can be downloaded manually or in attended mode.

To manually download CODA files, log on to the Isabel server and select the files that you want to download. The downloaded files can then be imported from the **Bank Account** table. For more information, see [Import CODA Statements](#).

To download CODA files in attended mode

1. Choose the  icon, enter **IBS Logs**, and then choose the related link.
2. Choose the **Download** action.
3. On the **IBS Download Request Options** page, fill in the fields as described in the following table.

FIELD	DESCRIPTION
From Date	Specify the start date of the download.
To Date	Specify the end date of the download.
File Format	Select Coda as the file format.
File Status	Select the file status of the download. File statuses include Not Downloaded , Downloaded , and All . Typically you will select Not Downloaded , because you are downloading the CODA files that have not been downloaded to your system.

4. Choose the **OK** button.

NOTE

You cannot delete any files from the Isabel server by using the **IBS Download Request Options** page. You must manually delete the files by logging on to the Isabel server.

After the CODA files have been downloaded, the **Process Status** field will display **Created** on the **IBS Logs** page. You can log on to the Isabel server to manually retrieve the files. For more information, see [Import CODA Statements](#).

Belgian Electronic Banking

3/31/2019 • 2 minutes to read

NOTE

The Isabel features are available only for on-premises deployments.

Electronic banking allows you to electronically exchange data with Belgian financial institutions, either on disk or via Interbanks Standards Association Belgium (Isabel). This speeds up processing time and helps avoid errors caused by manual data entry or processing.

In Business Central, you can use electronic banking to perform the following functions:

- Send electronic payments
- Process bank statements with CODA
- Process direct debits with domiciliations

Set Up Electronic Banking

3/31/2019 • 3 minutes to read

NOTE

The Isabel features are available only for on-premises deployments.

With electronic banking, you can make electronic payments to domestic, international, SEPA, and non-Euro SEPA vendors and customers.

Your company subscribes to an eBanking contract with the bank to maintain a certain bank account or several bank accounts. The company also subscribes to Isabel to send payment files to and receive bank statement files from the bank electronically. Therefore, the company receives smartcards linked to the eBanking contract. The smartcards are secured by PIN codes.

You will receive one of these smartcards to connect to IBS so that you are connected to the eBanking contract of the company.

When uploading to or downloading files from the IBS platform, you will insert the smartcard in the card reader and use a PIN code to make connection to IBS. When the IBS session is established, the eBanking contract and eBanking user is known by the system. Also the eBanking contract and user linked bank account numbers are known.

Before you can use electronic banking, you must set up the following information:

- Electronic banking setup.
- IBLC/BLWI codes - For more information, see [Set Up IBLC-BLWI Transaction Codes](#).

To set up electronic banking

1. Choose the  icon, enter **Electronic Banking Setup**, and then choose the related link.
2. On the **Electronic Banking Setup** page, on the **General** FastTab, fill in the fields as described in the following table.

FIELD	DESCRIPTION
Summarize Gen. Jnl. Lines	Select to indicate if you want to group the payment journal lines for each vendor.
Cut off Payment Message Texts	Select to indicate if you want to truncate long payment messages. Messages will be truncated if greater than 106 characters for domestic payments and less than 140 characters for international payments.
IBS Version	Specify the version of Isabel that is currently used for electronic banking in your organization.
Notification E-mail address	Specify the notification email address that you want to use for electronic banking balance and transaction messages. This is the default address that is used to contact the Isabel server.

FIELD	DESCRIPTION
Language	Specify the language that you want to use for electronic bank balance and transaction messages.
IBS Service Version	Specify the service version that is used to communicate with the Isabel server.

3. On the **Upload** FastTab, fill in the fields as described in the following table.

FIELD	DESCRIPTION
Upload integration Mode	Specify the mode that you want to use to upload content to the Isabel server. The integration mode options include Attended and Manual . If the integration mode is set to Attended , you must set the IBS Version field to 6 . The entries in the IBS Log table will be created when payment files are generated. If the integration mode is set to Manual , you must log on to the Isabel server manually and no log entries will be created.
Upload Path	Specify the path to the folder where the files will be saved during the upload process.

4. On the **Download** FastTab, fill in the fields as described in the following table.

FIELD	DESCRIPTION
Download integration Mode	Specify the mode that you want to use to download content to the Isabel server. The options include Attended and Manual . If the integration mode is set to Attended , you must set the IBS Version field to 6 . The entries in the IBS Log table will be created when the download is performed. If the integration mode is set to Manual , you must log on to the Isabel server manually and no log entries will be created.
Download Path	Specify the path to the folder where the files will be saved during the download process.

5. On the **Numbering** FastTab, fill in the fields as described in the following table.

FIELD	DESCRIPTION
IBS Log Upload Nos.	Specify the number series that is used for Isabel log entries created during the file upload process.
IBS Log Download Nos.	Specify the number series that is used for Isabel log entries created during the file download process.
IBS Request ID	Specify a number sequence used for automatic and unique numbering of the requests.

6. Choose the **OK** button.

Set Up Export Protocols

3/31/2019 • 2 minutes to read

Before you can use electronic banking, you must set up export protocols. Export protocols define the file format that is generated when you export payment history to be processed by the bank. Each line contains an export protocol identified by a code and a description. You can set up as many export protocols as necessary. You must set up an export protocol for domestic payments, international payments, SEPA payments, and non-Euro SEPA payments.

With export protocols, you can assign the codeunit that defines the check that should be performed before exporting the payment lines to a file and the report that defines the payment format. For example, you might have an export protocol named **DOM1**. This export protocol contains the **Check Domestic Payments** check codeunit and the **File Domestic Payments** report. Each export protocol has both a check codeunit and a matching report, as shown in the following table.

CHECK OBJECT ID	EXPORT OBJECT ID
2000002 Check Domestic Payments	Report 2000001 File Domestic Payments
2000003 Check International Payments	Report 2000002 File International Payments
2000004 Check SEPA Payments	Report 2000005 File SEPA Payments
2000005 Check Non Euro SEPA Payments	Report 2000006 File Non Euro SEPA Payments
If you do not want this option, set to zero, otherwise select another option.	XMLport 1000 (SEPA pain.001.001.03 Payments)

After you have set up export protocols, you can use them in your electronic banking payment journals.

To set up an export protocol

1. Choose the  icon, enter **Export Protocols**, and then choose the related link.
2. Choose the **New** action.
3. In the **Export Protocols** page, fill in the fields as described in the following table.

FIELD	DESCRIPTION
Code	Specify a code that uniquely identifies the export protocol.
Description	Specify a description for the export protocol entry. You can enter a maximum of 50 characters, both numbers and letters.
Code Expenses	Specify the code that describes the type of expenses associated with the export protocol entry. Code expenses include blank , SHA , BEN , and OUR . For international payments, SHA is the default.

FIELD	DESCRIPTION
Check Object ID	Specify the identification number of the codeunit that you want to use to perform a check on the object before the payment file is exported.
Check Object Name	Specify the name of a verification process that is used to perform a check on the object before the payment file is exported. After you select the Check Object ID , this field will display the Check Object Name .
Export Object Type	Specify the type of the object that defines the export format of the payment file export. After you select the Export Object ID , this field will display the Export Object Type . NOTE: To set the export protocol up for SEPA pain.001.001.03, select XMLPort .
Export Object ID	Specify the identification number of the object that defines the export format of the payment file export. For example, if you select 2000002 , the export format for the payment file will be File International Payments . NOTE: To set up the export protocol for SEPA pain.001.001.03, select XMLport 1000 .
Export No. Series	Specify the number series that is used to assign identification numbers to the payment file export.

4. Choose the **OK** button.

Belgian Electronic Payments

3/31/2019 • 2 minutes to read

In the electronic banking module in Business Central, you can make domestic, international, SEPA, and non-Euro SEPA electronic payments.

ELECTRONIC PAYMENT	DESCRIPTION
Domestic	These payments are in the local currency (LCY) and are processed by a local financial institution for beneficiaries who have accounts that have a local financial institution. The validity of the bank account numbers will be verified by Business Central.
International	These payments are either in foreign currencies or in LCY and are processed by a local financial institution for beneficiaries who have accounts that have foreign financial institutions. The validity of the bank account numbers will not be verified by Business Central.
SEPA	These payments are in euro and are processed in countries/regions that accept SEPA payments. The validity of the bank account numbers will be verified by Business Central.
Non-Euro SEPA	These payments are in currency other than euro and made to a country/region outside the European Economic Association (EEA). The validity of the bank account numbers will be verified by Business Central.

In electronic banking, because the standard for electronic payments is different for countries/regions, electronic payments created in Business Central can only be processed by financial institutions in Belgium. For international payments, the local financial institutions will then have to process the payment with the foreign institutions.

NOTE

Credit memos cannot be processed separately because payments must not have a negative balance. To process a credit memo, the credit memo must be added to one or more invoices by summarizing payments.

Before you can make electronic payments, you must set up use electronic banking in Business Central.

Correcting Payment Lines

You must correct all errors before you can post the electronic payment lines. You can correct payment lines in the following ways.

CORRECTION	DESCRIPTION
------------	-------------

CORRECTION	DESCRIPTION
Add a payment journal line	If the payment journal already contains many lines and you want to add an additional line, you can enter the journal line manually. For example, if you want to reimburse a credit memo to a customer. These types of customer payments are not suggested automatically by the Suggest Vendor Payments batch job.
Edit a payment journal line	If you have not assigned a bank account to the payment journal or if you have not specified a preferred bank account on the Vendor card, you will have to manually enter this information on each journal line before posting the journal. If you specify a bank account for a vendor, the bank account will be copied to all payment journal lines for that vendor. For more information, see Set Up Electronic Banking .
Delete a payment journal line	The Suggest Vendor Payments batch job creates payment suggestions for all vendors matching the specified criteria. If you want to prevent payment for a specific vendor ledger entry or vendor, you can delete the corresponding journal lines.

For more information, see [Manage Electronic Payment Lines](#).

Set Up IBLC-BLWI Transaction Codes

3/31/2019 • 2 minutes to read

In order to process electronic payments, you must set up transaction codes according to the requirements of the Belgian-Luxembourg Exchange Institute. These are international identification codes for the different types of payment transactions. The IBLC/BLWI codes are used only for international payments.

To set up IBLC/BLWI transaction codes

1. Choose the  icon, enter **IBLC/BLWI Transaction Codes**, and then choose the related link.
2. Choose the **New** action.
3. Enter the **Transaction Code** and **Description**.
4. Choose the **OK** button.

Set Up Vendors for Automatic Payment Suggestions

3/31/2019 • 2 minutes to read

You can set up each vendor so that unpaid invoices from that vendor are automatically included in payment suggestions. For each vendor, you must decide whether you want to automatically generate payment suggestions. If you do not want to generate payment suggestions for a vendor, you should not select the **Suggest Payments** check box. This way the outstanding ledger entries for the vendor will not be included in payment suggestions.

To set up a vendor to be included in the payment suggestion batch

1. Choose the  icon, enter **Vendors**, and then choose the related link.
2. On the **Vendors** page, select a relevant vendor, and then choose the **Edit** action.
3. On the **Payments** FastTab, select the **Suggest Payments** check box.

If this field is not selected, no payment suggestions will be generated for the vendor.

4. Choose the **OK** button.

Create Payment Journal Templates and Batches

3/31/2019 • 2 minutes to read

In Business Central, payment suggestions are generated and posted in payment journals. The structure of the payment journal is similar to the structure of other journal types. However, the payment journal contains some fields that are specific for processing payments. Before you can start generating payment suggestions, you have to set up a payment journal template and a payment journal batch.

If you assign a bank account to the payment journal template, the bank account will be inserted on all payment journal batches and payment journal lines that are created by using this template. By specifying a bank account for the journal template, you can reduce the time that is required for checking the payment suggestions.

To create a payment journal template

1. Choose the  icon, enter **Payment Journal Templates**, and then choose the related link.
2. Choose the **New** action.
3. On the **EB Payment Journal Templates** page, fill in the fields as described in the following table.

FIELD	DESCRIPTION
Name	Enter the unique name for the payment journal template that you are creating.
Description	Enter a description of the payment journal template.
Bank Account	Select the bank account that will be used when you create a payment suggestion.
Reason Code	Select the reason code that will be used on all the journal batches and lines that are created by using the journal template. If you want to use a different reason code on a journal line, you can manually change it.
Source Code	Select the source code that will be used on all the journal batches and lines that are created by using the journal template.

4. Choose the **OK** button.

To add payment journal batches to the journal template

1. On the **Payment Journal Templates** page, choose the **Batches** action.
2. On the **Paym. Journal Batch** page, fill in the fields as described in the following table.

FIELD	DESCRIPTION
Journal Template Name	Specify a journal template name for the payment journal batch.

FIELD	DESCRIPTION
Name	Enter a unique name for the journal batch. NOTE: To have the journal name update numerically, include a number in the journal batch name. For example, the name KBC1 will increment by one number with every posting to KBC2, KBC3, and so on.
Description	Enter a description for the journal batch.
Reason Code	Specifies the reason code that is linked to this journal batch.
Status	Specifies the status of the batch.

3. Choose the **OK** button.

Test Electronic Payments

3/31/2019 • 2 minutes to read

NOTE

The Isabel features are available only for on-premises deployments.

After you have set up electronic banking and generated payment suggestions, you can test the payment journal lines for errors before posting them.

Some of the information that is validated includes:

- Bank accounts numbers are valid.
- Positive payment lines are present.
- If domestic and international payments are made from only one bank account.
- If only one bank account can be used for Isabel.
- If payment lines are in Euro for SEPA.
- If a number series has been defined for SEPA.

You can view any errors on the **Export Check Error Logs** page.

IMPORTANT

You have to correct all errors before you can post the lines.

To test payment journal lines

1. Choose the  icon, enter **Payment Journals**, and then choose the related link.
2. In the **Batch Name** field, select the required journal batch.
3. In the **Export Protocol** field, select the export protocol.
4. Enter the payment journal line information, and then choose the **Check Payment Lines** action to validate the payment journal lines. The validation that is performed on the journal lines depends on the type of check that is specified on the **Export Protocols** page.

Generate Payment Suggestions

3/31/2019 • 2 minutes to read

After you have set up electronic banking, you can start generating payment suggestions. You can do this in the payment journal.

To generate payment suggestions

1. Choose the  icon, enter **Payment Journals**, and then choose the related link.
2. Select the appropriate journal batch, and then choose the **Suggest Vendor Payments** action.
3. In the **Suggest Vendor Payments EB** page, on the **Options** FastTab, fill in the fields as described in the following table.

FIELD	DESCRIPTION
Last Due Date	Enter the last due date that can appear on the vendor ledger entries to be included in the batch job.
Take Credit Memos	Select to include outstanding credit memos for vendors. The credit memos will be subtracted from the amount due. When selecting credit memos, the due date is not used.
Take Payment Discounts	Select to include vendor ledger entries for which you can receive a payment discount.
Payment Discount Date	Enter the date that will be used to calculate a payment discount.
Available Amount	If there is a maximum amount available for payments, you can enter it here. The batch job will then create a payment suggestion based on this amount and the priority of vendors.
Posting Date	Enter the date that will appear as the posting date on the lines that the batch job inserts in the payment journal.

4. On the **Vendor** FastTab, enter the filter criteria.
5. Choose the **OK** button to start the batch job.

When the batch job is finished, the payment journal contains all vendor ledger entries that match the filters.

Isabel 6

3/31/2019 • 2 minutes to read

The Isabel organization has developed a Client Isabel Synchronizer (CIS) platform that allows Business Central to securely integrate with Isabel. CIS handles document exchange to and from the Isabel server.

To upload or download the bank files, you will have to set up your environment to work with Isabel. Business Central communicates to the CIS.dll through a COM wrapper.

To set up your system to work with Isabel, complete the following:

- Install the Isabel security components. For more information, see the download area on the [Isabel website](#).
- Install the COM wrapper that is manufactured by the Isabel organization. This wrapper is included with the Isabel GO 6.20 package.
- Register the COM wrapper on your computer. At the command prompt, locate the CIS.dll and then execute the **regsvr32 CISComWrapper.dll** command.

Upload Payment Files to an Isabel Server

3/31/2019 • 2 minutes to read

NOTE

The Isabel features are available only for on-premises deployments.

Payment files can be uploaded using the **IBS Logs** page. The **Upload Integration Mode** and **Download Integration Mode** fields on the **Electronic Banking Setup** page must be set to **Attended** to upload payment files.

NOTE

Before you can upload payment files you must be logged on to the Isabel server.

To upload payment files in attended mode

1. Choose the  icon, enter **IBS Logs**, and then choose the related link.
2. Choose the **Get Contract and User** action.
3. After verifying the payment files, a user ID and contract ID will be displayed in the **IBS User ID** and **IBS Contract ID** fields.

The **Upload Status** field will be set to **Ready for Upload**. If more than one contract exists on the Isabel server for the bank account, the **Upload Status** will be set to **Conflict Exists**. Select the correct contract.

4. Choose the **Perform Download** action. The payment files will be uploaded to the Isabel server and the **Process Status** field will be set to **Processed**.
5. Continue processing the payment files by signing and sending the files on the Isabel server.

Import CODA Statements

3/31/2019 • 2 minutes to read

When you receive a CODA statement from your bank, you must import it into Business Central. For more information, see [Set Up Bank Accounts for CODA](#).

To import a CODA statement

1. Choose the  icon, enter **Bank Accounts**, and then choose the related link.
2. Select the bank account, and then choose **Import CODA File** action.
3. Enter the name of the file to import and then choose the **OK** button.

This imports the CODA statement. Next, you must process the CODA statement lines. For more information, see [Apply CODA Statements](#).

Manage Electronic Payment Lines

3/31/2019 • 2 minutes to read

You can have Business Central suggest payments automatically and then you can add more payments manually. You can also edit or delete suggested payments. You must correct all errors before you can post the electronic payment lines. The following procedure describes how to manually add or edit payment journal lines, but you can also delete payment journal lines on the **Payment Journal** page.

To manage a payment journal line

1. Choose the  icon, enter **Payment Journals**, and then choose the related link.
2. In the **Batch Name** field, select the required journal batch.
3. Select a journal line and enter the information as needed.
 - or -
To delete the selected line, choose the **Delete** action.
4. Choose the **OK** button.

Manually Transfer and Post CODA Statements

3/31/2019 • 2 minutes to read

After you have applied and processed all CODA statement lines, you can manually transfer the CODA statement lines to a financial journal. The financial journal lets you enter a starting balance and an ending balance and automatically calculate the difference between the two balances. Posting is not allowed if the statement line amounts do not balance with the statement ending balance.

For information about how to automatically transfer statements, see [Automatically Transfer and Post CODA Statements](#).

To manually transfer and post statement lines

1. Choose the  icon, enter **General Journal**, and then choose the related link.
2. Select the journal, and then choose the **OK** button.
3. Enter the **Statement Ending Balance** field.
4. Manually enter each line of the statement.
5. Choose the **Post** action.

Print Payment Files

3/31/2019 • 2 minutes to read

After you have printed a test report and corrected all errors, you can print the payment journal lines to a payment file.

A payment file contains either domestic, international, SEPA, or non-euro SEPA payments. The file can be sent to a bank either on disk, by modem, or via Interbanks Standards Association Belgium (Isabel). You can only create one file for each posting date and each currency code. When you export the payments to a file, an accompanying note is printed, which can also be sent to the bank.

In the payment journal, the **Status** field on the exported lines will be set to **Posted**.

To print a payment file

1. Choose the  icon, enter **Payment Journal**, and then choose the related link.
2. On the **Options** FastTab, fill in the fields as described in the following table.

FIELD	DESCRIPTION
Batch Name	Specify the batch name of the payment journal.
Bank Account	Specify the bank account of the payment journal.
Export Protocol	<p>Specify the export protocol code of the payment journal line. Export protocols control which payment file will be generated in the payment journal.</p> <p>You can have a mixture of export formats in a single batch, such as domestic, international, SEPA, or a combination of these. However, when exporting the payment lines to a file, you can only use one export format, or export protocol. Note: By defining the export protocol, you also define the type of validation that will be performed in the payment journal.</p>

3. Choose the **Check Payment Lines** action.

The **Export Check Error Logs** page displays any errors that may exist. If there are errors, you must fix the errors before you can continue.

4. If there are no errors, choose the **Export Payment Lines** action.

The report that you specified in the **Test Report ID** field in the **EB Payment Journal Templates** will open.

5. Choose the **Print** button.

SEPA Payments

3/31/2019 • 2 minutes to read

The Single Euro Payments Area (SEPA) unifies payment methods in participating European countries. This makes international payments as easy to process as domestic payments. Regardless of location, European citizens and companies can make and receive payments in euros, whether within or across national borders, with the same basic conditions, rights, and obligations.

Activate SEPA Payments

3/31/2019 • 2 minutes to read

To submit vendor payments electronically in Single Euro Payments Area (SEPA) ISO 20022 payment format, you must set up prerequisites for enabling SEPA payments.

In the following procedures describe how to enable SEPA payment and set up vendor bank accounts.

To enable countries/regions for SEPA

1. Choose the  icon, enter **Countries/Regions**, and then choose the related link.
2. Choose the **Edit List** action.
3. Select the **SEPA Allowed** check box for each country or region that you want to enable for SEPA.
4. Choose the **OK** button.

To enable bank accounts for SEPA

1. Choose the  icon, enter **Bank Accounts**, and then choose the related link.
2. Select the bank account that you want to enable for SEPA, and then choose the **Edit** action.
3. On the **General** FastTab, in the **Country/Region Code** field, select the appropriate code.

NOTE

The specified country/region code must be enabled for SEPA as described in the previous procedure.

4. Enter a value in the **Min. Balance** field.
5. On the **Transfer** FastTab, in the **SWIFT Code** field, enter a code.
6. Choose the **OK** button.

To set up vendor bank accounts for SEPA

1. Choose the  icon, enter **Vendors**, and then choose the related link.
2. Select the relevant vendor, and then choose the **Bank Accounts** action.
3. Select the vendor bank account to set up for SEPA, and then choose the **Edit**.
4. On the **Transfer** FastTab, in the **IBAN** and **SWIFT Code** fields, enter the international bank identifier code of the bank where the vendor has the account.
5. Choose the **OK** button.

File Non-Euro SEPA Payments

3/31/2019 • 2 minutes to read

In Business Central, you can file non-euro SEPA payments with the bank. This is useful when you make payments to other countries that do not use SEPA and for currencies other than the euro.

Before you can file a non-euro SEPA payment you must complete the following administration tasks:

- Set up a new export protocol for a non-euro SEPA. For more information, see [Export Protocol](#).
- In the **Country/Region** table, clear the **SEPA Allowed** field for each country that belongs to the EEA zone.
- Verify that the **Currency Euro** field in the **General Ledger Setup** table is not in euro currency.
- Verify that the vendor's **Preferred Bank Account** field in the **Vendor** table contains the IBAN and SWIFT code.

To file a non-euro SEPA payment

1. Choose the  icon, enter **File Non Euro SEPA Payments**, and then choose the related link.
2. Fill in the fields as described in the following table.

FIELD	DESCRIPTION
Journal Template Name	Specify the general journal template for the non-euro SEPA payment report.
Journal Batch	Specify the general journal batch for the non-euro SEPA payment report.
Post General Journal Lines	Specify if you want to transfer the payment lines to the general ledger.
Include Dimensions	Enter the dimensions that you want to include in the non-euro SEPA payment report. The option is only available if the Summarize Gen. Jnl. Lines field on the Electronic Banking Setup page is selected.
Execution Date	Enter an execution date if you want an execution date that differs from the posting date on the payment lines.
File Name	Enter the name of the file, including the drive and folder, to which you want to print the report.

3. Choose the **OK** button.

File SEPA Payments

3/31/2019 • 2 minutes to read

In Business Central, you can use Single Euro Payments Area (SEPA) credit transfers to file SEPA payments with the bank.

SEPA unifies payment methods in participating European countries/regions, which makes international payments as easy to process as domestic payments. European citizens and companies can make and receive payments in euros, whether within or across national borders, with the same basic conditions, rights, and obligations, regardless of location.

Before you can file a SEPA payment you must complete the following administration tasks:

- Set up a new export protocol. For more information, see Export Protocol.
- In the **Country/Region** table, select the **SEPA Allowed** field for each country that belongs to the EEA zone.
- Verify that the **Currency Euro** field in the **General Ledger Setup** table corresponds with the currency in the payment lines.
- Verify that the vendor's **Preferred Bank Account** field in the **Vendor** table contains the IBAN and SWIFT code.

To file a SEPA payment

1. Choose the  icon, enter **File SEPA Payments**, and then choose the related link.
2. Fill in the fields as described in the following table.

FIELD	DESCRIPTION
Journal Template Name	Specify the general journal template for the SEPA payment report.
Journal Batch	Specify the general journal batch for the SEPA payment report.
Post General Journal Lines	Specify if you want to transfer the payment lines to the general ledger.
Include Dimensions	Enter the dimensions that you want to include in the SEPA payment report. The option is only available if the Summarize Gen. Jnl. Lines field on the Electronic Banking Setup page is selected.
Execution Date	Enter an execution date if you want an execution date that differs from the posting date on the payment lines.
File Name	Enter the name of the file, including the drive and folder, to which you want to print the report.

3. Choose the **OK** button.

Direct Debit Using Domiciliation

3/31/2019 • 2 minutes to read

A domiciliation is a financial agreement between you and your customers, allowing you to automatically collect the payments for customer's invoices through a preferred bank account. Domiciliations can only be processed for domestic customers with domestic bank accounts. Domiciliations in foreign currencies or involving foreign banks are not supported.

Direct debit domiciliation is useful for companies with many customers or subscribers, such as a utility company or a publishing company.

Before you can start using electronic banking for domiciliations, you must enter certain basic information.

- Domiciliation number - This is a unique code obtained from the bank which identifies the domiciliation agreement between you, your customer, and the bank. The contract contains details regarding payment frequency, bank account numbers, and amounts. When you send your payments to the bank, the bank will use the domiciliation number to identify all parties involved.
- Preferred bank account - The preferred bank account will be suggested as a default bank account on all domiciliation suggestions for that customer. If necessary, you can change the bank account before posting the domiciliation suggestions. For more information, see [Generate Domiciliation Suggestions](#).

Set Up Domiciliations

3/31/2019 • 2 minutes to read

Before you can use electronic banking for domiciliations, you must enter the customer's domiciliation number and preferred bank account.

NOTE

You should use one bank account per customer for all domiciliations.

To set up domiciliation

1. Choose the  icon, enter **Customers**, and then choose the related link.
2. Select the customer, and then choose the **Edit** action.
3. On the **Payments** FastTab, fill in the fields as described in the following table.

FIELD	DESCRIPTION
Domiciliation	Enter the domiciliation number for the customer. This number will be used when you create domiciliations for this customer.
Preferred Bank Account	Enter the preferred bank account for transactions with this customer. This account will be used when you create a payment suggestion for this customer.

4. Choose the **OK** button.

Edit and Delete Domiciliation Lines

3/31/2019 • 2 minutes to read

After you have generated domiciliation suggestions, you may want to change the domiciliations lines. For example, you may want to reassign a bank account or prevent payment for a specific customer or customer ledger entry.

After you have modified the journal lines, print the **Domiciliation Journal - Test** report to test all journal lines.

The **Suggest Domiciliations** batch job creates domiciliation suggestions for all customers matching the specified criteria.

To edit a journal line

1. Choose the  icon, enter **Domiciliation Journals**, and then choose the related link.
2. In the **Batch Name** field, select the required journal batch.
3. Select the journal line, and edit the fields.

To delete a journal line

1. Choose the  icon, enter **Domiciliation Journals**, and then choose the related link.
2. In the **Batch Name** field, select the required journal batch.
3. Select the journal line, and then choose the **Delete** action.
4. Choose the **Yes** button.

Test Domiciliations

3/31/2019 • 2 minutes to read

To test the domiciliation journal lines, you can use the **Domiciliation Journal - Test** report. This report prints an overview of all journal lines along with any errors such as missing fields or incorrect bank accounts. You have to correct all errors before you can post the lines.

To print a domiciliation test report

1. Choose the  icon, enter **Domiciliation Journal**, and then choose the related link.
2. In the **Batch Name** field, select the required journal batch.
3. Choose the **Test Report** action.
4. Choose the **Print** button to print the report or choose the **Preview** button to view it on the screen.

Export and Post Domiciliations

3/31/2019 • 2 minutes to read

NOTE

The Isabel features are available only for on-premises deployments.

You can submit domiciliations to your bank by exporting the data to a file. When you export to a file, you can choose to automatically post the lines to the general ledger.

Depending on setup of the **SEPA Direct Debit Exp. Format** field on the **Bank Account Card** page, the **File Domiciliations** action opens either of these request pages:

- **Create Gen. Jnl. Lines** page – for the SEPA Direct Debit format.
- **File Domiciliations** page – for domestic formats.

To export and post domiciliations in SEPA format

1. Choose the  icon, enter **Domiciliation Journals**, and then choose the related link.
2. In the **Batch Name** field, select the required journal batch, and then choose the **File Domiciliations** action.
3. On the **Create Gen. Jnl. Lines** page, select the **Options** FastTab, and then fill in the fields as described in the following table.

FIELD	DESCRIPTION
Journal Template Name	Select the general journal template that the domiciliations will be posted from.
Journal Batch	Select the general journal batch that the journal lines will be transferred from.
Post General Journal Lines	Select to post to the general ledger.

4. Choose the **OK** button to export the file.
5. Choose an appropriate location from where you upload the file to your bank, and then choose **Save**.
6. Choose the **Yes** button to automatically post the domiciliation journal lines.

If you did not select the **Post General Journal Lines** check box, you will have to post the domiciliations manually in the general journal.

NOTE

After you have posted domiciliations in the general journal, delete the posted domiciliations on the **Domiciliation Journal** page. To do this, select all lines with status **Posted**, and then choose the **Delete** button.

To export and post domiciliations in Isabel format

1. Choose the  icon, enter **Domiciliation Journals**, and then choose the related link.
2. In the **Batch Name** field, select the required journal batch, and then choose the **File Domiciliations** action.
3. On the **File Domiciliations** page, select the **Options** FastTab, and then fill in the fields as described in the following table.

FIELD	DESCRIPTION
Journal Template Name	Select the general journal template that the domiciliations will be posted from.
Journal Batch	Select the general journal batch that the journal lines will be transferred from.
Post General Journal Lines	Select to post to the general ledger.
Pivot Date	Enter a pivot date if you want a date that differs from the posting date on the domiciliation lines. The date entered will overwrite the posting date on the selected journal lines.
Inscription No.	Enter the inscription number that is on the intra-community declaration disk. The number is included in the file and on the accompanying note.
File Name	Enter the name of the export file that you are creating.

4. Choose the **Print** button to export the domiciliations and print the accompanying note, or choose the **Preview** button to view it on the screen. If you do not want to export the file now, choose the **Cancel** button.
5. Choose the **OK** button to send the report to the printer.
6. Choose the **Yes** button to automatically post the domiciliation journal lines.

If you did not select the **Post General Journal Lines** check box, you will have to post the domiciliations manually in the general journal.

NOTE

After you have posted domiciliations in the general journal, delete the posted domiciliations on the **Domiciliation Journal** page. To do this, select all lines with status **Posted**, and then choose the **Delete** button.

Generate Domiciliation Suggestions

3/31/2019 • 2 minutes to read

After you have set up domiciliations, you can start generating domiciliation suggestions. In Business Central, you can only create domiciliation suggestions for domestic customers.

To generate domiciliation suggestions

1. Choose the  icon, enter **Domiciliation Journal**, and then choose the related link.
2. In the **Batch Name** field, select the required journal batch, and then choose the **Suggest Domiciliations** action.
3. On the **Options** FastTab, fill in the fields as displayed in the following table.

FIELD	DESCRIPTION
Due Date	Enter the due date to be included in the batch job. Only entries that have a due date before or on this date will be included.
Take Payment Discounts	Select if you want the batch job to include customer ledger entries for which you can receive a payment discount.
Payment Discount Date	Enter the date that will be used to calculate the payment discount.
Select Possible Refunds	Select if you want the batch job to include refunds.
Posting Date	Enter the date that will appear as the posting date on the lines that the batch job inserts in the domiciliation journal.

4. On the **Customer** FastTab, enter any additional filter criteria.
5. Choose the **OK** button.

When the batch job is finished, the domiciliation journal contains all open customer ledger entries that match the filters.

NOTE

The domiciliation suggestions will only include customers who have a Domiciliation number set up. For more information, see [Set Up Domiciliations](#).

Summarizing Payment Lines and General Journal Lines

3/31/2019 • 2 minutes to read

Business Central summarizes payment lines and journal line across the following types of payments:

- Domestic payments
- International payments
- SEPA payments
- Non-euro SEPA payments

How Payment Journal Lines are Transferred to the General Journal

When you export the payment journal lines to a file, Business Central transfers the payment journal lines to the specified general journal. By default, a general journal line is created for each payment journal line.

The following two fields on the **Electronic Banking Setup** page affect how the payment lines are summarized:

- **Summarize Gen. Jnl. Lines**
- **Cut off Payment Message Texts**

If you have selected the **Summarize Gen. Jnl. Lines** check box on the **Electronic Banking Setup** page, Business Central summarizes all payment journal lines for a specific vendor into one general journal line. The general description "Payment %1," where %1 is the vendor number, is used for the summarized journal line description. A separate payment line and a separate general journal line are created to handle:

- Payment journal lines that contain partial payments, with both the **Partial Payment** and the **Separate Line** fields selected.
- Payment journal lines that contain a standard format message (that is, passes the MOD97 test), which sets **Standard Format Message** to True in the electronic banking journal.

Example 1

In this example, you export payment lines, and the **Summarize Gen. Jnl. Lines** check box is selected. Business Central creates:

- One combined payment line in a XML file that has a concatenated payment message. White space is the delimiter.
- One payment line in the general journal with a generic description that .././includes the vendor name.

Example 2

In this example, you export payment lines, and the **Summarize Gen. Jnl. Lines** check box is selected. The **Cut off Payment Message Texts** check box is cleared, and combined SEPA and non-euro SEPA payment lines exceed 140 characters in payment message. Business Central creates:

- Two combined payment lines in a XML file. The first payment line contains the first concatenated payment messages. The second payment line contains the payment message from the third line.
- One payment line in the general journal with a generic description that .././includes the vendor name.

Example 3

In this example, you export payment lines, and the **Summarize Gen. Jnl. Lines** check box is selected. The **Cut off Payment Message Texts** check box is also selected and combined SEPA and non-SEPA payment lines exceed 140 characters in payment message. Business Central creates:

- One combined payment line in a XML file that has two concatenated payment messages. An ellipsis (...) is used to indicate that the message is truncated.
- One payment line in the general journal with a generic description that includes the vendor name.

Based on the XML structure, the payments are summarized per account number and beneficiary bank account no and bank account no. The bank account filter can be empty.

The EndToEndId in the SEPA message is taken from the payment message and can be truncated to the maximum length of 45 characters.

Archive IBS Log Entries

3/31/2019 • 2 minutes to read

NOTE

The Isabel features are available only for on-premises deployments.

IBS log lines that have a process status of **Processed** can be archived. IBS logs contain information about electronic banking files that are created during Isabel electronic bank transfers.

Isabel is a third-party software program that is frequently used in Belgium to manage and transfer electronic banking files. Isabel currently supports bank transactions, such as SEPA credit transfers, automated bank orders, and CODA files.

To archive an IBS log entry

1. Choose the  icon, enter **IBS Logs**, and then choose the related link.
2. Select the line that you want to archive, and then choose the **Archive** action.
3. A message appears asking if you want to archive the IBS log records.
4. Choose the **Yes** button.

NOTE

The **Process Status** field for the line will now be **Archived**. You can delete a record with a status of **Archived**.

Apply and Unapply General Ledger Entries

3/31/2019 • 2 minutes to read

Applying temporary general ledger entries allows companies to work with temporary and transfer accounts in the general ledger. Temporary and transfer accounts are used to store temporary ledger entries that are waiting for further processing into the general ledger.

You can use temporary accounts for:

- Money transfers from one bank account to another.
- Financial transaction transfers from one system to another in which part of the information temporarily resides on the original system.
- Transactions for which you have issued a sales invoice to a customer but have not yet received the corresponding purchase invoice from the vendor.

When the ledger entries have been processed, you can use the apply entries function to update the posted ledger entries and the posting account type.

You can unapply the applied general ledger entries and then open the closed entries to make changes.

To apply general ledger entries

1. Choose the  icon, enter **G/L Registers**, and then choose the related link.
2. Select a general ledger register, and then choose the **General Ledger** action.
3. On the **General Ledger Entries** page, choose the **Apply Entries** action.

All open ledger entries for the general ledger account are displayed on the **Apply General Ledger Entries** page.

NOTE

By default, the **Include Entries** field is set to **Open**. You can change the value of the **Include Entries** field to **All** or **Closed**. You can only apply general ledger entries that are **Open**.

4. Select the relevant general ledger entry, and then, on the **Navigate** tab, in the **Application** group, choose **Set Applies-to ID**.

The **Applies-to ID** field is updated with the user ID. The remaining amount is displayed in the **Balance** field on the **Apply General Ledger Entries** page.

5. Choose the **Post Application**.

You can post the application even if the balance amount is equal to 0. When posted, the **Remaining Amount** field is affected as follows:

- If the **Balance** is equal to 0, then the **Remaining Amount** field on all ledger entries is set to 0.
- If the **Balance** is not equal to 0, then the amount in the **Balance** field is transferred to the **Remaining Amount** field for the general ledger entry that was selected when you posted the application.
- For all other general ledger entries, the **Remaining Amount** field is set to 0 and the **Open, Closed**

by **Entry No.**, **Closed by Amount**, and **Closed at Date** fields are updated.

NOTE

When posted, the general ledger entries which update the **Applies-to ID** field are deleted.

6. Choose the **OK** button.

To view the applied general ledger entries

1. Choose the  icon, enter **G/L Registers**, and then choose the related link.
2. Select a general ledger register, and then choose the **General Ledger** action.
3. Select the relevant general ledger entry, and then choose the **Applied Entries** action.

You can view all the applied general ledger entries.

4. Choose the **OK** button.

To unapply general ledger entries

1. Choose the  icon, enter **G/L Registers**, and then choose the related link.
2. Select a general ledger register, and then choose the **General Ledger** action.
3. Select the general ledger entry that you want to unapply, and then choose the **Undo Application** action.

The applied general ledger entries are unapplied.

NOTE

If an entry is applied to more than one application entry, you must unapply the latest application entry first. By default, the latest entry is displayed.

4. Choose the **OK** button.

Create Financial Journals

3/31/2019 • 2 minutes to read

Financial journals are used to register bank account transactions. The financial journal lets you enter a starting balance and an ending balance and automatically calculate the difference so that you can verify that all of the transactions have been registered.

To create a financial journal

1. Choose the  icon, enter **Journal Templates**, and then choose the related link.
2. Choose the **New** action.
3. Fill in the fields as described in the following table.

FIELD	DESCRIPTION
Type	Select Financial for the type of journal.
Bal. Account Type	Select Bank Account for the type of balancing account.
Bal. Account No.	Select the number of the balancing account.

4. Choose the **OK** button.

Enterprise Numbers and Branch Numbers

3/31/2019 • 2 minutes to read

Companies receive a unique enterprise number and one or more branch numbers from the Belgian Crossroad Bank of Enterprises. These numbers are used in all correspondence to simplify communication with the Belgian administrative and legal authorities.

Enterprise Numbers

The enterprise number replaces the existing VAT number. For existing companies with a VAT registration number, the enterprise number is set as the VAT registration number preceded by a leading zero. New companies will receive a new enterprise number.

The enterprise number is printed on the following documents:

- Outgoing sales and purchase documents
- Financial statements
- Reminders and finance charge memos
- Intrastat forms and files

The enterprise number is set up in the following locations:

- Company Information table
- Contact card
- Customer table
- Vendor table

Branch Numbers

A branch number is given to a company to identify an address where at least one of the company's activities is exercised, for example, a workshop, office, warehouse, agency, or subsidiary. Unlike the enterprise number, there is no legal requirement to print the branch number.

All branches of a company will receive a unique number that is different from the enterprise number. The branch number is transferable to another company, such as after a merger or takeover.

The branch number is set up in the following locations:

- Company Information table
- Location table

Limit the Posting Period

3/31/2019 • 2 minutes to read

In Business Central, you can limit the period by which posting is permitted on three different levels: **by company**, **by user**, and **by template**.

Limiting posting periods can be useful when a company closes its sales journal at the end of each month. This keeps salespeople from registering sales documents from the previous month. At the same time, the purchase journal may stay open to register incoming purchase invoices from the previous month.

When you post on the **General Journal Templates** page, the contents of the **Allow Posting From** field and **Allow Posting To** field are checked for a date interval. The date interval indicates when you can post to a journal template. If the field is blank, the **User Setup** page is checked for a date interval for the current user. If the **User Setup** page does not contain an interval, the **Allow Posting From** field and the **Allow Posting To** field on the **General Ledger Setup** page is checked for a date interval at the company level.

To limit the posting periods by company

1. Choose the  icon, enter **General Ledger Setup**, and then choose the related link.
2. To specify the start of the period, choose the **Allow Posting From** field, and then enter the earliest date on which posting to the company is enabled.
3. To specify the end of the period, choose the **Allow Posting To** field, and then enter the last date on which posting to the company is enabled.

To limit the posting periods by user

1. Choose the  icon, enter **User Setup**, and then choose the related link.
2. To specify the start of the period, choose the **Allow Posting From** field, and then enter the earliest date on which the user can post to the company.
3. To specify the end of the period, choose the **Allow Posting To** field, and then enter the last date the user will be able to post to the company.

To limit the posting periods by template

1. Choose the  icon, enter **General Journal Templates**, and then choose the related link.
2. To specify the start of the period, choose the **Allow Posting From** field, and then enter the earliest date on which the user can post to the company.
3. To specify the end of the period, choose the **Allow Posting To** field, and then enter the last date the user will be able to post to the company.

Reporting Sales Tax and Goods/Services Tax in Canada

3/31/2019 • 2 minutes to read

In Canada, when a vendor does not have a business presence in the province in which purchases are made, the vendor will charge the Goods and Services Tax (GST) or Harmonized Sales Tax (HST) only. However, if the province has a Provincial Sales Tax (PST), then the purchaser must still calculate the PST and pay it directly to the province. When a Provincial Tax Area Code is selected, Business Central uses it to calculate the PST and post it so that there is a tax liability in both the general ledger and the tax entry records. Therefore, the tax area code selected here should be one where only the PST is included, not the GST.

Submitting the GST/HST File

The tax information in purchase documents is used to generate a GST/HST online file transfer that you must provide to the tax authorities. This file includes goods and services tax (GST) and harmonized sales tax (HST). The file is created in a .tax file format, which can be transferred online.

Reporting Sales Tax in Canada

3/31/2019 • 2 minutes to read

When you first start using Business Central, you can run an assisted setup guide to quickly and easily set up sales tax information for your company, customers, and vendors. In a matter of minutes, you are ready to create sales documents and purchase documents with sales tax calculated correctly. This is explained [in our blog post](#). If you move to the empty My Company, we recommend that you start by using each of the assisted setup guides, including the one for sales tax. If you prefer to set up sales tax yourself, this article explains what you have to take into consideration.

Tax Groups, Tax Areas, and Tax Jurisdictions

In Business Central, a tax group represents a group of inventory items or resources that are subject to identical tax terms. For example, you can set up a tax group for taxable items and another for nontaxable items. You must assign tax group codes to inventory items and general ledger accounts. Similarly, you must assign tax area codes to customers, locations, and to your own company settings. The assisted setup guide helps you do this.

Each tax area is a grouping of sales tax jurisdictions based on a particular geographic location. For example, the Miami, Florida, tax area includes three sales tax jurisdictions: city (Miami), county (Dade), and state (Florida). Business Central includes a limited set of tax areas with a default configuration, but you can change them and add new tax areas.

If you set up new tax areas and tax jurisdictions, you must make sure that you fill in the fields correctly. In Canada, the federal government and provinces can charge sales tax. Companies collect and remit sales tax to these government authorities for products sold to end users. Sales tax can also be charged to existing sales tax. For example, tax can be calculated on a sales invoice amount that already includes the tax from other jurisdictions.

In Canada, tax amounts must be detailed in documents for each tax jurisdiction. Up to four jurisdictions can be displayed in a document, and jurisdictions that have the same print order are combined when they are printed.

Tax Details

The **Tax Details** page shows different combinations of sales tax jurisdictions and sales tax groups to establish sales tax rates. For each tax jurisdiction, we recommend that you set up one tax group for normal sales tax, another tax group for items or services that are not taxed, and an additional tax group for every type of item or service that is handled with a different sales tax rate in that jurisdiction.

In Canada, when you sell to a customer at a location where you do not have a *situs*—or a legal location in that state—you do not collect sales tax. For locations in which you do not have a situs, ensure that both the **Tax Below Minimum** and **Tax Above Maximum** fields are 0.00.

Set Up Unrealized Sales Tax and Sales Payment Discounts

3/31/2019 • 4 minutes to read

You can use the **General Ledger Setup** page to set up unrealized sales tax. You can also set up maximum correction tax amounts so that you can limit the tax correction amounts that are entered for sales and purchases. This allows you to overwrite the calculated tax when there are rounding differences between what is calculated on the purchase order, and what is calculated on the purchase invoice from the vendor.

To set up unrealized sales tax

1. Choose the  icon, enter **General Ledger Setup**, and then choose the related link.
2. On the **General Ledger Setup** page, on the **General** FastTab, fill in the fields as described in the following table.

FIELD	DESCRIPTION
Pmt. Disc. Excl. Tax	Select to calculate the payment discount on amounts excluding sales tax.
Adjust for Payment Disc.	Select to recalculate the tax amounts when you post payments that trigger payment discounts. This field is used in the context of VAT, not sales tax.
Unrealized VAT	Select if any of your sales tax jurisdictions allow you to pay your sales tax after you have been paid. If you do not select this check box this function will be blocked for all sales tax jurisdictions.

3. Choose the **OK** button.

To set up unrealized tax for jurisdictions

1. Choose the  icon, enter **Tax Jurisdictions**, and then choose the related link.
2. On the **Tax Jurisdictions** page, choose the **Edit List** action.
3. Fill in the fields as described in the following table.

FIELD	DESCRIPTION
-------	-------------

FIELD	DESCRIPTION
<p>Unrealized Tax Type</p>	<p>– The unrealized tax feature is not used for this tax jurisdiction.</p> <p>–or–</p> <p>Percentage – Each payment covers both tax amounts and invoice amounts in proportion to the remaining invoice amount. The paid tax amount is transferred from the unrealized tax account to the tax account.</p> <p>–or–</p> <p>First – Payments cover the tax first, and then the invoice amount.</p> <p>–or–</p> <p>Last – Payments cover the invoice amount first, and then the tax amount. In this case, nothing will be transferred from the unrealized tax account to the tax account until the total invoice amount—exclusive of tax—has been paid.</p> <p>–or–</p> <p>First (Fully Paid) – Payments cover the tax first, but nothing is transferred to the tax account until the full tax amount has been paid.</p> <p>–or–</p> <p>Last (Fully Paid) – Payments cover the invoice amount first, but nothing is transferred to the tax account until the full tax amount has been paid. Important: This field is available on the Tax Jurisdiction page, but it is not shown by default. To select the field, you must first add the column that shows this field. You can change how certain UI elements are displayed. For more information, see Personalizing Your Workspace.</p>
<p>Unreal. Tax Acc (Sales)</p>	<p>The general ledger account that you want to use to post calculated unrealized tax on sales transactions. Important: This field is available on the Tax Jurisdiction page, but it is not shown by default. To select the field, you must first add the column that shows this field. You can change how certain UI elements are displayed. For more information, see Personalizing Your Workspace.</p>
<p>Unreal. Tax Acc (Purchases)</p>	<p>The general ledger account that you want to use to post calculated unrealized tax on purchase transactions. Important: This field is available on the Tax Jurisdiction page, but it is not shown by default. To select the field, you must first add the column that shows this field. You can change how certain UI elements are displayed. For more information, see Personalizing Your Workspace.</p>

FIELD	DESCRIPTION
Unreal. Rev. Charge (Purch.)	The general ledger account that you want to use for posting calculated unrealized reverse-charge tax on purchase transactions. Important: This field is available on the Tax Jurisdiction page, but it is not shown by default. To select the field, you must first add the column that shows this field. You can change how certain UI elements are displayed. For more information, see Personalizing Your Workspace .

4. Choose the **OK** button.

To set up adjustments for payment discounts in a tax posting group

1. Choose the  icon, enter **Tax Posting Setup**, and then choose the related link.
2. Choose the **Edit** action.
3. On the **Tax Posting Setup Card** page, select the **Adjust for Payment Discount** check box.

IMPORTANT

This field is available on the **VAT Posting Setup** page, but it is not shown by default.

4. Choose the **OK** button.

To set up maximum tax correction amounts

1. Choose the  icon, enter **Sales & Receivables Setup**, and then choose the related link.
2. On the **Sales Receivables Setup** page, on the **General** FastTab, select the **Allow Tax Difference** check box.
3. Choose the **OK** button.
4. Choose the  icon, enter **Purchases & Payables Setup**, and then choose the related link.
5. On the **Purchases & Payables Setup** page, on the **General** FastTab, select the **Allow Tax Difference** check box.
6. Choose the **OK** button.
7. Choose the  icon, enter **General Ledger Setup**, and then choose the related link.
8. On the **General Ledger Setup** page, in the **Max. Tax Difference Allowed** field, enter the maximum tax correction amount that is allowed for the local currency.

NOTE

In this field, if you enter USD 5, you may correct tax amounts by up to five dollars. To use the tax difference function, an amount must be entered in the **Max. Tax Difference Allowed** field.

9. Choose the **OK** button.

Set Up Use Tax and Purchase Tax

3/31/2019 • 4 minutes to read

Sales tax includes taxes that companies pay for using items:

- Use tax (United States) – Use tax is a United States sales tax that is paid on items that are purchased by a company and are used by that company instead of being sold to a customer. The company must pay sales tax for those items to the government, in the form of use tax.
- Purchase tax (Canada) – Purchase tax is a Canadian sales tax that is paid by a company on items that are purchased from a vendor. When a company purchases items for use by the company itself, the vendor charges the appropriate sales tax for the items.

To set up use tax for a purchase order

1. Choose the  icon, enter **Purchase Orders**, and then choose the related link.
2. On the **Purchase Orders** page, on the **Home** tab, in the **New** group, choose **New**.
3. On the **Lines** FastTab, fill in the fields as necessary. Hover over a field to read a short description.
4. On the **Invoicing** FastTab, fill in the fields as described in the following table.

FIELD	DESCRIPTION
Tax Liable	Select to set up tax liability. Important: This field is available on the Purchase Header page, but it is not shown by default. To select the field, you must first add the column that shows this field. You can change how certain UI elements are displayed. For more information, see Personalizing Your Workspace .
Tax Area Code	The tax area code of the vendor. Important: This field is available on the Purchase Header page, but it is not shown by default. To select the field, you must first add the column that shows this field. You can change how certain UI elements are displayed. For more information, see Personalizing Your Workspace .
Tax Exemption No.	The company's tax exemption number. You can enter a maximum of 30 alphanumeric characters. Important: This field is available on the Purchase Header page, but it is not shown by default. To select the field, you must first add the column that shows this field. You can change how certain UI elements are displayed. For more information, see Personalizing Your Workspace .
Provincial Tax Area Code	The tax code for the province. Important: This field is available on the Purchase Header page, but it is not shown by default. To select the field, you must first add the column that shows this field. You can change how certain UI elements are displayed. For more information, see Personalizing Your Workspace .

5. Choose the **OK** button.

To set up use tax details

1. Choose the  icon, enter **Tax Details**, and then choose the related link.
2. On the **Tax Details** page, choose the **New** action.
3. On the **New - Tax Details** page, fill in the fields as described in the following table.

FIELD	DESCRIPTION
Tax Jurisdiction Code	The tax jurisdiction code for the tax detail entry.
Tax Group Code	The tax group code for the tax detail entry.
Tax Type	Sales and Use Tax – To apply both sales tax and use tax to the tax detail entry. –or– Excise Tax – To apply excise tax to the tax detail entry. –or– Sales Tax Only – To apply only sales tax to the tax detail entry. –or– Use Tax Only – To apply only use tax to the tax detail entry.

4. Choose the **OK** button.

To set up purchase tax for a company

1. Choose the  icon, enter **Company Information**, and then choose the related link.
2. On the **Company Information** page, on the **Tax** FastTab, fill in the fields as described in the following table.

FIELD	DESCRIPTION
Tax Area Code	The company's tax area code. The tax area code is used in conjunction with a tax group code field and the Tax Liable field to find the necessary information for calculating sales tax.
Tax Exemption No.	The company's tax exemption number. You can enter a maximum of 30 alphanumeric characters.
Provincial Tax Area Code	The tax code for the province.

3. Choose the **OK** button.

To set up purchase tax for a location

1. Choose the  icon, enter **Locations**, and then choose the related link.
2. On the **Locations** page, select the required location, and then choose the **Edit** action.

3. On the **General** FastTab, fill in the fields as described in the following table.

FIELD	DESCRIPTION
Do Not Use For Tax Calculation	Select to specify whether the tax information included on this location record is to be used for sales tax calculations on purchase documents.
Tax Area Code	The tax area code for the location. The tax area code is used in conjunction with a tax group code field and the Tax Liable field to find the necessary information for calculating sales tax.
Tax Exemption No.	The company's tax exemption number. You can enter a maximum of 30 alphanumeric characters.
Provincial Tax Area Code	The tax code for the province.

4. Choose the **OK** button.

To set up purchase tax for non-recoverable tax

1. Choose the  icon, enter **Tax Details**, and then choose the related link.
2. On the **Tax Details** page, choose the **New** action.
3. Select the **Expense/Capitalize** check box.

NOTE

This check box must be selected if the tax paid is not recoverable.

4. Choose the **OK** button.

Create Deposits

3/31/2019 • 2 minutes to read

You can make deposits to maintain a transaction record that contains information that can be applied to outstanding invoices and credit memos.

To create a deposit

1. Choose the  icon, enter **Deposits**, and then choose the related link.
2. Choose the **New** action.
3. On the **General** FastTab, fill in the required fields as described in the following table.

FIELD	DESCRIPTION
No.	The unique identification number for the deposit.
Bank Account No.	The bank account number for the deposit.
Total Deposit Amount	The total deposit amount posted to the bank ledger. You can post this deposit only if the sum of the deposit lines is equal to the value in this field.
Posting Date	The posting date for the deposit.
Document Date	The deposit document date.

4. On the **Lines** FastTab, fill in the required fields as described in the following table.

FIELD	DESCRIPTION
Account Type	The account type.
Account No.	The unique identification account number that is associated with the selected account type, to which the entry will be posted.
Description	The journal line entry description.
Document Date	The journal line entry document date.
Document Type	The journal line entry document type.
Document No.	The journal line entry document number.
Credit Amount	The total credit amount on the journal line.

5. Optionally, on the **Navigate** tab, choose **Dimensions**, and then add relevant dimensions on the **Dimension Set Entries** page.

After you have created a deposit, you must post it.

To post a deposit

1. Choose the **Post** action.

NOTE

You can post a deposit only if the amount displayed in the **Total Deposit Lines** field is equal to the amount in the **Total Deposit Amount** field.

Next, you can use the Deposit Test Report and Deposit reports to reconcile your posted deposits with outstanding invoices and credit memos.

Manage Customer Credit Information

2 minutes to read

In Business Central, you can add comments to customer credit information. You can also hold and block customers with bad credit before shipping or invoicing occurs.

To add comments to customer credit information

1. Choose the  icon, enter **Credit Management**, and then choose the related link.
2. On the **Customer List - Credit Mgmt.** page, select a customer, and then choose the **Comments** action.
3. On the **Comment Sheet** page, fill in the fields as described in the following table.

FIELD	DESCRIPTION
Date	The date of the comment.
Comment	The comment about the customer. You can enter a maximum of 80 alphanumeric characters.

4. Choose the **OK** button.

To prevent an order from shipping or invoicing

1. Choose the  icon, enter **Customers**, and then choose the related link.
2. Select the customer, and then choose the **Ledger Entries** action.
3. In the **On Hold** field, enter the initials of the customer.
4. Choose the **OK** button.

NOTE

You must have the proper security clearance to add or remove holds on individual sales orders using the **On Hold** field.

To block a sales order for a customer

1. Choose the  icon, enter **Customers**, and then choose the related link.
2. Select a customer, and then choose the **Edit** action.
3. On the **General** FastTab, in the **Blocked** field, select one of the following options:
 - **Transaction is allowed for this customer.**
 - **Ship** – New orders and new shipments cannot be created for this customer. Existing shipments not yet invoiced can be invoiced.
 - **Invoice** – New orders, new shipments, and new invoices cannot be created for this customer. Existing shipments not yet invoiced cannot be invoiced.
 - **All** – No transaction is allowed for this customer, including payments.

4. Choose the **OK** button.

Making Payments with Bank Data Conversion Service or SEPA Credit Transfer

4/12/2019 • 9 minutes to read

On the **Payment Journal** page, you can process payments to your vendors by exporting a file together with the payment information from the journal lines. You can then upload the file to your electronic bank where the related money transfers are processed. Business Central supports the SEPA Credit Transfer format, but in your country/region, other formats for electronic payments may be available.

In the generic version of Business Central, a global provider of services to convert bank data to any file format that your bank requires is set up and connected. In North American versions, the same service can be used to send payment files as electronic funds transfer (EFT), however with a slightly different process. See step 6 in [To export payments to a bank file](#).

To enable SEPA credit transfers, you must first set up a bank account, a vendor, and the general journal batch that the payment journal is based on. You then prepare payments to vendors by automatically filling the **Payment Journal** page with due payments with specified posting dates.

NOTE

When you have verified that the payments are successfully processed by the bank, you can proceed to post the payment journal lines.

Setting Up the Bank Data Conversion Service.

Activate the Bank Data Conversion Service feature to have any bank statement file converted to a format that you can import or to have your exported payment files converted to the format that your bank requires. For more information, see [Set Up the Bank Data Conversion Service](#).

Setting Up SEPA Credit Transfer

From the **Payment Journal** page, you can export payments to a file for upload to your electronic bank for processing of the related money transfers. Business Central supports the SEPA Credit Transfer format, but in your country/region, other formats for electronic payments may be available.

To enable export of a bank file formats that are not supported out of the box in Business Central, you can set up a data exchange definition by using the data exchange framework. For more information, see [Set Up Data Exchange Definitions](#).

Before you can process payment electronically by exporting payment files in the SEPA Credit Transfer format, you must perform the following setup steps:

- Set up the bank account in question to handle the SEPA Credit Transfer format
- Set up vendor cards to process payments by exporting files in the SEPA Credit Transfer format
- Set up the related general journal batch to enable payment export from the **Payment Journal** page
- Connect the data exchange definition for one or more payment types with the relevant payment method or methods

To set up a bank account for SEPA Credit Transfer

1. In the **Search** box, enter **Bank Accounts**, and then choose the related link.

2. Open the card of the bank account from which you will export payment files in the SEPA Credit Transfer format.
3. On the **Transfer** FastTab, in the **Payment Export Format** field, choose **SEPADD**.
4. In the **SEPA CT Msg. ID No. Series** field, choose a number series from which numbers are assigned to SEPA credit transfer entries.
5. Make sure the **IBAN** field is filled.

NOTE

The **Currency Code** field must be set to **EUR**, because SEPA credit transfers can only be made in the EURO currency.

To set up a vendor card for SEPA Credit Transfer

1. In the **Search** box, enter **Vendors**, and then choose the related link.
2. Open the card of the vendor whom you will pay electronically by export payment files in the SEPA Credit Transfer format.
3. On the **Payment** FastTab, in the **Payment Method Code** field, choose **BANK**.
4. In the **Preferred Bank Account** field, choose the bank to which the money will be transferred when it is processed by your electronic bank.

The value in the **Preferred Bank Account** field is copied to the **Recipient Bank Account** field on the **Payment Journal** page.

To set the payment journal up to export payment files

1. In the **Search** box, enter **Payment Journals**, and then choose the related link.
2. Open the payment journal that you use to process payments by exporting files in the SEPA Credit Transfer format.
3. In the **Batch Name** field, choose the drop-down button.
4. On the **General Journal Batches** page, on the **Home** tab, in the **Manage** group, choose **Edit List**.
5. On the line for the payment journal that you will use to export payments, select the **Allow Payment Export** check box.

To connect the data exchange definition for one or more payment types with the relevant payment method or methods

1. In the **Search** box, enter **Payment Methods**, and then choose the related link.
2. On the **Payment Methods** page, select the payment method that is used to export payments from, and then choose the **Pmt. Export Line Definition** field.
3. On the **Pmt. Export Line Definitions** page, select the code that you specified in the **Code** field on the **Line Definitions** FastTab in step 4 in the "To describe the formatting of lines and columns in the file" section in the [Set Up Data Exchange Definitions](#) procedure.

The direct-debit mandate is automatically inserted in the **Direct Debit Mandate ID** field when you create a sales invoice for the customer that you selected in step 2. For more information, see [Create Recurring Sales and Purchase Lines](#).

Preparing the Payment Journal

Fill the payment journal with lines for due payments to vendors, with the option to insert posting dates based on the due date of the related purchase documents. For more information, see [Managing Payables](#).

Exporting Payments to a Bank File

When you are ready to make payments to your vendors, or reimbursements to your employees, you can export a file with the payment information on the lines on the **Payment Journal** page. You can then upload the file to your bank to process the related money transfers.

In the generic version of Business Central, the Bank Data Conversion service is set up and connected. In North American versions, the same service can be used to send payment files as electronic funds transfer (EFT), however with a slightly different process. See step 6 in [To export payments to a bank file](#).

NOTE

Before you can export payment files from the payment journal, you must specify the electronic format for the involved bank account, and you must enable the bank data conversion service. For more information, see [Set Up Bank Accounts](#) and [Set Up the Bank Data Conversion Service](#). In addition, you must select the **Allow Payment Export** check box on the **General Journal Batches** page. For more information, see [Working with General Journals](#).

You use the **Credit Transfer Registers** page to view the payment files that have been exported from the payment journal. From this page, you can also re-export payment files in case of technical errors or file changes. Note, however, that exported EFT files are not shown in this page and cannot be re-exported.

To export payments to a bank file

The following describes how to pay a vendor by check. The steps are similar to refund a customer by check.

1. Choose the  icon, enter **Payment Journals**, and then choose the related link.
2. Fill in the payment journal lines. For more information, see [Record Payments and Refunds](#).

NOTE

If you are using EFT, you must select either **Electronic Payment** or **Electronic Payment-IAT** in the **Bank Payment Type** field. Different file export services and their formats require different setup values in the **Bank Account Card** and **Vendor Bank Account Card** pages. You will be informed about wrong or missing setup values as you try to export the file.

3. When you have completed all payment journal lines, choose the **Export** action.
4. On the **Export Electronic Payments** page, fill in the fields as necessary.

Any error messages will be shown in the **Payment File Errors** FactBox where you can also choose an error message to see detailed information. You must resolve all errors before the payment file can be exported.

TIP

When you use the bank data conversion service, a common error message states that the bank account number does not have the length that your bank requires. To avoid or resolve the error, you must remove the value in the **IBAN** field on the **Bank Account Card** page and then, in the **Bank Account No.** field, enter a bank account number in the format that your bank requires.

5. On the **Save As** page, specify the location that the file is exported to, and then choose **Save**.

NOTE

If you are using EFT, save the resulting vendor remittance form as a Word document or select to have it emailed directly to the vendor. The payments are now added to the **Generate EFT File** page from where you can generate multiple payment orders together to save transmission cost. For more information, see the following steps.

6. On the **Payment Journal** page, choose the **Generate EFT File** action.

On the **Generate EFT File** page, all payments set up for EFT that you have exported from the payment journal for a specified bank account but not yet generated are listed on the **Lines** FastTab.

7. Choose the **Generate EFT File** action to export one file for all the EFT payments.

8. On the **Save As** page, specify the location that the file is exported to, and then choose **Save**.

The bank payment file is exported to the location that you specify, and you can proceed to upload it to your electronic bank account and make the actual payments. Then you can post the exported payment journal lines.

To plan when to post exported payments

If you do not want to post a payment journal line for an exported payment, for example because you are waiting for confirmation that the transaction has been processed by the bank, you can just delete the journal line. When you later create a payment journal line to pay the remaining amount on the invoice, the **Total Exported Amount** field shows how much of the payment amount has already been exported. Also, you can find detailed information about the exported total by choosing the **Credit Transfer Reg. Entries** button to see details about exported payment files.

If you follow a process where you do not post payments until you have confirmation that they have been processed in the bank, you can control this in two ways.

- In a payment journal with suggested payment lines, you can sort on either the **Exported to Payment File** column or the **Total Exported Amount** and then delete payment suggestions for open invoices for which payments have already been made and you do not want to make payments for.
- On the **Suggest Vendor Payments** page, where you specify which payments to insert in the payment journal, you can select the **Skip Exported Payments** check box if you do not want to insert journal lines for payments that have already been exported.

To see information about exported payments, choose the **Payment Export History** action.

To re-export payments to a bank file

You can re-export payment files from the **Credit Transfer Registers** page. Before you delete or post payment journal lines, you can also re-export the payment file from the **Payment Journal** page by simply exporting it again. If you have deleted or posted the payment journal lines after exporting them, you can re-export the same payment file from the **Credit Transfer Registers** page. Select the line for the batch of credit transfers that you want to re-export, and then use the **Reexport Payments to File** action.

NOTE

Exported EFT files are not shown on the **Credit Transfer Registers** page and cannot be re-exported.

1. Choose the  icon, enter **Credit Transfer Registers**, and then choose the related link.
2. Select a payment export that you want to re-export, and then choose the **Reexport Payment to File** action.

Posting the Payments

When the electronic payment is successfully processed by the bank, post the payments. For more information, see [Making Payments](#).

Print Troubleshooting Reports

3/31/2019 • 2 minutes to read

The following troubleshooting reports are available to assist Microsoft Certified Partners with troubleshooting issues:

- **License Information** report – This report contains the license number, the name of the licensed user, which application granules they have purchased, and when the license expires, if applicable.
- **Data Dictionary** report (report #10315) – This report allows you to print detailed table reference, field reference, and table properties for table objects.

You must have access to Business Central Object Designer, which is available only to administrators.

You can print these reports and send them to your Microsoft Certified Partner to help resolve issues with your Business Central implementation.

To print the License Information report

1. In Business Central Object Designer, on the **Tools** menu, choose **License Information**.
2. On the **License Information** page, you can preview the license information, or you can choose the **Export** button to print the **License Information** report.

To print the Data Dictionary report

1. In Business Central Object Designer, on the **Tools** menu, choose **Object Designer**.
2. Choose the **Report** button.
3. In the **Type** column, find **ID 10315**, which is the **Data Dictionary** report.
4. On the **Object Designer** page, choose the **Run** button to open the **Data Dictionary** report.
5. On the **Options** tab, enter the relevant information into the fields.
6. Choose the **Print** button to print the report or choose the **Preview** button to view it on the screen.

Work With GIFI Codes

3/31/2019 • 2 minutes to read

Fiscal information can include general ledger accounts, reports, income statements, balance sheets, and statements of retained earnings. Fiscal information is classified using codes. The use of codes helps the government to process information, prepare for electronic filing, and validate tax information electronically. The use of codes also helps statistical organizations to work more efficiently, as financial information is more readily available. For more information, see the [Canada Revenue Agency website](#).

The Canada Revenue Agency uses General Index of Financial Information (GIFI) codes to collect, validate, and process financial and tax information electronically. It is a best practice to assign GIFI codes only to posting accounts, so that all totaling is done by your tax preparation software.

When an account is associated with a GIFI code, it is reported to the revenue agency under that code. Multiple accounts can all have the same GIFI code, but each account can have only one GIFI code.

You can export balance information by GIFI code and save the exported file in Excel, which is useful for transferring information to your tax preparation software.

To set up GIFI codes

In Business Central, you must set up GIFI codes for general ledger accounts, reports, balance sheets, income sheets, and statements of retained earnings.

1. Choose the  icon, enter **GIFI Codes**, and then choose the related link.
2. On the **GIFI Codes** page, choose the **New** action.
3. Set up GIFI codes by filling the fields. Hover over a field to read a short description.

To associate GIFI codes with G/L accounts

To report financial information by GIFI code, each GIFI code must be associated with the appropriate accounts in the chart of accounts.

1. Choose the  icon, enter **Chart of Accounts**, and then choose the related link.
2. Select a relevant general ledger account, and then choose the **Edit** action.
3. On the **Cost Accounting** FastTab, in the **GIFI Code** field, select an appropriate GIFI code.

To view account balances using the GIFI code report

You can review your account balances by GIFI code by using the **Account Balances by GIFI Code** report.

1. Choose the  icon, enter **Account Balances by GIFI Code**, and then choose the related link.
2. Specify what to include in the report by filling the fields. Hover over a field to read a short description.
3. Choose the **Print** or the **Preview** button.

To export balance information using GIFI codes

You can export balance information using GIFI codes and save the exported file in Excel. You can modify, save, or delete the file. You can use the file to transfer information to your tax preparation software.

1. Choose the  icon, enter **Export GIFI Info. to Excel**, and then choose the related link.

2. Specify what to export to Excel by filling the fields. Hover over a field to read a short description.
3. Choose the **OK** button.

NOTE

The Excel file has the following characteristics:

- The balance is rounded to the nearest percentage, but the cell value maintains the same percentage as it does in the general ledger.
- Negative numbers are represented as positive number in brackets. Accordingly, -123 is represented as (123).

VAT Control Report

3/31/2019 • 2 minutes to read

The Business Central functionality has been extended by the **VAT Control Report**. Basic form is **VAT Control Report Card**. VAT items are loaded by the VAT Date or Posting Date (according to the general ledger setup) into the form for the selected period. The basic setup, i.e. distribution of combinations of VAT posting groups into the individual sections of control report, is determined in the VAT statement. To process the control report you have to setup VAT control report sections, tariff numbers, VAT statement, stat. reporting setup and extended the VAT posting setup. Functionality contains:

- **VAT Control Report Card** - allows you to select report period.
- **Control report lines suggestion** - loads control report lines of selected period.
- Control performance - **VAT Control Report - test** report - prints overview according to individual sections.
- Control report export - **Export** function exports control report to the file.
- Closing lines - **Close lines** function fills the **Closed by document no.** field in control report lines.

Registration of Sales (EET)

3/31/2019 • 2 minutes to read

Registration of sales (EET) is registration of sales coming from business activities and paid in cash. Information about these transactions are sent to the tax authorities. At the time of payment is created data message and sent online to the server of Tax office. As answer from the server is message with unique transaction ID, which has to be printed on the receipt for customer.

Payment methods included in EET:

- In cash
- By card
- Check
- Bill of Exchange
- Other similar types like gift cards, coupons, bitcoin etc.

For more information see official portal www.etrzby.cz.

How it works in Business Central

There are covered following sales documents in Business Central:

- Sales invoice payment
- Payment of prepayment invoice
- Refund sales credit memo
- Refund of prepayment invoice
- Cash desk receipt for sales to the G/L account (without source sales document)

With posting of defined documents (and with defined payment method) is created EET ledger entry and based on the functionality regime is processed:

- On-line – EET entry is created and stored in Business Central, message to the tax authorities is generated and sent to the server. Answer from the server is processed, stored and on customer's receipt is printed unique transaction ID generated by tax authorities.
- Off-line - EET entry is created and stored in Business Central. On customer's receipt is printed unique ID generated in Business Central(identification of company and document). EET records are processed later by batch job.

Main parts of functionality

- EET ledger entries – table where are stored and processed registered documents. Each record contains sales data required by tax authorities, needed for print on receipt and data from electronic communication. New records are created automatically by posting of source documents.
- EET service settings.
- Certificate settings.
- EET POS terminals – identification of registered places.

Print VAT Reconciliation Reports

3/31/2019 • 2 minutes to read

In Business Central, you can use the **VAT Reconciliation** report to view a list of general ledger accounts with their base amounts and VAT amounts. These amounts are grouped by VAT type to help with VAT settlement reconciliation.

To print a VAT reconciliation report

1. Choose the  icon, enter **VAT Reconciliation**, and then choose the related link.
2. On the **Options** FastTab, fill in the fields as described in the following table.

FIELD	DESCRIPTION
Show Details	Select to print all transaction amounts in the report. If you do not select this field, a single cumulative line is printed for each general ledger account.
Show Transactions without VAT	Select to print a line for each general ledger account that transactions are posted to. You can use this option for both single accounts and multiple accounts. The default is No . The report includes only those transactions that include VAT entries. If you select this field, the report includes all transactions.

3. On the **G/L Entry** FastTab, select the appropriate filters.
4. Choose the **Print** button to print the report or choose the **Preview** button to view it on the screen.

VAT-VIES Reporting

3/31/2019 • 2 minutes to read

Danish companies must submit VAT declarations for trade of goods or services with other EU countries/regions. You can create the required file by using the **VAT- VIES Declaration Disk** batch job.

Reporting EU Sales

In order to track VAT for the trade of goods or services between EU countries/regions, you must submit information about this trade to the Danish Listesystem. The **VAT- VIES Declaration Disk** batch job creates a comma-separated file that you can then upload to the tax authorities at the www.virk.dk online portal. Before you create the file, you can verify your customers' VAT registration number online. The tax authorities also recommend that you do not submit large files to the online portal. If your declaration consists of more than 1,000 lines, it is recommended that you submit several smaller files instead. For more information, see the tax authorities' [website](#).

FIK Details in the Payment Reconciliation Journal

3/31/2019 • 2 minutes to read

The **Transaction Text** field on the **Payment Reconciliation Journal** page shows information about the automatic application of payments using the Danish FIK standard. For more information, see [Reconcile Payments Using Automatic Application](#).

The following table describes the six values that may be shown in the **Transaction Text** field.

TRANSACTION TEXT	DESCRIPTION
Matching Amount	The amount paid covers exactly the remaining amount on an unpaid sales invoice that is identified by the FIK number.
Partial Amount	The amount paid is less than the remaining amount on an unpaid sales invoice that is identified by the FIK number.
Excess Amount	The amount paid is more than the remaining amount on an unpaid sales invoice that is identified by the FIK number.
No Matching FIK Number	The system has not found any unpaid or paid sales invoices with a FIK number that matches the FIK number on the payment.
Duplicate FIK Number	The system has discovered that there are payments that have similar FIK numbers.
Invoice Already Paid	The system has discovered that a FIK number on a payment matches a sales invoice that is fully applied and closed.

The Payments and Reconciliations (DK) Extension

3/31/2019 • 3 minutes to read

Make fast, error-free payments by exporting files that are formatted specifically for exchanges with your vendor or bank. These files speed up the payment and reconciliation processes, and eliminate errors that can happen when you manually enter the information on a bank website.

This extension supports file formats for several Danish banks. When you export payment information to a file, the extension packages the data into the format that your bank requires. For example, the formats include Bankdata-V3, BEC, SDC, and FIK, which many different banks use, and some that are more specialized for certain banks, for example, Danske Bank and Nordea. The extension also includes some formats for importing and reconciling bank statements.

NOTE

To use the extension, you must know the format that your bank or vendor requires. Some banks or vendors provide this information on their websites; however, you might need to contact their customer service to get the information.

Supported Bank Formats

This extension can apply the following file formats for payment files:

- BANKDATA-V3
- BEC-INDLAND
- BEC-CSV
- DANSKEBANK-CMKV
- DANSKEBANK-CMKXSX
- DANSKEBANK
- FIK71
- NORDEA-ERHVERV-CSV
- NORDEA
- NORDEA-UNITEL-V3
- SDC
- SDC-CSV

To set up the extension

There are a few steps to get started.

- Allow payment data exports. To help protect your data, this is not readily available.
- Set up purchase and payables so that you do not require external document numbers on invoices. If needed, you can use the reference number to refer to a specific invoice.
- Specify the payment method for each vendor. Payment methods define how you pay invoices from the vendor. For example, Bank, Cash, Check, or Account.
- Specify the type of format to use for each of your bank accounts. For example, NORDEA, DANSKEBANK, SDC, and so on.

Additionally, you must assign vendors to a domestic **Gen. Bus. Posting Group** and a **Vendor Posting Group**.

The Country/Region setting for the vendor must be Denmark (DK). For more information, see [Setting Up Posting Groups](#).

To allow Business Central to export payment data

1. Choose the  icon, enter **Payment Journal**, and then choose the related link.
2. On the **Edit Payment Journal** page, choose the **Bank** batch.
3. Choose the **Allow Payment Export** check box.

To specify a payment method for a vendor

The following table shows the combinations of FIK and GIRO payment methods that Business Central supports.

	TYPE 01	TYPE 04	TYPE 71	TYPE 73
Giro Account No. or FIK Creditor No.?	Giro Account No.	Giro Account No.	FIK Creditor No.	FIK Creditor No.
Allows Message to Recipient?	Yes	No	No	Yes
Contains Payment Reference number?	No	Yes, 16 digits.	Yes, 15 digits.	No

1. Choose the  icon, enter **Vendors**, and then choose the related link.
2. Open the card, expand the **Payments** tab, in the **Payment Method** field choose the payment method.
3. Depending on your selection, you must complete other fields. See the table above for a description of the combinations.

To specify the format to use for a bank account

1. Choose the  icon, enter **Bank Accounts**, and then choose the related link.
2. Open the card for the bank account.
3. In the **Payment Export Format** field, choose the format for your export file.

Choosing the FIK or Giro payment information for vendor invoices

1. Choose the  icon, enter **Purchase Invoices**, and then choose the related link.
2. Choose the vendor. Remember, this must be a Danish vendor with an address in Denmark.
3. Create an invoice. The **Payment Method** and **Vendor Number** fields are filled in based on settings on the Vendor card. You can change them if you want.
4. In the **Payment Reference** field, enter the 15-digit number from the vendor invoice.

TIP

You only have to add the last 11 digits of the number. Business Central will add four zeros to the beginning of the number.

5. Post the invoice.

To use the extension to export payment data

1. Choose the  icon, enter **Payment Journals**, and then choose the related link.
2. Choose the **Suggest Vendor Payment Journals** action.

TIP

If you want to export only specific payments, use the options for filtering the data.

3. If needed, you can add filters to export only specific payments.
4. In the **Bank Payment Type** field, choose **Electronic Payment**.
5. Choose the **Export** action.

OIOUBL Electronic Invoicing Overview

3/31/2019 • 2 minutes to read

Companies must send sales invoices, credit memos, finance charge memos, and reminders to the Danish public sector electronically in the Offentlig Information Online UBL (OIOUBL) format. If a company does not send these documents electronically, the authorities can deny payment.

For more information about OIOUBL electronic invoicing, see oioubl.info.

Implementation in Business Central

The current requirements for sending electronic invoices are based on OIOUBL, which is based on the Universal Business Language (UBL) version 2.0 standard. For more information, see the [OASIS UBL](#) web site. The generated XML documents can then be sent to the customer.

To send documents electronically, you must assign European Article Numbering (EAN) location numbers and account codes to the relevant customers on the **Customer Card** page. For more information, see [Set Up Customers for OIOUBL](#). These numbers are included when you create documents, and post or issue them. After the documents have been posted or issued, you can create electronic versions to be sent to the customer. You can submit the following types of documents:

- Sales invoice
- Service invoice
- Sales credit memo
- Service credit memo
- Finance charge memo
- Reminder

The electronic documents are stored in the locations that are defined in the Sales & Receivables Setup.

OIOUBL Profiles

Your customers can use a profile that is based on the Danish OIOUBL definitions, or they can use a profile that is based on the OIOUBL implementation of the Northern European Subset (NES) definitions. Some profiles require responses to be sent when an electronic document is received. You can set up which profile most of your customers use. If a customer uses a different profile, you can change that in the customer card. For example, you can specify that the default profile is Procurement-OrdSim-BilSim-1.0, but that customer 10000 requires profile urn:www.nesubl.eu:profiles:profile5:ver2.0. For more information, see [Set Up OIOUBL](#).

For more information, see the entry on OIOUBL profiles in the frequently asked questions section at [Digitaliseringsstyrelsen](#).

Set Up Customers for OIOUBL

3/31/2019 • 2 minutes to read

To create Offentlig Information Online UBL (OIOUBL) documents for customers in the public sector, you must add OIOUBL information to the relevant customers.

This topic only describes fields that apply to OIOUBL. For more information, see [Register New Customers](#).

To set up customers for OIOUBL

1. Choose the  icon, enter **Customers**, and then choose the related link.
2. Open the customer that you want to enable for OIOUBL.
3. On the **Invoicing** FastTab, fill in the fields as described in the following table.

FIELD	DESCRIPTION
GLN	Enter the customer's Global Location Number, which uniquely identifies the billing address. A GLN has a fixed length of 13 digits. It includes an assigned company prefix, a location reference, and a check digit.
Account Code	Enter the account code for the customer. Customers in the public sector provide an account code when they place an order or requisition. Based on the value of this field, the account code is included in the OIOUBL documents that you create in Business Central. In accordance with Lov om Offentlige Betalinger and related statutes, the customer is entitled to withhold payment until they receive an invoice with the relevant account code.
OIOUBL Profile Code	Specifies the profile that this customer requires for electronic documents if this is different from the default profile that you specified on the Sales & Receivables Setup page.
OIOUBL Profile Code Required	Specifies if this customer requires a profile code for electronic documents. Tip: If the OIOUBL Profile Code Required field is selected, you cannot post a sales document for this customer unless you have specified a profile.

These fields are specific to OIOUBL. The values are used in all OIOUBL documents that you create for this customer. For more information, see [OIOUBL Electronic Invoicing Overview](#).

[Create Electronic Documents by Using OIOUBL](#)

[OIOUBL Electronic Invoicing Overview](#)

Set Up OIOUBL

3/31/2019 • 3 minutes to read

You must define a location for storing Offentlig Information Online UBL (OIOUBL) files when you create electronic documents such as invoices or credit memos. You must also define payment methods, payment terms, and item charges, and you must set up relevant customers for OIOUBL.

- Set up payment terms and item charges.
- Set up customers for OIOUBL.

About OIOUBL Profiles

OIOUBL profiles are adaptations of business processes for various types of transactions, and differ depending on the types and contents of the documents that are exchanged. In Denmark, the two profiles that are required are the **Simpel fakturaproces** (Procurement-OrdSim-BilSim-1.0) and **Billing Basic** (urn:www.nesubl.eu:profiles:profile5:ver2.0) profiles. The Billing Basic profile is based on the Northern European Subset (NES). Your customer must be able to receive documents in one of these profiles. If you are not sure, ask your customer about the profile they require. For more information, see the entry on OIOUBL profiles in the frequently asked questions section at [Digitaliseringsstyrelsen](#).

The default profile for all customers is the Simpel fakturaproces profile, which is chosen on the **Sales & Receivables Setup** page. You specify the profile for a specific customer on the **Customer** card. If you want to use the Billing Basic profile you will need to add it. To do so, on the **Sales & Receivables Setup** page, choose the button in the **Default Profile Code** field, and then choose **New**. Enter a name for the code, and then in the **Profile** field, enter **urn:www.nesubl.eu:profiles:profile5:ver2.0**. You can then choose the profile either as the default profile, or for one or more customers.

##To set up payment terms If you set up payment terms for customers, the electronic documents will include discounts you give for early payments.

1. Choose the  icon, enter **Payment Terms**, and then choose the related link.
2. In the **OIOXML Code** field, choose a code for each payment term that you will use for electronic invoices.

To set up customers for OIOUBL

You can use the **Offentlig kunde (OIOXML)** customer template to apply standard settings for OIOUBL to a new customer, or the **Apply Template** function to apply the settings in the template to an existing customer. The following steps describe how to manually complete the required fields for OIOUBL.

1. Choose the  icon, enter **Customers**, and then choose the related link.
2. Open the customer that you want to enable for OIOUBL.
3. Enter the customer's address. Make sure that you specify a country/region code, and the contact information for the sell-to contact.
4. In the **Document Sending Profile** field, choose the **OIOUBL** profile.
5. On the **Invoicing** FastTab, fill in the fields as described in the following table.

TIP

To display all of the fields, you might need to choose the **Show more** for the **Invoicing** FastTab.

FIELD	DESCRIPTION
GLN	Enter the Global Location Number for the customer.
Account Code	<p>Enter the account code for the customer.</p> <p>Customers in the public sector provide an account code when they place an order or requisition. Based on the value of this field, the account code is included in the OIOUBL documents that you create in Business Central. In accordance with Lov om Offentlige Betalinger and related statutes, the customer is entitled to withhold payment until they receive an invoice with the relevant account code.</p>
Profile Code	Specifies the profile that this customer requires for electronic documents if this is different from the default profile that you specified on the Sales & Receivables Setup page.
Profile Code Required	<p>Specifies if this customer requires a profile code for electronic documents.</p> <p>Tip If the Profile Code Required field is selected, you cannot post a sales document for this customer unless you have specified a profile.</p>

6. In the **Payment Terms** field, choose the terms under which you expect the customer to pay.

For more information about how to set up a customer, see [Register New Customers](#).

To set up item charges

1. Choose the  icon, enter **Item Charges**, and then choose the related link.
2. For each item charge, in the **Charge Category** field, select a category.

Finally, you must specify EAN numbers and account codes for the relevant customers. For more information, see [Set Up Customers for OIOUBL](#).

The OIOUBL Extension for Electronic Invoicing in Denmark

3/31/2019 • 2 minutes to read

When you sell goods or services to customers in the Danish public sector, you must submit documents to the customer electronically in an XML file that is structured to meet the requirements of one or more Offentlig Information Online - Universal Business Language (OIOUBL) profiles.

The OIOUBL extension in Business Central makes it easy to generate these XML documents for posted sales and service invoices, credit memos, and issued reminders (which include finance charge memos).

The current requirements for sending electronic invoices are based on UBL version 2.0 standard. For more information, see the <https://aka.ms/OasisUblSite> web site.

For more information about OIOUBL in general, see the website for [Online OIOUBL Documentation](#), and the [Frequently Asked Questions](#) page on the Digitaliseringsstyrelsen website.

Getting Started with the OIOUBL Extension

By default, the OIOUBL extension is installed in Business Central. However, there are a few things to do before you can use the extension:

- Set up payment methods, payment terms, and item charges.
- Set up customers for OIOUBL by specifying an account code, the OILUBL profile to use to exchange documents, and the customer's Geographic Location Number (GLN).

For more information, see [Set Up the OIOUBL Extension](#).

See Also

[Denmark Local Functionality](#)

[Set Up the OIOUBL Extension](#)

[Create Electronic Documents in an OIOUBL Format](#)

Create Electronic Documents by Using OIOUBL

3/31/2019 • 2 minutes to read

When you sell goods or services to a customer in the public sector, you must submit documents electronically. In Business Central, you can create electronic documents for invoices, credit memos, reminders, and finance charge memos. Before you can create the electronic documents, you must have set up file locations and information about the customers. For more information, see [Set Up Customers for OIOUBL](#).

You can create an electronic document after you post the sales or service document. The following sections describe how to post a sales invoice with the required information and then create an electronic sales invoice, but the same procedure applies to sales and service credit memos and reminders.

To post a sales invoice

1. Choose the  icon, enter **Sales Invoices**, and then choose the related link.
2. Open the sales invoice that you want to post.
3. Make sure that the **External Document No.** field contains the document number that the customer supplied. OIOUBL electronic documents require this number.

NOTE

For service documents, you must fill in the **Your Reference** field.

4. On the **Invoicing** FastTab, fill in the **GLN** and **OIOUBL Account Code** fields.
For reminders and finance charge memos, the fields are on the **Posting** FastTab.
5. Post the invoice.

To create an electronic sales invoice

After you post a document, you can create an electronic invoice in an OIOUBL format. The following steps describe the process for posted sales invoices, but the process is the same for other documents.

1. Choose the  icon, enter **Posted Sales Invoices**, and then choose the related link.
2. Open the relevant posted sales invoice.
3. Choose the **Create Electronic <document type>** action.
4. Optionally, in the **Create Electronic <document type>** page, set additional filters, and then choose the **OK** button.

An XML file is created and stored at the location that was defined on the **Sales & Receivables Setup** page. You can now submit the document to the customer.

[OIOUBL Electronic Invoicing Overview](#)

The Payroll Data Definitions (DK) Extension

3/31/2019 • 2 minutes to read

If your business uses the Danløn, Dataløn, Lønservice, Multiløn, or Proløn payroll service providers in Denmark, the Payroll Data Definitions (DK) extension can help you quickly and accurately register payroll transactions from these providers. The extension contains data exchange definitions that enable you to import payroll transactions in files that the providers send to you. For more information about data exchange definitions, see [Set Up Data Exchange Definitions](#).

Getting Started

The first step is to map the types of payroll transactions to the general ledger accounts that you want to post them to in Business Central. For example, you might want to post retirement plan contributions to an account named Pension, and the taxes paid on the contributions to an account named Pension Tax. This happens outside of Business Central, for example, you might use an Excel worksheet to visualize the mapping. Work with the payroll service provider to ensure that the file they export contains the mapping. Typically, you can find information about how to configure export files on the provider's website.

After you install the extension, the next step is to specify the format for the payroll data file from the payroll service provider. To do that, go to the **General Ledger Setup** page and choose the provider in the **Payroll Trans. Import Format** field.

To import a payroll file

1. Choose the  icon, enter **General Journals**, and then choose the related link.
2. Choose the journal to use, and then use the **Import Payroll File** action to import the data file from the payroll service provider.

Print Finnish Intrastat Reports

3/31/2019 • 2 minutes to read

Companies in the European Union (EU) must report the extent of their trade with other EU countries/regions according to specific rules. You must report the movement of goods to the Intrastat authorities in their respective countries/regions.

The completed entries can be sent in a file to the Intrastat authorities, or you can print a report and manually enter the information on the forms from the Intrastat authorities.

To print a Finnish Intrastat report

1. Choose the  icon, enter **Intrastat Journal**, and then choose the related link.
2. Enter the batch name for the Intrastat report.
3. Choose the **Print** action, and then choose the **Checklist Report** action.
4. Choose the **Print** action.

VAT-VIES Declaration in Finland

3/31/2019 • 2 minutes to read

Business Central provides Finnish enhancements to comply with regulations for VAT and European Union (EU) sales reporting. The **VAT-VIES Declaration Tax Auth** report and the **EC Sales List** report include the **EU Service** field, which allows you to print service-related sales amounts separately from item-related sales amounts based on different posting groups. This information is required in VAT reports for EU third-party trade transactions in 2010 and all subsequent years.

Electronic Banking in Finland

3/31/2019 • 2 minutes to read

The Business Central electronic banking feature allows you to process electronic customer and vendor payments. This feature supports domestic payments (LM03) and foreign payments (LUM2) for transferring electronic bank payments. To export or import electronic payments, you must first set up bank reference files to determine how payment files are processed.

Customer Payments

Domestic customer payments can be imported from the bank and linked to the associated accounts receivable entry with a reference number. This type of automation enables incoming payments to be linked directly to open receivables without a delay in manual processing. The following steps explain how to import customer payments into a file from the bank and how to link these payments to invoices through their reference numbers.

- Create a sales invoice and assign a unique reference number to the invoice. This reference number will be used by the customer when paying the invoice.
- Import the payment files that contain customer payments into the cash receipt journal. These files contain the reference numbers received from the bank. The payments are linked to the accounts receivable entry through their reference numbers.
- Post the cash receipt journal and close the open accounts receivable entries with the applied payments from the file.

Reference Number

A reference number is automatically created when an invoice is posted or when an order is posted for invoicing. However, you can enter a reference number manually on a sales journal transaction. This reference number is not based on the reference number options on the **Sales & Receivables Setup** page. If you enter a reference number for the sales journal, only the validity of the reference number is checked.

Vendor Payments

To send electronic bank payments to vendors, you can export domestic or foreign vendor payments into a transfer file that can be sent to the bank. The following steps show how to export vendor payments.

- Use the **Bank Payments to Send** page to select the vendors for which you want to create payment files.
- Enter payment information for each transaction in the payment journal or use **Suggest Vendor Payments** to create suggested payments.
- Generate and preview the payment report.
- Create a transfer file for domestic or foreign vendor payments.
- Send the payment transfer file to the bank.

Set Up Bank Reference Files

3/31/2019 • 2 minutes to read

To process electronic payments, you must first set up bank reference files to determine how payment data should be imported or exported.

To set up a bank reference file

1. Choose the  icon, enter **Bank Reference File Setup**, and then choose the related link.
2. On the **General** FastTab, fill in the fields as described in the following table.

FIELD	DESCRIPTION
No.	Specifies a bank account code.
Export Reference Payments	Enter the full path of the payment file to export.
Import Reference Payments	Enter the full path of the payment file to import.
Currency Exchange Rate File	Enter the full path of the currency exchange rate file.
Inform. of Appl. Cr. Memos	Select to display credits applied to invoices on the payment recipient's account statement.

3. On the **Foreign Payments** FastTab, fill in the fields as described in the following table.

FIELD	DESCRIPTION
Export Foreign Payments	Enter the full path of the payment file to export to foreign banks.
Due Date Handling	Select how due date processing should be applied to foreign payments. Batch – All payments in the file receive the same payment date. –or– Transaction – Each payment in the file receives a transaction-specific payment date. Contact your bank to determine whether this setting should be used.
Default Service Fee Code	Select a default service fee code for foreign banks.
Default Payment Method	Select a default payment method for foreign payments.
Exchange Rate Contract No.	Enter the exchange rate contract number.
Allow Comb. Foreign Pmts.	Select to combine all foreign payments made to one recipient in one day from the same bank account.

4. On the **SEPA** FastTab, fill in the fields as described in the following table.

FIELD	DESCRIPTION
Bank Party ID	Enter a SEPA bank party ID. Note: This field is only used for the SEPA pain.001.001.02 standard.
File Name	Enter the full path of the SEPA payment file. Note: This field is only used for the SEPA pain.001.001.02 standard.

IMPORTANT

To export vendor payments using the SEPA standard, you must fill the **Payment Export Format** field on the **Bank Account Card** page.

5. Choose the **OK** button.

Disregard Payment Discounts

3/31/2019 • 2 minutes to read

Use the disregard payment discount at full payment feature to accept payments when the following conditions are true:

- Payment discount date < payment date <= payment tolerance date
- Full amount >= payment amount >= full amount - payment discount

To disregard a payment discount

1. Choose the  icon, enter **Payment Terms**, and then choose the related link.
2. Select the line with the payment term for which you want to activate or deactivate payment discounts.
3. Select the **Disreg. Pmt. Disc. at Full Pmt** check box to initiate activation for this feature. To deactivate, clear the check box.

NOTE

When you apply one payment to multiple invoices, the feature to ignore payment discount at full payment is not supported.

Set Up Automatic Account Posting Groups

3/31/2019 • 2 minutes to read

To use automatic account codes, you must create an automatic account posting group.

To set up automatic account posting groups

1. Choose the  icon, enter **Auto. Acc. Groups**, and then choose the related link.
2. Choose the **New** action.
3. On the **General** FastTab, fill in the fields as described in the following table.

FIELD	DESCRIPTION
No.	Enter a unique alphanumeric number for the automatic account posting group.
Description	Enter a description for the automatic account posting group.

4. On the **Automatic Acc. Line** FastTab, fill in the fields as described in the following table.

FIELD	DESCRIPTION
Allocation Percentage	Enter the percentage of the source line amount that is to be allocated.
G/L Account No.	Enter the general ledger account number to which the allocation should be posted.

NOTE

The **Total Balance** field totals the **Allocation Percentage** field for automatic account lines in a posting group. If the total allocation percent for a posting group does not balance to zero, an error message will be displayed when the item is posted.

5. Choose the **OK** button.

Automatic Account Codes

3/31/2019 • 2 minutes to read

You can use customized posting groups to automate recurring transactions in journals, sales documents, or purchase documents. These posting groups can be used throughout Business Central to trigger automatic postings and allocations across different accounts or dimensions.

Automatic account codes can be used to automate postings related to payroll overhead. For example, when posting total salary expenses at the end of the month, you can use automatic account codes to assign a percentage of the total salary to automatically post as overhead expenses.

You can also use automatic account codes to trigger cost or revenue allocations across different dimensions. For example, you can set up an automatic account group to divide total expenses across three departments when posting an invoice.

Posting Depreciation Differences

3/31/2019 • 2 minutes to read

In Finland, the following depreciation methods are commonly used for fixed assets:

- Straight-line depreciation which posts fixed assets to the general ledger.
- Declining balance depreciation which does not post fixed assets to the general ledger.

If two depreciation methods are used, Finnish tax legislation requires that the difference in accumulated depreciation between the different depreciation methods be calculated and posted to the general ledger.

Export General Ledger Entries for Tax Audits

3/31/2019 • 2 minutes to read

The standard audit file for tax purposes records key business information (transactions and ledger postings) into a file in a specified common format for audit purposes. In France, you are required to provide the government with this information in a standard audit file beginning in January 2014. This applies to companies for both corporate tax and VAT audit purposes.

In general, the report is designed to provide information on account types that include posted entries.

You can choose to include opening balances in the file, but these are not actual entries that are posted in Business Central calculates the opening balance by using the entries for a given account up to the starting date that you have specified for the file. The closing entries generated by the closing prior year end process are also included in the calculation. The opening balances are then mapped into the required fields of the report.

If you do not close your fiscal year or do not run the **Close Year** action before generating the report, income statement accounts will still have balances, which will be reported in the file.

NOTE

Opening balances are only included in the report for accounts that have a balance not equal to zero. You can identify opening balances by the following values in the fields:

- JournalCode = 0
- JournalLib = BALANCE OUVERTURE
- EcritureNum = 0
- EcritureLib = Accounts prefixed with BAL OUV
- ValidDate = Start date specified on the report's request page

To export general ledger entries to a text file for a tax audit

1. Choose the  icon, enter **Export G/L Entries – Tax Audit**, and then choose the relevant link.
2. On the **Export G/L Entries – Tax Audit** page, on the **Options** FastTab, fill in the fields as described in the following table.

FIELD	DESCRIPTION
Starting Date	Enter the date to use as the starting date for the time period to be covered by the audit.
Ending Date	Enter the date to use as the ending date for the time period to be covered by the audit.
Include Opening Balances	Select if you want to include opening balances in the audit report file. The balances are calculated as of the date before the first date of the period covered by the report.

3. Choose the **OK** button to export the file.

When you create the report, Business Central sorts the information in the report by the **No.** and **Creation Date** fields in the general ledger register.

The report will have the following name: FEC

Export General Ledger Entries to an XML File

3/31/2019 • 2 minutes to read

You can export financial transactions for a particular period to an XML file for external archiving. After the closing of the fiscal year, you can export the general ledger transactions for the closed year by applying the correct date filter and then exporting the financial transactions within the specified period to the XML file. The XML file includes all the general ledger transaction information, such as document posting date, document type, document number, account type, account number, credit amount, and debit amount retrieved from the **General Journal** page.

To export general ledger entries to an XML file

1. Choose the  icon, enter **Export G/L Entries to XML**, and then choose the relevant link.
2. On the **Export G/L Entries to XML** page, on the **Options** FastTab, fill in the fields as described in the following table.

FIELD	DESCRIPTION
Starting Date	Sets the starting date to export the financial transactions.
Ending Date	Sets the ending date to export the financial transactions.

3. To export the file, choose the **OK** button.

You can save the generated file to a specified location, or you can open the file.

WARNING

If you have set the start date and end date to include the entire fiscal year, the process can take several minutes.

Requirements for Reporting Declaration of Trade in Goods

3/31/2019 • 2 minutes to read

This topic shows a list of required fields that are needed for reporting Declaration of Trade in Goods (DEB) based on the DTI+ format. For more information, see Export DEB DTI.

The following fields are required for reporting DEB:

- **CISD** from the **Company Information** table.
- **Registration No.** from the **Company Information** table.
- **VAT Registration No.** from the **Company Information** table.
- **Name** from the **Company Information** table.
- **Date** for the statistics period from the **Intrastat Jnl. Line** table.
- **Transaction Specification** from the **Intrastat Jnl. Line** table.
- **Quantity** from the **Intrastat Jnl. Line** table must be greater than 0.
- **Statistical Value** from the **Intrastat Jnl. Line** table must be greater than 0.

NOTE

The **Export DEB DTI** report exports shipments and receipts in one batch. If you want to report only shipments or receipts, then you must set a filter to remove the lines that are not needed in the **Intrastat Journal** table.

Set Up Payment Addresses

3/31/2019 • 2 minutes to read

To use payment management, you must set up payment addresses that will be used for vendors and customers at the time of settlement. The payment address can differ from the default address.

The following procedure describes how to set up a payment address for a vendor, but the same steps apply to setting up a payment address for a customer.

To set up a payment address

1. Choose the  icon, enter **Vendors**, and then choose the relevant link.
2. Select a vendor, and then choose the **Edit** action.
3. Choose the **Payment Addresses** action.
4. Fill in the required fields as described in the following table.

FIELD	DESCRIPTION
Code	The payment address code.
Default Value	Select to use this address as the default payment address. You can select one default payment address.
Name	The name associated with the payment address.
Address	The payment address.

- e. Choose the **OK** button.

NOTE

If a payment address is not set up, the address in the vendor or customer card is set as the default value.

Set Up Payment Statuses

3/31/2019 • 2 minutes to read

To use payment management, you must set up payment statuses to define payment document progress levels. You must define a set of statuses for each payment class. For more information, see [Set Up Payment Classes](#).

To set up payment statuses

1. Choose the  icon, enter **Payment Slip Setup**, and then choose the related link.
2. Select a payment class, and then choose the **Status** action.
3. On the **Payment Status** page, choose the **New** action.
4. Fill in the fields as described in the following table.

FIELD	DESCRIPTION
Name	The payment status description.
RIB	Select to indicate that information about the Relevé d'Identité Bancaire (RIB) statement for the customer or vendor must be displayed in the payment lines. The RIB information includes the bank branch number, agency code, bank account number, bank name, RIB key, and key verification.
Look	Select to indicate that the payment document lines that have reached this payment status can be edited and viewed on the View/Edit Payment Line page. For more information, see View-Edit Payment Line.
ReportMenu	Select to indicate that the documents that have reached this payment status can be printed.
Amount	Select to display the amount in the payment lines.
Payment in Progress	Select to indicate that all billing and payment lines with this status must be considered when calculating the payments in progress.
Archiving Authorized	Select to indicate that payment headers with this payment status can be archived.

5. Choose the **OK** button.

Set Up Payment Steps

3/31/2019 • 4 minutes to read

To use payment management, you must set up steps for payment documents and define payment steps for each payment status. For example, "Creation of documents," "Documents created," and "Creation of payments." For more information, see [Set Up Payment Statuses](#).

To set up payment steps

1. Choose the  icon, enter **Payment Slip Setup**, and then choose the relevant link.
2. Select a payment class, and then choose the **Steps** action.
3. In the **Name** field, enter a name for the payment step. You can enter a maximum of 50 alphanumeric characters.
4. Choose the **Edit** action.
5. On the **Payment Step Card** page, fill in the fields as described in the following table.

FIELD	DESCRIPTION
Name	The payment step name that you entered on the Payment Step page.
Previous Status	The previous status, from which the step was last executed. The default value is 0. When the previous status is equal to the next status, the status is not modified after it is executed. Therefore, this payment step is optional and can be executed indefinitely.
Previous Status Name	The name of the status selected in the Previous Status field.
Next Status	The status at which this payment step ends.
Next Status Name	The name of the status selected in the Next Status field. This field cannot be modified.

FIELD	DESCRIPTION
Action Type	<p>The type of action to be performed by this step.</p> <p>Ledger: If you specify Ledger, you must define the additional ledger information on the Payment Step Ledger page.</p> <p>Report: If you specify Report, you specify which report in the Report No. field.</p> <p>File:</p> <p>* If you specify File, you specify the type of file in the Export Type field: Report or XMLPort.</p> <p>* For SEPA Credit Transfer files, specify XMLport, and then set the Export No. field to 1000.</p> <p>* For SEPA Direct Debit files, specify XMLport, and then set the Export No. field to 1010.</p>
Report No.	<p>The identification number for the report. This field is available if the Action Type field is set to Report.</p>
Export Type	<p>The export type for the file. This field is available if the Action Type field is set to File.</p> <p>For example, see Export Payments.</p>
Export No.	<p>The identification code for the selected export type. This field is available if the Action Type field is set to File.</p>
Verify Lines RIB	<p>Select to verify that the Relevé d'Identité Bancaire (RIB) key value specified on the payment slip line has been correctly reported.</p>
Verify Due Date	<p>Select to verify that the due date on the billing and payment line has been correctly reported.</p>
Source Code	<p>The source code that is linked to the payment step.</p> <p>This field is available if the Action Type field is set to Ledger.</p>
Reason Code	<p>The reason code that is linked to the payment step.</p> <p>This field is available if the Action Type field is set to Ledger.</p>
Header Nos. Series	<p>The number series code that must be used to assign numbers to the header for a new payment slip.</p> <p>This field is available if the Action Type field is set to Create New Document.</p>
Correction	<p>Select to mark the payment entries as corrections. This field is available if the Action Type field is set to Ledger.</p>

FIELD	DESCRIPTION
Realize VAT	Select to indicate that unrealized VAT should be reversed and VAT should be declared for this payment step. This field is available if the Unrealized VAT Reversal field on the Payment Class page is set to Delayed .
Verify Header RIB	Select to verify that the RIB key value specified on the payment slip header has been correctly reported.
Acceptation Code<>No	Select to verify that the acceptance code for each payment line is not a number.

6. Choose the **OK** button.

If the action type of the payment step is **Ledger**, you must set up additional ledger information for the payment step.

To set up ledger information for a payment step

1. On the **Payment Step Card** page for the payment step, choose the **Ledger** action.
2. On the **Payment Step Ledger** page, choose the **New** action.
3. Fill in the fields as described in the following table.

FIELD	DESCRIPTION
Sign	The type of posting entry.
Description	The entry description.
Accounting Type	The accounting type that is used for posting the entry.
Account Type	The account type for posting the entry. This field is available if the Accounting Type is Setup Account .
Account No.	The account number to which the entry is posted. The account number displayed here depends on the type selected in the Account Type field. This field is available if the Accounting Type is Setup Account .
Customer Posting Group	The code for the customer posting group to which the entry is posted. This field is available if the Accounting Type is Payment Line Account, Associated G/L Account, or Header Payment Account .
Vendor Posting Group	The code for the vendor posting group to which the entry is posted. This field is available if the Accounting Type is Payment Line Account, Associated G/L Account, or Header Payment Account .
Root	The root for the general ledger accounts group. This is used if the Accounting Type is G/L Account / Month or G/L Account / Week .

FIELD	DESCRIPTION
Memorize Entry	Select to indicate that the ledger entries created in this step will be retained and applied to newly posted entries. If you select this check box, the Detail Level field is not available.
Application	The method for applying the entries. If you have cleared the Memorize Entry check box, and have set this field to None , the Detail Level field is available.
Detail Level	The method for posting the payment lines.
Document Type	The type of document assigned to the ledger entry.
Document No.	The method for assigning the document number to the ledger entry.

4. Choose the **OK** button.

Set Up Payment Classes

3/31/2019 • 2 minutes to read

To use payment management, you must set up payment classes to define operation types, such as bills of exchange, electronic payments, or checks.

To set up a payment class

1. Choose the  icon, enter **Payment Slip Setup**, and then choose the relevant link.
2. On the **Payment Class** page, choose the **New** action.
3. Fill in the fields as described in the following table.

FIELD	DESCRIPTION
Enable	Select to enable usage of the payment class.
Code	The unique identification code for the payment class.
Name	The payment class description.
Header No. Series	The number series code for the payment slip header.
Line No. Series	The number series code for the payment slip lines. If you leave this field blank, the number for each payment line is created based on the payment header number.
Suggestions	The type of payment proposals that can be created automatically on a payment slip.
Unrealized VAT Reversal	<p>Specify the method to handle unrealized VAT.</p> <p>If you select Application, VAT will be realized when you post the invoice application and payment application.</p> <p>If you select Delayed, you must define the payment step during which VAT must be realized, by selecting the Realize VAT field on the Payment Step Card page. For more information, see Realize VAT and Payment Step.</p>
SEPA Transfer Type	Specify the SEPA export format, either Credit Transfer or Direct Debit .

Archive Payment Slips

3/31/2019 • 2 minutes to read

When a payment slip has been processed, you can separate it from the active payment slips by archiving it.

You can archive the payment slip by using the following methods:

- Manually – for individual payment slips.
- Automatically – for a batch of payment slips.

To archive a payment slip

1. Choose the  icon, enter **Payment Slips**, and then choose the relevant link.
2. Select the relevant payment slip, and then choose the **Edit** action.
3. On the **Payment Slip** page, choose the **Archive** action.
4. Choose the **Yes** button to archive the payment slip.

NOTE

If the current status of the payment slip does not allow archiving, a message is displayed.

To archive a batch of payment slips

1. Choose the  icon, enter **Archive Payment Slips**, and then choose the relevant link.
2. On the **Archive Payment Slips** page, on the **Payment Header** FastTab, select the appropriate filters.
3. Choose the **OK** button.

The payment slips are archived.

NOTE

This batch job will only archive payment slips that have the **Archiving Authorized** check box selected on the **Payment Status** page. For more information, see [Set Up Payment Statuses](#).

Create Payment Slips

3/31/2019 • 3 minutes to read

You can create payments slips to manage vendor and customer payments. Before you create payment slips, you must set up payment classes. For more information, see [Set Up Payment Classes](#).

The following procedure describes how to create payment slips for vendor payments, but the same steps also apply to creating payment slips for customer payments.

To create a payment slip for vendors

1. Choose the  icon, enter **Payment Slips**, and then choose the relevant link.
2. Choose the **New** action.
3. On the **Payment Slip** page, choose a field to open the **Payment Class List** page.
4. Select a payment class, and then choose the **OK** button.
5. On the **General** FastTab, fill in the fields as described in the following table.

FIELD	DESCRIPTION
Currency Code	Specify the currency code to be used for the payment lines.
Posting Date	Specify the posting date.
Document Date	Specify the document date.
Amount (LCY)	The total amount from the payment lines. This field is updated automatically when the net line amounts are changed.

6. On the **Lines** FastTab, fill in the fields as described in the following table.

FIELD	DESCRIPTION
Account Type	The account type to which the payment line is posted.
Account No.	The unique identification number for the account to which the entry will be posted.

7. In the **Bank Account Code** field, select a bank name from the list, and then choose **Advanced**.
8. Optionally, for SEPA, on the **Select – Vendor Account List** page, and then choose the **Edit** action.

Fill in the following fields if needed:

- **Country/Region Code.** In the list, choose **Advanced**, and make sure that the **SEPA Allowed** check box is selected for the code that you select.
- **Swift Code**
- **IBAN**

Choose the **OK** button to close the page.

- Optionally, for SEPA, choose the **Header RIB** action. Select the **Bank Country/Region Code** field, and then choose **Advanced**. Make sure the **SEPA Allowed** check box is selected. Also make sure that the **IBAN** and **SWIFT Code** fields are filled in.
- Choose the **Suggest Vendor Payments** action.

NOTE

You can also manually fill in the payment lines.

- In the **Suggest Vendor Payments** batch job, on the **Options** FastTab, fill in the fields as described in the following table.

FIELD	DESCRIPTION
Last Payment Date	The last payment date for the vendor ledger entries that are to be included in the batch job.
Find Payment Discounts	Select to include vendor ledger entries for which you can receive a payment discount.
Summarize per	The criteria for summarizing the payment line.
Use Vendor Priority	Select to sort the suggested payments based on the value in the Priority field on the vendor cards. For more information, see Priority .
Available Amount (LCY)	The maximum amount that is available for payments in local currency.
Currency Filter	The code for the currency to be included in the batch job.

- On the **Vendor** FastTab, select the appropriate filters.
- Choose the **OK** button.

The payment lines are automatically created.

- On the **Payment Slip** page, on the **Posting** FastTab, fill in the fields as described in the following table.

FIELD	DESCRIPTION
Source Code	The source code for the payment slip.
Department Code	The relevant dimension code.
Project Code	The relevant dimension code.
Account Type	The account type to which or from which the payments will be transferred.
Account No.	The account number to which or from which the payments will be transferred.

15. Optionally, for SEPA, in the **Account No.** field, choose the **Advanced** option.

- a. On the **Bank Account List** page, choose the **Edit** action.
- b. Fill in the following fields if needed:

- **General** FastTab
- **Country/Region Code**
- **Transfer** FastTab
- **Swift Code**
- **IBAN**
- **RIB** FastTab
- **Payment Export Format:** SEPA
- **SEPA CT Msg. ID No. Series:** Bank

16. Choose the **OK** button.

After you create a payment slip, you can generate payment files and send them to the bank electronically.

NOTE

A payment file can be created if the payment slip displays **File** for the **Action Type** field.

To create a payment file

1. Choose the  icon, enter **Payment Slips**, and then choose the relevant link.
2. Select a payment slip, and then choose the **Edit** action.
3. On the **Payment Slip** page, choose the **Generate file** action.
4. Choose the **Yes** button, and then choose the **OK** button.

The payment file is generated and exported according to the export type that is specified on the **Payment Step** page.

5. In the case of error, review the errors listed in the **File Export Errors** FactBox, and take the appropriate action.

Export Payments

3/31/2019 • 2 minutes to read

The Payment Management module allows you to export your payments electronically via a text file or XMLport.

To export payments

1. Choose the  icon, enter **Payment Slip Setup**, and then choose the relevant link.
2. On the **Payment Class** page, select a payment class, and then choose the **Steps** action.
3. On the **Payment Step** page, fill in the **Name** field.
4. Choose the **Edit** action to open.
5. On the **Payment Step Card** page, fill in the fields.
6. In the **Action Type** field, select the **File** option, and then in the **Export Type** field, select the **Report** or the **XMLport** action.
7. In the **Export No.** field, specify the object that will export the payments.

The next time you make a payment that is based on this payment step, the payments will be exported to a file as specified.

Export or Import Payment Management Setup Parameters

3/31/2019 • 2 minutes to read

You can export or import payment management setup parameters to an external disk so that you can use the same parameters for another company with similar requirements.

You can use the following formats to export payment setup parameters:

- ETEBAC (XMLport 10860) – To create a bill of exchange remittance.
- Withdraw (XMLport 10861) – To create a customer payment withdrawal (direct debit).
- Transfer (XMLport 10862) – To create a vendor payment transfer (credit transfer).

You can select these formats when you set up the payment status for your payment class. For more information, see [Set Up Payment Classes](#).

To export or import payment management setup parameters

1. Choose the  icon, enter **Payment Slip Setup**, and then choose the relevant link.
2. On the **Payment Class** page, choose the **Export Parameters** action.

To import a parameter, choose the **Import Parameter** action, select the file, and then choose the **Open** button.

3. Choose the **Save** button to open the **Save As** page and navigate to the location where the file should be saved.
4. Choose the **OK** button.

Payment Management

3/31/2019 • 2 minutes to read

Business Central allows you to manage bills of exchange, electronic payments, and vendor payments using the payment management function.

You can manage customer and vendor payments using payment slips. Before you create a payment slip, you must set up the following prerequisites:

- Payment class – The type of payment that you want to perform, for example, bill of exchange, electronic payment, or check. For more information, see [Set Up Payment Classes](#).
- Payment status – The progress level of a payment document. You must define a set of statuses for each payment class. For more information, see [Set Up Payment Statuses](#).
- Payment steps – A payment that is executed at a specified time. After a payment step is completed, you can move the payment document from one status to another. If a step involves posting debit or credit entries, you must define additional actions in the **Payment Step Ledger** table. For more information, see [Set Up Payment Steps](#).
- Payment address for vendors and customers – The address that is used for a vendor or a customer at the time of settlement. The payment address can be different from the vendor's or customer's default address. For more information, see [Set Up Payment Addresses](#).

You can also transfer your payment management setup information to an external disk so that you can use the same parameters for another company with similar requirements. You can export the payment data in the following formats:

- ETEBAC – To create a bill of exchange remittance.
- Withdraw – To create a customer payment withdrawal (direct debit).
- Transfer – To create a vendor payment transfer (credit transfer).

Managing Payment Slips and Files

You can create payment slips to manage customer payments and vendor payments. After creating the payment slip, you must post it.

These payment slips can then be converted into payment files, which can be sent to the bank electronically.

For more information, see [Create Payment Slips](#).

Archiving Payment Slips

You can separate a fully processed payment slip from the active payment slips by archiving it. You can manually archive an individual payment slip or you can automatically archive a batch of payment slips. For more information, see [Archive Payment Slips](#).

Post Payment Slips

3/31/2019 • 2 minutes to read

You must post payment slips to complete a payment transaction and to create the related financial data. You can post a payment slip if the payment slip's **Action Type** is set to **Ledger**.

Before you post a payment slip, you must create the payment slip. For more information, see [Create Payment Slips](#).

To post a payment slip

1. Choose the  icon, enter **Payment Slips**, and then choose the relevant link.
2. Select a payment slip, and then choose the **Edit** action.
3. On the **Payment Slip** page, choose the **Post** action.
4. Choose the **OK** button.

The payment slip is posted.

Apply General Ledger Entries

3/31/2019 • 2 minutes to read

You apply general ledger entries to justify ledger balances on asset and liability accounts. For example, you can apply transactions on the bill of exchange accounts to get a clear picture of which bills make up the balance of the account.

To apply general ledger entries

1. Choose the  icon, enter **Chart of Accounts**, and then choose the related link.
2. On the **Chart of Accounts** page, select the account that you want to apply entries for, and then choose the **Apply Entries** action.
3. On the **Apply G/L Entries** page, select the ledger entries that you want to apply.
4. Choose the **Set Applies-to ID** action to populate the **Applies-to ID** field with the user ID of the current user.
5. Choose the **Post Application** action.

This effectuates the application by setting the **Letter** and **Letter Date** fields.

NOTE

Applied entries can be identified by having the same three-letter combination and the same date.

Unapply General Ledger Entries

3/31/2019 • 2 minutes to read

You can unapply general ledger entries in a very straightforward way.

To unapply general ledger entries

1. Choose the  icon, enter **Chart of Accounts**, and then choose the related link.
2. On the **Chart of Accounts** page, select the account you want to unapply entries for, and then choose the **Apply Entries** action.
3. On the **Apply G/L Entries** page, select the ledger entries you want to unapply.
4. Choose the **Unapply Entries** action.

Close Years

3/31/2019 • 2 minutes to read

When a fiscal year is over, you must close the periods that it comprises.

To close a year

1. Choose the  icon, enter **Accounting Periods**, and then choose the relevant link.
2. Choose the **Close Year** action.

If more than one fiscal year is open, the earliest one should be closed. A message appears to identify the year that should be closed and explains the consequences of closing it.

3. To close the year, choose the **Yes** button.

When the fiscal year is closed, the **Closed** and **Date Locked** fields are selected for all the periods in the year. At this point the fiscal year cannot be opened again, and you cannot clear the **Closed** or **Date Locked** fields.

WARNING

You cannot close a fiscal year before you create a new one. When a fiscal year has been closed, you cannot change the starting date of the following fiscal year.

Even though a fiscal year has been closed, you can still post general ledger entries to it until you fiscally close the fiscal year. When you do this, the entries will be marked as posted to a closed fiscal year, and the Prior-Year Entry field will be selected. For more information, see [Fiscally Close Years](#).

After a fiscal year is closed, you must close the income statement accounts and transfer the year's results to an account in the balance sheet. You can repeat this each time you post to the closed fiscal year.

After a fiscal year is fiscally closed, it cannot be opened again, and general ledger entries cannot be posted.

Close Income Statement Accounts

3/31/2019 • 2 minutes to read

Before you can run the **Close Income Statement** batch job, you must close the fiscal year. For more information, see [Fiscally Close Years](#).

To close the income statement accounts

1. Choose the  icon, enter **Close Income Statement**, and then choose the relevant link.
2. On the **Close Income Statement** page, on the **Options** FastTab, specify the conditions of the batch job.
3. Choose the **OK** button.

When the batch job is finished, you must close the accounts.

4. Choose the  icon, enter **General Journals**, and then choose the relevant link.
5. Select the general journal that contains the closing entries.
6. Enter one line with a balancing entry that posts the net income to the correct general ledger account under owners' equity on the balance sheet.
7. Choose the **Post** action to post the journal.

Fiscally Close Accounting Periods

3/31/2019 • 2 minutes to read

When a fiscal period is complete, you can fiscally close the period to make sure that no more general ledger entries can be posted.

To fiscally close accounting periods

1. Choose the  icon, enter **Accounting Periods**, and then choose the relevant link.
2. On the **Accounting Periods** page, choose the **Close Fiscal Period** action.

If more than one fiscal period is not fiscally closed, the earliest one should be fiscally closed. A message appears to identify the period that should be closed and explains the consequences of closing it.

3. To fiscally close the period, choose the **Yes** button.

When the period is fiscally closed, the **Fiscally Closed** field is selected, and the **Fiscal Closing Date** field is updated for the period.

Fiscally Close Years

3/31/2019 • 2 minutes to read

When a fiscal year is complete, you must fiscally close the periods that it comprises to make sure that no more general ledger entries can be posted.

Before fiscal closing is allowed the following must be done:

- The fiscal year has been closed first. For more information, see [Close Years](#).
- All journal lines that are not posted for the year are either posted or deleted before the year is fiscally closed.
- All closing entries are up-to-date.

To fiscally close years

1. Choose the  icon, enter **Accounting Periods**, and then choose the relevant link.
2. On the **Navigate** tab, in the **Fiscal Closing** group, choose the **Fiscally Close Year** check box.

If more than one fiscal year is not fiscally closed, the earliest one should be fiscally closed. A message appears that identifies the year that should be closed and explains the consequences of closing it.

3. To fiscally close the year, choose the **Yes** button.

When the fiscal year is fiscally closed, the **Fiscally Closed** field for all the periods in the year is selected. The fiscally closed year cannot be opened again, and you cannot clear the **Fiscally Closed** field.

[Closing Years and Periods](#)

Fiscal Periods and Fiscal Years

3/31/2019 • 2 minutes to read

A fiscal year is typically divided into 12 monthly fiscal periods. In Business Central, you can have two fiscal years open at the same time. You cannot create a third fiscal year if there are two fiscal years open.

To close a fiscal year, you must close the accounting periods within that year.

You can only reopen a closed accounting period if the period falls within an open fiscal year. For more information, see [Close Years](#). You cannot reopen a closed fiscal year.

Closing Fiscal Periods and Fiscal Years

After a fiscal year is complete, you must close the accounting periods within that fiscal year. This is to ensure that general ledger entries are not posted for that period. For more information, see [Fiscally Close Accounting Periods](#).

A fiscal year can be closed if all of the following criteria are met:

- The posting dates on the **User Setup** page and the **General Ledger Setup** page do not fall within the year that you are closing. For more information, see [User Setup](#) and [General Ledger Setup](#).
- The fiscal year has been closed using the **Close Year** function on the **Accounting Periods** page. For more information, see [Closing Years and Periods](#).
- All the unposted journal lines for the year have been posted or deleted.
- All closing entries are up to date.

When you close a fiscal period, the earliest open fiscal period is closed. The **Allow Posting From** field on the **General Ledger Setup** page is updated with the start date for the next open period, if the existing date in this field is not already a later date. If the **Allow Posting To** field on the **General Ledger Setup** page is within the closed period, then the value in the **Allow Posting To** field is updated with the end date for the first open fiscal period. For more information, see [General Ledger Setup](#).

At the end of the year, you must do the following:

- Close the fiscal year using the **Close Year** function.
- Generate a year-end closing entry.
- Post the year-end closing entry, along with the offset equity account entries.
- Close the fiscal year using the **Fiscally Close Year** function.

Open a New Fiscal Year

3/31/2019 • 2 minutes to read

Before you can post in a fiscal year, you must open the fiscal year and define its accounting periods.

To open a new fiscal year

1. Choose the  icon, enter **Accounting Periods**, and then choose the relevant link.
2. Choose the **Create Year** action.
3. On the **Options** FastTab, define the structure of the fiscal year. The fiscal year is usually 12 periods of one month each, but you can also divide it in other ways.
4. Fill in the fields.
5. Choose the **OK** button.

The accounting periods are created, and the result is shown. The **Starting Date** field and the **Name** field are filled in with the name of the month from the starting date.

After the last period in the fiscal year, an accounting period is inserted with the **New Fiscal Year** field selected.

IMPORTANT

In concordance with French law no more than two open fiscal years are allowed.

Post the Year-End Closing Entry

3/31/2019 • 2 minutes to read

After you use the **Close Income Statement** batch job to generate the year-end closing entry or entries, you must open the journal you specified in the batch job, and then review and post the entries.

To post the year-end closing entry

1. Choose the  icon, enter **General Journal**, and then choose the related link.
2. Review the entries.
3. Choose the **Post** action.
4. In the posting confirmation page, choose the **Yes** button.

If an error is detected, an error message is displayed. If the posting is successful, the system removes the posted entries from the journal.

Once posted, an entry is posted to each income statement account so that its balance becomes zero and the year's result is transferred to the balance sheet.

[Fiscally Close Years](#)

Year End Processes Overview

3/31/2019 • 2 minutes to read

Year end closing in Business Central involves three steps:

1. Closing the fiscal year. For more information, see [Fiscally Close Accounting Periods](#).
2. Generating a year-end closing entry using the **Close Income Statement** option along with the offsetting equity account entries. For more information, see [Posting the year-end closing entry](#).
3. Fiscally closing the fiscal year. For more information, see [Fiscally Close Accounting Periods](#).

According to the French law *NF Logiciel compatibilité informatisée* the system has to refuse the creation of a third open fiscal year, so only two open fiscal years are allowed at the same time.

So in time you are required to close a year. You also do not have to worry about losing details of transactions when you close because all details are retained, even after you (fiscally) close the year.

When you close at the end of the year, the system moves your earnings from calculated earnings, or the Current Earnings account, to a posted account, or the Retained Earnings account. The system also marks the fiscal year as "closed," and marks all subsequent entries for the closed year as "prior year entries."

The system then generates a closing entry, but it does not post the entry automatically. You are given the opportunity to make the offsetting equity account entry or entries, which allows you to decide how to allocate your closing entry. For example, if your company has several divisions, you can let the system generate a single closing entry for all the divisions, and you can then make an offsetting entry for each division's equity account.

Once a year has been fiscally closed you will not be able to post in this fiscal year.

Print General Ledger Reports

3/31/2019 • 2 minutes to read

General ledger reports meet financial accounting standards, and they contain information about ledger entries, customer entries, vendor entries, and bank entries.

To print general ledger reports

1. Choose the  icon, enter **General Ledger**, and then choose the relevant link.
2. Choose the **Reports and Analysis** action, choose the **France** action, and then choose one of the following reports.

REPORT	DESCRIPTION
Journals	<ul style="list-style-type: none">- Shows all of the general ledger transactions.- Shows the subtotals of the transactions per period. <p>For more information, see Journals.</p>
G/L Journal	<p>Shows the subtotals for each source code per month.</p> <p>For more information, see G-L Journal.</p>
G/L Trial Balance	<p>Shows opening debit and credit balances, period debit and credit balances, and final debit and credit balances for all general ledger accounts.</p> <p>For more information, see G-L Trial Balance.</p>
G/L Detail Trial Balance	<ul style="list-style-type: none">- Shows the general ledger transactions for all general ledger accounts.- Shows the subtotals of the transactions per general ledger account. <p>For more information, see G-L Detail Trial Balance.</p>
Customer Journal	<ul style="list-style-type: none">- Shows the transactions of all customer accounts.- Show the subtotals of the customer transactions per period. <p>For more information, see Customer Journal.</p>
Customer Trial Balance	<p>Shows opening debit and credit balances, period debit and credit balances, and final debit and credit balances for all customer accounts.</p> <p>For more information, see Customer Trial Balance.</p>
Customer Trial Balance	<ul style="list-style-type: none">- Shows all of the transactions for all customer accounts.- Shows the subtotals of the customer transactions per account. <p>For more information, see Customer Trial Balance.</p>

REPORT	DESCRIPTION
Vendor Journal	<ul style="list-style-type: none"> - Shows the transactions for all vendor accounts. - Shows the subtotals of the vendor transactions per period. <p>For more information, see Vendor Journal.</p>
Vendor Trial Balance	<p>Shows opening debit and credit balances, period debit and credit balances, and final debit and credit balances for all vendor accounts.</p> <p>For more information, see Vendor Trial Balance.</p>
Vendor Detail Trial Balance	<ul style="list-style-type: none"> - Shows transactions for all vendor accounts. - Show the subtotals of the vendor transactions per account. <p>For more information, see Vendor Detail Trial Balance.</p>
Bank Account Journal	<ul style="list-style-type: none"> - Shows transactions for all bank accounts. - Shows the subtotals of the bank transactions per period. <p>For more information, see Bank Account Journal.</p>
Bank Account Trial Balance	<p>Shows opening debit and credit balances, period debit and credit balances, and final debit and credit balances for all bank accounts.</p> <p>For more information, see Bank Account Trial Balance.</p>
Bank Acc. Detail Trial Balance	<ul style="list-style-type: none"> - Shows transactions for all bank accounts. - Shows the subtotals of the transactions per account. <p>For more information, see Bank Acc. Detail Trial Balance.</p>

3. On the **Options** FastTab, enter information in the relevant fields, and then select the appropriate filters.

NOTE

The **Options** FastTab is not available for the **G/L Journal** batch job.

4. Choose the **Print** button to print the report, or choose the **Preview** button to view it on the screen.

Reopen Accounting Periods

3/31/2019 • 2 minutes to read

When a single fiscal period has been fiscally closed it might be necessary to reopen it to post general ledger entries.

NOTE

After the year that the accounting period belongs to is fiscally closed, you cannot reopen it.

To reopen accounting periods

1. Choose the  icon, enter **Accounting Periods**, and then choose the relevant link.
2. Choose the **Reopen Fiscal Period** action.

If more than one fiscal period is fiscally closed, the last one should be reopened. A message appears that identifies the period that should be reopened and explains the consequences of reopening it.

3. To fiscally open the period, choose the **Yes** button.

When the period is reopened, the **Fiscally Closed** field is cleared, and the **Period Reopened Date** field is updated for the period.

Specify Posting Periods

3/31/2019 • 2 minutes to read

When you specify posting periods, you limit the period in which posting is allowed.

To specify posting periods

1. Choose the  icon, enter **General Ledger Setup**, and then choose the related link.
2. On the **General Ledger Setup** page, on the **General** tab, in the **Allow Posting From** field, specify the start date of the posting period.
3. In the **Allow Posting To** field, specify the end date of the posting period.

The dates are validated against the allowed posting ranges to make sure that they belong to open fiscal years. For more information, see [Allowed Posting Range](#).

4. To verify what the allowed posting range is, choose the **Get Allowed Posting Range** action.

The dates that you define here apply to the whole company, that is, to all users.

NOTE

You can define different posting periods for different users and apply a posting period to a user on the **User Setup** page.

If you enter dates here, the dates entered on the **General** tab on the **General Ledger Setup** page will not apply to these users.

View Ledger Reconciliations

3/31/2019 • 2 minutes to read

Business Central includes two reports that can help you reconcile general ledger entries with customer ledger entries and vendor ledger entries. The reports print a separate page for each customer or vendor that sums up amounts from general ledger transactions based on payments and posted invoices.

The following procedure applies to viewing reconciliation between the general ledger and the customer ledger, but the same steps apply to reconciliation with the vendor ledger.

To view general ledger reconciliation with the customer ledger

1. Choose the  icon, enter **General Ledger**, and then choose the related link in **General Ledger**.
2. Choose the **Reports** action, choose the **France** action, and then choose the **GL/Cust. Ledger Reconciliation** action.
3. On the **GL/Cust. Ledger Reconciliation** page, set the appropriate filters.

NOTE

You must specify a date filter.

4. Choose the **Preview** button.

You can now view the debit and credit amounts for each customer, and you can see the document numbers that resulted in each general ledger transaction.

Set Up Accelerated Depreciation

3/31/2019 • 2 minutes to read

To use the accelerated depreciation calculation, you must set up the following depreciation books for fixed assets:

- The accounting depreciation book (integrated with the general ledger).
- The tax depreciation book (not integrated with the general ledger).

NOTE

When you post an acquisition, depreciation, or disposal for the accounting depreciation book, the transaction is duplicated and posted in the tax depreciation book when the fixed asset journal is posted.

To set up the accounting depreciation book

1. Choose the  icon, enter **Depreciation Books**, and then choose the relevant link.
2. On the **Depreciation Book List** page, choose the **New** action.
3. On the **General** FastTab, fill in the required fields as described in the following table.

FIELD	DESCRIPTION
Code	The unique identification code for the accounting depreciation book. You can enter a maximum of 10 alphanumeric characters.
Description	The depreciation book description.

IMPORTANT

Leave the **Derogatory Calculation** field blank.

4. On the **Integration** FastTab, select the **Derogatory** check box to integrate accelerated depreciation with the general ledger.

For more information, see [Set Up Fixed Asset Depreciation](#).

5. Choose the **OK** button.

To set up the tax depreciation book

1. Choose the  icon, enter **Depreciation Books**, and then choose the relevant link.
2. On the **Depreciation Book List** page, choose the **New** action.
3. On the **General** FastTab, fill in the required fields as described in the following table.

FIELD	DESCRIPTION
-------	-------------

FIELD	DESCRIPTION
Code	The unique identification code for the tax depreciation book. You can enter a maximum of 10 alphanumeric characters.
Description	The tax depreciation book description.

4. In the **Derogatory Calculation** field, select the accounting depreciation book code to indicate that this is a tax depreciation book to calculate derogatory depreciation.

For more information, see [Set Up Fixed Asset Depreciation](#).

5. Choose the **OK** button.

The **Used with Derogatory Book** field in the accounting depreciation book is updated with the tax depreciation book code.

Accelerated Depreciation

3/31/2019 • 2 minutes to read

Accelerated depreciation is calculated based on the differences between the accounting depreciation book and the tax depreciation book fixed asset, during the life of the fixed asset.

Fixed assets that have higher tax depreciation and lower accounting depreciation are depreciated using the accelerated depreciation method, as allowed by the tax authorities.

Companies must use the accelerated depreciation method to post the extra tax amounts if they meet at least two of the following criteria:

- They have more than 50 employees.
- They have at least two million euros in assets.
- They have at least four million euros in sales.

Depreciation Book

The accelerated depreciation method helps you to calculate and post differences between tax depreciation amounts and accounting depreciation amounts that are allowed for fixed assets. To calculate accelerated depreciation for fixed assets, the following depreciation books must be set up:

- The accounting depreciation book (integrated with the general ledger).
- The tax depreciation book (not integrated with the general ledger).

You must set up the tax book as a derogatory book by using an accelerated depreciation setup parameter. If this parameter is set, differences between the tax book and the accounting book are calculated and posted as accelerated depreciation amounts. For more information, see [Set Up Accelerated Depreciation](#).

Example

If you have a fixed asset valued at 1,000 euros that is depreciated in the accounting depreciation book over five years, and depreciated in the tax depreciation book over three years, then the accounting depreciation for the first year is 200 euros ($1,000/5$) and the tax depreciation for the first year is 333.33 euros ($1,000/3$). The accelerated depreciation amount is the difference between these two amounts: 133.33 euros ($333.33 - 200$).

Accelerated Depreciation Accounts

Accelerated depreciation uses the derogatory fixed asset posting type. Statistics and reports use this posting type to report the accelerated depreciation calculation. For more information, see [Set Up Fixed Asset Depreciation](#).

There are two accounts to set up for derogatory amounts:

- Positive accelerated depreciation amounts (increase of accelerated depreciation):
 - Derogatory account
 - Derogatory expense account
- Negative accelerated depreciation amounts (decrease of accelerated depreciation):
 - Derogatory Acc. on Disposal
 - Derog. Bal. Acc. on Disposal

If you post an acquisition, depreciation, or disposal for the accounting depreciation book, the transaction is automatically duplicated and posted in the tax depreciation book when the journal is posted.

After you set up the tax depreciation book and the accounting depreciation book, the accelerated depreciation is calculated automatically for fixed assets using the calculate depreciation batch job in the accounting depreciation book. For more information, see [Calculate Accelerated Depreciation](#).

Calculate Accelerated Depreciation

3/31/2019 • 2 minutes to read

In Business Central, you calculate periodic depreciation for fixed assets by using the **Calculate Depreciation** batch job. The fixed asset depreciation book that is linked to the fixed asset defines the depreciation method, the starting date for depreciation, and the fixed asset posting group that is used in the batch job.

If a fixed asset depreciation book is integrated with the general ledger, then it is called an *accounting depreciation book*. If a fixed asset depreciation book is not integrated with the general ledger, then it is called a *tax depreciation book*.

You can only calculate the accelerated depreciation for fixed assets that have an accounting depreciation book and a tax depreciation book. For more information about setting up tax depreciation books and accounting depreciation books for fixed assets, see [Set Up Accelerated Depreciation](#).

Entries are transferred to the fixed asset general journal when you select an accounting depreciation book in the batch job. Entries are transferred to the fixed asset journal when you select the tax depreciation book.

To calculate accelerated depreciation

1. Choose the  icon, enter **Calculate Depreciation**, and then choose the relevant link.
2. On the **Calculate Depreciation** page, on the **Options** FastTab, fill in the fields as described in the following table.

FIELD	DESCRIPTION
Depreciation Book	The unique identification code for the accounting depreciation book.
FA Posting Date	Specify the ending date for the depreciation calculation, if this is the first depreciation entry for the asset. The depreciation starting date that is defined on the FA Depreciation Books page is used as the starting date for the depreciation calculation. If you have already depreciated the asset, the fixed asset posting date of the last depreciation entry is used as the starting date for the depreciation calculation.
Use Force No. of Days	Select to use the number of days in the Force No. of Days field for the depreciation calculation.
Force No. of Days	The number of days for the depreciation calculation. You can only enter a number in this field if the Use Force No of Days check box is selected.
Posting Date	The posting date for the calculated depreciation. You can leave this field blank if the Use Same FA + G/L Posting Dates field in the accounting depreciation book is selected. The posting date is copied to the resulting journal lines.

FIELD	DESCRIPTION
Document No.	The document number for the fixed asset journal batch. Leave this field blank if you have set up a numbering series for the fixed asset journal batch on the No. Series page. For more information, see No. Series.
Posting Description	The posting description for the fixed asset journal entries.
Insert Bal. Account	Select to automatically insert balancing accounts in the resulting journal. The Calculate Depreciation batch job only uses balancing accounts that are defined in the FA Posting Group.

3. On the **Fixed Asset** FastTab, select the appropriate filters.
4. Choose the **OK** button.

The accelerated depreciation for the fixed asset is calculated.

Set Up Reports for VAT and Intrastat

3/31/2019 • 2 minutes to read

In Business Central, you can specify which reports to use to create the documents that you must submit to the authorities, such as the VAT statement and the Intrastat form.

To set up reports for VAT

1. Choose the  icon, enter **Report Selections VAT**, and then choose the related link.
2. On the **Report Selection – VAT** page, in the **Usage** field, select the type of document that you want to specify reports for. This includes the VAT statement and the VAT statement schedule.
3. Specify the report or batch job that must run when a user starts the activity for the document type that you specified in the **Usage** field. Fill in the fields as described in the following table.

FIELD	DESCRIPTION
Sequence	Specifies where a report is in the printing order.
Report ID	Specifies the ID of the report that prints for this document type.
Report Name	Specifies the name of the report that prints for this document type. The Report Name field updates based on the selection in the Report ID field.

4. Choose the **OK** button.

To set up reports for Intrastat

1. Choose the  icon, enter **Report Selection**, and then choose the related link.
2. On the **Report Selection – Intrastat** page, in the **Usage** field, select the type of document that you want to specify reports for. This includes the Intrastat checklist and Intrastat form.
3. Specify the report or batch job that must run when a user starts the activity for the document type that you specified in the **Usage** field. Fill in the fields as described in the following table.

FIELD	DESCRIPTION
Sequence	Specifies where a report is in the printing order.
Report ID	Specifies the ID of the report that prints for this document type.
Report Name	Specifies the name of the report that prints for this document type. The Report Name field updates based on the selection in the Report ID field.

4. Choose the **OK** button.

Set Up VAT Reports

3/31/2019 • 2 minutes to read

Information from various invoice types is used to feed data into the EU Sales List report. To file a VAT report under the ELMA5 system from Business Central, you need to set up report parameters.

To set up a VAT report

1. Choose the  icon, enter **VAT Report Setup**, and then choose the related link.
2. On the **General** FastTab, select the **Modify Submitted Reports** check box to let users modify VAT reports that have been submitted to the tax authorities.

If the field is left blank, users must create a corrective VAT report instead.

3. Select the **Export Cancellation Lines** check box if you want to include information about cancellation lines when you export data for the VAT report of EU sales. For more information, see [Correct VAT Reports](#).
4. On the **Numbering** FastTab, specify the number series that will be used for standard VAT reports. This will be the default numbering series that is used on any VAT Report that you then create.

Depending on the requirements, you can use the same number series for all VAT reports, or separate number series for each type of VAT report.

For example, if your company uses separate number series for standard and corrective VAT reports, this number series is the default number series. Users can select a different number series in the **No.** field when they create corrective reports.

5. On the **ZIVIT** FastTab, specify information for the fields.
6. Choose the **OK** button.

VAT Reporting

5/22/2019 • 2 minutes to read

You can report VAT to the German tax authorities on the Elektronische Steuererklärungen (ELSTER) online portal. You can generate and export your VAT declaration as an XML file that you send to the German ELSTER portal. For more information, see [Sales VAT Advance Notifications](#).

You can print the following local VAT reports.

REPORT	DESCRIPTION
VAT Statement Germany	<p>A simple VAT report. The main VAT reporting is handled by the ELSTER functionality. The amounts are differentiated by taxable base and taxable amount.</p> <p>Serves as the basis for VAT registration for a selected period, and is printed according to the VAT statement in the VAT Statement Line table.</p> <p>Use this report in conjunction with VAT correction.</p>
Sales VAT Adv. Not. Acc. Proof	<p>Confirms that entries in the VAT statement form are also posted in general ledger accounts.</p> <p>To verify VAT in sales VAT advance notifications, select the same settings for the VAT statement form and the sales VAT advance notification.</p>
VAT Statement Schedule	<p>This report can be retrieved from the VAT Statement page.</p> <p>Prints the settings in the VAT statement. Using this report, you can print the characteristics of the Sales VAT Adv. Not. Acc. Proof.</p>

[Set Up Reports for VAT and Intrastat](#)

Create VAT Reports

3/31/2019 • 2 minutes to read

You can configure different types of VAT reports based on requirements. Then, when you have to submit a VAT report, you can create it on the **VAT Report** page and then export it in electronic format that conforms to the ELMA5 format requirements.

To create a VAT report

1. Choose the  icon, enter **VAT Report**, and then choose the related link.
2. Fill in the fields in the **General** FastTab, including the fields that are described in the following table.

FIELD	DESCRIPTION
No.	Specify the report number. Depending on the type of report, and the configuration in your company, you can use the automatically generated number, select a different number series, or enter a different number manually.
VAT Report Type	Select the appropriate VAT Report type. The default setting is Standard . If the report is an update to an existing report, choose Corrective .
Trade Type	Specify the type of trade that the report is to describe. The default is Sales . Other options are Purchases or Both .
Start Date	Specify the start date of the report period.
End Date	Specify the end date of the report period.
EU Goods/Services	Specify whether the report applies to Goods , Services , or both. The default is Both .
Report Period Type	Specify the time period that the report applies to: - Month - Quarter - Year - Bi-Monthly
Report Period No.	Specify the number of the VAT period.
Report Year	Specify the year that the VAT report covers.
Processing Date	Specify the date that the VAT report is created.

3. Fill in the fields in the **Sign-off** FastTab, including the key fields that are described in the following table.

FIELD	DESCRIPTION
Sign-off Place	Specify the location where the VAT report was signed off.
Sign-off Date	Specify the date that the VAT report has been signed off.
Signed by Employee No.	Specify the number of the employee who signed the VAT report from the lookup list.
Created by Employee No.	Specify the number of the employee who created the VAT report from the lookup list.

4. Import the VAT ledger entries that must be included in the VAT report.
5. Choose the **Suggest Lines** action.

This adds VAT entries to the page. For each line, in the **Amount** field, you can drill down to see the VAT ledger entries that are the source of the line.

After you create the VAT report, you have to submit it to the tax authorities.

To submit a VAT report

1. On the **VAT Report** page, choose the **Release** action.
2. Confirm that you want to release the report.

Business Central validates that the VAT report is set up correctly. If the validation fails, the errors are shown on the **VAT Report Error Log** page so that you can make the appropriate changes. For example, an error displays if you try to release a standard VAT report but you have not yet added any lines to the report.

When you mark a VAT report as released, it becomes non-editable. If you must change the report after marking it as released, you must first reopen it.

3. Choose the **Export** action to create a VAT report of EU Sales List data in ELMA5 format. Save a copy of the report, which has the required name specified by ELMA5.

You can now submit the report to the tax authorities.

4. Choose the **Mark as Submitted** action.

See Also

[Correct VAT Reports](#)

[Set Up VAT Reports](#)

Correct VAT Reports

3/31/2019 • 2 minutes to read

If you have to submit a corrective VAT report or delete a submitted VAT report, you must create a new VAT report. According to the legislation, a corrective report must be submitted within a month of the initial report.

When you create a corrective report, the report will contain two line types per corrected line. In one line type, Cancellation, the base value of the VAT is reported as a cancellation. All other information remains the same, and cannot be edited. On a new line, Correction type, you can make corrections as needed to the VAT amount. The **Suggest Lines** action, however, will suggest the correct amount based on the filters and posted documents. You cannot correct or modify the **VAT Registration No.** Each period being corrected needs its own corrective report.

The **Suggest Lines** action recalculates the values to report. The **Correct Lines** action is used to make manual changes. You can combine the effects of the two actions to correct your report.

Example corrections scenarios

1. If you post additional VAT entries after you submit the Standard report in the report period, choose **Suggest Lines** in the **Process** group to get the updated amounts.

NOTE

If you manually changed the amount for a customer or vendor, this amount will be overwritten when additional VAT entries are posted. Update the amount accordingly.

2. If you want to change the amount of a report line that has already been submitted and no new VAT entries are posted, choose the **Correct Lines** action. On the **VAT Report Lines** page, select the lines that you want to correct, and then choose the **OK** button.

For each entry, two lines are displayed: Cancellation and Correction. You can now change the amount on the Correction line.

NOTE

The **Correct Lines** action will not suggest the amount based in VAT entries. If you have new VAT entries for the customer or vendor, instead use the **Suggest Lines** action.

3. If you used the wrong filters, for example, the wrong VAT product posting group, choose the **Suggest Lines** action, and then set filters as needed.

Suggest Lines will create entries to account for the difference between the filters.

NOTE

If the updated filters exclude a customer or vendor, Business Central creates a Cancellation line for the previous reported amount and a Correction entry with amount 0.

To correct a VAT report

1. Create a new VAT report. For more information, see [Create VAT Reports](#).

2. Fill in the fields in the **General** FastTab, and set the **VAT Report Type** field to Corrective.
3. In the **Original Report No.** field, select the report that you want to correct. You can only select reports of type Standard that have been marked as Submitted.
4. Create your correction VAT report line entries.

Choose the **Suggest Lines** action. Set filters as needed.

On each line you can drill down on the amounts to see which VAT entries make up the amount. Change the amount if needed. You cannot edit, however, the **VAT Registration No.**

5. If the **Suggest Lines** action does not provide suggestions to correct the amounts that you intended, use the **Correct Lines** action to insert cancellation and correction lines for the customer or vendor.
6. Continue with the VAT report creation process, and release the report.

[Set Up VAT Reports](#)

Sales VAT Advance Notifications

5/22/2019 • 2 minutes to read

A Sales VAT Advance Notification in Business Central is an XML file that you can use to report VAT to the German tax authorities on the Elektronische Steuererklärungen (ELSTER) online portal. The XML file includes tax and base amounts, and information about your company, and is created in the format and layout that German tax authorities require.

Set Up and Export Sales VAT Advance Notifications

To create valid sales VAT advance notifications, you must set up the following:

- The company registration information and tax office information.
- Basic sales VAT advance notification on the **Electronic VAT Decl. Setup** page.
- The VAT statement.

To set up company information

1. Choose the  icon, enter **Company Information**, and then choose the related link.
2. On the **Company Information** page, in the **VAT Representative** field, enter the contact person for VAT related information.
3. Choose the **OK** button.

To set up the Electronic VAT Decl. Setup

1. Choose the  icon, enter **Electronic VAT Decl. Setup**, and then choose the related link.
2. Fill in the fields as described in the following table.

FIELD	DESCRIPTION
Sales VAT Adv. Notif. Nos.	Choose the number series to use to assign identification numbers to new sales VAT advance notifications.
Sales VAT Adv. Notif. Path	Enter the path and name of the folder where you want to store the XML files.
XML File Default Name	Enter the name of the file.

To set up a VAT statement for sales VAT advance notifications

1. Choose the  icon, enter **VAT Statement**, and then choose the related link.
2. On the **VAT Statement** page, in the **Name** field, choose the drop-down arrow.
3. On the **VAT Statement Names** page, in the line for the appropriate VAT statement name, select the **Sales VAT Adv. Notification** check box.

NOTE

The VAT statement must have a VAT statement line for each key figure required by the tax authority, where the **Row No.** field contains the key figure and the **Amount Type** field specifies whether this is a base amount or a tax amount. Ask your tax office if you have questions concerning the key figures and their definition.

4. Choose the **OK** button.

To create an XML document for Sales VAT advance notification

1. Choose the  icon, enter **Sales Vat Advanced Notification List**, and then choose the related link.
2. On the **Sales Vat Advanced Notification List** page, choose the **New** action.
3. On the **Sales VAT Adv. Notif. Card** page, fill in the fields.
4. Choose **Process**, and then choose the **Create XML-File** action.
5. On the **Create XML - VAT Adv. Notif.** page, in the **XML-File** field, choose either the **Create** or the **Create and Export** option.
6. Choose the **OK** button.

Declare VAT-VIES Tax

3/31/2019 • 2 minutes to read

Business Central includes the VAT-VIES declaration report, which you can use to submit information about sales transactions with other European Union (EU) countries/regions to the customs and tax authorities' list system. The report displays information in the same format that is used in the customs and tax authorities' declaration list.

Depending on the volume of sales of goods or services to other EU countries/regions, you must submit monthly, bi-monthly, or quarterly declarations. If your company has sales of more than 100,000 euros per quarter, you must submit a monthly declaration. If your company has sales of less than 100,000 euros per quarter, you must submit a quarterly declaration. For more information, see the [BZSt website](#).

The report is based on the VAT Entry table.

To declare VAT-VIES tax

1. Choose the  icon, enter **VAT-Vies Declaration Tax – DE**, and then choose the related link.
2. On the **VAT-Vies Declaration Tax – DE** page, on the **Options** FastTab, fill in the fields as described in the following table.

FIELD	DESCRIPTION
Reporting Period	Select the time period that the report applies to. This can be a month, a two-month period, a quarter, or the calendar year.
Date of Signature	Enter the date on which the VAT-VIES declaration is sent.
Corrected Notification	If selected, this field indicates that this is a corrected version of an already delivered VAT-VIES declaration.
Show Amounts in Add. Reporting Currency	If selected, the amounts of the report will be in the additional reporting currency. For more information, see Additional Reporting Currency .
Change to monthly reporting	If selected, your company has sales of more than 100,000 euros per quarter and you must migrate from a quarterly report to a monthly report. Important: Only select this field the first time that you submit a monthly report.
Revoke monthly reporting	If selected, you want to switch from monthly reporting to another reporting period. For example, if you have previously submitted monthly declarations but the EU sales are less than 100,000 euros per quarter, select this field and then select one of the quarters in the Reporting Period field.

3. On the **VAT Entry** FastTab, select the appropriate filters.

NOTE

In order to run this report, you must select the **Posting Date** as a filter, and enter the posting date value.

Print Vendor Payments List Reports

3/31/2019 • 2 minutes to read

The **Vendor Payments List** report provides a list of payments for each vendor. The report can sort payments chronologically or grouped by vendor.

To print the vendor payments list report

1. Choose the  icon, enter **Vendor Payments List**, and then choose the related link.
2. On the **Options** FastTab, fill in the fields as described in the following table.

FIELD	DESCRIPTION
Sorting	Specifies the sort order. You can sort by vendor or chronologically. If you sort by vendor, you will see a subtotal for each vendor. If you sort chronologically, you will not see subtotals.
Layout	<p>Specifies the layout of the report.</p> <p>The results can be displayed in the following layouts:</p> <p>Standard Displays the vendor number and vendor name, together with posting details, such as the document number and the amount in local currency.</p> <p>FCY Amounts Displays the vendor number, vendor name, document number, payment status (O for open, PP for partial payment, and C for closed), and payment amount.</p> <p>Posting Info Displays the vendor number, vendor name, cost center, cost object, user ID, and payment amount.</p>

At the end of the report, the number of processed payments is displayed.

[Making Payments](#)

Export and Print Intrastat Reports

3/31/2019 • 2 minutes to read

Intrastat reporting is required throughout the European Union (EU) and must follow local requirements, such as specific formats and files. All companies in the EU must report their trade with other EU countries. The movement of goods must be reported to the statistics authorities (Statistisches Bundesamt) every month, and a report must be delivered to the tax authorities.

For Intrastat reporting, you must provide paper reports and files, which must be in ASCII format for Germany. Business Central includes reports and batch jobs that generate all of the information that must be sent to the German tax authorities. This information automatically includes both receipt and delivery of goods. The Intrastat file contains information from the lines in the **Intrastat** journal.

To print the German Intrastat checklist

1. Choose the  icon, enter **Intrastat Journals**, and then choose the related link.
2. In the **Batch Name** field, select the required journal batch name.
3. Choose the **Checklist Report** action.
4. On the **Intrastat - Checklist DE** page, on the **Options** FastTab, select the **Show Intrastat Journal Lines** check box.

IMPORTANT

If you clear the **Show Intrastat Journal Lines** check box, the report displays only the information that must be reported to the tax authorities, and not the lines in the journal.

5. Optionally, on the **Intrastat Jnl. Batch** FastTab, select the appropriate filters.
6. Optionally, on the **Intrastat Jnl. Line** FastTab, select the appropriate filters.
7. Choose the **Print** button to print the Intrastat checklist or choose the **Preview** button to view it on the screen.

To print the German Intrastat form

1. Choose the  icon, enter **Intrastat Journals**, and then choose the related link.
2. In the **Batch Name** field, select the required journal batch name.
3. Choose the **Form** action.
4. Optionally, on the **Intrastat Jnl. Batch** FastTab, select the appropriate filters.
5. Optionally, on the **Intrastat Jnl. Line** FastTab, select the appropriate filters.
6. Choose the **Print** button to print the Intrastat checklist or choose the **Preview** button to view it on the screen.

To export Intrastat information to a disk

1. Choose the  icon, enter **Intrastat Journals**, and then choose the related link.
2. In the **Batch Name** field, select the required journal batch name.
3. Choose the **Make Diskette** action.

4. On the **Options** FastTab, in the **Path** field, enter the full path and the name of the file to which you want to write the information.

Optionally, on the **Intrastat Jnl. Batch** FastTab, select the appropriate filters.

5. To export the file, choose the **OK** button.

The Intrastat information is exported, and you can either save the data to a file, or you can open the file in the appropriate program.

When the file is exported, the **Reported** check box on the **Intrastat Jnl. Batches** page will be selected, and the **Internal Ref. No.** field on every entry in the journal will be filled in. You can manually change the contents of the field. For example, you can make changes when you need to run the report again. For more information, see **Intrastat Jnl. Batch**.

Post a Negative Entry

3/31/2019 • 2 minutes to read

You can use the **Correction** field to post a negative debit instead of a credit, or to post a negative credit instead of a debit on an account. To meet legal requirements, this field is visible by default in all journals. The **Debit Amount** and **Credit Amount** fields include both the original entry, and the corrected entry. These fields have no effect on the account balance.

To post a negative entry

1. Choose the  icon, enter **General Journals**, and then choose the related link
2. In the **Batch Name** field, select the required batch name.
3. Enter information into the relevant fields.
4. In the journal line that you want to activate for negative entries, select the **Correction** check box.
5. To post the journal, choose the **Post** action, and then choose the **Yes** button.

Process for Digital Audits (GoBD/GDPdU)

3/31/2019 • 5 minutes to read

You can export data from Business Central according to the process for digital audits (GoBD/GDPdU), which is based on German tax law.

Overview

Section 146 and 147 of the German Fiscal Code (Abgabenordnung, AO) allows tax authorities to assess the data of electronic accounting systems digitally. They may do this with a data storage device submitted to them or by direct or indirect access to the system. In the data storage device scenario, the tax liable company (or the person or entity entrusted with accounting and tax duties) must provide appropriate data storage devices with the data in computer-readable form. This means for the tax authorities that they will be able to access at will all stored data, including the master data and connections with sort and filter functions. To provide data that can be used and evaluated in this manner, you must define and standardize the file formats for submission by data storage device.

Tax authorities in Germany use analysis software, IDEA, which imports data from ASCII files. The IDEA software can import data in variable length or fixed length format. It requires an XML file, index.xml, that describes the structure of the data files. For more information, see the [Audicon website for GDPdU](#).

Defining GDPdU Export Data

You can configure Business Central to export data to meet your needs. You can export large sets of data, and you can export small sets of data. You can export data from a single table or a table and related tables.

For each data export, you define the tables and fields that you want to export. This depends on the auditor's requests. The selected information is exported to the ASCII files. A corresponding XML file, INDEX.XML, is also created to describe the ASCII file structure.

The elements in the INDEX.XML file define the names of the tables and fields that are exported. Because the current auditing tool has restrictions on these field names, such as the length and the characters that are used, Business Central removes spaces and special characters and then truncates the names to match the 20 character limitation. You can change the suggested table and field names when you add fields to a table definition.

In most cases, you will set up GDPdU data export one time, and then a person in your company can run the export when the auditor requests new data. It is recommended that the setup is handled by people with an understanding of the database structure and the technical hardware in your company, but also in collaboration with people who understand the business data, such as the accountant.

Configuration

You can set up different GDPdU data exports depending on the type of data that you want to be able to export. For example, you can create two GDPdU data exports:

- One exports high-level information about all general ledger entries, customer ledger entries, vendor ledger entries, and VAT entries.
- The other exports detailed information about the general ledger entries.

NOTE

How to set up the GDPdU data exports depends on your company's needs and the auditor's requests.

For an example of how to set up data exports for GDPdU, see [Walkthrough: Exporting Data for a Digital Audit](#).

Data Export Filters

When you set up a data export, you can filter data on different levels as described in the following table.

FILTER LEVEL	DESCRIPTION
Period filters	You can specify a start date and end date for the data that will be exported. You can then use this period filter to filter the data. For example, if you set a period filter for the export, you can then set table filters that use the period.
Table filters	<p>You can set filters on each table in the export. For example, you can include only open ledger entries, or entries that have a posting date in the specified filter. You can also set a filter that is based on FlowFields, such as Net Change (LCY), to only export customers where there has been a change, for example. Important: You cannot set a table filter that is based on a FlowFilter.</p> <p>When you add table filters, you can increase performance by specifying the fields that the exported data will be sorted by the value of the Key No. field for the record definition. Which keys to use depends on the table. For example, if the table only has two key fields and relatively few entries, then the sort order does not affect the speed of the export. But for a table such as G/L Entry, the export is faster if you specify the key in advance, such as the <code>G/L Account No., Posting Date</code> key. If you do not specify a key, then the primary key is used, which might not be the best choice.</p> <p>Other tables in which it can be useful to specify the key include the Cust. Ledger Entry and Vendor Ledger Entry tables.</p>
FlowField filters	You can include FlowFields in the export and set filters based on the period. For example, you can apply the period filter to the Balance at Date field on the G/L Account table.

If you include a FlowField such as the **Net Change (LCY)** field on the **Customer** table, you can specify that the entries must be filtered based on the remaining amount at the end date of the GDPdU period. If you add this as a field filter, then the calculation formulas are based on the dates that are specified during the export.

For more information, see [GDPdU Filter Examples](#).

Export Performance

If you want to export large sets of data, it can take a very long time. We recommend that you set up data exports based on advice from your tax advisor to establish your business needs, and the requirements of the tax auditor. The number of records in a table is also something that you should consider.

Set Up Data Exports for a Digital Audit

3/31/2019 • 5 minutes to read

You must set up data export record sources to be able to export Grundsätze zum Datenzugriff und zur Prüfbarkeit digitaler Unterlagen (GDPdU) data. For each data export type, you must define one or more record sources, where each source is a table from which you want to export data.

To set up a GDPdU data export

1. Choose the  icon, enter **Data Exports**, and then choose the related link.
2. Choose the **New** action.
3. On the **Data Exports** page, fill in the fields as described in the following table.

FIELD	DESCRIPTION
Code	Specify the unique code for the data export, such as Export-1 .
Description	Specify the description for the data export.

You must add record definitions to the data export. Each record definition represents a set of data that will be exported.

To add a record definition to a digital audit definition group

1. On the **Data Exports** page, choose the **Record Definitions** action.
2. On the **Data Export Record Definitions** page, fill in the fields as described in the following table.

FIELD	DESCRIPTION
Data Export Code	Select the data export code. If no data export code exists, you can create a new one.
Description	Specify the description for the record definition.

Next, you must add the relevant .dtd file that is required according to the GDPdU, such as **gdpdu-01-08-2002.dtd**. If you must import a new DTD file to replace an existing file, you must first export the existing DTD file.

3. Choose the **Import** action.
4. On the **Import** page, navigate to the location of the relevant DTD file, and then choose the **Open** button.

Next, you must specify the source for the data that will be exported.

To add source tables to a data export

1. On the **Data Export Record Definitions** page, choose the **Record Source** action.

2. On the **Data Export Record Source** page, fill in the fields as described in the following table.

FIELD	DESCRIPTION
Table No.	<p>Select the number of the main table to export data from.</p> <p>When you enter a value in the Table No. field, the Table Name field is updated.</p>
Export Table Name	<p>Optional. Change the suggested name of the table to be used in the INDEX.XML file during the export.</p> <p>The value of the Export Table Name field is used to generate the INDEX.XML file during the GDPdU data export. The default name is the name of the table without special characters due to the requirements of the auditors' tool.</p> <p>Tip: In most cases, the Export Table Name and Export File Name fields are based on the same value.</p> <p>There may be cases where you specify exporting the same table more than once. You can choose different Export Table Names for each table entry, and the Export File Name will be automatically adjusted to match. You can then change the Export File Name as long as it is unique.</p> <p>Business Central automatically names the files as follows.</p> <p>Table Name: G/L Account</p> <p>Export Table Name: GLAccount</p> <p>Export File Name: GLAccount.txt</p> <p>Table Name: G/L Account</p> <p>Export Table Name: GLAccount1</p> <p>Export File Name: GLAccount1.txt</p>
Period Field No.	<p>Specify a filter for which date field will be used in setting the start date and end date of the report.</p> <p>For example, if you select the G/L Entry table as your data export source, you can select one of the date fields that are available in that table.</p>
Table Filter	<p>Specify a field on which you want to set a filter.</p> <p>On the Table Filter page, enter filter settings in the Field Filter column.</p> <p>For example, you can specify a field that conveys information about the amount. You can also specify a date field and set a filter for it if you want to filter on a time period other than Start Date .. End Date. However, you cannot specify a date field and set a filter for it if the same field is already used in the Period Field No.</p>

FIELD	DESCRIPTION
Date Filter Field No.	Specify a date filter field if the table has one. If the table has more than one date filter, do not specify one in this field.
Date Filter Handling	Specify how the date filter is to be handled: * : No filter is set. * Period: Use the specified Start Date and End Date. * End Date Only: Use the batch job's End Date. * Start Date Only: Use the batch job's Start Date - 1.
Export File Name	Specify the name of the file that data from this table will be exported to. For example, if the table is the G/L Account table, the value of the Export Table Name can be GLAccount , and the value of the Export File Name field can be GLAccount.txt .
Key No.	Optional. Specify the key field.

For more information, see [GDPdU Filter Examples](#).

Next, you must specify the fields that data will be exported from.

3. In the **Fields** pane, choose the **Add** action.
4. On the **Data Exp. Field List** page, select one or more fields that you want to export, and then choose the **OK** button.
 - a. To change the order of the fields, choose the **Move Up** or the **Move Down** action.
 - b. To remove a field from the list of selected fields, choose the **Delete** action.

You have added the main table from which to export. Optionally, you can add one or more related tables.

To add related tables to a data export source

1. On the **Data Export Record Source** page, in the line below the line for the main table, add the related table.
2. Choose the **Indent** action.
3. Select the indented table, and then choose the **Relationships** action.
4. On the **Data Export Table Relation** page, fill in the fields as described in the following table.

FIELD	DESCRIPTION
From Field No.	Contains the number of the field in the parent table. You can specify that this field is related to a field in the subordinate table.

FIELD	DESCRIPTION
To Field No.	Contains the number of the field in the subordinate table. You can specify that a field in the parent table is related to this field.

NOTE

The **From Field Name** and the **To Field Name** fields are populated automatically.

5. Choose the **OK** button.

After you have added tables and fields, you must validate that the structure of the data export source is correct.

To validate the data export source

On the **Data Exp. Record Source** page, choose the **Validate** action.

This validates the list of fields against the keys for the tables. If you select a primary key after you select a secondary key, an error message displays, and you must change the order of the fields in the **Fields** pane.

[Export Data for a Digital Audit](#)

Set Up Data Exports for a Digital Audit

3/31/2019 • 5 minutes to read

You must set up data export record sources to be able to export data for a digital audit. For each data export type, you must define one or more record sources, where each source is a table from which you want to export data.

To set up a data export

1. Choose the  icon, enter **Data Exports**, and then choose the related link.
2. Choose the **New** action.
3. On the **Data Exports** page, fill in the fields as described in the following table.

FIELD	DESCRIPTION
Code	Specify the unique code for the data export, such as Export-1 .
Description	Specify the description for the data export.

You must add record definitions to the data export. Each record definition represents a set of data that will be exported.

To add a record definition to a digital audit definition group

1. On the **Data Exports** page, choose the **Record Definitions** action.
2. On the **Data Export Record Definitions** page, fill in the fields as described in the following table.

FIELD	DESCRIPTION
Data Export Code	Select the data export code. If no data export code exists, you can create a new one.
Description	Specify the description for the record definition.
Export Path	Specify the path where the exported files will be stored.

Next, you must add the relevant .dtd file that is required according to the GDPdU, such as **gdpdu-01-08-2002.dtd**. If you must import a new DTD file to replace an existing file, you must first export the existing DTD file.

3. Choose the **Import** action.
4. On the **Import** page, navigate to the location of the relevant DTD file, and then choose the **Open** button.

Next, you must specify the source for the data that will be exported.

To add source tables to a data export

1. On the **Data Export Record Definitions** page, choose the **Record Source** action.

2. On the **Data Export Record Source** page, fill in the fields as described in the following table.

FIELD	DESCRIPTION
Table No.	<p>Select the number of the main table to export data from.</p> <p>When you enter a value in the Table No. field, the Table Name field is updated.</p>
Export Table Name	<p>Optional. Change the suggested name of the table to be used in the INDEX.XML file during the export.</p> <p>The value of the Export Table Name field is used to generate the INDEX.XML file during the GDPdU data export. The default name is the name of the table without special characters due to the requirements of the auditors' tool.</p> <p>Tip: In most cases, the Export Table Name and Export File Name fields are based on the same value.</p> <p>There may be cases where you specify exporting the same table more than once. You can choose different Export Table Names for each table entry, and the Export File Name will be automatically adjusted to match. You can then change the Export File Name as long as it is unique.</p> <p>Business Central automatically names the files as follows.</p> <p>Table Name: G/L Account</p> <p>Export Table Name: GLAccount</p> <p>Export File Name: GLAccount.txt</p> <p>Table Name: G/L Account</p> <p>Export Table Name: GLAccount1</p> <p>Export File Name: GLAccount1.txt</p>
Period Field No.	<p>Specify a filter for which date field will be used in setting the start date and end date of the report.</p> <p>For example, if you select the G/L Entry table as your data export source, you can select one of the date fields that are available in that table.</p>
Table Filter	<p>Specify a field on which you want to set a filter.</p> <p>On the Table Filter page, enter filter settings in the Field Filter column.</p> <p>For example, you can specify a field that conveys information about the amount. You can also specify a date field and set a filter for it if you want to filter on a time period other than Start Date .. End Date. However, you cannot specify a date field and set a filter for it if the same field is already used in the Period Field No.</p>

FIELD	DESCRIPTION
Date Filter Field No.	Specify a date filter field if the table has one. If the table has more than one date filter, do not specify one in this field.
Date Filter Handling	Specify how the date filter is to be handled: * : No filter is set. * Period: Use the specified Start Date and End Date. * End Date Only: Use the batch job's End Date. * Start Date Only: Use the batch job's Start Date - 1.
Export File Name	Specify the name of the file that data from this table will be exported to. For example, if the table is the G/L Account table, the value of the Export Table Name can be GLAccount , and the value of the Export File Name field can be GLAccount.txt .
Key No.	Optional. Specify the key field.

For more information, see [GDPdU Filter Examples](#).

Next, you must specify the fields that data will be exported from.

3. In the **Fields** pane, choose the **Add** action.
4. On the **Data Exp. Field List** page, select one or more fields that you want to export, and then choose the **OK** button.
 - a. To change the order of the fields, choose the **Move Up** or the **Move Down** action.
 - b. To remove a field from the list of selected fields, choose the **Delete** action.

You have added the main table from which to export. Optionally, you can add one or more related tables.

To add related tables to a data export source

1. On the **Data Export Record Source** page, in the line below the line for the main table, add the related table.
2. Choose the **Indent** action.
3. Select the indented table, and then choose the **Relationships** action.
4. On the **Data Export Table Relation** page, fill in the fields as described in the following table.

FIELD	DESCRIPTION
From Field No.	Contains the number of the field in the parent table. You can specify that this field is related to a field in the subordinate table.

FIELD	DESCRIPTION
To Field No.	Contains the number of the field in the subordinate table. You can specify that a field in the parent table is related to this field.

NOTE

The **From Field Name** and the **To Field Name** fields are populated automatically.

5. Choose the **OK** button.

After you have added tables and fields, you must validate that the structure of the data export source is correct.

To validate the data export source

On the **Data Exp. Record Source** page, choose the **Validate** action.

This validates the list of fields against the keys for the tables. If you select a primary key after you select a secondary key, an error message displays, and you must change the order of the fields in the **Fields** pane.

[Export Data for a Digital Audit](#)

Export Data for a Digital Audit

3/31/2019 • 2 minutes to read

You can export financial data and tax data according to the process for digital audits (GoBD/GDPdU). You can also select various options to be included in an XML file.

If there is no data to export, Business Central creates empty files.

To export data for a digital audit

1. Choose the  icon, enter **Export Business Data**, and then choose the related link.
2. On the **Data Export** page, on the **Options** FastTab, fill in the fields as described in the following table.

OPTION	DESCRIPTION
Starting Date	Specifies the start date for the data export. NOTE: If the data export source includes period fields, the start date and the end date are used as filter values for the period fields.
Ending Date	Specifies the end date for the data export.
Include Closing Date	Specifies if the data export must include the closing date for the period.

3. On the **Data Export Record Definition** FastTab, select the appropriate filters to identify the data export and data export record type. For more information, see [Process for Digital Audits \(GoBD/GDPdU\)](#).
4. To export the data, choose the **OK** button.

WARNING

During the export, any existing files, including the log file, will be overwritten. If you export the same data twice, the files from the first export are overwritten

You will be notified when the export completes. If you cancel the export, or if you close the page, you will also be notified that the export has completed, but the log folder will be empty. However, depending on your configuration, some files may have been exported, but the export might not be complete.

GDPdU Filter Examples

3/31/2019 • 2 minutes to read

The following topic provides examples of how you can use and combine different filter types when you set up your GDPdU exports. By setting filters appropriately, you can improve performance.

The following examples use the G/L Entry and Cust. Ledger Entry tables for data. They assume that you have specified the following date in the **Export Business Data** batch job.

Start Date = 01/01/2013

End Date = 12/31/2013

Setting Up Export Record Source Examples

Period Field No.

On the **Data Export Record Source** page, the set up is as described in the following table.

TABLE NO.	TABLE NAME	PERIOD FIELD NO.	PERIOD FIELD NAME	TABLE FILTER
17	G/L Entry	4	Posting Date	No filter set.
21	Cust. Ledger Entry	4	Posting Date	No filter set.

Export Results

- G/L Entries with Posting Date between 1/1/2013 and 12/31/2013.
- Cust. Ledger Entries with Posting Date between 1/1/2013 and 12/31/2013.

Table Filter

In this example, in addition to Period Field No. information, you also specify a table filter. This is useful when you want to not only include a starting date and ending date for your export, but also include an additional filter to specify other criteria, for example, amounts.

TABLE NO.	TABLE NAME	PERIOD FIELD NO.	PERIOD FIELD NAME	TABLE FILTER
17	G/L Entry	4	Posting Date	
21	Cust. Ledger Entry			Cust. Ledger Entry: Posting Date=..31-12-13

Export Results

- G/L Entries with Posting Date between 1/1/2013 and 12/31/2013.
- Cust. Ledger Entries with Posting Date earlier than 01/01/2014.

Date Filter Field No. and Date Filter Handling

The following example demonstrates setting Date type FlowFilters. If a table has more than one date FlowFilter, you cannot specify one to use, but you can specify how the date filter should be handled.

TABLE NO.	TABLE NAME	PERIOD FIELD NO.	PERIOD FIELD NAME	TABLE FILTER	DATE FILTER HANDLING
18	Customer			Customer: Net Change (LCY)= <>0	Period
21	Cust. Ledger Entry	4	Posting Date	Cust. Ledger Entry: Remaining Amt. (LCY)= <>0	End Date Only

Export Results

- Customers that have Net Change (LCY) <> 0 in the period from 1/1/2013 and 12/31/2013.
- Cust. Ledger Entries with Posting Date between 01/01/2013 and 12/31/2013 that have Remaining Amt. (LCY) <> 0 at 12/31/2013.

Date Filter Handling for the Same Table

In this example, you set multiple filter definitions for the same table.

TABLE NO.	TABLE NAME	TABLE FILTER	DATE FILTER HANDLING
18	Customer	Customer: Net Change (LCY)= <>0	Period
18	Customer	Customer: Net Change (LCY)= <>0	Start Date Only

Export Results

- Customers that have Net Change (LCY) <> 0 in the period from 1/1/2013 and 12/31/2013.
- Customers that have Net Change (LCY) <> 0 on the day before the start date.

Upgrade a .DTD Definition File

3/31/2019 • 2 minutes to read

You can explicitly validate a .dtd file after you import one in order to address upgrade issues. This is useful when you have an existing setup that needs to be updated to reflect the current version of Business Central.

To upgrade and validate a .dtd file

1. Choose the  icon, enter **Data Exports**, and choose the related link.
2. Choose the **Record Definitions** action.
3. Set up a record definition, and choose the **Import** action.
4. Select a file to import, and then choose the **Validate** action.

[Set Up Data Exports for GDPdU](#)

Walkthrough: Exporting Data for a Digital Audit

3/31/2019 • 10 minutes to read

You can export business data for auditing purposes. How the data export is set up is different for all companies, and you should ask your tax advisor and the tax auditor. The following walkthrough describes the end-to-end process, but it is an example only.

The sample implementation illustrates a scenario where the auditor has requested that you export data from your general ledger, and information about your customers and vendors. This is not an example that is based on actual requirements from a tax auditor, but it serves to illustrate how to export data for a digital audit (GoBD/GDPdU) in Business Central.

About This Walkthrough

This walkthrough illustrates the following tasks:

- Setting up requirements for the data export.
- Setting up the source for the data export.
- Exporting data for the tax auditor.

Prerequisites

To complete this walkthrough, you will need:

- The German version of Business Central with the CRONUS AG demonstration company.
- The .DTD file that is required according to the GDPdU. In this scenario, **gdpdu-01-08-2002.dtd**.

Story

Cassie is an accountant at CRONUS AG. She has been notified by the company's tax auditor that they want to see a list of purchase and sales transactions in the first quarter of the calendar year 2013. Cassie knows the type of financial data that the auditor wants, but she needs the help of Sean to set up the export.

Sean is a power user with CRONUS AG. He understands how the data is set up technically with tables and fields. Therefore he usually helps Cassie set up the data exports for the auditors. From other data exports, he knows that the tool that the auditors use has some requirements on what the exported files must contain, but he needs the help of Cassie to establish exactly which data is needed.

Defining the Requirements

Cassie sets up the requirements for the data export. The auditors have asked her for transactions with customers and vendors. Therefore she knows that she needs data from the customer ledger, the vendor ledger, and the general ledger.

To set up the requirements for a data export

1. Choose the  icon, enter **Data Export**, and then choose the related link.
2. Choose the **New** action.
3. On the **Data Exports** page, fill in the fields as described in the following table.

FIELD	DESCRIPTION
Code	The unique code for the data export, AUDIT-Q113 .
Description	The description for the data export, Data export for Q1 of CY 2013 .

The **AUDIT-Q113** code is a container for the data export.

Next, Cassie adds descriptions of the kind of data that she needs in the export.

- On the **Data Exports** page, choose the **Record Definitions** action.
- On the **Data Export Record Definitions** page, choose the **Record Code** field, and then, on the page that appears, choose the **New** action.
- On the **Data Export Record Types** page, fill in the fields as described in the following table.

FIELD	DESCRIPTION
Code	The code for the record type, GLCUSTVEND .
Description	The description for the record type, G/L, Cust., Vend..

- Choose the **OK** button.
- On the **Data Export Record Definitions** page, fill in the fields as described in the following table.

FIELD	DESCRIPTION
Record Code	Select the record code, GLCUSTVEND .
Description	The description for the record type is added automatically, but you can change this to General ledger, customers and vendors , for example.
Export Path	Specify the path where the exported files will be stored. In this scenario, C:Exports .

If the specified folder does not exist, choose the **Yes** button to create it.

Next, Cassie specifies the source for the data that will be exported. She knows from previous exports that she wants data from the following tables:

- **G/L Account**
- **Customer**
- **Vendor**

To specify requirements for the source for the data export

- On the **Data Export Record Definitions** page, choose the **Record Source** action.
- On the **Data Export Record Source** page, in the **Table No.** field, enter **15**.

The **Table Name** field is automatically updated with the name of the **G/L Account** table.

- In the **Notes** part, choose the link, and then enter the following text:

I need entries that show the affected accounts, the posting date, the balance, and the net change.

- Repeat the two previous steps to add tables 18, **Customer**, and 23, **Vendor** to the data export record source.

For these tables, Cassie asks for data about each customer and vendor and detailed information about each transaction based on the customer ledger and the vendor ledger. She also asks for the net change at the start of the period, during the period, and after the period that the data export is for.

- Choose the **OK** button.

Cassie has described the kind of data that she needs, and she notifies Sean that she wants his help is setting up the data export.

Setting Up the Source for the Data Export

Cassie and Sean have talked about the requirements. Cassie has explained what she means with the comments she has made for the first three tables in the record sources. The next day, Sean can complete the setup for the data export source.

First, Sean adds the required .dtd file to the data export record definition.

To add a .dtd file to a record definition

- On the **Data Exports** page, choose the **AUDIT-Q113** data export, and then choose the **Record Definitions** action.
- On the **Data Export Record Definitions** page, choose the line where the **Data Export Record Type Code** field is set to **GLCUSTVEND**, and then choose the **Import** action.
- On the **Import** page, navigate to the location of the relevant DTD file, and then choose the **Open** button.

Next, Sean adds the **G/L Entry** table to the source. Then he adds fields from that table and the **G/L Account** table.

To add the G/L Entry table to the data export record source

- On the **Data Export Record Definitions** page, choose the line where the **Data Export Record Type Code** field is set to **GLCUSTVEND**, and then choose the **Record Source** action.
- On the **Data Export Record Source** page, select the line under the line for the **G/L Account** table, and then choose the **New** action.
- In the **Table No.** field, enter **17**.

The **Table Name** field is automatically updated with the name of the **G/L Entry** table.

- Choose the **Indent** action.

This indents the **G/L Entry** table under the **G/L Account** table. Next, Sean adds a table relationship between the two tables.

- Choose the **Relationships** action.

- On the **Data Exp. Table Relationship** page, fill in the fields as described in the following table.

FIELD	DESCRIPTION
From Field No.	Contains the number of the field in the parent table. In this scenario, the No. field on the G/L Account table.

FIELD	DESCRIPTION
To Field No.	Contains the number of the field in the parent table. In this scenario, the G/L Account No. field on the G/L Entry table.

7. Choose the **OK** button.

To add fields from the G/L Account and G/L Entry tables to the data export record source

1. On the **Data Export Record Source** page, select the line for the **G/L Account** table, and then choose the **Add** action.
2. Choose the following fields, and then choose the **OK** button.

FIELD NUMBER	FIELD NAME
1	No.
2	Name
4	Account Type.
31	Balance at Date
32	Net Change

3. On the **Data Export Record Source** page, select the line for the **G/L Entry** table, and then in the **Fields** pane, in the toolbar, choose the **Add** action.
4. Choose the following fields, and then choose the **OK** button.

FIELD NUMBER	FIELD NAME
4	Posting Date
5	Document Type
17	Amount

Sean added the **Posting Date** field from the **G/L Entry** table because Cassie needs the data to be filtered based on the posting date. Now, Sean will use the field to specify the field on the **G/L Entry** table that will be used to calculate the period for the data export.

To add a period filter to a table in a data export source

1. On the **Data Export Record Source** page, select the line for the **G/L Entry** table, and then choose the **Period Field No.** field.
2. On the **Data Exp. Field List** page, choose the **Posting Date** field, and then choose the **OK** button.

The **Data Exp. Field List** page is filtered to show only the date fields.

This means that when Cassie exports the data and specifies the start date and the end date for the period that the auditors want, the export will include entries where the **Posting Date** field is between the specified start date and end date.

Next, Sean adds the **Customer** and **Vendor** tables.

To add the Customer table

1. On the **Data Export Record Source** page, fill in the fields as described in the following table.

FIELD	DESCRIPTION
Table No.	18
Export Table Name	Customer
Export File Name	Customer.txt

2. In the **Fields** pane, in the toolbar, choose the **Add** action.

3. Choose the following fields, and then choose the **OK** button.

FIELD NUMBER	FIELD NAME
1	No.
2	Name
21	Customer Posting Group
59	Balance (LCY)
61	Net Change (LCY)

4. Repeat the previous two steps to add the **Balance (LCY)** field again.

5. Choose the line for the first instance of the **Balance (LCY)** field, and then, in the **Datefilter Handling** field, choose **Startdate**.

6. Choose the line for the second instance of the **Balance (LCY)** field, and then, in the **Datefilter Handling** field, choose **Enddate**.

7. Choose the line for the **Net Change (LCY)** field, and then, in the **Datefilter Handling** field, choose **Startdate..Enddate**.

The following table describes the field values for the fields on the **Customer** table.

FIELD NO.	FIELD NAME	FIELD CLASS	DATEFILTER HANDLING	EXPORT FIELD NAME
1	No.	Normal		No
2	Name	Normal		Name
21	Customer Posting Group	Normal		CustomerPostingG roup
59	Balance (LCY)	FlowField	..Startdate	StartBalanceLCY
59	Balance (LCY)	FlowField	..Enddate	EndBalanceLCY

FIELD NO.	FIELD NAME	FIELD CLASS	DATEFILTER HANDLING	EXPORT FIELD NAME
61	Net Change (LCY)	FlowField	Startdate..Enddate	NetChangeLCYPeriod

TIP

To change the order of the fields, select a field, and then choose the **Move Up** or the **Move Down** action.

Sean has added the **Customer** table to the data export source. Now, he adds the **Vendor** table.

To add the Vendor table

1. On the **Data Export Record Source** page, fill in the fields as described in the following table.

FIELD	DESCRIPTION
Table No.	23
Export Table Name	Vendor
Export File Name	Vendor.txt

2. Follow the steps in the previous procedure to add fields from the **Vendor** table to the data export source.

The following table describes the field values for the fields in the **Vendor** table.

FIELD NO.	FIELD NAME	FIELD CLASS	DATEFILTER HANDLING	EXPORT FIELD NAME
1	No.	Normal		No
2	Name	Normal		Name
21	Vendor Posting Group	Normal		VendorPostingGroup
59	Balance (LCY)	FlowField	..Startdate	StartBalanceLCY
59	Balance (LCY)	FlowField	..Enddate	EndBalanceLCY
61	Net Change (LCY)	FlowField	Startdate..Enddate	NetChangeLCYPeriod

Sean has almost completed the setup, but he wants to verify that the data export source meets the technical requirements of the auditors' tool.

To validate the data export source

Choose the **Validate** action.

Sean has now completed the setup of the data export based on the requirements from Cassie. He notifies her that she can start exporting data for the tax auditors.

Exporting Data for the Tax Auditors

Cassie wants to export data that she can then send to the tax auditors.

To export data

1. Choose the  icon, enter **Export Business Data**, and then choose the related link.
2. On the **Export Business Data** page, on the **Options** FastTab, fill in the fields as described in the following table.

FIELD	DESCRIPTION
Starting Date	The start date. In this scenario, 01-01-2018 .
Ending Date	The end date. In this scenario, 03-31-2018 .

3. On the **Data Export Record Definition** FastTab, select filters as described in the following table.

FIELD	DESCRIPTION
Data Export Code	In this scenario, AUDIT-Q113 .
Data Exp. Rec. Type Code	In this scenario, GLCUSTVEND .

4. To export the data, choose the **OK** button.

When the export is completed, Cassie is notified. She can now submit the exported files to the tax auditors. First, she examines the files in the C:Exports folder on her computer. There is a file for each table, and the files have the names that Sean specified in the data export source. There is also an INDEX.XML file that describes the structure of the data export with the names of the tables and fields that Sean specified.

Next Steps

When the tax auditors import Cassie's files into their software, they can read the data that she exported. If the auditors need a new version of the same data export, Cassie can run the export again.

The next time the tax auditors request new data, Cassie and Sean can collaborate to create a new data export.

Walkthrough: Exporting Data for a Digital Audit

3/31/2019 • 10 minutes to read

You can export business data for auditing purposes. How the data export is set up is different for all companies, and you should ask your tax advisor and the tax auditor. The following walkthrough describes the end-to-end process, but it is an example only.

The sample implementation illustrates a scenario where the auditor has requested that you export data from your general ledger, and information about your customers and vendors. This is not an example that is based on actual requirements from a tax auditor, but it serves to illustrate how to export data for a digital audit (GoBD/GDPdU) in Business Central.

About This Walkthrough

This walkthrough illustrates the following tasks:

- Setting up requirements for the data export.
- Setting up the source for the data export.
- Exporting data for the tax auditor.

Prerequisites

To complete this walkthrough, you will need:

- The German version of Business Central with the CRONUS AG demonstration company.
- The .DTD file that is required according to the GDPdU. In this scenario, **gdpdu-01-08-2002.dtd**.

Story

Cassie is an accountant at CRONUS AG. She has been notified by the company's tax auditor that they want to see a list of purchase and sales transactions in the first quarter of the calendar year 2013. Cassie knows the type of financial data that the auditor wants, but she needs the help of Sean to set up the export.

Sean is a power user with CRONUS AG. He understands how the data is set up technically with tables and fields. Therefore he usually helps Cassie set up the data exports for the auditors. From other data exports, he knows that the tool that the auditors use has some requirements on what the exported files must contain, but he needs the help of Cassie to establish exactly which data is needed.

Defining the Requirements

Cassie sets up the requirements for the data export. The auditors have asked her for transactions with customers and vendors. Therefore she knows that she needs data from the customer ledger, the vendor ledger, and the general ledger.

To set up the requirements for a data export

1. Choose the  icon, enter **Data Export**, and then choose the related link.
2. Choose the **New** action.
3. On the **Data Exports** page, fill in the fields as described in the following table.

FIELD	DESCRIPTION
Code	The unique code for the data export, AUDIT-Q113 .
Description	The description for the data export, Data export for Q1 of CY 2013 .

The **AUDIT-Q113** code is a container for the data export.

Next, Cassie adds descriptions of the kind of data that she needs in the export.

- On the **Data Exports** page, choose the **Record Definitions** action.
- On the **Data Export Record Definitions** page, choose the **Record Code** field, and then, on the page that appears, choose the **New** action.
- On the **Data Export Record Types** page, fill in the fields as described in the following table.

FIELD	DESCRIPTION
Code	The code for the record type, GLCUSTVEND .
Description	The description for the record type, G/L, Cust., Vend..

- Choose the **OK** button.
- On the **Data Export Record Definitions** page, fill in the fields as described in the following table.

FIELD	DESCRIPTION
Record Code	Select the record code, GLCUSTVEND .
Description	The description for the record type is added automatically, but you can change this to General ledger, customers and vendors , for example.
Export Path	Specify the path where the exported files will be stored. In this scenario, C:Exports .

If the specified folder does not exist, choose the **Yes** button to create it.

Next, Cassie specifies the source for the data that will be exported. She knows from previous exports that she wants data from the following tables:

- **G/L Account**
- **Customer**
- **Vendor**

To specify requirements for the source for the data export

- On the **Data Export Record Definitions** page, choose the **Record Source** action.
- On the **Data Export Record Source** page, in the **Table No.** field, enter **15**.

The **Table Name** field is automatically updated with the name of the **G/L Account** table.

- In the **Notes** part, choose the link, and then enter the following text:

I need entries that show the affected accounts, the posting date, the balance, and the net change.

- Repeat the two previous steps to add tables 18, **Customer**, and 23, **Vendor** to the data export record source.

For these tables, Cassie asks for data about each customer and vendor and detailed information about each transaction based on the customer ledger and the vendor ledger. She also asks for the net change at the start of the period, during the period, and after the period that the data export is for.

- Choose the **OK** button.

Cassie has described the kind of data that she needs, and she notifies Sean that she wants his help is setting up the data export.

Setting Up the Source for the Data Export

Cassie and Sean have talked about the requirements. Cassie has explained what she means with the comments she has made for the first three tables in the record sources. The next day, Sean can complete the setup for the data export source.

First, Sean adds the required .dtd file to the data export record definition.

To add a .dtd file to a record definition

- On the **Data Exports** page, choose the **AUDIT-Q113** data export, and then choose the **Record Definitions** action.
- On the **Data Export Record Definitions** page, choose the line where the **Data Export Record Type Code** field is set to **GLCUSTVEND**, and then choose the **Import** action.
- On the **Import** page, navigate to the location of the relevant DTD file, and then choose the **Open** button.

Next, Sean adds the **G/L Entry** table to the source. Then he adds fields from that table and the **G/L Account** table.

To add the G/L Entry table to the data export record source

- On the **Data Export Record Definitions** page, choose the line where the **Data Export Record Type Code** field is set to **GLCUSTVEND**, and then choose the **Record Source** action.
- On the **Data Export Record Source** page, select the line under the line for the **G/L Account** table, and then choose the **New** action.
- In the **Table No.** field, enter **17**.

The **Table Name** field is automatically updated with the name of the **G/L Entry** table.

- Choose the **Indent** action.

This indents the **G/L Entry** table under the **G/L Account** table. Next, Sean adds a table relationship between the two tables.

- Choose the **Relationships** action.

- On the **Data Exp. Table Relationship** page, fill in the fields as described in the following table.

FIELD	DESCRIPTION
From Field No.	Contains the number of the field in the parent table. In this scenario, the No. field on the G/L Account table.

FIELD	DESCRIPTION
To Field No.	Contains the number of the field in the parent table. In this scenario, the G/L Account No. field on the G/L Entry table.

7. Choose the **OK** button.

To add fields from the G/L Account and G/L Entry tables to the data export record source

1. On the **Data Export Record Source** page, select the line for the **G/L Account** table, and then choose the **Add** action.
2. Choose the following fields, and then choose the **OK** button.

FIELD NUMBER	FIELD NAME
1	No.
2	Name
4	Account Type.
31	Balance at Date
32	Net Change

3. On the **Data Export Record Source** page, select the line for the **G/L Entry** table, and then in the **Fields** pane, in the toolbar, choose the **Add** action.
4. Choose the following fields, and then choose the **OK** button.

FIELD NUMBER	FIELD NAME
4	Posting Date
5	Document Type
17	Amount

Sean added the **Posting Date** field from the **G/L Entry** table because Cassie needs the data to be filtered based on the posting date. Now, Sean will use the field to specify the field on the **G/L Entry** table that will be used to calculate the period for the data export.

To add a period filter to a table in a data export source

1. On the **Data Export Record Source** page, select the line for the **G/L Entry** table, and then choose the **Period Field No.** field.
2. On the **Data Exp. Field List** page, choose the **Posting Date** field, and then choose the **OK** button.

The **Data Exp. Field List** page is filtered to show only the date fields.

This means that when Cassie exports the data and specifies the start date and the end date for the period that the auditors want, the export will include entries where the **Posting Date** field is between the specified start date and end date.

Next, Sean adds the **Customer** and **Vendor** tables.

To add the Customer table

1. On the **Data Export Record Source** page, fill in the fields as described in the following table.

FIELD	DESCRIPTION
Table No.	18
Export Table Name	Customer
Export File Name	Customer.txt

2. In the **Fields** pane, in the toolbar, choose the **Add** action.

3. Choose the following fields, and then choose the **OK** button.

FIELD NUMBER	FIELD NAME
1	No.
2	Name
21	Customer Posting Group
59	Balance (LCY)
61	Net Change (LCY)

4. Repeat the previous two steps to add the **Balance (LCY)** field again.

5. Choose the line for the first instance of the **Balance (LCY)** field, and then, in the **Datefilter Handling** field, choose **Startdate**.

6. Choose the line for the second instance of the **Balance (LCY)** field, and then, in the **Datefilter Handling** field, choose **Enddate**.

7. Choose the line for the **Net Change (LCY)** field, and then, in the **Datefilter Handling** field, choose **Startdate..Enddate**.

The following table describes the field values for the fields on the **Customer** table.

FIELD NO.	FIELD NAME	FIELD CLASS	DATEFILTER HANDLING	EXPORT FIELD NAME
1	No.	Normal		No
2	Name	Normal		Name
21	Customer Posting Group	Normal		CustomerPostingG roup
59	Balance (LCY)	FlowField	..Startdate	StartBalanceLCY
59	Balance (LCY)	FlowField	..Enddate	EndBalanceLCY

FIELD NO.	FIELD NAME	FIELD CLASS	DATEFILTER HANDLING	EXPORT FIELD NAME
61	Net Change (LCY)	FlowField	Startdate..Enddate	NetChangeLCYPeriod

TIP

To change the order of the fields, select a field, and then choose the **Move Up** or the **Move Down** action.

Sean has added the **Customer** table to the data export source. Now, he adds the **Vendor** table.

To add the Vendor table

1. On the **Data Export Record Source** page, fill in the fields as described in the following table.

FIELD	DESCRIPTION
Table No.	23
Export Table Name	Vendor
Export File Name	Vendor.txt

2. Follow the steps in the previous procedure to add fields from the **Vendor** table to the data export source.

The following table describes the field values for the fields in the **Vendor** table.

FIELD NO.	FIELD NAME	FIELD CLASS	DATEFILTER HANDLING	EXPORT FIELD NAME
1	No.	Normal		No
2	Name	Normal		Name
21	Vendor Posting Group	Normal		VendorPostingGroup
59	Balance (LCY)	FlowField	..Startdate	StartBalanceLCY
59	Balance (LCY)	FlowField	..Enddate	EndBalanceLCY
61	Net Change (LCY)	FlowField	Startdate..Enddate	NetChangeLCYPeriod

Sean has almost completed the setup, but he wants to verify that the data export source meets the technical requirements of the auditors' tool.

To validate the data export source

Choose the **Validate** action.

Sean has now completed the setup of the data export based on the requirements from Cassie. He notifies her that she can start exporting data for the tax auditors.

Exporting Data for the Tax Auditors

Cassie wants to export data that she can then send to the tax auditors.

To export data

1. Choose the  icon, enter **Export Business Data**, and then choose the related link.
2. On the **Export Business Data** page, on the **Options** FastTab, fill in the fields as described in the following table.

FIELD	DESCRIPTION
Starting Date	The start date. In this scenario, 01-01-2018 .
Ending Date	The end date. In this scenario, 03-31-2018 .

3. On the **Data Export Record Definition** FastTab, select filters as described in the following table.

FIELD	DESCRIPTION
Data Export Code	In this scenario, AUDIT-Q113 .
Data Exp. Rec. Type Code	In this scenario, GLCUSTVEND .

4. To export the data, choose the **OK** button.

When the export is completed, Cassie is notified. She can now submit the exported files to the tax auditors. First, she examines the files in the C:Exports folder on her computer. There is a file for each table, and the files have the names that Sean specified in the data export source. There is also an INDEX.XML file that describes the structure of the data export with the names of the tables and fields that Sean specified.

Next Steps

When the tax auditors import Cassie's files into their software, they can read the data that she exported. If the auditors need a new version of the same data export, Cassie can run the export again.

The next time the tax auditors request new data, Cassie and Sean can collaborate to create a new data export.

Set Up Delivery Reminders

3/31/2019 • 2 minutes to read

In Business Central, you can use purchase delivery reminders to remind vendors about overdue deliveries. To create delivery reminders for vendors, you must set up base data for delivery reminder creation and number series for the delivery reminders on the **Purchases & Payables Setup** page.

To set up delivery reminders

1. Choose the  icon, enter **Purchases & Payables Setup**, and then choose the related link.
2. On the **General** FastTab, in the **Default Del. Rem. Date Field** field, specify one of the following options as described in the following table.

OPTION	DESCRIPTION
Requested Receipt Date	To specify that the date value in the Requested Receipt Date field on the purchase order line will be used as the default date for creating delivery reminders.
Promised Receipt Date	To specify that the date value in the Promised Receipt Date field on the purchase order line will be used as the default date for creating delivery reminders.
Expected Receipt Date	To specify that the date value in the Expected Receipt Date field on the purchase order line will be used as the default date for creating delivery reminders.

3. On the **Numbering** FastTab, fill in the fields as described in the following table.

FIELD	DESCRIPTION
Delivery Reminder Nos.	The number series code for delivery reminders.
Issued Delivery Reminder Nos.	The number series code for issued delivery reminders.

4. Choose the **OK** button.

Set Up Delivery Reminder Terms, Levels, and Text

3/31/2019 • 2 minutes to read

To create delivery reminders, you must set up the following:

- Delivery reminder terms
- Delivery reminder levels
- Delivery reminder text messages

Each delivery reminder term has two or more delivery reminder levels, and for each delivery reminder level, you can specify text that will be part of the delivery reminder.

For more information, see [Delivery Reminders](#).

To set up delivery reminder terms

1. Choose the  icon, enter **Delivery Reminder Terms**, and then choose the related link.
2. Choose the **New** action.
3. Fill in the fields as described in the following table.

FIELD	DESCRIPTION
Code	The code for the delivery reminder term. You can enter a maximum of 10 alphanumeric characters.
Description	The description for the delivery reminder term. You can enter a maximum of 30 alphanumeric characters.
Max. No. of Delivery Reminders	The maximum number of delivery reminders that can be created for an order. NOTE: This is the maximum number across all reminder levels for this reminder term. For example, if you have set up three levels, and you set Max. No. of Delivery Reminders to 5, the first reminder is created at level 1, the second at level 2, and the last three at level 3.

4. Choose the **OK** button.

To add delivery reminder levels to a delivery reminder term

1. On the **Delivery Reminder Terms** page, select the delivery reminder term for which you want to set up levels, and then choose the **Levels** action.
2. Choose the **New** action.
3. Fill in the fields as described in the following table.

FIELD	DESCRIPTION
No.	The delivery reminder level number. This field is filled in automatically.

FIELD	DESCRIPTION
Due Date Calculation	The formula for the due date calculation for the delivery reminder. You can enter a combination of numbers from 0 to 9999, and date codes (D for day, WD for weekday, W for week, M for month, Q for quarter, or Y for year). The date codes denote the calculation for the delivery reminder due date. You can enter a maximum of 20 characters for the due date calculation formula.

4. Choose the **OK** button.

For each delivery reminder level, you can define text messages that are added to the delivery reminder. You can define beginning text that is added before the description of the overdue purchase order, and ending text that is added after the description of the overdue purchase order.

The following procedure describes how to set up beginning text messages, but the same steps apply for setting up ending text messages.

To set up delivery reminder text messages

1. On the **Delivery Reminder Levels** page, select a level, and then choose the **Beginning Text** action.
2. Choose the **New** action.
3. In the **Description** field, enter the beginning text message for the delivery reminder.
4. Choose the **OK** button.

Delivery Reminders

3/31/2019 • 2 minutes to read

Delivery reminders are used to track overdue vendor shipments, and to remind vendors about overdue deliveries. To create delivery reminders, you must set up the following:

- Delivery reminder terms

Delivery reminder terms are identified by a code that must be assigned to vendors. To use more than one combination of settings, you must set up a code for each setting separately. You can set up any number of delivery reminder terms.

- Delivery reminder levels

For every delivery reminder term, you must set up delivery reminder levels. These levels determine how often delivery reminders can be created for a specific term. Level 1 is the first delivery reminder that you create for an overdue delivery. Level 2 is the second delivery reminder, and so on. When delivery reminders are created, the number of reminders that were created previously is considered, and the current number is used to apply terms.

- Delivery reminder text messages

You must set up delivery reminder text messages for every delivery reminder level. There are two types of delivery reminder text messages: beginning and ending. The beginning text message is printed under the header section, before the list of entries that are marked for reminder. The ending text message is printed after this list.

For more information, see [Set Up Delivery Reminder Terms, Levels, and Text](#).

After you have set up the delivery terms, you must assign the delivery reminder term codes to vendors. For more information, see [Assign Delivery Reminder Codes to Vendors](#).

You can create delivery reminders manually or automatically. You can use the **Create Delivery Reminder** batch job to create delivery reminders automatically. This batch job allows you to select the purchase orders for which delivery reminders must be created. For more information, see [Generate Delivery Reminders](#).

You can also track documents in relation to purchase order lines and sales order lines.

Business Central provides the following reports:

- **Issued Delivery Reminder** - To view the delivery reminders for vendors.
- **Delivery Reminder - Test** - To verify the delivery reminders before you issue them.

For more information, see [Print Test Reports for Delivery Reminders](#).

Assign Delivery Reminder Codes to Vendors

3/31/2019 • 2 minutes to read

In order to enable delivery reminders for overdue purchases, you must assign delivery reminder terms to vendors. For more information, see [Delivery Reminders](#).

To assign delivery reminders codes to vendors

1. Choose the  icon, enter **Vendors**, and then choose the related link.
2. Select the vendor for whom you want to set up delivery reminders, and then choose the **Edit** action.
3. On the **Receiving** FastTab, in the **Delivery Reminder Terms** field, select a delivery reminder terms code for the vendor.
4. Choose the **OK** button.

Create Delivery Reminders Manually

3/31/2019 • 2 minutes to read

In Business Central, you can create delivery reminders when a purchase has not been delivered as expected. You can create a single delivery reminder manually, or you can generate delivery reminders for all overdue deliveries. For more information, see [Generate Delivery Reminders](#).

NOTE

To create delivery reminders, you must set up the delivery reminder properties. For more information, see [Set Up Delivery Reminders](#).

To create a delivery reminder manually

1. Choose the  icon, enter **Delivery Reminder**, and then choose the related link.
2. Choose the **New** action.
3. On the **Delivery Reminder** page, on the **General** FastTab, fill in the fields as described in the following table.

FIELD	DESCRIPTION
No.	The unique identification number for the delivery reminder.
Vendor No.	The number of the vendor for whom you want to post the delivery reminder. When you select the vendor number, the Name , Address , Post Code/City , and Contact fields are filled in automatically.
Posting Date	The posting date for the delivery reminder. This date is copied to all of the delivery reminder ledger entries.
Document Date	The document date for the delivery reminder. This date is also used to calculate the due date for the delivery reminder. You can modify the posting date if required.
Reminder Level	The delivery reminder level. This value is based on the number of delivery reminders that have already been sent. For more information, see Set Up Delivery Reminder Terms, Levels, and Text .
Reminder Terms Code	Specify the delivery reminder terms code that is set up for the vendor.
Due Date	The due date for the delivery reminder.

4. Choose the **Suggest Reminder Lines** action

If there are overdue deliveries from the specified vendor, these are added to the deliver reminder.

5. Choose the **OK** button.

The delivery reminder is created. You can now issue and print the delivery reminder.

Generate Delivery Reminders

3/31/2019 • 2 minutes to read

In Business Central, you can create delivery reminders when a purchase has not been delivered as expected. You can generate delivery reminders for all overdue deliveries, or you can create a single delivery reminder manually. For more information, see [Create Delivery Reminders Manually](#).

NOTE

To create delivery reminders, you must set up the delivery reminder properties. For more information, see [Set Up Delivery Reminders](#).

To generate delivery reminders for all overdue deliveries

1. Choose the  icon, enter **Delivery Reminder**, and then choose the related link.
2. Choose the **New** action.
3. On the **Delivery Reminder** page, choose the **Create Delivery Reminder** action.
4. On the **Purchase Header** FastTab and the **Purchase Line** FastTab, select the appropriate filters.
5. Choose the **OK** button.

If there are overdue deliveries that match the filters that you have set, delivery reminders are created. You can now issue and print the delivery reminders.

Issue Delivery Reminders

3/31/2019 • 2 minutes to read

After you have created delivery reminders, you must issue and print them so that you can send reminders to vendors. Before you issue the delivery reminders, you can print a test report. For more information, see [Print Test Reports for Delivery Reminders](#).

When you issue the delivery reminders, delivery reminder ledger entries are created. You can view the created ledger entries on the **Deliv. Reminder Ledger Entries** page.

To issue delivery reminders

1. Choose the  icon, enter **Delivery Reminder**, and then choose the related link.
2. On the **Delivery Reminder** page, select the delivery reminder that you want to issue, and then choose the **Edit** action.
3. Choose the **Issue** action.
4. On the **Issue Delivery Reminder** page, on the **Options** FastTab, fill in the fields as described in the following table.

FIELD	DESCRIPTION
Print	Select to print the delivery reminders when they are issued.
Replace Posting Date	Select to replace the existing posting date for the delivery reminder.
Posting Date	The posting date for the delivery reminder. This posting date is used for all delivery reminders if you have selected the Replace Posting Date check box. If the Replace Posting Date check box is cleared, this date will be used for only those delivery reminders for which a posting date is not available.

5. Optionally, on the **Delivery Reminder Header** FastTab, select the appropriate filters.

NOTE

You can remove filters and issue all delivery reminders at the same time.

6. Choose the **OK** button.

You can view the issued reminders on the **Issued Delivery Reminder** page. Optionally, you can now print a delivery reminder.

To view delivery reminder ledger entries

1. Choose the  icon, enter **Purchase Orders**, and then choose the related link.
2. Select the purchase order for which you want to view the reminder status, and then choose the **Edit** action.

3. Choose the **Deliv. Reminder Ledger Entries** action.

In the Deliv. Reminder Ledger Entries page, you can view the delivery reminder ledger entries for the selected purchase order.

Currency Exchange Rates

3/31/2019 • 2 minutes to read

At the end of the fiscal year, you must adjust currency exchange rates for payables and receivables so that they are valued correctly in the annual balance. The **Adjust Exchange Rates** batch job supports different valuation methods in order to meet legal requirements in Germany.

Valuation Methods

According to the Bilanz Modernisierungs Gesetz (BilMoG), payables and receivables are valued differently depending on the difference between the reference date and the due date. This is managed by the **Adjust Exchange Rates** batch job where you can specify which valuation method to use. If the due date is less than one year after the reference date, the **Adjust Exchange Rates** batch job must be run using the lowest value valuation method.

The following table describes the valuation methods.

VALUATION METHOD	DESCRIPTION
BilMoG (Germany)	Beginning in 2010, each ledger entry is adjusted as follows: <ul style="list-style-type: none">- If the due date is less than one year after the reference date, payable/receivable transactions are valued at the actual exchange rate.- If the due date is more than one year after the reference date, payable/receivable transactions are valued at the lowest value, with the possibility of appreciation in value (Wertaufholung) up to the initial value. Note: Ledger entries must contain a due date. An entry that does not have a due date is treated as a long term liability.
Lowest value	Exchange rates are adjusted by using the lowest value of the two exchange rates. Currency losses are always calculated and posted. Currency gains are only calculated and posted up to the original local currency value of the transaction. This ensures that receivables are not valued above their original posting amounts, and that payables are not valued below their original posting amounts.
Standard	Exchange rates are adjusted according to standard valuation principles. Full unrealized gains and losses are calculated and posted. If the transaction is partially applied, only the remaining amount is included in the adjustment. For more information, see Adjust Exchange Rates.

German companies must use the **BilMoG (Germany)** option when they run the **Adjust Exchange Rates** batch job. This ensures that each transaction is adjusted using the appropriate valuation method as required in Germany. This also enables two fields in the request page, where you can specify the two dates that must be used to calculate the adjustment. The following table describes the fields.

FIELD	DESCRIPTION
Valuation Reference Date	Specifies the base date that is used to calculate which entries are short-term entries.
Short term liabilities until	Specifies the date that separates short-term entries from long-term entries. Short-term entries have a due date that is before or on this date. The default value is the value of the Valuation Reference Date field plus one year.

EU Sales List in Germany

3/31/2019 • 2 minutes to read

In Germany, the German EU sales list is submitted to the "Bundeszentralamt für Steuern" (BZSt) through the BZSt Online Portal by using the ELMA5 interface.

In order to increase security, all types of taxes and tax reports must be submitted under an authentication method. Beginning in January 1, 2013, it has become mandatory that you make submissions with authentication. To do so, you sign in with your BZSt number and private key using your pass phrase on the ELMA5 communications server. ELMA5 is designed to handle the transmission of large datasets of more than 1000 records. Following successful login, you can upload the data transfer in an interactive way. You can also set up the transfer to be automatic.

Include Company Registration Numbers on Sales Reports and Purchase Reports

3/31/2019 • 2 minutes to read

When generating certain sales reports and purchase reports, you can print registration numbers on the reports.

To print company registration numbers on sales reports

1. Choose the  icon, enter **Company Information**, and then choose the related link.
2. On the **Tax Office** FastTab, in the **Registration No.** field, enter the registration number of the company.
3. Choose the **OK** button.

To print company registration numbers on purchase reports

1. Choose the  icon, enter **Vendors**, and then choose the related link.
2. Select the vendor that you want to add a registration number for, and then choose the **Edit** action.
3. On the **Invoicing** FastTab, in the **Registration No.** field, enter the registration number of the vendor.
4. Choose the **OK** button.

Print Sales and Purchase Orders During Batch Posting

3/31/2019 • 2 minutes to read

After sales orders and purchase orders are batch posted, you can print the corresponding posted documents.

The following procedure describes how to print sales orders, but the same steps also apply to purchase orders.

To print sales and purchase orders during batch posting

1. Choose the  icon, enter **Sales Orders**, and then choose the related link.
2. Choose the **Post Batch** action.
3. On the **Batch Post Sales Orders** page, on the **Options** FastTab, select the **Print** check box.
4. Optionally, on the **Options** FastTab, fill in the additional fields.
5. To batch post and print the sales orders, choose the **OK** button.

Print General Ledger Setup Information

3/31/2019 • 2 minutes to read

Before you use Business Central in the daily business, you can run the **G/L Setup Information** report to display the master data that you have set up. You can look over this master data so that you have a baseline to compare to, and then verify that you have set up posting groups correctly, for example.

To print general ledger setup information

1. Choose the  icon, enter **G/L Setup Information**, and then choose the related link.
2. On the **Options** FastTab, in the **Setup Information** field, select the master data area as described in the following table.

OPTION	DESCRIPTION
G/L Setup - Company Data - Consolidation	Displays tables for general ledger setup, company information, and business units.
Posting Groups	Displays customer posting group tables, vendor posting group tables, inventory posting group tables, and bank account posting group tables.
Posting Matrix	Displays general business posting group tables, general product posting group tables, and general posting group tables.
VAT Setup	Displays VAT business posting group tables, VAT product posting group tables, and VAT posting setup tables.
Source Code - Reason Code	Displays source tables, source code setup tables, and reason codes tables.
Check Number Series	Select to provide an overview of the use of number series so that you can identify number series that are problematic for the data export for the Grundsätze zum Datenzugriff und zur Prüfbarkeit digitaler Unterlagen (GDPdU). The report will show number series with one of the following issues: <ul style="list-style-type: none">- The number series allows manual document numbers.- The number series is not chronological.- The number series is used in more than one table or field.

3. Choose the **Print** button to print the report or choose the **Preview** button to view it on the screen.

Copy Existing Items to New Items

3/31/2019 • 2 minutes to read

You can group items with similar settings in an item catalog. When you add a new item, to save time, you can use the **Copy Item** function to copy an existing item to use as a template for a new item.

To copy existing items to new items

1. Choose the  icon, enter **Items**, and then choose the related link.
2. Select the item that you want to copy, and then choose the **Copy Item** action.
3. On the **Item Copy** page, fill in the fields as described in the following table.

FIELD	DESCRIPTION
Source Item No.	Sets the item number from which the data is to be copied.
Target Item No.	Sets the item number for the item to which the data is to be copied.
Target No. Series	Sets the item number series to which the data is to be copied.

NOTE

You can specify an item number in the **Target Item No.** field or in the **Target No. Series** field. The copy item will be assigned to the next available number in that number series.

4. Select the appropriate check boxes for the data that you want to copy.
5. To copy your selections to the new item, choose the **OK** button.

Icelandic Tax Regulations of Conditional Discounts

2 minutes to read

In Iceland, it is a legal requirement to issue a credit memo if a conditional discount has been given.

The local tax regulation of conditional discounts feature enables you to issue a credit memo if a conditional discount is given to a customer. The payment for a conditional discount must be made within a specified period.

On the Sales and Receivables Setup form, a field has been added for number series for credit invoices. A new field has also been added in the Customer Ledger Entry table to link the appropriate entries to a credit invoice.

Print VAT Summary Information on Documents

3/31/2019 • 2 minutes to read

If VAT is calculated, VAT summary information is typically printed on sales and purchase documents. However, in Iceland, Business Central does not print VAT summary information if only one VAT sales code is used in the document. You can modify this behavior by using the **Always Show VAT Summary** option.

The following procedure describes how to display VAT summary information on a sales invoice document, but the same steps also apply to sales order confirmations, sales quotes, sales credit memos, blanket sales orders, purchase orders, purchase invoices, and purchase credit memos.

To show VAT summary information

1. Choose the  icon, enter **Posted Sales Invoices**, and then choose the related link.
2. In the list, select the relevant document, and then choose the **Print** action.
3. To display VAT information in the report, select the **Always Show VAT Summary** check box.

Special Data Output and Reports for the Tax Authority

3/31/2019 • 2 minutes to read

It is a legal requirement to send the tax authority a data file in a predefined format.

To generate the data file for the tax authorities, every account in the chart of accounts must be set up with the correct Internal Revenue Service (IRS) tax number as defined by the tax authority.

General ledger accounts are mapped to predefined government account codes and these codes are divided into groups and types. You need to add the relevant IRS numbers and then manually map general ledger accounts to these codes. You must also report the data to the tax authorities.

Electronic Invoicing Requirement: Issuing Single Copy Invoice

3/31/2019 • 2 minutes to read

In Iceland, you must send a report to the government if an invoice has been printed more than once. This report includes legal text, which confirms that the invoice originates from an Enterprise Resource Planning (ERP) solution that complies with legislation.

Using this feature, you can send a legal statement with terms and limitations for using single-copy invoices to the tax authorities. The **Printing** FastTab on the **Sales & Receivables Setup** page contains a legal statement (terms and limitations for using single-copy invoices) and also provides an **Electronic Invoicing** check box, which you can select as a reminder that you need to print a statement for the tax authority. You can then print the **IRS Notification** report from the **Sales & Receivables Setup** page. On the **Home** tab, in the **Report** group, choose **Print Statement**.

On the standard posted invoices (invoice and credit memo), legal text is inserted stating that the invoices originate from an ERP solution that complies with Regulation No. 598/1999.

Map IRS Numbers to Chart of Accounts

3/31/2019 • 2 minutes to read

Companies in Iceland are required to send the tax authority a data file in a predefined format. Before you can do this, you must map predefined Internal Revenue Service (IRS) account codes to general ledger accounts.

To create an Internal Revenue Service number

1. Choose the  icon, enter **IRS Number**, and then choose the related link.
2. Choose the **New** action.
3. On the new line, enter a number in the **IRS number** field, and provide a name in the **Name** field.
4. Select the **Reverse Prefix** check box if you want the negative operator to be reversed on the balance of the general ledger account that the IRS number is mapped to.
5. Choose the **OK** button.

To map an IRS number to a general ledger account

1. Choose the  icon, enter **Chart of Accounts**, and then choose the related link.
2. Select a general ledger account that has an **Account Type** of **Posting**.
3. In the **IRS Number** field, select an IRS number from the list.

Italian VAT

3/31/2019 • 6 minutes to read

Companies must pay VAT to the state for most purchased goods and services. VAT can be deducted if the goods or services purchased by a company are used in the production of its income.

In Business Central, you can define periodic VAT reports on the **VAT Report** page. You can fill in the lines based on VAT entries, and then export the VAT report to the appropriate authorities.

VAT Codes and Rates

VAT codes and rates must be set up even though some transactions are not subject to VAT rates. There are also many VAT-liable operations that are subject to a zero VAT rate by provision of the law.

The related VAT code is printed for each invoice line. Invoices for VAT transaction entries that are not subject to VAT rates must be recorded and printed with a note stating that VAT is not owed.

Computing VAT

VAT is computed for transactions to comply with the rules in effect on that the day the transactions occur. Thus, the date on which a transaction legally occurs must be tracked when recording transactions.

Dates

The date of issue is the document date and the date of registration is the posting date. Reporting date filters are based on the posting dates. This is changed from the previous behavior in which reporting date filters were based on the Operation Occured Date.

Non-deductible VAT

VAT cannot be deducted for some purchases because of:

- The type of goods or services purchased – VAT is fully or partially non-deductible by provision of the law on goods like cars, mobile phones, food purchased at restaurants, and so on.
- Partially deductible pro-rated VAT – VAT is pro-rated according to the ratio between sales operations for which VAT is owed, and all operations performed. VAT exceeding this ratio cannot be deducted.

Service Tariffs

The European Union (EU) has issued directives that change the VAT reporting for cross-border trade of goods and services in the EU.

In Italy, the EU sales list (Intrastat) and annual listing reports are updated to include services. This involves a change in the reporting format. A new table for service tariffs is added so that companies can classify services that must be included in the Intrastat report. Users must add the relevant service tariff to all documents that are for cross-border transactions. The service tariff specified on the **Foreign Trade** FastTab for the document can be modified in each line in the document.

VAT Transaction Reports

You must submit periodic reports to the tax authorities, which list transactions that include VAT with amounts over a specified threshold. The VAT transaction reports are created based on transactions with customers or vendors from a country/region that is outside the EU and is not blacklisted. Transactions with customers or vendors from EU countries/regions are reported through **Intrastat** reports. Transactions with customers or vendors from

countries/regions that are blacklisted are reported through the **Blacklist Communication Report** report. Business Central provides support for the following transaction types:

TRANSACTION TYPE	SUPPORTED
FE - Customer invoices (factures issued)	Yes
FR - Vendor invoices (factures received)	Yes
NE - Customer credit notes (notes issued)	Yes
NR - Vendor credit notes (notes received)	Yes
DF - Transactions without invoices (direct invoices) (customer)	No
FN - Customers invoices, when customer is non-resident	Yes
SE - Vendor invoices, when vendor is non-resident	Yes Note: The purchase of services is assumed, but differentiation between service and goods is left for the user to implement.

Business Central does not report the following types of transactions:

- Prepayment invoices, because the total amount will be reported at the time of the final invoice.
- Operations without an invoice, for example, VAT entries posted via general ledger accounts, because a VAT registration number, a fiscal code, or a customer or vendor reference is required for inclusion in a report.
- Self-billed transactions, which are not supported.

The VAT transactions reports include lines where the amount is over the threshold and lines that must be included for other legal reasons. The threshold amount is set by the Italian authorities.

Document lines contain a field to indicate if the line must be included in the VAT transaction reports. The **Include in VAT Transac. Rep.** fields are selected automatically based on the day of the transaction and a comparison with the threshold amount for the calendar year. If sales lines are related to a blanket order, the threshold is compared to the amount for the blanket order. This only applies to sales line of type **Item**. For service lines, the comparison is made with the service contract amount.

NOTE

Credit memos are included in the VAT transaction report if the customer or vendor is from a country/region that is outside the EU and is not blacklisted.

When you post credit memos, you must update the **Refers to Period** field to specify the relevant period. The VAT transaction reports will include credit memos where the **Refers to Period** field is set to **Current Calendar Year** or **Previous Calendar Year**.

Business Central adds credit memos to the VAT reports in different ways depending on the application status and the value of the **Refers to Period** field. The following table describes the scenarios.

SCENARIO	IMPACT
<p>A credit memo is applied to a single invoice.</p> <p>The Refers to Period field is set to Current Calendar Year.</p>	<p>The Invoice No. field will be set to the document number of the invoice.</p> <p>The Invoice Date field will be set to the date that is specified in the Operation Occurred Date field</p> <p>Business Central will deduct the credit memo amount from the amount of the original invoice. If the resulting amount is above the threshold, both the invoice and credit memo will be included in the VAT transactions report. If the resulting amount is below the threshold, neither invoice or credit memo will be included in the VAT transactions report.</p>
<p>A credit memo is applied to multiple invoices, or it is not applied.</p> <p>The Refers to Period field is set to Current Calendar Year.</p>	<p>The Invoice Date field will be set to the last day of the year that is specified in the Operation Occurred Date field. For example, if the Operation Occurred Date field is 07-11-11, the Invoice Date field will be set to 31-12-11.</p> <p>Only the credit memo will be included in the VAT transactions report.</p>
<p>A credit memo is applied to multiple invoices, or it is not applied.</p> <p>The Refers to Period field is set to Previous Calendar Year.</p>	<p>The Invoice Date field will be set to the last day of the year before the date that is specified in the Operation Occurred Date field. For example, if the Operation Occurred Date field is 07-11-11, the Invoice Date field will be set to 31-12-10.</p> <p>Only the credit memo will be included in the VAT transactions report.</p>

When service contracts are compared with the threshold, the **Annual Amount** field is converted to your local currency (LCY). The conversion is based on the **Currency Code** field and the exchange rate on the date in the **Starting Date** field for the service contract.

Transactions with reverse charges are not included in the VAT transaction reports. Transactions with prepayments are also not included in the VAT transaction reports.

To prepare your data for these reports, you must set up VAT posting to include VAT transaction report amounts. When a transaction such as posting a sales invoice is made that uses this VAT posting setup, Business Central checks if the transaction meets the threshold amounts. The check is based on document lines because a document can contain lines that must be included in the VAT transaction report and lines that must be excluded. The VAT transaction reports must only contain the lines that must be submitted, so Business Central compares amounts against the threshold for each line instead of for a document.

You must submit a VAT transactions report electronically to the tax authorities. For more information, see [Create Electronic VAT Transactions Reports](#).

Submit VAT Statements

3/31/2019 • 2 minutes to read

Companies must pay VAT for most purchased goods and services. VAT can be deducted if the goods and services that are purchased by a company are used in the production of its income.

You must submit periodic VAT statements to the tax authorities to list transactions that include VAT with amounts over a specific threshold. Before you submit your VAT statement, you should review the VAT statement, and then settle and post the VAT transactions.

To review and print VAT statements

1. Choose the  icon, enter **VAT Statements**, and then choose the related link.
2. On the **VAT Statement** page, in the **Name** field, select the required VAT statement, and then choose the **Print** action.
3. On the **Options** FastTab, enter a date interval to limit the period covered by the statement and define what type of VAT entries that you want to include.
4. Choose the **Print** button to print the VAT statement.

You can use the printed VAT statement to review the VAT entries to be submitted to the tax authorities.

To settle and post VAT transactions

1. Choose the  icon, enter **Calc. and Post VAT Settlement**, and then choose the related link.
2. On the **Options** FastTab, enter a date interval to limit the period covered by the VAT settlement, select the correct VAT settlement account, and then select the **Post** action if you want to post the VAT amounts to the settlement account.
3. Choose the **Print** button to print the VAT settlement and post the entries.

After you calculate and post the VAT settlement, VAT amounts are transferred to the appropriate VAT settlement accounts.

To submit VAT statements

1. Choose the  icon, enter **VAT Statements**, and then choose the related link.
2. On the **VAT Statement** page, in the **Name** field, select the required VAT statement, choose the **Print** action, and then choose the **PDF** option.

The exported file can now be submitted to the tax authorities.

[Report VAT to Tax Authorities](#)

Correct VAT Transactions Reports

3/31/2019 • 2 minutes to read

1. Choose the  icon, enter **VAT Reports**, and then choose the related link.
2. Create a new report. For more information, see [Create Electronic VAT Transactions Reports](#).
3. In the new report, change the **VAT Report Type** field to **Corrective** or **Cancellation**. In the **Original Report No.** field, select the report that you want to correct from the list of available reports. The **Start Date** and **End Date** fields are copied from the original report.

NOTE

You can only select VAT reports that are marked as Submitted, as it is required that the original report has a **Tax Auth. Receipt No.**

If it is a corrective report, on the **Home** tab, in the **Process** group, choose **Suggest Lines** to get the relevant VAT entries for the period. A cancellation report does not contain any lines.

The suggested lines are based on the VAT entries within the specified period and the current threshold setup. It is not correlated with the information from the original report.

4. Review the transaction details. To exclude a line from being reported to the tax authority, on the line, clear the **Incl. in Report** check box.

Choose the **Export** action. The **Export VAT Transactions** batch job opens.

NOTE

When you choose **Export** for a report with the status Open, it will be automatically validated and the status will be changed to Released. At this point, you can reopen the report to make changes.

5. Submit the file to the authority. Use the guidelines provided by the authority. For more information, see the [Italian Revenue Agency](#).

After you receive a response from the tax authorities, you must update the VAT report.

6. On the **General** FastTab, in the **Tax Auth. Receipt No.** field, specify the receipt number that you received from the tax authorities.
7. Choose the **Mark as Submitted** action to finalize the report. The **Status** field is updated to Submitted.

[Export VAT Transactions Reports](#)

Create Electronic VAT Transactions Reports

3/31/2019 • 2 minutes to read

You must create a list of transactions that include VAT with amounts over the current threshold on or before the specified occurrence date. You submit this report to the tax authorities.

To create a VAT transactions report

1. Choose the  icon, enter **VAT Report**, and then choose the related link.
2. Fill in the fields as described in the following table.

FIELD	DESCRIPTION
Without Contract	The VAT entries that resulted in this line are not associated with a contract.
Contract	The VAT entries that resulted in this line are associated with a contract.
Other	The VAT entries that resulted in this line are not associated with a special contract, such as ongoing maintenance or other exceptions.

TIP

In Business Central, the contract that the tax authorities are looking for can be blanket orders or service contracts. To identify if the VAT report line belongs to a blanket order or service contract, you can drill down to see the underlying VAT entries from the **Amount** field.

Credit memos are included in the VAT transaction report if the customer or vendor is from a country/region that is outside the EU and not black-listed. For more information, see [Italian VAT](#).

Now that you have created the VAT report, you must submit it to the tax authorities. For more information, see [Export VAT Transactions Reports](#).

See Also

[Italian VAT](#)

Export VAT Transactions Reports

3/31/2019 • 2 minutes to read

After you create a report, you can release it, and then export it for the authorities. To change the report, make sure that the Modify Submitted Reports check box is enabled in the VAT Report Setup page. If it is not, to change the report when you want to correct an error, you will have to create a new report, add the report with the error in the original report number, and then create a corrective report. For more information, see [Correct VAT Transactions Reports](#).

It is only possible to change the lines and fields when the document has the status Open. In the Released status, only the receipt no. is available for change. In the Submitted status, all fields are locked.

To export and submit a VAT transaction report

1. Choose the  icon, enter **VAT Reports**, and then choose the related link.
2. Select an existing report or create a new report:
 - Select the relevant VAT report from the list, and then choose the **Edit** action.
 - Choose the **New** action, and create a new report. For more information, see [Create Electronic VAT Transactions Reports](#).
3. Review the transaction details. To exclude a line from being reported to the tax authority, on the line, clear the **Incl. in Report** check box. To see the VAT entries that the line is based on, choose the drill-down button in the **Amount** field.

NOTE

You can create an empty report, that is, a report that has no lines, in the case in which there are no transactions to report.

4. Choose the **Release** action. The **Status** field is updated to Released.

Business Central validates that the VAT report is valid and ready for submission. If the validation fails, the errors are shown on the **VAT Report Error Log** page so that you can make the appropriate changes.

After you release a VAT report, you cannot edit it. If you have to change the report after it is released, you have to first reopen it. Choose the **Reopen** action.

5. Choose the **Export** action. The **Export VAT Transactions** batch job opens.
6. Select the **Detailed Export** check box, depending on your needs. The field controls whether to export the data in detailed format or in aggregate. If aggregate, lines are further grouped by VAT registration number or fiscal code.
7. Choose the **OK** button.

The VAT report is exported as a .ccf file. You can now submit the report to the tax authorities by using the tool from the Italian Revenue Agency. Use the guidelines provided by the authority. For more information, see the [Italian Revenue Agency](#).

After you receive a response from the tax authorities, you must update the VAT report.

8. On the **General** FastTab, in the **Tax Auth. Receipt No.** field, specify the receipt number that you received

from the tax authorities. In the **Tax Auth. Doc. No.** field, specify the document number that you receive.

9. Choose the **Mark as Submitted** action to finalize the report. The **Status** field is updated to Submitted.

NOTE

You can modify a report that has the status of Submitted only if you have enabled the **Modify Submitted Reports** check box on the **VAT Report Setup** page.

[Correct VAT Transactions Reports](#)

Update VAT Transactions Data

3/31/2019 • 2 minutes to read

Before you create the first VAT transaction report, you should prepare the existing data by running the **Update VAT Transaction Data** report. You should also run this report if you have made changes to the setup based on new requirements from the tax authorities.

You can run the **Update VAT Transaction Data** report as a test before you change any data. When you have verified that the filters meet your expectations and the requirements of the tax authorities, you should run the report again to make the appropriate changes to data.

Caution

Before you run the **Update VAT Transaction Data** report, you should activate the change log on the **Change Log Setup** page. Also, you should enable logging for modifications to the **Include in VAT Transac. Report** field on the **VAT Entry** table.

To update VAT transaction data

1. Choose the  icon, enter **Update VAT Transaction Data**, and then choose the related link.
2. Optionally, on the **VAT Entry** FastTab, set the appropriate filters.
3. On the **Options** FastTab, fill in the fields as described in the following table.

FIELD	DESCRIPTION
Compare against Threshold	Select to compare VAT entries against the threshold amounts that are specified in the VAT posting setup.
Show List Only	Select if you do not want to update data. If you select this field, Business Central prints a report so that you can verify the changes before data is modified. The report contains a line for each document where the VAT base is equal to or greater than the threshold amounts. Warning: Do not select both this field and the Set Include in VAT Transaction Report field.
Set Include in VAT Transaction Report	Select to set the Include in VAT Trans. Report to Yes on all VAT entries where the amounts meet the threshold amounts that are specified in the VAT posting setup. Warning: If you select this field, your data is updated. You should run the report as a test before you run it to change data.

4. Choose the **Print** button to update VAT transaction data, or choose the **Preview** button to view the changes.

When you run the report, Business Central processes VAT entries based on the filters that you set. The following rules are also applied:

- The **Blacklisted** field for the VAT entry must be blank.
- The **Type** field for the VAT entry must not be **Settlement**.

[Italian VAT](#)

Prepare for VAT Transactions Reports

3/31/2019 • 2 minutes to read

You must submit periodic reports to the tax authorities to list all transactions that include VAT. The tax authority establishes the thresholds at which reporting is required. Currently, the threshold is set at zero, meaning that all transactions are to be reported. To prepare for these reports, you must set up VAT posting to include VAT transaction report amounts.

To set up VAT transaction amounts

1. Choose the  icon, enter **VAT Posting Setup**, and then choose the related link.
2. Choose the **VAT Transaction Report Amount** action.
3. Fill in the fields as described in the following table.

FIELD	DESCRIPTION
Individual Person	Select if this customer is an individual person.
Resident	Specify if the customer is a resident in Italy. If a customer is not a resident, you must also specify a tax representative on the Foreign Trade FastTab.
First Name	Specifies the first name of the person.
Last Name	Specifies the last name of the person.
Date of Birth	Specifies the date of birth of the person.
Place of Birth	Specifies the place of birth of the person.

4. If the customer is not resident in Italy and is not an individual person, you must specify a tax representative for the customer.

NOTE

Before you can specify a tax representative, you must have created the tax representative as a contact.

To specify a tax representative for a non-resident customer

1. Choose the  icon, enter **Customers**, and then choose the related link.
2. Select a customer.
3. On the **Foreign Trade** FastTab, fill in the fields as described in the following table.

FIELD	DESCRIPTION
Tax Representative Type	Specifies if the tax representative is a customer or a contact. You must set this field to Contact .

FIELD	DESCRIPTION
Tax Representative No.	Specify the contact that is the tax representative for this customer.

You have set up information so that Business Central will track new transactions with VAT that meet the thresholds that are specified by the tax authorities. Before you create the first VAT transaction report, you should prepare the existing data. For more information, see [Update VAT Transactions Data](#). You can then create VAT transactions reports. For more information, see [Create Electronic VAT Transactions Reports](#).

Print and Reprint GL Books and VAT Registers

3/31/2019 • 2 minutes to read

The tax authorities require that you submit two fiscal reports that list all of the posted ledger entries, the **G/L Book - Print** report and the **VAT Register - Print** report. Each printed page must have its own progressive number, and therefore, you must update Business Central with the last printed page number before you run these reports again.

The following procedure describes how to print or reprint the **G/L Book - Print** report, but the same steps apply to printing or reprinting the **VAT Register - Print** report.

To print the general ledger book report

1. Choose the  icon, enter **G/L Book - Print**, and then choose the related link.
2. Fill in the fields as described in the following table.

FIELD	DESCRIPTION
Report Type	Select the type of report to create. If you select Reprint , the From Progressive No. field becomes enabled.
Starting Date	Enter the first date in the period from which posted entries will be shown.
Ending Date	Enter the last date in the period from which posted entries will be shown.
From Progressive No.	Specifies the progressive number for the report.
Print Company Information	Select to print company information on the report. The remaining fields are populated based on the Company Information page.

When you print the report, you will be reminded to update the **General Ledger Setup** page with the page number on the last page.

IMPORTANT

Business Central does not save the page number automatically when you run the reports. After you run the **G/L Book - Print** report or the **VAT Register - Print** report, you must update Business Central with the last printed page number.

3. Choose the  icon, enter **General Ledger Setup**, and then choose the related link.

To set the last printed page number for the VAT register report, search for **VAT Register**, and choose the link for the page under **VAT Posting Group**.

4. In the **Fiscal Reporting** FastTab, in the **Last Printed G/L Book Page** field, specify the page number that is on the last page of the **G/L Book - Print** report that you just printed.

Both official reports can be reprinted. When you reprint a report, the first page of the report must have the same page number as it did when the report was printed the first time. If you want to reprint one of the reports, and the page number is incorrect, you can change the reprinting information for the report

The following procedure describes how to view or change the page numbering for previously printed versions of the **G/L Book - Print** report, but the same steps apply to the **VAT Register - Print** report.

To view or change page numbering for reprinting the general ledger book report

1. Choose the  icon, enter **General Ledger Setup**, and then choose the related link.
2. Choose the **Change G/L Book Reprint Info.** action. On the **G/L Book Reprint Info** page, the **First Page Number** field specifies the first page number of the previously printed reports.

When you update the **General Ledger Setup** page or the **VAT Registers** page with the page number of the last page of the printed report, make sure that you specify the correct page number. If the reprinted report starts with the wrong page number, the report will not be accepted by the tax authorities. The **G/L Book Reprint Info** page and the **VAT Register Reprint Info** can help you identify the correct page number.

Print Intrastat Reports for Italy

3/31/2019 • 2 minutes to read

You can print monthly and quarterly Intrastat reports and submit them to the authorities on a diskette by running the **Intrastat Make Disk Tax Auth** batch job. Information regarding the receipt and the delivery of goods is included automatically.

The following Intrastat reports are available:

- **Intrastat - Checklist** report
- **Intrastat - Form** report

To print quarterly or monthly reports

1. Choose the  icon, enter **Intrastat Journals**, and then choose the related link.
2. Select the required journal batch.
3. To open the **Intrastat - Monthly** report or the **Intrastat - Quarterly** report, choose the **Monthly Report** action or the **Quarterly Report** action.
4. On the **Intrastat Jnl. Line** FastTab, select the appropriate filters.
5. Choose the **Print** button to print the report, or choose the **Preview** button to view it on the screen.
6. On the **Intrastat Journal** page, to save the report details to a diskette, on the **Actions** tab, in the **Print** group, choose **Make Diskette**.

NOTE

Before you print, you can select the path and file name. If you do not specify this information, the file will be named **scambi.cee** and will print to the root of the C drive.

To print Intrastat - Checklist reports

1. Choose the  icon, enter **Intrastat - Checklist**, and then choose the related link.
2. On the **Options** FastTab, select the **Show Intrastat Journal Lines** check box to include detailed information about the journal lines in the report.
3. On the **Intrastat Jnl. Batch** and **Intrastat Jnl. Line** FastTabs, select the appropriate filters.
4. Choose the **Print** button to print the report, or choose the **Preview** button to view it on the screen.

To print Intrastat - Form reports

1. Choose the  icon, enter **Intrastat - Form**, and then choose the related link.
2. On the **Intrastat Jnl. Batch** and **Intrastat Jnl. Line** FastTabs, select the appropriate filters.
3. Choose the **Print** button to print the report, or choose the **Preview** button to view it on the screen.

Print Withholding Tax Reports

3/31/2019 • 2 minutes to read

The **Withholding Taxes** report displays a list of withholding taxes that are payable to the government.

To print a withholding tax report

1. Choose the  icon, enter **Withholding Taxes**, and then choose the related link.
2. On the **Options** FastTab, fill in the fields as described in the following table.

FIELD	DESCRIPTION
Reference Month	Enter the month of the withholding tax period in numeric format.
Reference Year	Enter the year of the withholding tax period in numeric format.
Print Details	Select if you want to show all detailed information about withholding tax transactions.
Final Printing	Select if you want to mark this report as the final printed version. If you select this check box, the withholding taxes report will be marked as printed.

3. Chose the **Print** button to print the report, or choose the **Preview** button to view it on the screen.

Set Up Payment Terms

3/31/2019 • 2 minutes to read

For each payment term, you can specify if the payment can be made in installments. For example, you can define that a payment can be made in three installments with a third of the payment due after 30, 60, and 90 days.

If a payment term must be paid in one installment, you must still specify how the due date will be calculated.

To set up payment terms

1. Choose the  icon, enter **Payment Terms**, and then choose the related link.
2. Fill in the fields on the **Payment Terms** page. Hover over a field to read a short description.
3. Choose the **Calculation** action.
4. On the **Payment Terms Lines** page, fill in the fields as described in the following table.

FIELD	DESCRIPTION
Payment %	Specify the percentage of the total payment that this installment is for. For example, if the payment must be made in one installment, enter 100 .
Due Date Calculation	Specify the formula that is used to calculate the date that a payment must be made. For example, if the payment must be made in one installment after two weeks, enter 14D . For more information, see Using Date Formulas
Discount Date Calculation	Specify the formula that is used to calculate the date that a payment must be made in order to obtain a discount.
Discount %	Specify the discount percentage that is applied for early payment of an invoice amount.

5. Choose the **OK** button.

The **Payment Nos.** field on the **Payment Terms** page is updated. The payment terms that you set here will be a reference for automatic due date calculation for documents that you post for relevant customers and vendors.

Set Up Automatic Payments and Automatic Bills

3/31/2019 • 2 minutes to read

In Business Central, you can manage automatic payments and bills.

To use automatic payments and automatic bills, you must set up the relevant information.

To add bank information for your company

1. Choose the  icon, enter **Company Information**, and then choose the related link.
2. On the **Payments** FastTab, fill in the key fields as described in the following table.

FIELD	DESCRIPTION
Payment Method	Select the payment method for the type of payments made to or from this bank account. For example, for the bank account that will be used for automatic payments made by customers, select a payment method for bank transfers.
Bills For Collection Acc. No.	Specify the general ledger account where bills for collection will be credited.
Bills For Discount Acc. No.	Specify the general ledger account where bill discounts will be debited.
Bills Subj. to Coll. Acc. No.	Specify the general ledger account where bills subject to collection will be credited.
Expense Bill Account No.	Specify the general ledger account where expenses for bank receipts will be posted.

3. Choose the **OK** button.

IMPORTANT

Before you can export a vendor bill, you must select a payment format in the **Payment Export Format** field on the **Bank Account Card** page.

Before you can export a customer bill, you must select a payment format in the **SEPA Direct Debit Exp. Format** field on the **Bank Account Card** page.

The following procedure describes how to set up automatic bills for sales and receivables, but the same steps also apply to setting up purchases and payables for using automatic payments.

To set up automatic bills for sales and receivables

1. Choose the  icon, enter **Sales & Receivables Setup**, and then choose the related link.
2. On the **Bills** FastTab, in the **Temporary Bill List No.** field, select the temporary bill list number. Fill in the fields as described in the following table.

FIELD	DESCRIPTION
Temporary Bill List No.	Select the number series that will be used for temporary bill lists.
Recall Bill Description	Specify the descriptive text that will be used for recalled bills.
Bank Receipts Risk Period	Specify a date formula to calculate the risk period in days, such as 20D . This will be a reference for bank receipt closing. Customer bills will be closed only at the end of the risk period that you specify here.

3. Choose the **OK** button.

Next, you must specify bill codes for those payment methods that you use for automatic payments and automatic bills.

To specify bill codes for a payment method

1. Choose the  icon, enter **Payment Methods**, and then choose the related link.
2. Select the payment method that you use for bank transfers to vendors, and then, in the **Bill Code** field, select a bill code.
 - a. To create a bill code, in the **Bill Code** field, choose the field, and then choose the **New** action.
 - b. On the **Bill** page, fill in the fields.

Now, you can process customer bills and vendor bills so that they are handled automatically.

Vendor Payments and Customer Bills Overview

3/31/2019 • 2 minutes to read

In Business Central, you can manage automatic bills to customers and from vendors.

In addition, the bill pay feature supports the issuance of payment in many formats, including SEPA Credit Transfer, SEPA Direct Debit, and Italian bill formats.

Customer Bills and Vendor Bills

You can issue a document to your bank with the payment amounts that are due to vendors on or before a certain date. The bank will pay the amount on or before that date by transferring the money from your bank account to the vendor's bank account.

Similarly, you can issue a billing document to your customers who have payments that are due on or before a certain date. The customers can pay the amount to your bank, which then transfers that amount to your bank account. The bill is then given to the customer as evidence of your receipt of the payment.

Before you can process bills, you must add your bank information to the **Company Information** page. You must also create bill posting groups and assign a bill posting group to the bank account that you will use for automatic bills. For more information, see [Set Up Automatic Payments and Automatic Bills](#). Then, you can generate lists of customer bills and vendor bills and process them.

Issue Vendor Payments and Customer Bills

3/31/2019 • 2 minutes to read

The vendor and customer bill pay feature supports SEPA-based formats in addition to Italian file formats. You can pay vendors according to the SEPA Credit Transfer standard and collect payment from customers according to the SEPA Direct Debit standard. The following procedure describes the process for sending a SEPA-based payment to a vendor. The steps are similar for collecting payment from a customer.

Before starting the following procedure, make sure that information for your company's bank has been provided on the **Bank Account Card** page. On the card, include information for the following fields:

- IBAN
- SWIFT Code (optional)
- Payment Export Format
- SEPA CT Msg. ID No. Series

In addition, there must be a posted purchased invoice against which you can send a payment.

To issue payment to a vendor

1. Choose the  icon, enter **Vendors**, and then choose the related link.
2. Select the vendor to which you want to send payment. On the **Payment** FastTab, in the **Payment Method Code** field, choose the **TRASFBANC** option.
3. Choose the **Bank Accounts** action.
4. In the **Vendor Bank Account List**, select the vendor's bank account, and then choose the **Edit** action.
5. On the **Transfer** FastTab, specify information for the **IBAN** field.
6. Choose the **OK** button.
7. Choose the  icon, enter **Vendor Bill Card**, and then choose the related link.
8. Choose the **New** action.
9. On the **General** FastTab, enter information in the following fields: **Bank Account No.** of the vendor and **Payment Method Code**.
10. Choose the **Suggest Payment** action.
11. Set filters, as appropriate, and then choose the **OK** button to run the batch job.
12. Choose the **Create List** action.
13. Choose the **Yes** button to send the bill payment.
14. Choose the  icon, enter **Vendor Bill List Issued**, and choose the related link.
15. Select the bill payment that you issued from the list, and then choose the **Edit** action. The **Vendor Bill List Sent Card** page opens.
16. To export the payment information, choose the **Export Bill List to File** action. You can review the xml file that was sent.
 - a. Export to File (for standard SEPA format files)

b. Export Bill List to File

You can review the .xml file before sending it. To review and fix errors, you can refer to the **File Export Errors** FactBox.

Close a Fiscal Year

3/31/2019 • 2 minutes to read

To evaluate profit and loss, a fiscal year closing report is provided at the end of each fiscal year.

Fiscal year closing involves the following steps:

- Closing the fiscal year using the **Accounting Period** option.
- Generating a year-end closing entry using the **Close Income Statement** option.
- Posting the year-end closing entry.

To close a fiscal year

1. Choose the  icon, enter **Accounting Periods**, and then choose the related link.
2. To close an accounting period, select the accounting period, and then choose the **Close Year** action.
3. To confirm that you want to close the fiscal year, choose the **Yes** button.

IMPORTANT

After the fiscal year is closed it cannot be opened again, and the period in the fiscal year cannot be changed.

To generate a year-end closing entry using the Close Income Statement option

1. Choose the  icon, enter **Close Income Statement**, and then choose the related link.
2. On the **Options** tab, fill in the fields as described in the following table.

FIELD	DESCRIPTION
Fiscal Year Ending Date	The ending date for the fiscal year.
Gen. Journal Template	The name of the general journal template in which to place the entries.
Gen. Journal Batch	The name of the general journal batch in which to place the entries.
Balancing Account No.	Select the relevant account number.
Document No.	The batch job automatically populates this field with the next available number for the journal batch if you fill in the Gen. Journal Template and Gen. Journal Batch fields. You can also enter a number into this field manually.
Net Profit Account No.	Select the unique net profit account number.
Net Loss Account No.	Select the unique net loss account number.

FIELD	DESCRIPTION
Posting Description	Enter a description. The default text is Close Income Statement .
Business Unit Code	Select this check box if you require an entry for each business unit code.
Dimensions	Optionally, select the field to select the dimension codes if you require an entry for each dimension used in the general ledger account.
Inventory Period Closed	This field indicates that the inventory periods with ending dates greater than or equal to the last date of the accounting period are closed.

3. Choose the **OK** button to create the journal entries.

To post the year-end closing entry

1. Choose the  icon, enter **General Journals**, and then choose the related link.
2. In the **Batch** field, specify the batch that contains the closing entries.
3. Add the relevant entries to the journal lines.
4. To post the journal, choose the **Post** action.

An entry is posted to each income statement account so that it has a zero balance. The year-end result is transferred to the balance sheet.

Define Debit and Credit Amounts

3/31/2019 • 2 minutes to read

The **Debit Amount** and **Credit Amount** fields are included in multiple journals and tables, including the **General Journal**, **Cust. Ledger Entry** table, and **Vendor Ledger Entry** table. The debit and credit amounts must match in the journals and tables, or you will be unable to post or save.

To define debit and credit amounts

1. Choose the  icon, enter **General Journal**, and then choose the related link.
2. Fill in the fields as described in the following table.

FIELD	DESCRIPTION
Debit Amount	Enter the debit amount.
Credit Amount	Enter the credit amount.

WARNING

The **Debit Amount** and **Credit Amount** fields must match. If the amounts are different, you will not be able to post or save the journal.

3. Choose the **OK** button.

Set Up Initial Item Costs

3/31/2019 • 2 minutes to read

When you set up Business Central in your organization.

On the **Before Start Item Cost** page, you can enter information about inventory items, such as component costs, routing costs, and overhead costs.

To set up initial item costs

1. Choose the  icon, enter **Before Start Item Cost**, and then choose the related link.
2. Choose the **New** action.
3. Enter information into the required fields. This includes the **Starting Date**, **Purchase Quantity**, **Purchase Amount**, **Production Quantity**, and **Production Amount** fields.
4. Choose the **OK** button.

The entries in this page will be used to calculate the average year cost. For more information, see [Item Cost History List and Calculate End Year Costs](#).

See Also

[Fiscal Inventory Valuation](#)

[Set Up Fiscal Inventory Valuation](#)

Fiscal Inventory Valuation

3/31/2019 • 2 minutes to read

You must submit an annual report that shows the monetary value of inventory items for the fiscal year. According to the Italian requirements for fiscal inventory valuation, you must calculate the following cost types:

- Year average cost
- Weighted average cost
- First in, First Out (FIFO) cost
- Last in, First Out (LIFO) cost
- Discrete LIFO cost

Fiscal Inventory Valuation in Business Central

Initially, you must set up the fiscal inventory valuation for all cost types on the **Item Costing Setup** page and the **Item Card** page. For more information, see [Set Up Fiscal Inventory Valuation](#).

When you set up Business Central, you must enter the inventory item ledger entries for the first year in order to calculate the item's valuation. You can do this in the Before Start Item Cost page.

To calculate discrete LIFO cost, you must set up information on the **Item Card** page and the **Subcontracting Prices** page.

NOTE

The discrete LIFO cost can only be calculated for items for which the **Inventory Valuation** field is set to **Discrete LIFO** on the **Item Card** page.

After you set up the discrete LIFO cost calculation, you can post sales and purchase transactions based on year-end costs.

End of Year

At the end of the fiscal year, you can run the Calculate End Year Costs batch job to calculate the fiscal inventory value of each inventory item according to the required valuation methods. The results are shown in the Item Cost History List page. Then, you can run the **Fiscal Inventory Valuation** report and the **LIFO Valuation** report to show the inventory valuation.

For year-end operations, such as calculating the profit and loss during a fiscal year, there is a definitive period and a non-definitive period. If the **Competence Year** field on the **Item Cost History List** page is equal to the fiscal year end date, it is a definitive period, and you cannot recalculate data for a definitive period. If the definitive data differs from the fiscal year end date, then it is a non-definitive period. There should be data for at least one non-definitive period to perform calculations or partial calculations.

Italian Fixed Assets

3/31/2019 • 2 minutes to read

Fixed assets are properties owned by a company and used in the production of its income. Assets can be either tangible or intangible, and can be either durable or non-durable. Cars, machines, and furniture are examples of tangible assets. Startup costs and licenses are examples of intangible assets.

The following features have been added to the fixed assets functionality:

- There are several types of depreciation available, including the following: anticipated, accelerated, and reduced.
- Automatic creation of multiple fixed asset cards from an invoice.
- A **Depreciation Book** report that displays depreciation by fixed asset type.

Anticipated depreciation allows companies to delay payment of taxes on assets by using an augmented depreciation rate for the first three years. This augmented depreciation rate must be a maximum of twice the normal depreciation rate. Thereafter, the depreciation rate is halved for the first year, and then doubled for the remaining two years. For subsequent years, the depreciation follows the standard pattern.

Accelerated depreciation allows companies that can prove that an asset's use is more intensive than that of a standard asset to use a higher depreciation rate for this asset. Accelerated depreciation allows companies to shorten the period of an asset's depreciation.

Reduced depreciation allows companies that can prove that an asset's use is less intensive than that of a standard asset to use a lower depreciation rate for this asset, and recover the difference during the following fiscal years. Reduced depreciation allows companies to lengthen the period of an asset's depreciation.

Set Up Compressed Depreciation of Fixed Assets

3/31/2019 • 2 minutes to read

You can compress fixed asset depreciation into subclasses and choose to display only the total sum by subclass. You can choose to post only the depreciation totals of assets that are grouped by category. This is particularly important for companies that have multiple fixed assets divided into many individual items.

When you calculate depreciation, one line is generated for each fixed asset. For example, posting depreciations for 100 assets generates 100 lines that are posted to both the general ledger and fixed asset ledger entries.

To set up compressed depreciation of fixed assets

1. Choose the  icon, enter **Depreciation Books**, and then choose the related link.
2. On the **Depreciation Book List** page, select the relevant depreciation book, and then choose the **Edit** action.
3. To post only the depreciation totals of assets that are grouped by category, on the **Depreciation Book Card** page, on the **General** FastTab, select the **Compress Depreciation** check box.

NOTE

Multiple depreciation lines are then compressed in the general ledger and are displayed in a single entry that is divided by fixed asset categories.

4. Choose the **OK** button.

Set Up Alternate Depreciation Methods

3/31/2019 • 2 minutes to read

Alternate depreciation methods include the following:

- Anticipated depreciation.
- Accelerated depreciation.
- Reduced depreciation.

You must create depreciation tables to set up these depreciation methods.

To set up alternate depreciation methods

1. Choose the  icon, enter **Depreciation Tables**, and then choose the related link.
2. On the **Depreciation Table List** page, choose the **New** action.
3. On the **General** FastTab, fill in the fields as described in the following table.

FIELD	DESCRIPTION
Code	The code for the depreciation table.
Description	The description for the depreciation table.
Period Length	The length of the period to which each of the depreciation table lines will apply.
Total No. of Units	The total number of units that the asset is expected to produce in its lifetime.

4. On the **Lines** FastTab, fill in the fields as described in the following table.

FIELD	DESCRIPTION
Period Depreciation %	The depreciation percentage to apply to the period.
No. of Units in Period	The number of units produced by the asset to which this depreciation table applies.
Anticipated %	The anticipated depreciation percentage.
Accelerated/Reduced %	The actual depreciation percentage.

5. In the **Total Depreciation %** field, enter the total depreciation percentage.
6. Choose the **OK** button.

Create Multiple Fixed Asset Cards

3/31/2019 • 2 minutes to read

You can create multiple fixed asset cards automatically during purchase invoice posting. For example, if your company purchases 200 computers of the same kind from the same vendor, you do not have to manually create a fixed asset card for each computer; the fixed asset cards can be created automatically.

To create multiple fixed asset cards

1. Choose the  icon, enter **Fixed Assets**, and then choose the related link.
2. Choose the **Lists** action, and then choose the **Fixed Assets** action.
3. On the **Fixed Asset List** page, choose the **New** action.
4. On the **Fixed Asset Card** page, fill in the relevant fields.

You will use the value of the **No.** field when you generate the remaining fixed assets later.

5. Choose the  icon, enter **Purchase Orders**, and then choose the related link.
6. Create a new purchase order, or open the existing purchase order.
7. Expand the **Lines** FastTab.
8. Fill in the fields as described in the following table.

FIELD	DESCRIPTION
Type	Select Fixed Asset .
No.	Specify the fixed asset number. NOTE: This should be the same fixed asset number that you entered in the Fixed Asset list.
No. of Fixed Asset Cards	Specify the relevant number of duplicates for your fixed asset. NOTE: During invoice posting, duplicate fixed asset cards are automatically generated and added to the fixed asset list. The only difference between the duplicate fixed asset cards is the number assigned to each fixed asset.

9. Choose the **OK** button.

Print Depreciation Book Reports

3/31/2019 • 2 minutes to read

The **Depreciation Book** is a fiscal report that is sorted by year and item class. The **Depreciation Book** report shows changes in fixed asset stock in a given year by item class, rather than by the individual items. The **Depreciation Book** report is run after the depreciation method has been set up and assets have been entered.

To print depreciation book reports

1. Choose the  icon, enter **Fixed Assets**, and then choose the related link.
2. Choose the **Reports and Analysis** action, and then choose the **Depreciation Book** action.
3. Expand the **Options** FastTab.
4. Fill in the fields as described in the following table.

FIELD	DESCRIPTION
Depreciation Book	The depreciation book to be printed.
Starting Date	Sets the start date.
Ending Date	Sets the end date.
Print per Fixed Asset	Select to print the report for each fixed asset.

5. Expand the **Fixed Asset** FastTab, and then select the appropriate filters.
6. Choose the **Print** button to print the report or choose the **Preview** button to view it on the screen.

Set Up Company Information

3/31/2019 • 2 minutes to read

Fiscal documents must contain all company information. You can enter all relevant data on the **Company Information** page when setting up a company. This data will be included in all reports and fiscal documents.

To set up company information

1. Choose the  icon, enter **Company Information**, and then choose the related link.
2. Enter the information into the FastTabs as described in the following table.

FIELD	DESCRIPTION
General	The general company information.
Communication	The company contact information.
Payments	The bank information for the company.
Shipping	The shipping information for the company.
Administration	The administration information for the company.

3. Choose the **OK** button.

Italian Subcontracting

3/31/2019 • 2 minutes to read

Companies contracted for production often outsource the production of components to subcontractors. In order to know how many components to transfer to the subcontractor, there is a link between the subcontractors' operations and the BOM. This facilitates Master Production Scheduling (MPS) and Material Requirements Planning (MRP), and enables contractors to manage their outsourced and subcontracted components.

Special unit prices are often negotiated between main contractors and subcontractors, so an extra subcontracting price list is available.

Work in Progress

You can send an item to a subcontractor and have the subcontractor return it as a Work in Progress (WIP) to the main contractor. You can also send and receive groups of items without forced reference to the item card.

Set Up Journal Templates and Batches

3/31/2019 • 2 minutes to read

All European Union (EU) companies must submit Intrastat reports to the customs office, detailing their trade with other EU countries/regions for the current year. An Intrastat summary report is presented to the tax authorities monthly, quarterly, or yearly depending upon the company's business.

You can print Intrastat reports on the **Intrastat Jnl. Batches** page based on Intrastat journal entries. You can manually place entries into the journal, or use a batch job to place the entries there. Before you can do this, you must set up Intrastat journal templates and batches.

To set up Intrastat journal templates

1. Choose the  icon, enter **Intrastat Journal Templates**, and then choose the related link.
2. To create a new Intrastat journal template, choose the **New** action.
3. On the **Intrastat Journal Templates** page, fill in the fields as described in the following table.

FIELD	DESCRIPTION
Name	The name of the Intrastat journal template. You can enter a maximum of 10 alphanumeric characters.
Description	The description of the Intrastat journal template. You can enter a maximum of 80 alphanumeric characters.

4. Choose the **OK** button.

To set up Intrastat journal batches

1. Choose the  icon, enter **Intrastat Journal Templates**, and then choose the related link.
2. To open the **Intrastat Jnl. Batches** page, select the required template, and then choose the **Batches** action.
3. Fill in the fields as described in the following table.

FIELD	DESCRIPTION
Name	The name of the Intrastat journal. You can enter a maximum of 10 alphanumeric characters.
Description	The description of the Intrastat journal. You can enter a maximum of 50 alphanumeric characters.
Periodicity	Select one of the following options: <ul style="list-style-type: none">- Month- Quarter- Year

FIELD	DESCRIPTION
Type	Select one of the following options: - Purchases - Sales
Statistics Period	The statistics period that the report will cover. Enter the value in YYMM format.
Corrective Entry	Select the Corrective Entry check box to correct an entry.
File Disk No.	The number of the file disk. This is used when you run the Intrastat - Make Disk Tax Auth batch job.
Currency Identifier	The code to identify the currency for the Intrastat report.
Reported	If the entry has already been reported to the tax authorities, select the Reported check box. This check box is selected automatically when you run the Intrastat - Make Disk Tax Auth batch job for this entry.

4. To close the page, choose the **OK** button.

Report Trade with Customers and Vendors in Blacklist Countries-Regions

3/31/2019 • 9 minutes to read

You must submit a periodic report of transactions with customers and vendors in certain countries/regions that the Italian government has identified in a blacklist. The blacklist communication report must be submitted to the Italian Revenue Agency to help prevent VAT fraud. Transactions that are subject to blacklist reporting include the following:

- Purchases of goods or services
- Sales of goods or services

On a monthly or quarterly basis, you must generate the blacklist communication report for transactions with countries/regions that have privileged taxation and send it to the Italian Revenue Agency. The Italian Revenue Agency decides which countries/regions are included on the blacklist. You can view or change countries/regions on the blacklist by using the **Countries/Regions** page. The periodic report includes only transactions that have an amount above a certain threshold. The threshold amount calculation is applied at the document level. For more information, see the [Italian Revenue Agency](#).

Before you can submit the periodic report, you must set up Business Central.

To update the relevant countries/regions

1. Choose the  icon, enter **Countries/Regions**, and then choose the related link.
2. Choose the relevant country/region, and then select the **Blacklisted** check box.

NOTE

You may not be able to see the **Blacklisted** field. In that case, you must add it to the view.

3. Enter the **Foreign Country/Region Code** for the blacklisted country/region.

For a list of relevant countries/regions and codes, see the [Italian Revenue Agency](#).

To specify the current threshold amount

1. Choose the  icon, enter **VAT Posting Setup**, and then choose the related link.
2. On the **VAT Posting Setup** page, choose the **Blacklist Comm. Amount** action.
3. On the **Blacklist Comm. Amounts** page, fill in the fields as described in the following table.

FIELD	DESCRIPTION
Name	Specifies the name of the template, Blacklist .
Description	Specifies a description of the template, Blacklist Communication.

FIELD	DESCRIPTION
Form ID	Specifies the page where you set up the list of transactions for the blacklist communication, 12110 .
VAT Statement Report ID	Specifies the report that prints the list of transactions for the blacklist communication, 12128 .
VAT Stat. Export Report ID	Specifies the report that exports the list of transactions for the blacklist communication, 12129 .

4. Optional. Select the VAT Statement template, and then choose the **Statement Names** action. You can provide the template with a name and description. Otherwise, the template will have the name Default when you access it on the **Blacklist Communication** page.

Creating the List of Transactions

Depending on the size and type of company, you must generate and submit a report of transactions with vendors in blacklisted countries/regions on a monthly or quarterly basis. A suggested mapping of transactions to Business Central accounts is provided in the following procedure, based on Spesometro 2013.

To set up the template to create the list of Blacklist transactions

1. Choose the  icon, enter **Blacklist Communication**, and then choose the related link.
2. In the **Name** field, select the relevant VAT statement name.
3. Fill in the lines with the relevant information as described in the following table.

FIELD	DESCRIPTION	DATA TYPE
Row No.	Specify a row number. To enable correct filtering, we recommend that you number rows as follows: 1001..1006, and so forth.	Code
Description	<p>Enter a description of the line. You can enter up to a maximum of 50 characters.</p> <p>The types of transactions that you are required to report include the sales and purchase of goods and services. These transactions can be taxable, non-taxable, or exempt. Also subject to reporting are invoices for transactions that are not subject to VAT.</p> <p>Finally, you must also include information for credit note transactions.</p>	Text
Type	Specify the Type of the account that the blacklist report will include, for example, VAT Entry Totaling.	Option

FIELD	DESCRIPTION	DATA TYPE
Blacklist Country/Region Transaction	<p>Select the check box to include information from VAT entries that originate with a person or organization that has their residence in a blacklist country/region. In general, only select the check box when the Type of the line is VAT Entry Totaling.</p> <p>If the check box is not selected, Business Central only retrieves non-blacklist items.</p>	Boolean
Gen. Posting Type	<p>Select a posting type. For the blacklist communication report, you can choose any of the options, but typical choices are one of the following:</p> <p>Sale</p> <p>Purchase</p> <p>If you leave the field blank, Business Central will only return VAT Statement lines that have this field blank as well.</p> <p>If you choose the Type VAT Entry Totaling, then in this field, you can only choose among Purchase, Sale, and Settlement.</p>	Option
EU Service	<p>Specify whether the entry total represents sales of services to other EU countries/regions.</p>	Boolean
Document Type	<p>Specify a document type. You can choose any of the options, but typical choices are one of the following:</p> <p>Invoice</p> <p>Credit Memo</p> <p>If you leave the field blank, then Business Central returns all document types.</p>	Option
Refers To Period	<p>Specify what period the documents refer to. When you export data and you have not specified a date, the setting in this field is ignored.</p> <p>If you have leave this field blank, then Business Central returns those entries that have this field blank as well. In addition, it returns those entries that are without reverse sales for VAT Entry Totaling.</p>	Option

FIELD	DESCRIPTION	DATA TYPE
VAT Bus. Posting Group	<p>Specify a VAT Business Posting Group. Fill in this field when the Type of the line is VAT Entry Totaling.</p> <p>If you leave this field blank, then Business Central returns entries with any specified group.</p>	Code
VAT Prod. Posting Group	<p>Specify a VAT Product Posting Group. Fill in this field when the Type of the line is VAT Entry Totaling.</p> <p>If you leave this field blank, then Business Central returns entries with any specified group.</p>	Code
Amount Type	<p>Specify the type of the Amount that is being reported. Options include:</p> <p>Base</p> <p>Amount</p> <p>If you leave this field blank, then Business Central returns no information.</p>	Option
Row Totaling	<p>Specify which rows are to be totaled. For example, you can enter 1001..1006 to total those rows.</p>	Text
Round Factor	<p>Specify a rounding factor that is used to round the VAT entry amounts.</p>	Option
Calculate with	<p>Specify whether to calculate the amount with a sign or the opposite sign.</p>	Option
Print	<p>Specify if you want to print information from the line.</p>	Boolean
Print with	<p>Specify whether to include the sign of the amount when you print.</p>	Option

FIELD	DESCRIPTION	DATA TYPE
Blacklisted Comm. Field	Specify the field that the VAT totaling should map to in the file to be exported. Valid entries are limited to what is defined in the Spesometro 2013: BL003001 – BL008002. Important: The Blacklisted Comm. field can contain only the currently required field names that are specified by Spesometro. If you specify another field name, Business Central account fields to the same Blacklist Comm. Field value, the export of the data will be the sum of those lines. The printout will list each line.	Code
New Page	Specify if you want to insert a new page after the line when you print the information.	Boolean

The printed report includes all transactions that meet threshold requirements. It does not include those transactions that do not.

To create and print the list of transactions

1. Choose the  icon, enter **Blacklist Communication**, and then choose the related link.
2. In the **Name** field, select the relevant VAT statement name.
3. Fill in the lines with the relevant information. See the procedure for setting up the Blacklist template.
4. Choose the **Print** action.
5. Optionally, on the **VAT Statement Line** FastTab, set the relevant filters.
6. On the **Options** FastTab, fill in the fields as described in the following table.

FIELD	DESCRIPTION
Starting Date	Optional. Enter the start date for the blacklist report, which is based on the date that the operations occurred.
Ending Date	Enter the end date for the blacklist report.
Include VAT Entries	Specify if the list of transactions must include open or closed VAT entries or both open and closed VAT entries.
Include VAT Entries	Specify if the list of transactions must include VAT entries that are in the specified VAT period or must also include VAT entries that are from previous periods.
VAT Period	Enter the time that defines the VAT period for the blacklist report.
Source Type	Optional. Enter the source type of the blacklist transactions. The options include Customer and Vendor . If nothing is selected, both groups are included.

FIELD	DESCRIPTION
Source No.	If you choose a Source Type , then enter the identification number of the source transaction. If nothing is entered, then all vendors or customers are included.
Name	Read-only. Specifies the name of the organization.

7. Choose the **Print** button to print the report, or choose the **Preview** button to view the results.

NOTE

The printed report includes all transactions that meet threshold requirements. It does not include those transactions that do not.

To preview and export the list of transactions

1. Choose the  icon, enter **Blacklist Communication**, and then choose the related link.
2. In the **Name** field, select the relevant VAT statement name.
3. Fill in the lines with the relevant information. See the procedure for setting up the Blacklist template.
4. On the **Navigate** tab, choose the **Preview** action. You can review the information to make sure that your mappings have provided you with the information that you expected.
5. Choose the **OK** button to close the page
6. Choose the **Export** action.
7. Optionally, on the **VAT Statement Line** FastTab, set the relevant filters.
8. On the **Options** FastTab, fill in the fields as described in the following table.

FIELD	DESCRIPTION
Starting Date	Enter the start date for the blacklist report.
Ending Date	Enter the end date for the blacklist report.
Include VAT Entries	Specify if the list of transactions must include open or closed VAT entries or both open and closed VAT entries.
Include VAT Entries	Specify if the list of transactions must include VAT entries that are in the specified VAT period or must also include VAT entries that are from previous periods.
VAT Period	Enter the time that defines the VAT period for the blacklist report.

FIELD	DESCRIPTION
Communication Type	<p>Enter the communication type for the blacklist export. The options include , Corrective and Cancellation.</p> <p>If you enter Corrective, then a full report will be generated for the specified period, but you have the option to overwrite a previously submitted report.</p> <p>If you enter Cancellation, then you have to provide the values from the previously generated report and a new report will be generated.</p> <p>You enter information about the corrective or cancellation action in the Substitution Data group. Fill in the following fields, using information that was that was provided by the Italian Revenue Agency (IVA) in its communication with you when you originally submitted your blacklist report:</p> <ul style="list-style-type: none"> - Substitution Report No. - Substitution Doc. No.
Period Type	Specify if the report is monthly or quarterly.

9. Choose the **OK** button.

NOTE

The exported file includes those transactions that are above the current threshold amount.

You can now submit the list of transactions to the Italian Revenue Agency. If you have more than 1500 records, multiple files will be exported.

Reporting Sales Tax in the Mexico

3/31/2019 • 2 minutes to read

When you first start using Business Central, you can run an assisted setup guide to quickly and easily set up sales tax information for your company, customers, and vendors. In a matter of minutes, you are ready to create sales documents and purchase documents with sales tax calculated correctly. This is explained [in our blog post](#). If you move to the empty My Company, we recommend that you start by using each of the assisted setup guides, including the one for sales tax. If you prefer to set up sales tax yourself, this article explains what you have to take into consideration.

Tax Groups, Tax Areas, and Tax Jurisdictions

In Business Central, a tax group represents a group of inventory items or resources that are subject to identical tax terms. For example, you can set up a tax group for taxable items and another for nontaxable items. You must assign tax group codes to inventory items and general ledger accounts. Similarly, you must assign tax area codes to customers, locations, and to your own company settings. The assisted setup guide helps you do this.

If you set up new tax areas and tax jurisdictions, you must make sure that you fill in the fields correctly. In Mexico, states, counties, cities, and localities can charge sales tax. Companies collect and remit sales tax to these government authorities for products sold to end users. Sales tax can also be charged to existing sales tax. For example, tax can be calculated on a sales invoice amount that already includes the tax from other jurisdictions.

Tax Details

The **Tax Details** page shows different combinations of sales tax jurisdictions and sales tax groups to establish sales tax rates. For each tax jurisdiction, we recommend that you set up one tax group for normal sales tax, another tax group for items or services that are not taxed, and an additional tax group for every type of item or service that is handled with a different sales tax rate in that jurisdiction.

In Mexico, when you sell to a customer at a location where you do not have a *situs*—or a legal location in that state, you do not collect sales tax. For locations in which you do not have a situs, ensure that both the **Tax Below Minimum** and **Tax Above Maximum** fields are 0.00.

Set Up Use Tax and Purchase Tax

3/31/2019 • 4 minutes to read

Sales tax includes taxes that companies pay for using items:

- Use tax (United States) – Use tax is a United States sales tax that is paid on items that are purchased by a company and are used by that company instead of being sold to a customer. The company must pay sales tax for those items to the government, in the form of use tax.
- Purchase tax (Canada) – Purchase tax is a Canadian sales tax that is paid by a company on items that are purchased from a vendor. When a company purchases items for use by the company itself, the vendor charges the appropriate sales tax for the items.

To set up use tax for a purchase order

1. Choose the  icon, enter **Purchase Orders**, and then choose the related link in **Order Processing**.
2. On the **Purchase Orders** page, on the **Home** tab, in the **New** group, choose **New**.
3. On the **Lines** FastTab, fill in the fields as necessary. Hover over a field to read a short description.
4. On the **Invoicing** FastTab, fill in the fields as described in the following table.

FIELD	DESCRIPTION
Tax Liabile	Select to set up tax liability. Important: This field is available on the Purchase Header page, but it is not shown by default. To select the field, you must first add the column that shows this field. You can change how certain UI elements are displayed. For more information, see Personalizing Your Workspace .
Tax Area Code	The tax area code of the vendor. Important: This field is available on the Purchase Header page, but it is not shown by default. To select the field, you must first add the column that shows this field. You can change how certain UI elements are displayed. For more information, see Personalizing Your Workspace .
Tax Exemption No.	The company's tax exemption number. You can enter a maximum of 30 alphanumeric characters. Important: This field is available on the Purchase Header page, but it is not shown by default. To select the field, you must first add the column that shows this field. You can change how certain UI elements are displayed. For more information, see Personalizing Your Workspace .
Provincial Tax Area Code	The tax code for the province. Important: This field is available on the Purchase Header page, but it is not shown by default. To select the field, you must first add the column that shows this field. You can change how certain UI elements are displayed. For more information, see Personalizing Your Workspace .

5. Choose the **OK** button.

To set up use tax details

1. Choose the  icon, enter **Tax Details**, and then choose the related link.
2. On the **Tax Details** page, choose the **New** action.
3. On the **New - Tax Details** page, fill in the fields as described in the following table.

FIELD	DESCRIPTION
Tax Jurisdiction Code	The tax jurisdiction code for the tax detail entry.
Tax Group Code	The tax group code for the tax detail entry.
Tax Type	Sales and Use Tax – To apply both sales tax and use tax to the tax detail entry. –or– Excise Tax – To apply excise tax to the tax detail entry. –or– Sales Tax Only – To apply only sales tax to the tax detail entry. –or– Use Tax Only – To apply only use tax to the tax detail entry.

4. Choose the **OK** button.

To set up purchase tax for a company

1. Choose the  icon, enter **Company Information**, and then choose the related link.
2. On the **Company Information** page, on the **Tax** FastTab, fill in the fields as described in the following table.

FIELD	DESCRIPTION
Tax Area Code	The company's tax area code. The tax area code is used in conjunction with a tax group code field and the Tax Liable field to find the necessary information for calculating sales tax.
Tax Exemption No.	The company's tax exemption number. You can enter a maximum of 30 alphanumeric characters.
Provincial Tax Area Code	The tax code for the province.

3. Choose the **OK** button.

To set up purchase tax for a location

1. Choose the  icon, enter **Locations**, and then choose the related link.
2. On the **Locations** page, select the required location, and then choose the **Edit** action.

3. On the **General** FastTab, fill in the fields as described in the following table.

FIELD	DESCRIPTION
Do Not Use For Tax Calculation	Select to specify whether the tax information included on this location record is to be used for sales tax calculations on purchase documents.
Tax Area Code	The tax area code for the location. The tax area code is used in conjunction with a tax group code field and the Tax Liable field to find the necessary information for calculating sales tax.
Tax Exemption No.	The company's tax exemption number. You can enter a maximum of 30 alphanumeric characters.
Provincial Tax Area Code	The tax code for the province.

4. Choose the **OK** button.

To set up purchase tax for non-recoverable tax

1. Choose the  icon, enter **Tax Details**, and then choose the related link.
2. On the **Tax Details** page, choose the **New** action.
3. Select the **Expense/Capitalize** check box.

NOTE

This check box must be selected if the tax paid is not recoverable.

4. Choose the **OK** button.

Set Up Unrealized Sales Tax and Sales Payment Discounts

3/31/2019 • 4 minutes to read

You can use the **General Ledger Setup** page to set up unrealized sales tax. You can also set up maximum correction tax amounts so that you can limit the tax correction amounts that are entered for sales and purchases. This allows you to overwrite the calculated tax when there are rounding differences between what is calculated on the purchase order, and what is calculated on the purchase invoice from the vendor.

To set up unrealized sales tax

1. Choose the  icon, enter **General Ledger Setup**, and then choose the related link.
2. On the **General Ledger Setup** page, on the **General** FastTab, fill in the fields as described in the following table.

FIELD	DESCRIPTION
Pmt. Disc. Excl. Tax	Select to calculate the payment discount on amounts excluding sales tax.
Adjust for Payment Disc.	Select to recalculate the tax amounts when you post payments that trigger payment discounts. This field is used in the context of VAT, not sales tax.
Unrealized VAT	Select if any of your sales tax jurisdictions allow you to pay your sales tax after you have been paid. If you do not select this check box this function will be blocked for all sales tax jurisdictions.

3. Choose the **OK** button.

To set up unrealized tax for jurisdictions

1. Choose the  icon, enter **Tax Jurisdictions**, and then choose the related link.
2. On the **Tax Jurisdictions** page, choose the **Edit List** action.
3. Fill in the fields as described in the following table.

FIELD	DESCRIPTION
-------	-------------

FIELD	DESCRIPTION
<p>Unrealized Tax Type</p>	<p>– The unrealized tax feature is not used for this tax jurisdiction.</p> <p>–or–</p> <p>Percentage – Each payment covers both tax amounts and invoice amounts in proportion to the remaining invoice amount. The paid tax amount is transferred from the unrealized tax account to the tax account.</p> <p>–or–</p> <p>First – Payments cover the tax first, and then the invoice amount.</p> <p>–or–</p> <p>Last – Payments cover the invoice amount first, and then the tax amount. In this case, nothing will be transferred from the unrealized tax account to the tax account until the total invoice amount—exclusive of tax—has been paid.</p> <p>–or–</p> <p>First (Fully Paid) – Payments cover the tax first, but nothing is transferred to the tax account until the full tax amount has been paid.</p> <p>–or–</p> <p>Last (Fully Paid) – Payments cover the invoice amount first, but nothing is transferred to the tax account until the full tax amount has been paid. Important: This field is available on the Tax Jurisdiction page, but it is not shown by default. To select the field, you must first add the column that shows this field. You can change how certain UI elements are displayed. For more information, see Personalizing Your Workspace.</p>
<p>Unreal. Tax Acc (Sales)</p>	<p>The general ledger account that you want to use to post calculated unrealized tax on sales transactions. Important: This field is available on the Tax Jurisdiction page, but it is not shown by default. To select the field, you must first add the column that shows this field. You can change how certain UI elements are displayed. For more information, see Personalizing Your Workspace.</p>
<p>Unreal. Tax Acc (Purchases)</p>	<p>The general ledger account that you want to use to post calculated unrealized tax on purchase transactions. Important: This field is available on the Tax Jurisdiction page, but it is not shown by default. To select the field, you must first add the column that shows this field. You can change how certain UI elements are displayed. For more information, see Personalizing Your Workspace.</p>

FIELD	DESCRIPTION
Unreal. Rev. Charge (Purch.)	The general ledger account that you want to use for posting calculated unrealized reverse-charge tax on purchase transactions. Important: This field is available on the Tax Jurisdiction page, but it is not shown by default. To select the field, you must first add the column that shows this field. You can change how certain UI elements are displayed. For more information, see Personalizing Your Workspace .

4. Choose the **OK** button.

To set up adjustments for payment discounts in a tax posting group

1. Choose the  icon, enter **Tax Posting Setup**, and then choose the related link.
2. Choose the **Edit** action.
3. On the **Tax Posting Setup Card** page, select the **Adjust for Payment Discount** check box.

IMPORTANT

This field is available on the **VAT Posting Setup** page, but it is not shown by default. To select the field, you must first add the column that shows this field. You can change how certain UI elements are displayed. For more information, see [Personalizing Your Workspace](#).

4. Choose the **OK** button.

To set up maximum tax correction amounts

1. Choose the  icon, enter **Sales & Receivables Setup**, and then choose the related link.
2. On the **Sales Receivables Setup** page, on the **General** FastTab, select the **Allow Tax Difference** check box.
3. Choose the **OK** button.
4. Choose the  icon, enter **Purchases & Payables Setup**, and then choose the related link.
5. On the **Purchases & Payables Setup** page, on the **General** FastTab, select the **Allow Tax Difference** check box.
6. Choose the **OK** button.
7. Choose the  icon, enter **General Ledger Setup**, and then choose the related link.
8. On the **General Ledger Setup** page, in the **Max. Tax Difference Allowed** field, enter the maximum tax correction amount that is allowed for the local currency.

NOTE

In this field, if you enter USD 5, you may correct tax amounts by up to five dollars. To use the tax difference function, an amount must be entered in the **Max. Tax Difference Allowed** field.

9. Choose the **OK** button.

Reporting Sales Tax in the Mexico

3/31/2019 • 2 minutes to read

When you first start using Business Central, you can run an assisted setup guide to quickly and easily set up sales tax information for your company, customers, and vendors. In a matter of minutes, you are ready to create sales documents and purchase documents with sales tax calculated correctly. This is explained [in our blog post](#). If you move to the empty My Company, we recommend that you start by using each of the assisted setup guides, including the one for sales tax. If you prefer to set up sales tax yourself, this article explains what you have to take into consideration.

Tax Groups, Tax Areas, and Tax Jurisdictions

In Business Central, a tax group represents a group of inventory items or resources that are subject to identical tax terms. For example, you can set up a tax group for taxable items and another for nontaxable items. You must assign tax group codes to inventory items and general ledger accounts. Similarly, you must assign tax area codes to customers, locations, and to your own company settings. The assisted setup guide helps you do this.

If you set up new tax areas and tax jurisdictions, you must make sure that you fill in the fields correctly. In Mexico, states, counties, cities, and localities can charge sales tax. Companies collect and remit sales tax to these government authorities for products sold to end users. Sales tax can also be charged to existing sales tax. For example, tax can be calculated on a sales invoice amount that already includes the tax from other jurisdictions.

Tax Details

The **Tax Details** page shows different combinations of sales tax jurisdictions and sales tax groups to establish sales tax rates. For each tax jurisdiction, we recommend that you set up one tax group for normal sales tax, another tax group for items or services that are not taxed, and an additional tax group for every type of item or service that is handled with a different sales tax rate in that jurisdiction.

In Mexico, when you sell to a customer at a location where you do not have a *situs*—or a legal location in that state, you do not collect sales tax. For locations in which you do not have a situs, ensure that both the **Tax Below Minimum** and **Tax Above Maximum** fields are 0.00.

Create Deposits

3/31/2019 • 2 minutes to read

You can make deposits to maintain a transaction record that contains information that can be applied to outstanding invoices and credit memos.

To create a deposit

1. Choose the  icon, enter **Deposits**, and then choose the related link.
2. Choose the **New** action.
3. On the **General** FastTab, fill in the required fields as described in the following table.

FIELD	DESCRIPTION
No.	The unique identification number for the deposit.
Bank Account No.	The bank account number for the deposit.
Total Deposit Amount	The total deposit amount posted to the bank ledger. You can post this deposit only if the sum of the deposit lines is equal to the value in this field.
Posting Date	The posting date for the deposit.
Document Date	The deposit document date.

4. On the **Lines** FastTab, fill in the required fields as described in the following table.

FIELD	DESCRIPTION
Account Type	The account type.
Account No.	The unique identification account number that is associated with the selected account type, to which the entry will be posted.
Description	The journal line entry description.
Document Date	The journal line entry document date.
Document Type	The journal line entry document type.
Document No.	The journal line entry document number.
Credit Amount	The total credit amount on the journal line.

5. Optionally, on the **Navigate** tab, choose **Dimensions**, and then add relevant dimensions on the **Dimension Set Entries** page.

After you have created a deposit, you must post it.

To post a deposit

1. Choose the **Post** action.

NOTE

You can post a deposit only if the amount displayed in the **Total Deposit Lines** field is equal to the amount in the **Total Deposit Amount** field.

Next, you can use the Deposit Test Report and Deposit reports to reconcile your posted deposits with outstanding invoices and credit memos.

Tax Identification Types for Mexico

3/31/2019 • 2 minutes to read

All customers and vendors must have a federal tax identification number. The identification type used for a customer or vendor depends on whether the customer or vendor is classified as a company or as a person.

Available Tax Identification Types

In Mexico, a legal entity, such as a company or a person, is assigned a tax identification number according to two types.

Registro Federal de Contribuyentes (RFC)

This tax identification type can be applied to companies and to people. An RFC number for a company is 12 characters, while an RFC number for a person is 13 characters.

Cédula de identificación fiscal con clave única de registro de población (CURP)

This tax identification type can only be applied to people. A CURP number is 18 characters.

When you create a new customer or vendor in Business Central, you specify whether the customer or vendor is a company or a person, and then you specify the tax identification type. The tax identification type and the tax identification number are included in any reports that reference tax information about a customer or vendor.

VAT Recalculation

3/31/2019 • 2 minutes to read

When a customer makes payment in a foreign currency, VAT must be recalculated using the exchange rate at the time of the invoice payment.

A company creates an invoice in a foreign currency for the purchase of taxable goods and taxable services by a foreign customer. This invoice includes VAT. When the customer makes the payment at a later date, VAT is recalculated based on the original sales amount, and adjusted for the new currency rates.

The following steps show how to create a report for unrealized VAT amounts:

- Set up an option to allow recalculation of VAT upon receipt of payment.
- Recalculate VAT upon receipt of payment.
- Adjust journal entries for realization of VAT taxes payable to recognize exchange differences.
- Create a VAT statement that shows the unrealized VAT amounts.

Electronic Invoicing

3/31/2019 • 3 minutes to read

Mexican companies must be able to send invoices electronically as Comprobante Fiscal Digital por Internet (CFDI) files. Business Central supports CFDI so that you can export sales and service invoices and credit memos as electronic documents that have the required digital signature.

The CFDI file is an XML file that contains:

- Name of issuing company.
- Fiscal address of issuing company.
- Tax scheme of the issuing company.
- Federal tax registration number (RFC) of issuing company.
- RFC of the receiving company.
- Quantity and description of the goods or services.
- Unit price.
- Tax amounts listed by tax type.
- Currency code.
- Customs location, which includes the date and number of the customs document, if the transaction is an import.
- Digital stamp of the issuing company, which is assigned by the tax authorities (SAT).
- Digital stamp of an authorized service provider, PAC, that you choose.

IMPORTANT

You will be submitting the electronic invoices to a PAC, which is an authorized service provider appointed by the Mexican tax authorities (SAT).

Getting Started

Before you can use Business Central for electronic invoicing, you must obtain the appropriate certification, digital stamp, and control numbers from the tax authorities. You must install the certificate on the computer where the CFDI files will be generated. For more information, see [Set Up Electronic Invoicing](#). For information about SAT certificates and keys, see the [Servicio de Administración Tributaria](#) website.

You also must specify the web services that you will use to communicate with the PAC in order to obtain digital stamps. For more information, see [Set Up PAC Web Services](#).

IMPORTANT

SAT has certified more than one PAC in Mexico, and you must obtain the appropriate information to communicate with the PAC of your choice.

Sending Electronic Invoices

When you have posted an invoice or credit memo, you can send it to your customer. But first you must obtain a digital stamp from a PAC. Business Central communicates with the PAC through web services to request a stamp, and the document is automatically digitally signed by your company and the PAC.

When you send an electronic invoice or credit memo to your customer, Business Central uses the email address that you have specified on the **Company Information** page. The document is sent to the email address that you have specified on the **Customer Card** page for the bill-to customer on the invoice or credit memo. On the **General Ledger Setup** page, you also can choose to include the documents as PDF files in the email that is sent.

IMPORTANT

The users who will send electronic invoices must be able to send mail using the Simple Mail Transfer Protocol (SMTP). Depending on the configuration in your company, you may have to grant explicit permissions to each relevant user and computer.

If you also want to print the documents, the documents will include a Quick Response (QR) bar code and other information that identifies the related electronic invoice. This information makes the printed document computer-readable and provides a link between the electronic document and the printed document.

For more information, see [Generate Electronic Invoices](#).

Communication Component

The Business Central component for electronic invoicing deploys in a library assembly, Microsoft.Dynamics.NAV.MX.dll, which is installed automatically when you install the Business Central pages client. The component handles the communication with the PAC web services and also generates the QR codes that are included in the printed documents. For examples of how to use the Microsoft.Dynamics.NAV.MX.dll assembly, see codeunit 10145 **E-Invoice Mgt.** and codeunit 10147 **E-Invoice Object Factory**.

When you generate an electronic document to request a stamp, Business Central creates an XML document and sends it to the PAC for processing. The original XML document contains the same information as the original string field that is shown on the printed document. The original string includes the following information:

- Document date
- Document type
- Payment terms
- Name, address, and federal registration number of your company
- Name, address, and federal registration number of the customer
- Line amounts and quantities

The PAC returns an XML document that has the original string, but this file also includes a section for the digital stamp. In Business Central, you can export the XML files for documents that have a digital stamp and learn more about the data that goes into each XML element.

Set Up Electronic Invoicing

3/31/2019 • 2 minutes to read

Before you can send electronic documents, you must set up Business Central to ensure that the tax identification number (RFC), personal identification number (CURP), and state inscription IDs are available for your company and all your customers and vendors. You also need to set up the parameters that are needed for sending electronic invoices to customers and vendors. These parameters include the certificate thumbprint, which is the certificate that you received from the Mexico tax authority (SAT).

IMPORTANT

The certificate that you received from the Mexico tax authority must be installed for each user who sends electronic invoices. For more information, see the [Servicio de Administración Tributaria](#) website.

Your company must also have SMTP mail set up for emailing electronic invoices. Depending on the configuration in your company, you may need to grant explicit SMTP permissions to each relevant user and computer. The documents will be sent from the address that is specified on the **Company Information** page.

To set up company information

1. Choose the  icon, enter **Company Information**, and then choose the related link.
2. On the **Company Information** page, on the **Tax** FastTab, fill in the fields as described in the following table.

FIELD	DESCRIPTION
SAT Certificate Thumbprint	Enter the friendly name of the certificate that you want to use for issuing electronic invoices. Note: A certificate is needed for each user who sends electronic invoices. To get the certificate thumbprint, see the Help for the operating system.
Send PDF Report	Select to include a PDF when you email electronic invoices to customers or vendors. Electronic invoices are always sent as an XML file, this option allows you to include a PDF with the XML file.
PAC Code	Specify the authorized service provider, PAC, that you want apply digital stamps to your electronic invoices. Note: To use a PAC, you must set up web services. For more information, see Set Up PAC Web Services .
PAC Environment	Specify if your company uses electronic invoices, and if you are using the web services of your authorized service provider, PAC, in a test environment or a production environment.

Optionally, you can ask your Microsoft Certified Partner to modify the text that is included in the email that is sent when you send electronic invoices. The text is stored as text variables in codeunit 10145.

Generate Electronic Invoices

3/31/2019 • 2 minutes to read

In Business Central, after you post a sales invoice you must generate an electronic invoice that will be sent to the customer. You can also export the electronic invoice as an XML file, which you can save to a specified location.

The following procedure describes how to generate electronic invoices for sales invoices, but the same steps also apply to service invoices and credit memos.

To generate electronic invoices for sales invoices

1. Choose the  icon, enter **Posted Sales Invoice**, and then choose the related link.
2. Select the posted invoice.
3. Choose the **Send Electronic Document** action. An email will be sent to the customer with the electronic invoice attached as an XML file. If you selected the **Send PDF Report** field on the **General Ledger Setup** page, a PDF will be included with the XML file.
4. Optionally, choose the **Export E-Document as XML** action. Select the location where you want to save the electronic invoice as an XML file.

To verify the electronic invoice activity, on the **Posted Sales Invoice** page, on the **Invoicing** FastTab, the **Electronic Document Sent** and **No. of E-Document Submissions** fields will be updated.

NOTE

[Mexico Local Functionality](#)

Complying with Electronic Accounting Regulations in Mexico

3/31/2019 • 2 minutes to read

In Mexico, individuals and businesses must do their bookkeeping electronically and forward their monthly results to the Mexican Tax Authorities (SAT) as separate XML files at the end of each month. The XML files must contain the following:

- The chart of accounts. This file is to be submitted whenever the chart of accounts has been modified.
- The trial balance, including opening balances, movements (debit / credit), and final balances.
- All journal transactions, including all actual movements, such as purchases, sales, and so on. This file is to be submitted upon request from the authorities.

For more information about the structure of these files (also referred to as Annex 24), see the Secretaria de Gobernación website. The **Export Elect. Accounting** functionality has been developed to meet this regulatory requirement.

Setup Data Required to Export Successfully

To export the G/L balance information successfully, you must first set up certain data. Missing data will result in a warning message that some mandatory fields are blank, but the export will not be canceled. If in doubt, you can submit the file to the authorities to get more details about the missing values. The following describes the fields to fill in before you export the XML files.

For the files that contain the chart of accounts and the trial balance:

1. For each account, you must specify an account in the **SAT Account Code** field. Only accounts with a SAT account code are included in the files for the chart of accounts and trial balance.
2. Every G/L account that is used for export must be defined as either **Debit** or **Credit**. You cannot choose the **Both** option.

For the file that contains journal transactions:

- On the **Customer Bank Account Card**, **Vendor Bank Account Card**, and **Bank Account** pages you must choose a bank in the **Bank Code** field. This is required if the bank account is used in a transaction.
- On the **Customer** and **Vendor** pages, you must choose an account in the **Preferred Bank Account** field. When a preferred bank account is set for a customer or vendor, that bank account is copied to the Recipient Bank Account field whenever a payment to a vendor or a cash receipt from a customer is created. This default value can be changed on the journal lines before posting.
- The **Fiscal Invoice Number PAC** field on all purchase documents is used to register the UUID of an electronic invoice. You can import electronic invoices (response) when you create a purchase invoice, order, or credit memo. Only the UUID is imported, but this functionality can easily be expanded. After data is imported it appears on the invoice after posting.
- On the **Payment Method** page, in the **SAT Method of Payment** field you must specify how payment was made.

To generate the XML files

1. Choose the  icon, enter **Export Elect. Accounting**, and then choose the related link.
2. Fill in the fields as necessary. Hover over a field to read a short description.

Making Payments with Bank Data Conversion Service or SEPA Credit Transfer

4/12/2019 • 9 minutes to read

On the **Payment Journal** page, you can process payments to your vendors by exporting a file together with the payment information from the journal lines. You can then upload the file to your electronic bank where the related money transfers are processed. Business Central supports the SEPA Credit Transfer format, but in your country/region, other formats for electronic payments may be available.

In the generic version of Business Central, a global provider of services to convert bank data to any file format that your bank requires is set up and connected. In North American versions, the same service can be used to send payment files as electronic funds transfer (EFT), however with a slightly different process. See step 6 in [To export payments to a bank file](#).

To enable SEPA credit transfers, you must first set up a bank account, a vendor, and the general journal batch that the payment journal is based on. You then prepare payments to vendors by automatically filling the **Payment Journal** page with due payments with specified posting dates.

NOTE

When you have verified that the payments are successfully processed by the bank, you can proceed to post the payment journal lines.

Setting Up the Bank Data Conversion Service.

Activate the Bank Data Conversion Service feature to have any bank statement file converted to a format that you can import or to have your exported payment files converted to the format that your bank requires. For more information, see [Set Up the Bank Data Conversion Service](#).

Setting Up SEPA Credit Transfer

From the **Payment Journal** page, you can export payments to a file for upload to your electronic bank for processing of the related money transfers. Business Central supports the SEPA Credit Transfer format, but in your country/region, other formats for electronic payments may be available.

To enable export of a bank file formats that are not supported out of the box in Business Central, you can set up a data exchange definition by using the data exchange framework. For more information, see [Set Up Data Exchange Definitions](#).

Before you can process payment electronically by exporting payment files in the SEPA Credit Transfer format, you must perform the following setup steps:

- Set up the bank account in question to handle the SEPA Credit Transfer format
- Set up vendor cards to process payments by exporting files in the SEPA Credit Transfer format
- Set up the related general journal batch to enable payment export from the **Payment Journal** page
- Connect the data exchange definition for one or more payment types with the relevant payment method or methods

To set up a bank account for SEPA Credit Transfer

1. In the **Search** box, enter **Bank Accounts**, and then choose the related link.

2. Open the card of the bank account from which you will export payment files in the SEPA Credit Transfer format.
3. On the **Transfer** FastTab, in the **Payment Export Format** field, choose **SEPADD**.
4. In the **SEPA CT Msg. ID No. Series** field, choose a number series from which numbers are assigned to SEPA credit transfer entries.
5. Make sure the **IBAN** field is filled.

NOTE

The **Currency Code** field must be set to **EUR**, because SEPA credit transfers can only be made in the EURO currency.

To set up a vendor card for SEPA Credit Transfer

1. In the **Search** box, enter **Vendors**, and then choose the related link.
2. Open the card of the vendor whom you will pay electronically by export payment files in the SEPA Credit Transfer format.
3. On the **Payment** FastTab, in the **Payment Method Code** field, choose **BANK**.
4. In the **Preferred Bank Account** field, choose the bank to which the money will be transferred when it is processed by your electronic bank.

The value in the **Preferred Bank Account** field is copied to the **Recipient Bank Account** field on the **Payment Journal** page.

To set the payment journal up to export payment files

1. In the **Search** box, enter **Payment Journals**, and then choose the related link.
2. Open the payment journal that you use to process payments by exporting files in the SEPA Credit Transfer format.
3. In the **Batch Name** field, choose the drop-down button.
4. On the **General Journal Batches** page, on the **Home** tab, in the **Manage** group, choose **Edit List**.
5. On the line for the payment journal that you will use to export payments, select the **Allow Payment Export** check box.

To connect the data exchange definition for one or more payment types with the relevant payment method or methods

1. In the **Search** box, enter **Payment Methods**, and then choose the related link.
2. On the **Payment Methods** page, select the payment method that is used to export payments from, and then choose the **Pmt. Export Line Definition** field.
3. On the **Pmt. Export Line Definitions** page, select the code that you specified in the **Code** field on the **Line Definitions** FastTab in step 4 in the "To describe the formatting of lines and columns in the file" section in the [Set Up Data Exchange Definitions](#) procedure.

The direct-debit mandate is automatically inserted in the **Direct Debit Mandate ID** field when you create a sales invoice for the customer that you selected in step 2. For more information, see [Create Recurring Sales and Purchase Lines](#).

Preparing the Payment Journal

Fill the payment journal with lines for due payments to vendors, with the option to insert posting dates based on the due date of the related purchase documents. For more information, see [Managing Payables](#).

Exporting Payments to a Bank File

When you are ready to make payments to your vendors, or reimbursements to your employees, you can export a file with the payment information on the lines on the **Payment Journal** page. You can then upload the file to your bank to process the related money transfers.

In the generic version of Business Central, the Bank Data Conversion service is set up and connected. In North American versions, the same service can be used to send payment files as electronic funds transfer (EFT), however with a slightly different process. See step 6 in [To export payments to a bank file](#).

NOTE

Before you can export payment files from the payment journal, you must specify the electronic format for the involved bank account, and you must enable the bank data conversion service. For more information, see [Set Up Bank Accounts](#) and [Set Up the Bank Data Conversion Service](#). In addition, you must select the **Allow Payment Export** check box on the **General Journal Batches** page. For more information, see [Working with General Journals](#).

You use the **Credit Transfer Registers** page to view the payment files that have been exported from the payment journal. From this page, you can also re-export payment files in case of technical errors or file changes. Note, however, that exported EFT files are not shown in this page and cannot be re-exported.

To export payments to a bank file

The following describes how to pay a vendor by check. The steps are similar to refund a customer by check.

1. Choose the  icon, enter **Payment Journals**, and then choose the related link.
2. Fill in the payment journal lines. For more information, see [Record Payments and Refunds](#).

NOTE

If you are using EFT, you must select either **Electronic Payment** or **Electronic Payment-IAT** in the **Bank Payment Type** field. Different file export services and their formats require different setup values in the **Bank Account Card** and **Vendor Bank Account Card** pages. You will be informed about wrong or missing setup values as you try to export the file.

3. When you have completed all payment journal lines, choose the **Export** action.
4. On the **Export Electronic Payments** page, fill in the fields as necessary.

Any error messages will be shown in the **Payment File Errors** FactBox where you can also choose an error message to see detailed information. You must resolve all errors before the payment file can be exported.

TIP

When you use the bank data conversion service, a common error message states that the bank account number does not have the length that your bank requires. To avoid or resolve the error, you must remove the value in the **IBAN** field on the **Bank Account Card** page and then, in the **Bank Account No.** field, enter a bank account number in the format that your bank requires.

5. On the **Save As** page, specify the location that the file is exported to, and then choose **Save**.

NOTE

If you are using EFT, save the resulting vendor remittance form as a Word document or select to have it emailed directly to the vendor. The payments are now added to the **Generate EFT File** page from where you can generate multiple payment orders together to save transmission cost. For more information, see the following steps.

6. On the **Payment Journal** page, choose the **Generate EFT File** action.

On the **Generate EFT File** page, all payments set up for EFT that you have exported from the payment journal for a specified bank account but not yet generated are listed on the **Lines** FastTab.

7. Choose the **Generate EFT File** action to export one file for all the EFT payments.

8. On the **Save As** page, specify the location that the file is exported to, and then choose **Save**.

The bank payment file is exported to the location that you specify, and you can proceed to upload it to your electronic bank account and make the actual payments. Then you can post the exported payment journal lines.

To plan when to post exported payments

If you do not want to post a payment journal line for an exported payment, for example because you are waiting for confirmation that the transaction has been processed by the bank, you can just delete the journal line. When you later create a payment journal line to pay the remaining amount on the invoice, the **Total Exported Amount** field shows how much of the payment amount has already been exported. Also, you can find detailed information about the exported total by choosing the **Credit Transfer Reg. Entries** button to see details about exported payment files.

If you follow a process where you do not post payments until you have confirmation that they have been processed in the bank, you can control this in two ways.

- In a payment journal with suggested payment lines, you can sort on either the **Exported to Payment File** column or the **Total Exported Amount** and then delete payment suggestions for open invoices for which payments have already been made and you do not want to make payments for.
- On the **Suggest Vendor Payments** page, where you specify which payments to insert in the payment journal, you can select the **Skip Exported Payments** check box if you do not want to insert journal lines for payments that have already been exported.

To see information about exported payments, choose the **Payment Export History** action.

To re-export payments to a bank file

You can re-export payment files from the **Credit Transfer Registers** page. Before you delete or post payment journal lines, you can also re-export the payment file from the **Payment Journal** page by simply exporting it again. If you have deleted or posted the payment journal lines after exporting them, you can re-export the same payment file from the **Credit Transfer Registers** page. Select the line for the batch of credit transfers that you want to re-export, and then use the **Reexport Payments to File** action.

NOTE

Exported EFT files are not shown on the **Credit Transfer Registers** page and cannot be re-exported.

1. Choose the  icon, enter **Credit Transfer Registers**, and then choose the related link.
2. Select a payment export that you want to re-export, and then choose the **Reexport Payment to File** action.

Posting the Payments

When the electronic payment is successfully processed by the bank, post the payments. For more information, see [Making Payments](#).

Collect Payments with SEPA Direct Debit

Set Up PAC Web Services

3/31/2019 • 2 minutes to read

Before you can send invoices and credit memos electronically, you must specify one or more providers of the electronic stamp that must be included in invoices in Mexico.

When you send an electronic document, it must receive a digital stamp by an authorized service provider, PAC, before it can be sent to your customer. The communication between Business Central and the PAC is managed through web services, and therefore, you must specify technical information about the web services of the PAC that you intend to use.

To use web services, you must identify the name of the method on the web service that processes requests for digital stamps. Your PAC can give you this information.

If your PAC offers the service of canceling signed documents, you must specify two web methods: one web method for requesting the digital stamp, and the other for canceling an already signed document.

To set up a PAC web service

1. Choose the  icon, enter **PAC Web Services**, and then choose the related link.
2. Fill in the fields as described in the following table.

FIELD	DESCRIPTION
Environment	Specify if the web service is for a test environment or a production environment.
Type	Specify if the web method is for requesting a digital stamp or for canceling.
Method Name	Specify the name of the web method, such as GeneraTimbre or CancelaTimbre .
Address	Specify the URL of the web method.

Contact your PAC for this information.

3. Repeat the steps for any additional PAC that you want to set up.

IMPORTANT

SAT has certified more than one PAC in Mexico, and you must obtain the appropriate information for communication with the PAC of your choice.

Print Troubleshooting Reports

3/31/2019 • 2 minutes to read

The following troubleshooting reports are available to assist Microsoft Certified Partners with troubleshooting issues:

- **License Information** report – This report contains the license number, the name of the licensed user, which application granules they have purchased, and when the license expires, if applicable.
- **Data Dictionary** report (report #10315) – This report allows you to print detailed table reference, field reference, and table properties for table objects.

You must have access to Business Central Object Designer, which is available only to administrators.

You can print these reports and send them to your Microsoft Certified Partner to help resolve issues with your Business Central implementation.

To print the License Information report

1. In Business Central Object Designer, on the **Tools** menu, choose **License Information**.
2. On the **License Information** page, you can preview the license information, or you can choose the **Export** button to print the **License Information** report.

To print the Data Dictionary report

1. In Business Central Object Designer, on the **Tools** menu, choose **Object Designer**.
2. Choose the **Report** button.
3. In the **Type** column, find **ID 10315**, which is the **Data Dictionary** report.
4. On the **Object Designer** page, choose the **Run** button to open the **Data Dictionary** report.
5. On the **Options** tab, enter the relevant information into the fields.
6. Choose the **Print** button to print the report or choose the **Preview** button to view it on the screen.

Create an Audit File for the Tax Authority

3/31/2019 • 2 minutes to read

During an examination of the books for a fiscal year, a tax inspector can ask for data about the basis transactions from the general ledger for that fiscal year. Basis transactions usually are processed via journal entries. That is the reason why the journal entries are the basis for the audit file.

The tax authority stimulates companies to use the audit file but it is not prescribed.

The audit file can also be used to exchange data between companies. You can select every period you want, but the start and end date of the entered period must be in the same fiscal year.

To make an Audit file

1. Choose the  icon, enter **Tax Authority - Audit File**, and then choose the related link.
2. On the **Options** FastTab, fill in the fields as described in the following table.

FIELD	DESCRIPTION
Start Date	Specify the start date of the period on which the data must be based.
End Date	Specify the end date of the period on which the data must be based.
Exclude Begin Balance	Specifies if the audit file must contain the begin balance of general ledger accounts. The field is editable if the start date of the period is equal to the start date of a fiscal year.

3. Choose the **OK** button to create the audit file. If you do not want to create the audit file, choose the **Cancel** button to close the page.

When you run the report, you must specify the name and location of the exported file. The default file name is **audit.xaf**, but you can change that. The file extension must be .xaf.

[Submitting Electronic VAT and ICP Declarations](#)

Set Up VAT Categories

3/31/2019 • 2 minutes to read

To use the electronic VAT declaration, you must set up a VAT category code for all XML elements in the electronic VAT declaration.

You must set up all of the possible category and subcategory combinations that represent an XML element in the electronic VAT declaration. Then, you can map the VAT statement data directly to an XML element.

To set up a VAT category

1. Choose the , enter **Elec. Tax. Decl. VAT Categories**, and then choose the related link.
2. On the **Elec. Tax. Decl. VAT Categories** page, choose the **New** action.
3. Fill in the fields as described in the following table.

FIELD	DESCRIPTION
Code	The unique code for each category and subcategory combination. You can enter a maximum of 10 alphanumeric characters.
Category	Specify the main category option for the VAT statement.
By Us (Domestic)	The subcategory for the VAT Statement. Select a subcategory here if the Category field displays By Us (Domestic) .
To Us (Domestic)	The subcategory for the VAT Statement. Select a subcategory here if the Category field displays To Us (Domestic) .
By Us (Foreign)	The subcategory for the VAT Statement. Select a subcategory here if the Category field displays By Us (Foreign) .
To Us (Foreign)	The subcategory for the VAT Statement. Select a subcategory here if the Category field displays To Us (Foreign) .
Calculation	The subcategory for the VAT Statement. Select a subcategory here if the Category field displays Calculation .
Optional	Select to indicate that the XML element that is represented by the category code is not required in the electronic VAT declaration.

4. Choose the **OK** button.

You can now map the VAT statement data directly to an XML element.

[Submitting Electronic VAT and ICP Declarations](#)

[Setting Up Electronic VAT and ICP Declarations](#)

Submitting Electronic VAT and ICP Declarations

3/31/2019 • 4 minutes to read

Companies must submit periodic VAT and Intracommunautaire leveringen (ICP) declarations to the tax authorities.

VAT declarations must be submitted on a monthly or quarterly basis. ICP declarations must be submitted on a quarterly basis.

NOTE

ICP declarations must be submitted by companies that sell goods or services to European Union (EU) countries. Purchases are not included in this declaration.

For a transaction to qualify for ICP, it is required that the merchandise have crossed the border physically. It is not enough that the location of an invoice address or the office of the vendor or customer is in another EU country or region.

You can submit the VAT declarations and ICP declarations in the following ways:

- Log on to the website of the Dutch tax office and enter the information manually. For more information, see the [website](#) of the Dutch tax office.
- Create an electronic declaration and submit the encrypted file through file through the Digipoort channel to the Dutch tax office. Digipoort is the electronic post office provided by the Dutch government for companies. It provides the common infrastructure for the communication of information between companies and the government, including VAT declarations. The reports are in the eXtensible Business Reporting Language (XBRL) format. For more information, see [Create Reports with XBRL](#).

To prepare for electronic declaration

Before you can send electronic declarations to the tax authorities you must perform the following tasks:

1. Ensure that you have obtained the certificates from the government. If you have not, take the following steps to obtain the certificates:
 - Obtain a PKIoverheid certificate for the company if you do not have one already. A list of certificate providers can be found here:
<https://www.logius.nl/producten/toegang/pkioverheid/aansluiten/toegetreden-csps>.
 - Register a user of Digipoort, which can be done here:
<https://aansluiten.procesinfrastructuur.nl/site/registratie/nieuw>.
 - Obtain a **Digipoort Service certificate**, which can be obtained at the Dutch Tax Administration website: <https://aansluiten.procesinfrastructuur.nl>.
2. Enter general data and personal data received from the tax authorities on the **Elec. Tax Declaration Setup** page. For more information, see [Setting Up Electronic VAT and ICP Declarations](#).
3. Set up a VAT category code for all XML elements in the electronic VAT declaration. For more information, see [Set Up VAT Categories](#).

To create an electronic declaration

1. Choose the  icon, enter **Elec. Tax Declarations**, and then choose the related link.

2. On the **Elec. Tax Declaration List** page, choose the **New** action.
3. On the **Elec. Tax Declaration Card** page, fill in the fields as necessary. Hover over a field to read a short description.
4. Choose the **OK** button.

The XML elements and the accompanying data of the electronic declaration are displayed on the **Lines** FastTab on the **Elec. Tax Declaration Card** page.

The XBRL reporter ensures that all account numbers that are imported from Business Central are mapped to the XBRL elements in a report. The XBRL reporter also displays a list of errors of unmapped elements or accounts.

To submit an electronic declaration

With the XBRL reporter, you can submit the Intracommunautaire Leveringen (ICP) declaration or the VAT declaration in the required XML format. When it is submitted, the file is sent to the tax authorities as defined on the **Elec. Tax Declaration Setup** page.

1. On the **Elec. Tax Declaration Card** page, choose the **Submit Electronic Tax Declaration** action.
2. Fill in the fields as described in the following table.

FIELD	DESCRIPTION
Client Certificate	Select the PKloverheid certificate for the company.
Client Certificate Password	Enter the password that encrypts the client certificate.
Service Certificate	Select the Digipoort Service certificate.

3. Choose the **OK** button.

The electronic declaration is submitted to the tax authorities.

NOTE

If there are no intra-community deliveries in the declaration period, then an electronic ICP declaration is created without XML elements for the deliveries. If you submit such a declaration, an error message will be displayed.

To import a response message from the tax authorities

For each electronic declaration, the tax authorities will send a response message. These messages must be received from the server of the tax authorities and be processed. The first step is to import the response message into Business Central.

1. Choose the  icon, enter **Elec. Tax Decl. Response Msgs.**, and then choose the related link.
2. Choose the **Receive Response Messages** action.
3. On the **Options** FastTab, fill in the fields as described in the following table.

FIELD	DESCRIPTION
Client Certificate	Select the PKloverheid certificate for the company.
Client Certificate Password	Enter the password that encrypts the client certificate.

FIELD	DESCRIPTION
Service Certificate	Select the Digipoort Service certificate.

4. Choose the **OK** button.

To process a response message from the tax authorities

When a response message is imported, it must be processed by validating its content against the related electronic declaration. If no errors are found in the electronic declaration and the data has been processed by the tax authorities, then the **Status** field on the **Elec. Tax Declaration Card** page is changed to **Acknowledgement**.

1. Choose the  icon, enter **Elec. Tax Decl. Response Msgs.**, and then choose the related link.
2. Choose the **Process Response Messages** action.
3. On the **Process Response Messages Batch Job** page, select the appropriate filters, and then choose the **OK** button.

The processed information about the response message is displayed in the **Elec. Tax Decl. Response Msgs..** page.

4. To export a message or attachment, choose the **Export Response Message** action or the **Export Response Attachment** action.

Setting Up Electronic VAT and ICP Declarations

3/31/2019 • 2 minutes to read

To create electronic VAT and ICP declarations and communicate with the tax authorities, you must first set up general information about electronic tax declarations. Your company must be registered with the tax authorities before you can send electronic declarations.

When electronic declarations are set up, you can begin to declare VAT and ICP to the tax authorities. For more information, see [Submitting Electronic VAT and ICP Declarations](#).

To set up electronic declarations

1. Choose the  icon, enter **Elec. Tax Declaration Setup**, and then choose the related link.
2. On the **Elec. Tax Declaration Setup** page, fill in the fields as necessary. Hover over a field to read a short description.
3. If you want the contact ID in the electronic declaration to be filled with the VAT registration number of the company, then select **Tax Payer** in the **VAT Contact Type** field.
4. If you want to send electronic ICP declarations for a subsidiary company of a fiscal entity, then select the **Part of Fiscal Entity** check box.

NOTE

If a company has several companies registered as subsidiaries of a holding company, they have the option to submit the VAT declaration individually or combined for one fiscal entity. To set up electronic declarations for subsidiaries of a holding company, you must select the **Part of Fiscal Entity** field on the **Elec. Tax Declaration Setup** page. You can then create an electronic declaration for only one company.

If you want to combine the tax information for all subsidiaries of a holding company, you must create a VAT statement on paper for each subsidiary company and manually calculate the total amounts for the holding company. These total amounts of the holding company must be entered on the website of the tax authorities.

You cannot combine tax information for ICP declarations. ICP declarations must always be submitted individually.

For each subsidiary company an electronic ICP declaration can be created and submitted to the tax authorities. These electronic ICP declarations must contain the VAT registration number of the subsidiary company and the value of the **Fiscal Entity No.** field on the **Company Information** page of the holding company.

5. In the **Digipoort Delivery URL** field, specify the URL for the production version of the Digipoort Aanlever service. For more information, see <https://www.logius.nl/producten/gegevensuitwisseling/digipoort>.
6. In the **Digipoort Status URL** field, specify the URL for the status information that is coming from the Digipoort Statusinformatie service. For more information, see [Electronic VAT and ICP Declarations](#).

[Netherlands Local Functionality](#)

Dutch Electronic Banking

3/31/2019 • 2 minutes to read

Electronic banking functionality allows you to create electronic payment files and direct debit files, and to import electronic bank statements from supported bank software.

Telebanking

Using Telebanking, you can export payments, import bank statements, and collect data to forward to the bank. For more information, see [Telebanking](#).

You can create payment proposals and reconcile bank accounts in the cash, bank, and giro journals.

Payment Files

You can make payment proposals for paying open invoices to suppliers. Payment proposals can be edited manually prior to processing to add or remove payment invoices, or to change payment amounts. After processing a proposed payment batch, you can transfer electronic payment files to the bank. If an error occurs in the payment file while importing into the banking software, you can make a copy of the payment file to resubmit to the bank.

You can make domestic payments and international payments using the designated formats. For more information, see [Telebanking](#).

Direct Debit Files

You can create a payment proposal to collect payment from customer bank accounts. You can edit payment proposals manually to add or remove invoices, or to change collection amounts. After processing a proposed payment batch, you can transfer electronic direct debit files to the bank. If an error occurs in the direct debit file while importing into the banking software, you can make a copy of the direct debit file to resubmit to the bank.

You can only collect payments domestically at this time. For more information, see [Create Proposals](#).

Bank Statement Import

You can import bank statements from supported bank software, and reconcile them with incoming and outgoing payments. You can also reconcile bank charges and interest earned.

Electronic bank statement files are supported for the following banks:

- ABN AMRO Bank (SWIFT MT940)
- ING Bank (SWIFT MT940, PAYMUL)
- Rabobank (MUT.ASC, VVMUT.ASC, BBV and ASCII)
- Postbank (SWIFT MT940)

Bank Account Number Validation

Bank account numbers are validated by ensuring that they are either 9 or 10 digits long and they pass the "eleven test" algorithm. For giro accounts, the account number must be less than eight digits.

[Enter and Post Cash and Bank/Giro Journals](#)

[Import and Reconcile Bank Statements](#)

Telebanking

3/31/2019 • 2 minutes to read

Based on both sales and purchase transactions, telebanking enables you to generate your payments and collections and interchange them with your bank electronically. This includes the export of payment and collection data that need to be forwarded to the bank as well as the import of bank statements sent to you by the bank.

Transactions

In general, all financial interactions with vendors and customers are done through either purchase or sales invoices and credit memos. As soon as these transactions have been registered and posted, payments or collections can be carried out by your company.

Proposals

Based on vendor and customer ledger entries, telebanking enables you to generate payment and collection proposals. This can be done for any bank that has been set up for your company. Both domestic and foreign payments and collections are possible.

You can set up Business Central to combine payments to or collections from the same bank account automatically.

When a proposal has been agreed upon, it should be processed into a payment history.

NOTE

In general, for any open vendor and customer ledger entries, a proposal can be generated if it meets a number of criteria. For more information, see [Create Proposals](#).

Payment Histories

A payment history is nothing more than a proposal except for the fact that data on a payment history cannot be modified. The payment or collection data is ready to be exported and forwarded to the bank.

For more information, see [Create and Export Payment History](#).

Bank Statements

For all your financial interactions through your bank, the bank can send you electronic bank statements. These statements can be imported into the Bank/Giro Journals. If you want, you can have Business Central automatically reconcile these statements during this import process and determine whether a statement can be applied to open ledger entries for the relevant vendor/customer.

For more information, see [Import and Reconcile Bank Statements](#).

Exchange Protocols

For both exporting and importing, a number of protocols have been defined. Business Central supports the following protocols:

- BTL91 (export)
- BBV (export)

- PAYMUL (export)
- Rabobank mut.asc (import)
- Rabobank vvmut.asc (import)
- Rabobank ASCII (import)
- SEPA CAMT

Payment Scenarios

3/31/2019 • 2 minutes to read

Based on a sales or purchase invoice or credit memo a proposal can be generated and exported in order to be processed by our bank.

Using telebanking you can deal with three scenarios:

1. The payment is done by means of a bank account denominated in your local currency (LCY), which is the same currency as linked to the invoice/credit memo.

For more information, see [Payment Scenario 1 - Domestic Payments \(LCY to LCY\)](#).

2. The payment is done by means of a bank account denominated in the same currency as the currency linked to the invoice/credit memo. Both foreign.

For more information, see [Payment Scenario 2 - Foreign Payment \(FCY to FCY\)](#).

3. The payment is done by means of a bank account denominated in your local currency (LCY), while the invoice/credit memo is linked to a foreign currency.

For more information, see [Payment Scenario 3 - Foreign Payment \(LCY to FCY\)](#).

See Also

[Telebanking](#)

Payment Scenario 1 - Domestic Payments (LCY to LCY)

3/31/2019 • 4 minutes to read

You can use telebanking for trade with domestic and foreign customers and vendors. This topic describes a scenario where the trade is with domestic customers and vendors.

The following list describes the main steps:

1. Create Vendor/Customer.
2. Create Vendor/Customer Bank Account.
3. Create and Post Purchase Invoice for Vendor or Sales Invoice for Customer.
4. Create Proposal.
5. Create Payment History.
6. Export Payment History.
7. Import Bank Statement.

NOTE

In the examples below some standard CRONUS data is being used. Likewise instead of creating a vendor/customer and a vendor/customer bank account you could use existing data.

Create Vendor/Customer

Create vendor/customer and enter all necessary information. Special attention should be paid to the following fields:

- **Currency Code:** Leave empty - i.e. it is set to the local currency (LCY).
- **Transaction Mode:** Select an appropriate, default transaction mode - i.e. one that can deal with local currency payments for your bank.
- **Preferred Bank Account:** Select an appropriate, default vendor/customer bank account having the same Currency Code as the vendor/customer itself.

NOTE

In order to be able to enter a bank account in the **Bank Account** vendor/customer bank accounts must be available. See below.

Example

Olek Johansson (code **OLEK**) is one of our local vendors. Purchase invoices will be paid through our national bank account (code **ABN**) to his bank account (code **OJBA**). Both bank account ABN and OJBA are denominated in local currency (LCY). Therefore, on Olek Johansson's vendor card we leave the **Currency Code** field empty, fill the **Transaction Mode** field with **ABN** that is linked to our bank account, ABN, and set the **Bank Account** field to **OJBA**.

Create Vendor/Customer Bank Account

Create vendor/customer bank account and enter all necessary information. Special attention should be paid to the

following fields:

- **Preferred Bank Account:** Enter a valid bank account number.
- **Currency Code:** Leave empty - i.e. it is set to the local currency (LCY).
- **Owner Information:** Be sure all owner information has been entered.

Example

Olek Johansson's bank account (code **OJBA**) is denominated in local currency (LCY). Therefore, on Olek Johansson's vendor bank account card we enter a valid number in the **Bank Account No.** field, leave the **Currency Code** field empty and fill the fields on the **Owner Information** FastTab with appropriate values.

Create and Post Purchase Invoice for Vendor or Sales Invoice for Customer

Create a purchase/sales invoice and enter all necessary information. Special attention should be paid to the following fields:

- **Currency Code:** Leave empty - i.e. it is set to the local currency (LCY).
- **Transaction Mode:** Select an appropriate, default transaction mode - i.e. one that can deal with local currency payments for your bank.
- **Preferred Bank Account:** Select an appropriate, default vendor/customer bank account having the same Currency Code is the vendor/customer itself.

By default these three fields will be populated with values taken from the vendor/customer card.

When the invoice is finished it can be posted.

Example

When creating a purchase invoice for Olek Johansson we enter **OLEK** in the **Buy-from Vendor No.** field. By default the **Currency Code**, **Transaction Mode** and **Bank Account** fields will be populated with values taken from the Olek Johansson's vendor card. Therefore, the **Currency Code**, **Transaction Mode** and **Bank Account** fields will be , **ABN** and **OJBA** respectively. Nevertheless, these values can be changed.

Create Proposal

Open the **Telebank - Bank Overview** page and browse to the bank through which we want to perform our payment. Open the **Proposal** page and generate payment proposals using the **Get Proposal Entries** batch job.

Example

Through the **Telebank - Bank Overview** page, we open the **Proposal** page for our bank, ABN. Using the batch job, one proposal line will be created for the purchase invoice we just created and posted for vendor OLEK.

Create Payment History

From the **Proposal** page, we process our proposal into a payment history. The proposal will disappear and can be found on the **Payment History Overview** page for the same bank.

Example

We process our proposal concerning the payment to vendor OLEK and open the **Payment History Overview** page for our bank, ABN. The last payment history is the one we just created.

Export Payment History

Open the **Payment History Overview** page, browse to the relevant payment history and choose the **Export** action. The export batch job will appear for the export protocol that is linked to this payment. For this export the

system already has entered appropriate filters. Check, if wanted, any of the fields on the **Options** FastTab, and then choose the **OK** action to export the payment. The system will generate a text file using a filename as defined in the **Default File Names Field** field of the export protocol, which now is ready to be sent to our bank.

Import Bank Statement

After receiving electronic bank statements from our bank we can import them by running the appropriate import protocol from the **Import Protocol List** page.

Example

The bank statement containing our payment to Olek Johansson will be sent to us by our bank, ABN. Therefore, we should chose **OFFICE NET EXTRA** as the appropriate import protocol.

[Create and Export Payment History](#)

Payment Scenario 2 - Foreign Payment (FCY to FCY)

3/31/2019 • 4 minutes to read

You can use telebanking for trade with domestic and foreign customers and vendors. This topic describes a scenario where the trade is with foreign customers and vendor that use the same foreign currency as your bank account is set up to use.

The following list describes the main steps:

1. Create Vendor/Customer.
2. Create Vendor/Customer Bank Account.
3. Create and Post Purchase Invoice for Vendor or Sales Invoice for Customer.
4. Create Proposal.
5. Create Payment History.
6. Export Payment History.
7. Import Bank Statement.

NOTE

In the examples below some standard CRONUS data is being used. Likewise instead of creating a vendor/customer and a vendor/customer bank account you could use existing data.

Create Vendor/Customer

Create vendor/customer and enter all necessary information. Special attention should be paid to the following fields:

- **Currency Code:** Set it to the foreign currency (FCY).
- **Transaction Mode:** Select an appropriate, default transaction mode - i.e. one that can deal with foreign currency payments for your foreign bank.
- **Preferred Bank Account:** Select an appropriate, default vendor/customer bank account having the same Currency Code as the vendor/customer itself.

NOTE

In order to be able to enter a bank account in the **Bank Account** vendor/customer bank accounts must be available. See below.

Example

Jannet Carter (code **JANNET**) is one of our US vendors. Purchase invoices will be paid through our foreign bank account (code **ABN-USD**) to her bank account (code **JCBA**). Both bank account ABN-USD and JCBA are denominated in the same foreign currency (FCY) - i.e. USD. Therefore, on Jannet Carter's vendor card, we set the **Currency Code** field to **USD**, fill the **Transaction Mode** field with **ABN-USD** that is linked to our bank account, ABN-USD and set the **Bank Account** field to **JCBA**.

Create Vendor/Customer Bank Account

Create vendor/customer bank account and enter all necessary information. Special attention should be paid to the

following fields:

- **Preferred Bank Account:** Enter a valid bank account number.
- **Currency Code:** Set it to the foreign currency (FCY).
- **Owner Information:** Be sure all owner information has been entered.

Example

Jannet Carter's bank account (code **JCBA**) is denominated in foreign currency (FCY) - i.e. USD. Therefore, on Jannet Carter's vendor bank account card, we enter a valid number in the **Bank Account No.** field, set the **Currency Code** field to **USD**, and fill the fields on the **Owner Information** tab with appropriate values.

Create and Post Purchase Invoice for Vendor or Sales Invoice for Customer

Create a purchase/sales invoice and enter all necessary information. Special attention should be paid to the following fields:

- **Currency Code:** Set it to the foreign currency (FCY).
- **Transaction Mode:** Select an appropriate, default transaction mode - i.e. one that can deal with foreign currency payments for your foreign bank.
- **Preferred Bank Account:** Select an appropriate, default vendor/customer bank account having the same Currency Code as the vendor/customer itself.

By default, these three fields will be populated with values taken from the vendor/customer card.

When the invoice is finished it can be posted.

Example

When creating a purchase invoice for Jannet Carter we enter **JANNET** in the **Buy-from Vendor No.** field. By default, the **Currency Code**, **Transaction Mode**, and **Bank Account** fields will be populated with values taken from the Jannet Carter's vendor card. Therefore, the **Currency Code**, **Transaction Mode**, and **Bank Account** fields will be **USD**, **ABN-USD**, and **JCBA** respectively. Nevertheless, these values can be changed.

Create Proposal

Open the **Telebank - Bank Overview** page and browse to the bank through which we want to perform our payment. Open the **Proposal** page and generate payment proposals using the **Get Proposal Entries** batch job.

Example

Through the **Telebank - Bank Overview** page, we open the **Proposal** page for our bank, ABN-USD. Using the batch job, one proposal line will be created for the purchase invoice we just created and posted for the vendor JANNET.

Create Payment History

From the **Proposal** page we process our proposal into a payment history. The proposal will disappear and can be found on the **Payment History Overview** page for the same bank.

Example

We process our proposal concerning the payment to the vendor JANNET and open the **Payment History Overview** page for our bank, ABN-USD. The last payment history is the one we just created.

Export Payment History

Open the **Payment History Overview** page, browse to the relevant payment history and choose the **Export**

action. The export batch job will appear for the export protocol that is linked to this payment. For this export the system already has entered appropriate filters. Check, if wanted, any of the fields on the **Options** FastTab, and then choose the **OK** button to export the payment. The system will generate a text file using a filename as defined in the **Default File Names Field** field of the export protocol, which now is ready to be sent to our bank.

Example

As the transaction mode associated with our payment is ABN-USD, the **BBV** or **PAYMUL** batch job will appear.

Import Bank Statement

After receiving electronic bank statements from our bank we can import them by running the appropriate import protocol from the **Import Protocol List** page.

Example

The bank statement containing our payment to Jannet Carter will be sent to us by our bank, ABN-USD. Therefore, we should chose **OFFICE NET EXTRA** as the appropriate import protocol.

Payment Scenario 3 - Foreign Payment (LCY to FCY)

5/13/2019 • 4 minutes to read

You can use telebanking for trade with domestic and foreign customers and vendors. This topic describes a scenario where the trade is with foreign customers and vendors that use a different currency than your local currency.

1. Create Vendor/Customer.
2. Create Vendor/Customer Bank Account.
3. Create and Post Purchase Invoice for Vendor or Sales Invoice for Customer.
4. Create Proposal.
5. Create Payment History.
6. Export Payment History.
7. Import Bank Statement.

NOTE

In the examples below some standard CRONUS data is being used. Likewise instead of creating a vendor/customer and a vendor/customer bank account you could use existing data.

Create Vendor/Customer

Create vendor/customer and enter all necessary information. Special attention should be paid to the following fields:

- **Currency Code:** Set it to the foreign currency (FCY).
- **Transaction Mode:** Select an appropriate, default transaction mode - i.e. one that can deal with foreign currency payments for your local bank.
- **Preferred Bank Account:** Select an appropriate, default vendor/customer bank account having the same Currency Code as the vendor/customer itself.

NOTE

In order to be able to enter a bank account in the **Bank Account** vendor/customer bank accounts must be available. See below.

Example

Hernandez Ortiz (code **ORTIZ**) is one of our Mexican vendors. Purchase invoices will be paid through our national bank account (code **ABN**) to his bank account (code **HOBA**). While our bank account ABN is denominated in local currency (LCY), Hernandez Ortiz's bank account HOBA is denominated in Mexican peso (MXN). Therefore, on Hernandez Ortiz's vendor card, we set the **Currency Code** field to **MXN**, fill the **Transaction Mode** field with **ABN** that is linked to our bank account, ABN, and set the **Bank Account** field to **HOBA**.

Create Vendor/Customer Bank Account

Create vendor/customer bank account and enter all necessary information. Special attention should be paid to the following fields:

- **Preferred Bank Account:** Enter a valid bank account number.
- **Currency Code:** Set it to the foreign currency (FCY).
- **Owner Information:** Be sure all owner information has been entered.

Example

Hernandez Ortiz's bank account (code **HOBA**) is denominated in **MXN**. Therefore, on Hernandez Ortiz's vendor bank account card, we enter a valid number in the **Bank Account No.** field, set the **Currency Code** field to **MXN**, and fill the fields on the **Owner Information** FastTab with appropriate values.

Create and Post Purchase Invoice for Vendor or Sales Invoice for Customer

Create a purchase/sales invoice and enter all necessary information. Special attention should be paid to the following fields:

- **Currency Code:** Set it to the foreign currency (FCY).
- **Transaction Mode:** Select an appropriate, default transaction mode - i.e. one that can deal with local currency payments for your local bank.
- **Preferred Bank Account:** Select an appropriate, default vendor/customer bank account having the same Currency Code is the vendor/customer itself.

By default these three fields will be populated with values taken from the vendor/customer card.

When the invoice is finished it can be posted.

Example

When creating a purchase invoice for Hernandez Ortiz we enter **ORTIZ** in the **Buy-from Vendor No.** field. By default, the **Currency Code**, **Transaction Mode**, and **Bank Account** fields will be populated with values taken from the Hernandez Ortiz's vendor card. Therefore, the **Currency Code**, **Transaction Mode**, and **Bank Account** fields will be **MXN**, **ABN**, and **HOBA** respectively. Nevertheless, these values can be changed.

Create Proposal

Open the **Telebank - Bank Overview** page and browse to the bank through which we want to perform our payment. Open the **Proposal** page and generate payment proposals using the **Get Proposal Entries** batch job.

Example

Through the **Telebank - Bank Overview** page, we open the **Proposal** page for our bank, ABN. Using the batch job, one proposal line will be created for the purchase invoice we just created and posted for the vendor ORTIZ. The amount of the payment will be in local currency (LCY).

Create Payment History

From the **Proposal** page, we process our proposal into a payment history. The proposal will disappear and can be found on the **Payment History Overview** page for the same bank.

Example

We process our proposal concerning the payment to the vendor ORTIZ and open the **Payment History Overview** page for our bank, ABN. The last payment history is the one we just created.

Export Payment History

Open the **Payment History Overview** page, browse to the relevant payment history and then choose the **Export** action. The export batch job will appear for the export protocol that is linked to this payment. For this export the

system already has entered appropriate filters. Check, if wanted, any of the fields on the **Options** FastTab, and choose the **OK** button to export the payment. The system will generate a text file using a filename as defined in the **Default File Names Field** field of the export protocol, which now is ready to be sent to our bank.

Example

As the transaction mode associated with our payment is **ABN**, the **BBV** or **PAYMUL** batch job will appear.

Import Bank Statement

After receiving electronic bank statements from our bank we can import them by running the appropriate import protocol from the **Import Protocol List** page.

Example

The bank statement containing our payment to Hernandez Ortiz will be sent to us by our bank, ABN. Therefore, we should chose **OFFICE NET EXTRA** as the appropriate import protocol.

Create Proposals

3/31/2019 • 2 minutes to read

Proposals can be generated manually or automatically based on either vendor or customer ledger entries.

IMPORTANT

To create a proposal, you must use the **Owner Information** field in the Vendor Bank Account Card and Customer Bank Account Card pages.

NOTE

At any time and at any level, before processing a proposal, the transaction mode and bank account can be modified. At the lowest level on the relevant vendor or customer ledger entries.

To create proposals manually

1. Choose the  icon, enter **Telebank - Bank Overview**, and then choose the related link.
2. Select the relevant bank account and then choose the **Proposal** action.
3. At a minimum, you must fill in the **Account Type**, **Account No.**, **Transaction Mode**, **Bank Account No.**, and **Amount** fields.
4. If you want to view or adjust the proposal's detail lines, choose the **Detail Information** action. To return to the proposal, close the **Proposal Detail Line** page.

To create proposals automatically from sales

1. Set up a card for the customer who sent the invoice with appropriate values for the **Currency Code**, **Transaction Mode**, and **Bank Account** fields.
2. Create a sales invoice or credit memo, enter the customer and relevant items and post the invoice.
3. Check whether the **Currency Code**, **Transaction Mode**, and **Bank Account** fields of the invoice/credit memo contain appropriate values. By default, they will be copied from the customer card.
4. Choose the  icon, enter **Telebank - Bank Overview**, and then choose the related link.
5. Select the relevant bank account, and then choose the **Proposal** action.
6. Choose the **Get Entries** action.

You can use the Get Proposal Entries Batch Job batch job to generate proposal lines based on relevant customer ledger entries.

NOTE

Only proposal lines will be created for ledger entries that have a transaction mode of account type **Customer** and a link to the active bank account.

7. If you want to view or adjust the proposal's detail lines, choose the **Detail Information** action. To return

to the proposal, close the **Proposal Detail Line** page.

To create proposals automatically from purchases

1. Set up a card for the vendor that sent the invoice with appropriate values for **Currency Code**, **Transaction Mode**, and **Bank Account** fields.
2. Create a purchase invoice or credit memo, enter the vendor and relevant items.
3. Post the invoice.
4. Check whether the **Currency Code**, **Transaction Mode**, and **Bank Account** fields of the invoice/credit memo contain appropriate values. By default, they will be copied from the vendor card.
5. Choose the  icon, enter **Telebank - Bank Overview**, and then choose the related link.
6. Select the relevant bank account, and then choose the **Proposal** action.
7. Choose the **Get Entries** action.

You can use the Get Proposal Entries Batch Job batch job to generate proposal lines based on relevant vendor ledger entries.

NOTE

Only proposal lines will be created for ledger entries that have a transaction mode of account type **Vendor** and a link to the active bank account.

8. If you want to view or adjust the proposal's detail lines, choose the **Detail Information** action. To return to the proposal, close the **Proposal Detail Line** page.

Docket Reports

3/31/2019 • 2 minutes to read

The Dutch telebanking application allows you to combine ledger entries for the same customer or vendor, having the same transaction mode, into one payment or collection order to the bank. As such one total amount will be paid to or collected from the vendor or customer involved. Possibly this combined payment could lack all detail information about the individual payments or collections. Telebanking offers you the possibility to inform your vendor or customer in detail by generating a docket report that describes the individual payments that constitute the total amount paid or collected.

When generating payment proposals using the **Get Proposal Entries** batch job the system will select the **Docket** check box on the proposal in case that:

- The resulting combined payment includes too many invoice numbers to list them in the available four description fields of the new proposal line: **Description 1** field, **Description 2** field, **Description 3** field, and **Description 4** field.
- The payment is not based upon an invoice.

Enter and Post Cash and Bank/Giro Journals

3/31/2019 • 3 minutes to read

The cash journal and the bank/giro journal help you post transactions into the system in an easier and more direct way than using the general journal.

In conjunction with Telebanking, they allow you to import electronic bank statements into the **Bank/Giro Journal** page. The system can automatically reconcile these statements during the import process and determine whether a statement can be applied to open ledger entries for the relevant vendor/customer.

In Business Central, you can use the cash and bank journals to enter the transactions that affect the cash and bank accounts by using the **Cash Book** and **Bank Book** types.

You can enter increases or decreases to the cash account on the **Cash Journal** page. For example, you can use this journal for paying out petty cash or receiving transfers from a different bank account.

The **Bank/Giro Journal** page records the inflow or outflow of the cash to a specific bank account. This journal forms the basis for bank reconciliation. The layout of this journal resembles the paper bank statement, so you can transpose the required fields from the paper statement to the journal, or you can import an electronic bank statement file. The transactions can be customer payments or vendor payments.

You can apply the payments from customers to the open invoices from accounts receivables. You can also enter general ledger transactions to capture miscellaneous amounts, such as bank charges or interest income. VAT codes can also be applied to these transaction lines. You can define a journal for every bank account.

To post cash journals

1. Choose the  icon, enter **Cash Journal**, and then choose the related link.
2. Choose the **New** action.
3. On the **Cash Journal** page, on the **Lines** FastTab, fill in the required fields as described in the following table.

FIELD	DESCRIPTION
Date	The journal entry date.
Document No.	The document number for which journal entry is created.
Account Type	The account type to which the entry is to be posted.
Account No.	The account number to which the entry is to be posted.
Description	The description of the entry. This field automatically populates the description of the account number selected in the Account No. field.
VAT Prod. Posting Group	The VAT product posting group code used to post the entry. You can select a code in this field only if the Account Type is G/L Account . For more information, see VAT Product Posting Groups.

FIELD	DESCRIPTION
Amount	<p>The total amount that the statement line consists of. You must enter the debit amount without a plus or minus sign and the credit amount with a minus sign.</p> <p>If this amount includes the VAT amount, then select the Amount incl. VAT check box.</p>

- Choose the **Post** action.

NOTE

If there is a difference between the opening balance and the closing balance, you must change the closing balance before posting the entry.

The entries are posted to the general ledger. For more information, see [General Ledger Entries](#).

To post bank or giro journals

- Choose the  icon, enter **Bank/Giro Journal**, and then choose the related link.
- Choose the **New** action.
- Select the relevant journal template, and then choose the **OK** button.
- On the **Bank/Giro Journal** page, fill in the fields as described in the following table.

FIELD	DESCRIPTION
Opening Balance	The current balance of the bank or giro account. It equals the closing balance of previously posted entries for the journal.
Closing Balance	The new closing balance of the journal.

- On the **Lines** FastTab, fill in the required fields as described in the following table.

FIELD	DESCRIPTION
Date	The journal entry date.
Account Type	The account type to which the journal entry is to be posted.
Account No.	The account number to which the journal entry is to be posted.
Identification	The identification number that links the statement line to a payment history line.
Description	The description of the entry.
VAT Prod. Posting Group	The VAT product posting group code that will be used when you post the entry on the statement line.

FIELD	DESCRIPTION
Amount	The total amount that the statement line consists of. You must enter the debit amount without a plus or minus sign and the credit amount with a minus sign. If this amount includes the VAT amount, then select the Amount incl. VAT check box.

6. Choose the **Post** action.

NOTE

If there is a difference between the opening balance and the closing balance, you must change the closing balance before posting the entry.

The entries are posted to the general ledger. For more information, see General Ledger Entries.

Print the Test Reports for Cash and Bank or Giro Journals

3/31/2019 • 2 minutes to read

You can use the **CBG Posting - Test** report to edit the statement lines and see the effect of posting before you post cash journals and bank or giro journals.

This report displays the statement lines of a cash journal and bank journal or giro journal. For more information, see [CBG Statement Line Table](#) and [Bank-Giro Journal Page](#).

To print the test report for cash journal

1. Choose the  icon, enter **Cash Journal**, and then choose the related link.
2. On the **Cash Journal** page, choose the **Test Report** action.
3. To include the information on applied entries for the statement lines, select the **Show Applied Entries** check box.

For more information, see [Apply and Unapply General Ledger Entries](#).

4. On the **CBG Statement** FastTab, select the appropriate filters.
You can select the **Journal Template Name** and **No.** fields as filters when you generate this report.
5. Choose the **Print** button to print the report or choose the **Preview** button to view it in on the screen.

To print the test report for bank or giro journal

1. Choose the  icon, enter **Bank/Giro Journal**, and then choose the related link
2. Choose the **General Ledger** action.
3. On the **General Journal Template List** page, Choose the **OK** button.
4. On the **Bank/Giro Journal** page, choose the **Test Report** action.
5. To include the information on applied entries for the statement lines, select the **Show Applied Entries** check box.
6. On the **CBG Statement** FastTab, select the appropriate filters.

You can select the **Journal Template Name** and **No.** as filters when you generate this report.

7. Choose the **Print** button to print the report or choose the **Preview** button to view it in on the screen.

Single EURO Payments Area (SEPA)

3/31/2019 • 2 minutes to read

The Single Euro Payments Area (SEPA) unifies payment methods in participating European countries, making international payments as easy to process as domestic payments. 300 million European citizens and companies are able to make and receive payments in euros, whether within or across national borders, with the same basic conditions, rights, and obligations, regardless of location.

Business Central supports the Dutch requirements for submitting SEPA payments, credit transfers, and direct debit.

Before you can submit vendor payments electronically in SEPA ISO2022 format, you must activate SEPA in the following pages:

- Countries/Regions
- Bank Accounts
- Export Protocols
- Transaction Modes

Additionally you will need to verify that vendor payment transaction modes and vendor bank accounts are set up to use SEPA for each vendor.

Vendor payments made using SEPA ISO 20022 must comply with the following rules.

- Make all payments in euros.
- Make payments within the European Economic Area (EEA).
- Use the vendor bank's International Bank Account Number (IBAN) and Bank Identifier Code (BIC) information.

[Netherlands Local Functionality](#)

Activate SEPA Payments

3/31/2019 • 2 minutes to read

To submit vendor payments electronically in Single Euro Payments Area (SEPA) ISO 20022 payment format, you must set up prerequisites for enabling SEPA payments.

In the following procedures, the first four describe how to enable SEPA payments, and the remaining two relate to the individual vendors.

To enable countries/regions for SEPA

1. Choose the  icon, enter **Countries/Regions**, and then choose the related link.
2. Choose the **Edit List** action.
3. Select the **SEPA Allowed** check box for each country or region that you want to enable for SEPA.
4. Choose the **OK** button.

To enable bank accounts for SEPA

1. Choose the  icon, enter **Bank Accounts**, and then choose the related link.
2. Select the bank account that you want to enable for SEPA, and then choose the **Edit** action.
3. On the **General** FastTab, in the **Country/Region Code** field, select the appropriate code.

NOTE

The specified country/region code must be enabled for SEPA as described in the previous procedure.

4. Enter a value in the **Min. Balance** field.
5. On the **Transfer** FastTab, in the **SWIFT Code** field, enter a code.
6. Choose the **OK** button.

To set up a SEPA ISO 20022 export protocol

1. Choose the  icon, enter **Export Protocols**, and then choose the related link.
2. On the **Export Protocols** page, choose the **New** action.
3. Fill in the fields as described in the following table.

FIELD	DESCRIPTION
Code	Sets the export protocol code, such as SEPA ISO20022 .
Description	Provides the description for the export protocol.
Check ID	Sets the ID for the codeunit to check payment, such as 11000010 .
Check Name	Sets the name of the codeunit.

FIELD	DESCRIPTION
Export Protocol Type	Specifies the type of the export protocol: - Report - XMLPort
Export ID	Sets the ID for the batch job to export payment, such as 11000011 . If you select XMLPort as your export protocol type, then choose an ID such as 1000 .
Export Name	The name of the batch job.
Docket ID	Sets the ID for the batch job to inform the contact on combined payments, such as 11000004 . This does not apply to XMLPort protocol types.
Docket Name	The name of the docket report.
Default File Names	Sets the location to export payment and collection data.

4. Choose the **OK** button.

To enable transaction modes for SEPA

1. Choose the  icon, enter **Transaction Modes**, and then choose the related link.
2. Select the transaction mode that you want to enable for SEPA, and then choose the **Edit** action.
3. On the **Transaction Mode Card** page, on the **Paym. Proposal** FastTab, in the **Export Protocol** field, select the SEPA export protocol that you have created, such as **SEPA ISO20022**.
4. Choose the **OK** button.

To verify vendor payment transaction modes for SEPA

1. Choose the  icon, enter **Vendors**, and then choose the related link.
2. Select the vendor that you want to verify the transaction mode for, and then choose the **View** action.
3. On the **Payments** FastTab, in the **Transaction Mode Code** field, verify that the vendor payment transaction mode is one that has been enabled for SEPA.
4. Choose the **OK** button.

To set up vendor bank accounts for SEPA

1. Choose the  icon, enter **Vendors**, and then choose the related link.
2. Select the relevant vendor, and then choose the **Bank Accounts** action.
3. Select the vendor bank account to set up for SEPA, and then choose the **Edit** action.
4. On the **Transfer** FastTab, in the **IBAN** and **SWIFT Code** fields, enter the international bank identifier code of the bank where the vendor has the account.
5. Choose the **OK** button.

[Submit Vendor Payments Electronically in SEPA ISO 20022 Payment Format](#)

Submit Vendor Payments Electronically in SEPA ISO 20022 Payment Format

3/31/2019 • 2 minutes to read

In Business Central, you can create and submit Single Euro Payments Area (SEPA) ISO 20022 vendor payments electronically.

Before you can create and submit SEPA vendor payments, you must enable SEPA payments. For more information, see [Activate SEPA Payments](#).

To submit vendor payments electronically in SEPA ISO 20022 payment format

1. Choose the  icon, enter **Telebank-Bank Overview**, and then choose the related link.
2. Select the relevant bank account, and then choose the **Proposal** action.
3. Select the relevant vendor bank account, and then choose the **Get Entries** action.
4. In the **Get Proposal Entries** batch job, on the **Options** FastTab, fill in the fields as described in the following table.

FIELD	DESCRIPTION
Currency Date	Specify the currency date.
Pmt. Discount Date	Specify the payment discount date.

5. On the **Transaction Mode** FastTab, select the appropriate filters.
6. On the **Cust. Ledger Entry** FastTab, select the appropriate filters.
7. On the **Vendor Ledger Entry** FastTab, select the **Vendor No.** filter, and then select a vendor number.

NOTE

Select other appropriate filters if required.

8. Choose the **OK** button.

The proposal lines populate on the **Telebank Proposal** page.

Create and Export Payment History

3/31/2019 • 2 minutes to read

After you have created a proposal and made any modifications, you can process the proposal to create a payment history. Proposals can be created manually or automatically from a vendor or customer ledger entry. For more information, see [Create Proposals](#).

For exporting payment histories, the following protocols are supported:

- BTL91 \$)
- BBV
- PAYMUL

To create a payment history for a proposal

1. Choose the  icon, enter **Telebank - Bank Overview**, and then choose the related link.

If you want to print the proposal before you process it, choose the **Print** button.

2. To process the proposal, choose the **Process** action.

3. To view the payment history, close the **Telebank Proposal** page. Make sure the same bank account on the **Telebank – Bank Overview** page is selected, and then choose the **Payment History** action.

The **Payment History List** page displays the payment history that you just created.

To export a payment history

- On the **Payment History List** page, choose the **Export** action.

NOTE

A text file will be created. This file contains the path and file name as defined in the **Default File Names Field** field of the export protocol.

Import and Reconcile Bank Statements

3/31/2019 • 2 minutes to read

Banks provide electronic bank statements for all your financial interactions. You can import these statements into the bank or giro journals.

The import bank statement is supported by the following protocols:

- Rabobank mut.asc
- Rabobank vvmut.ac
- Rabobank ASCII
- SEPA CAMT

To import and reconcile bank statements

1. Choose the  icon, enter **Bank/Giro Journal**, and then choose the related link.
2. Choose the **Import Bank Statement** action, select the required import protocol, and then choose the **OK** button.
3. To reconcile the bank statements automatically when importing, on the **Options** FastTab, select the **Automatic Reconciliation** check box.

NOTE

This function does not work for bank statement files of type SEPA CAMT. Instead, use the **Match Automatically** action on the **Bank Acc. Reconciliation** page. For more information, see [Reconcile Bank Accounts Separately](#).

4. Choose the **OK** button.
5. To import the file that contains the electronic bank statement, specify the file name and path, and then choose the **Open** button.

The electronic bank statement is imported into the bank or giro journals. For more information, see [Dutch Electronic Banking](#).

General Ledger

3/31/2019 • 2 minutes to read

General ledger functionality for the Netherlands is described in the below topics.

In This Section

[Apply Customer Payments Manually](#)

[Required Descriptions in G-L Entry](#)

[Create an Audit File for the Tax Authority](#)

Apply and Unapply General Ledger Entries

3/31/2019 • 2 minutes to read

Applying temporary general ledger entries allows companies to work with temporary and transfer accounts in the general ledger. Temporary and transfer accounts are used to store temporary ledger entries that are waiting for further processing into the general ledger.

You can use temporary accounts for:

- Money transfers from one bank account to another.
- Financial transaction transfers from one system to another in which part of the information temporarily resides on the original system.
- Transactions for which you have issued a sales invoice to a customer but have not yet received the corresponding purchase invoice from the vendor.

When the ledger entries have been processed, you can use the apply entries function to update the posted ledger entries and the posting account type.

You can unapply the applied general ledger entries and then open the closed entries to make changes.

To apply general ledger entries

1. Choose the  icon, enter **G/L Registers**, and then choose the related link.
2. Select a general ledger register, and then choose the **General Ledger** action.
3. On the **General Ledger Entries** page, choose the **Apply Entries** action.

All open ledger entries for the general ledger account are displayed on the **Apply General Ledger Entries** page.

NOTE

By default, the **Include Entries** field is set to **Open**. You can change the value of the **Include Entries** field to **All** or **Closed**. You can only apply general ledger entries that are **Open**.

4. Select the relevant general ledger entry, and then choose the **Set Applies-to ID** action.

The **Applies-to ID** field is updated with the user ID. The remaining amount is displayed in the **Balance** field on the **Apply General Ledger Entries** page.

5. Choose the **Post Application** action.

You can post the application even if the balance amount is equal to 0. When posted, the **Remaining Amount** field is affected as follows:

- If the **Balance** is equal to 0, then the **Remaining Amount** field on all ledger entries is set to 0.
- If the **Balance** is not equal to 0, then the amount in the **Balance** field is transferred to the **Remaining Amount** field for the general ledger entry that was selected when you posted the application.
- For all other general ledger entries, the **Remaining Amount** field is set to 0 and the **Open, Closed by Entry No., Closed by Amount, and Closed at Date** fields are updated.

NOTE

When posted, the general ledger entries which update the **Applies-to ID** field are deleted.

6. Choose the **OK** button.

To view the applied general ledger entries

1. Choose the  icon, enter **G/L Registers**, and then choose the related link.
2. Select a general ledger register, and then choose the **General Ledger** action.
3. Select the relevant general ledger entry, and then choose the **Applied Entries** action.

You can view all the applied general ledger entries.

4. Choose the **OK** button.

To unapply general ledger entries

1. Choose the  icon, enter **G/L Registers**, and then choose the related link.
2. Select a general ledger register, and then choose the **General Ledger** action.
3. Select the general ledger entry that you want to unapply, and then choose the **Undo Application** action.

The applied general ledger entries are unapplied.

NOTE

If an entry is applied to more than one application entry, you must unapply the latest application entry first. By default, the latest entry is displayed.

4. Choose the **OK** button.

See Also

[General Ledger](#)

Required Descriptions in G-L Entry

3/31/2019 • 2 minutes to read

When entering general journal lines on a form, the system fills in automatically the description field. This description will also be stored in the G/L entry after posting the journal. For a good audit trail, a more detailed description is desirable, when you post a journal line of type G/L Account.

To force the user to enter a more detailed description, it is possible to choose if the system must fill in automatically the description of the G/L account or leave the field blank. If the **Omit Default Descr. in Jnl. Field** check box on the **G/L Account Card** page is checked, the system will not fill in the **Description** field for that G/L account when selected in a general journal line.

When posting the journal lines, the system will check if all the **Description** fields are filled in. If there is a blank description, an error message will appear.

NOTE

Leaving the description field blank and check if all the description fields are filled in before posting, will only be done on the general journal pages in several application areas and on the local Cash Bank Giro pages.

See Also

[General Ledger](#)

Check Purchase Amounts

3/31/2019 • 2 minutes to read

Before posting a purchase invoice or credit memo, the program checks if the amount including VAT and the VAT amount stated on the purchase document is equal to the total amount of the inserted purchase lines. To do this, the **Doc. Amount Incl. VAT** and **Doc. Amount VAT** fields must be filled in in the **Purchase Invoice** or **Purchase Credit Memo** page.

In case there is only one purchase line or in case all lines are subject to the same VAT %, the correct **Doc. Amount VAT Field** will be calculated automatically when you have inserted the purchase lines and the **Doc. Amount Incl. VAT Field**. In case several lines exist with different VAT percentages, the **Doc. Amount VAT Field** must be changed manually.

Default the program will check the purchase document total amounts, but you can switch it off by deselecting the **Check Doc. Total Amounts** check box on the **Purchases & Payables Setup** page.

To determine the reason of the difference between the document total amounts and the total amounts of the inserted purchase lines, you have the possibility to let the program calculate the total amount, total base amount, total VAT amount and total amount including VAT of the inserted purchase lines and show them at the bottom of the purchase invoice or purchase credit memo page.

Default the program will not show these total amounts, but you can switch it on by selecting the **Show Totals on Purch. Inv.-CM.** check box on the **Purchases & Payables Setup** page.

NOTE

If you activate this field, totals on all purchase invoices and credit memos must be recalculated. This can be a time-consuming process depending on the number of documents that must be recalculated. You can not activate this field in case purchase invoices and/or credit memos exist without any purchase lines or in case you have purchase invoices and/or purchase credit memos with no quantity specified on the lines.

Edit Document Amounts in Purchase Invoices and Credit Memos

3/31/2019 • 2 minutes to read

Business Central lets you easily edit document amounts in purchase invoices and credit memos.

To edit document amounts

1. Choose the  icon, enter **Purchase Invoice** or **Purchase Credit Memo**, and then choose the related link.
2. Edit the document amount in the **Doc. Amount Incl. VAT** field and the **Doc. Amount VAT** field.
3. When you use the **Get Recurring Purchase Lines** action to insert lines based on a **Standard Purchase Code**, if the quantity in the first line is 0 or 1 and the unit cost is 0, Business Central compares the amount entered with the calculated total amount and applies the difference to the first line that was inserted.

Set Up Validation of Purchase Amounts

3/31/2019 • 2 minutes to read

In Business Central, you can activate the **Check Doc. Total Amounts** function to validate the total amount of purchase documents before posting a purchase invoice and purchase credit memo. By default, the purchase document total amount is validated when you post. The total amount of the inserted purchase lines must be equal to the amount including VAT and the VAT amount. To validate the purchase document amount automatically, you must enter the document amount including VAT and the document amount VAT in the **Purchase Invoice** or **Purchase Credit Memo** page.

If you have only one purchase line or several purchase lines with the same VAT percentage, the correct document amount VAT is calculated automatically when you insert the purchase lines and the document amount including VAT. If you have several purchase lines with different VAT percentages, the document amount VAT value must be changed manually.

You can also locate when the document total amounts and the total amounts of the inserted purchase lines are different. You can activate the **Show Totals on Purch. Inv./CM.** option to view the following in the inserted purchase lines:

- Total amount
- Total base amount
- Total VAT amount
- Total amount including VAT

The calculated amounts are displayed in the purchase invoice or purchase credit memo. By default, this total amount is not displayed.

You can activate this option only if the purchase invoice or purchase credit memo has:

- A minimum of one purchase line.
- The quantity field specified.

To set up validation of total amounts for purchase documents

1. Choose the  icon, enter **Purchases & Payables Setup**, and then choose the related link.
2. On the **General** FastTab, fill in the fields as described in the following table.

FIELD	DESCRIPTION
Show Totals on Purch. Inv./CM.	Select to recalculate the totals on all purchase invoices and credit memos. This can take more time depending on the number of documents that must be recalculated.
Check Doc. Total Amounts	Select to modify the Doc. Amount Incl. VAT and Doc. Amount VAT fields in the Purchase Invoice and Purchase Credit Memo pages.

3. Choose the **OK** button.

CMR Notes

3/31/2019 • 2 minutes to read

A CMR note is a bill of lading or an international consignment note defined under the 1956 United Nations Convention for the Contract of the International Carriage of Goods by Road. This is also known as the CMR Convention.

Claims with complete CMR note information are easily processed.

CMR Notes

Countries that follow the CMR Convention adhere to a standard form for CMR notes. The type of CMR note used depends on the type of transaction. There are three types:

- **CMR - Sales Shipment** – This report is used to print CMR documents for sales shipments. For each CMR document, the report shows address data for the sender, shipping agent and consignee, along with data about the shipped items.
- **CMR - Purchase Return Shipment** – This report is used to print CMR documents for purchase return shipments. For each CMR document, the report shows address data for the sender, shipping agent and consignee, along with data about the shipped items.
- **CMR - Transfer Shipment** – This report is used to print CMR documents for transfer shipments. For each CMR document, the report shows address data for the location from which the items are shipped, the location to which the items are shipped, and information regarding the shipping agent, along with data about the shipped items.
- **CMR - Purchase Return Shipment** – This report is used to print CMR documents for purchase return shipments. For each CMR document, the report shows address data for the sender, shipping agent and consignee, along with data about the shipped items.

NOTE

CMR notes are formatted to print on preprinted CMR forms.

The following details the standard life cycle of a CMR note:

- The warehouse manager prints the CMR notes for the shipments that need to be sent.
- The shipments are then packed and handed to the truck driver, along with the CMR notes.
- The driver ensures that each shipment has a CMR note.
- When goods are delivered to the customers, the driver ensures that the customers sign the CMR notes.
- The signed CMR notes are then given to the respective internal Accounts Receivable departments.
- The Accounts Payable administrators receive the signed CMR notes, along with the invoice for freight forwarding services from the freight forwarder.

Import Post Code Updates

3/31/2019 • 2 minutes to read

Every month a post code file will be delivered with all post code mutations in a month. This post code file can be imported and update the relevant data of the **Post Code Range** table.

To import the update file

1. Choose the  icon, enter **Post Codes Updates**, and then choose the related link.
2. On the **Post Codes Updates** page, choose the **Import Post Codes Update** action.
3. Specify the path and name of the post code update file, and then choose the **OK** button. If you do not want to import the file, choose the **Cancel** button to close the page.

If there is no file imported with a full set of post code data, then a message appears.

Before updating the post codes the following checks will be performed:

- Is there already an update file imported with a Date Field later then the date of this new update file? If so then the process will stop.
- Is there a gap between the date of this file and the value in the Date Field field for the last imported file? If there is a gap then a message appears. You can choose if you still want to import the update file.

Information about the imported post code will be saved in the Post Code Update Log Entry Table table.

Withholding Tax

3/31/2019 • 2 minutes to read

Withholding Tax (WHT) is tax withheld by a company when making a payment to a vendor, in which the full amount owed to that vendor is reduced by the tax withheld. The withheld tax is then remitted to tax authorities during the next Business Activity Statement (BAS) submission.

The New Zealand government requires taxes to be withheld from payment to vendors under the following circumstances:

- The vendor is a local supplier who has not supplied a New Zealand Inland Revenue Department number (IRD) before the payment is processed, and the individual transaction amount is greater than the specified threshold amount.
- The vendor is a non-resident supplier and the payment is to be made to this non-resident entity in the form of interest, royalty, or dividend payments. Currently, there is no minimum threshold amount. Withholding rates may vary due to payment, or international tax treaties existing between New Zealand and the vendor's country.

Fields within **WHT Business Posting Groups** and **WHT Product Posting Groups** must be set up on the **WHT Posting Setup** page so that the correct WHT calculations are made for each vendor.

- **WHT Calculation Rule** – This field controls how calculation applies to the **WHT Minimum Invoice Amount**, or the invoice threshold amount. The following options exist:
 - **Less than**
 - **Less than or equal to**
 - **Equal to**
 - **Greater than**
 - **Greater than or equal to**

In New Zealand, WHT is not calculated if the individual invoice amount is less than or equal to the threshold amount. Companies should select **Less than or equal to**.

- **WHT Minimum Invoice Amount** – Enter the invoice threshold amount.
- **WHT %** – Enter the relevant WHT rate for the particular combination of **WHT Business Posting Group** and **WHT Product Posting Group**. If you do not wish to calculate any withholding amount, enter 0.00.
- **Realised WHT Type** – Select **Payment** to calculate only the withholding amount at the time of payment. The other options of **Invoice** and **Earliest** do not apply to New Zealand.
- **Payable WHT Account Code** – Enter the number of the G/L account to which you want to post **Purchase WHT** for the particular combination of **WHT Business Posting Group** and **WHT Product Posting Group**.
- **Purch. WHT Adjustment Account No.** – Select an account number for **Purchase CR/Adj Note** adjustments.
- **Revenue Types** – Drill down to the **WHT Revenue Types** page. These values determine how the combination of **WHT Business Posting Group** and **WHT Product Posting Group** are displayed in reports. You must enter a value in order for this combination to appear in the WHT reports.

WHT for Suppliers Without an IRD

Ensure that there is a valid combination of **General Business** and **General Product Posting Groups** with the correct threshold. For example, in New Zealand today the minimum threshold is \$75 with a rate of 46.50%.

The percentage withheld is specified in **WHT Posting Setup**. The amount to be withheld is calculated

automatically at the time of payment. The WHT certificate is printed automatically, and then sent to the vendor with payment. The WHT certificate explains the reasons for not sending the full invoiced amount.

WHT for Foreign Suppliers

Ensure that a valid combination of **General Business** and **General Product Posting Groups** has been established for vendors for whom you need to withhold tax, other than for non-IRD.

Set Up Withholding Tax

3/31/2019 • 3 minutes to read

Withholding tax (WHT) is the tax withheld by a company when it makes a payment to a vendor, in which the full amount owed to the vendor is reduced by the tax withheld. The withheld tax is then remitted to tax authorities when the next Business Activity Statement (BAS) is submitted.

If a supplier without a New Zealand Inland Revenue Department number (IRD) provides an invoice, a withholding tax amount must be withheld if the total amount of the invoice is more than the threshold amount.

To use withholding tax, you must set up the business posting groups and product posting groups for withholding tax so that the correct WHT calculations are made for each vendor.

NOTE

As a prerequisite, you need to set up source codes for WHT settlement on the **Source Code Setup** page.

The following procedure describes how to set up product posting groups for WHT, but the same steps also apply to setting up business posting groups for WHT.

To set up a product posting group for withholding tax

1. Choose the  icon, enter **WHT Product Posting Group**, and then choose the related link.
2. Fill in the fields as described in the following table.

FIELD	DESCRIPTION
Code	Specify the code for the product posting group. You can enter a maximum of 10 alphanumeric characters.
Description	Specify the description for the product posting group. You can enter a maximum of 50 alphanumeric characters.

3. Choose the **OK** button.

To set up posting for withholding tax

1. Choose the  icon, enter **WHT Posting Setup**, and then choose the related link.
2. Fill in the fields as described in the following table.

FIELD	DESCRIPTION
WHT Business Posting Group	Specifies the business posting group code for withholding tax.
WHT Product Posting Group	Specifies the product posting group code for withholding tax.

FIELD	DESCRIPTION
WHT Calculation Rule	<p>Specifies the calculation rule for WHT, which is used with the amount specified in the WHT Minimum Invoice Amount field. This will help identify the transactions for which WHT will not be deducted.</p> <p>For example, if you select the Less than option here and enter 100 in the WHT Minimum Invoice Amount field, then WHT will not be deducted for those transactions with an amount less than 100.</p>
WHT Minimum Invoice Amount	Specifies the threshold amount that is below which WHT will not be deducted.
WHT %	Specifies the WHT rate. You must enter the rate without the percent sign.
Realized WHT Type	Specifies the mode of WHT calculation for purchases or sales of items.
Prepaid WHT Account Code	Specifies the general ledger account number to which sales WHT is to be posted.
Payable WHT Account Code	Specifies the general ledger account number to which purchase WHT is to be posted.
WHT Report	Specifies the withholding tax report type.
Bal. Prepaid Account Type	Specifies the type of balancing account for sales WHT transactions.
Bal. Prepaid Account No.	Specifies the account number or bank name for sales WHT transactions, based on the type selected in the Bal. Prepaid Account Type field.
Bal. Payable Account Type	Specifies the type of balancing account for purchase WHT transactions.
Bal. Payable Account No.	Specifies the account number or bank name for purchase WHT transactions. This is based on the type selected in the Bal. Payable Account Type field.
WHT Report Line No. Series	Specifies the number series for the WHT report line.
Revenue Type	Specifies the revenue type. For more information, see Set Up Revenue Types for Withholding Tax .
Purch. WHT Adj. Account No.	Specifies the account number which to post purchase credit memo adjustments.
Sales WHT Adj. Account No.	Specifies the account number to post sales credit memo adjustments.
Sequence	Specifies the sequence in which the withholding tax posting setup information must be displayed in reports.

3. Choose the **OK** button.

Set Up Revenue Types for Withholding Tax

3/31/2019 • 2 minutes to read

Revenue types are used to categorize withholding tax (WHT) entries and are used for WHT certificates. You can use the **WHT Revenue Types** page to set up the revenue types for withholding tax.

To set up revenue types for withholding tax

1. Choose the  icon, enter **WHT Revenue Types**, and then choose the related link.
2. Fill in the fields as described in the following table.

FIELD	DESCRIPTION
Code	Specifies the unique code for the revenue type. You can enter a maximum of 10 alphanumeric characters.
Description	Specifies the description for the WHT revenue type.
Sequence	Specifies the sequence in which you want to group the revenue types. For example, a revenue type with sequence 0 will be displayed before sequence 1.

3. Choose the **OK** button.

Set Up Goods and Service Tax Posting

3/31/2019 • 2 minutes to read

Goods and services tax (GST) is the tax that is applied on most goods and services. The GST that is paid and received during a period is reported in the Business Activity Statement (BAS) that has to be submitted to the tax authority.

To set up posting details for GST, you must define the posting groups, rate of GST, and the accounts to which GST is to be posted. You can set up this information for a particular combination business posting groups and product posting groups.

To set up goods and sales tax posting

1. Choose the  icon, enter **VAT Posting Setup**, and then choose the related link.
2. Fill in the fields as described in the following table.

FIELD	DESCRIPTION
VAT Bus. Posting Group	Specifies the VAT business posting group code.
VAT Prod. Posting Group	Specifies the VAT product posting group code.
VAT Identifier	Specifies the code that is used to group similar VAT setups with similar attributes. For example, you can group a number of VAT posting setups that have a common VAT percentage.
VAT %	Specifies the VAT rate.
VAT Calculation Type	Specifies the method that is used to calculate the purchase or sale of items.
Sales VAT Account	Specifies the number of the general ledger account to which you want to post the sales VAT. If you have selected the Reverse Charge VAT option in the VAT Calculation Type field, then do not enter a value in this field.
Purchase VAT Account	Specifies the number of the general ledger account to which you want to post the purchase VAT.
Reverse Chrg. VAT Acc.	Specifies the number of the general ledger account to which you want to post the reverse charge VAT. You can enter a value in this field only if you have selected the Reverse Charge VAT option in the VAT Calculation Type field.

3. Choose the **OK** button.

Set Up Vendors Without IRD numbers for Calculating the Withholding Tax

3/31/2019 • 2 minutes to read

Withholding Tax (WHT) is calculated for local vendors who do not have a New Zealand Inland Revenue Department number (IRD), as required by tax law.

To set up vendors without IRD for calculating the withholding tax

1. Choose the  icon, enter **Vendors**, and then choose the related link.
2. Choose the required vendor, and then choose the **Edit** action.
3. On the **Vendor Card** page, on the **Registration** FastTab, make sure the **IRD No.** field and the **Foreign Vend** field must be empty.
4. Choose the **OK** button.

NOTE

The WHT percentage is automatically withheld in accordance with what was specified on the **WHT Posting Setup** page. The WHT certificate is produced for submission to the vendor. For more information, see [Withholding Tax](#).

Calculate and Post Withholding Tax Settlements

3/31/2019 • 2 minutes to read

You can use the **Calc. and Post WHT Settlement** page to calculate and post the withholding tax (WHT). You can close WHT entries that are open or not settled and transfer the corresponding amount to the WHT settlement account.

The sum of all withheld amounts is reported as a truncated whole number to the New Zealand tax authorities.

NOTE

The truncated cents are accounted for in a rounding account.

To calculate and post withholding tax settlements

1. Choose the  icon, enter **Calc. and Post WHT Settlement**, and then choose the related link.
2. On the **Options** FastTab, fill in the fields as described in the following table.

FIELD	DESCRIPTION
Starting Date	The start date of the period for which WHT has to be settled.
Ending Date	The end date of the period for which WHT has to be settled.
Posting Date	The posting date of the WHT settlement entries.
Document No.	The document number of the WHT settlement entries.
Description	The WHT settlement description.
Settlement Account Type	The settlement account type.
Settlement Account	The account number based on the account type selected in the Settlement Account Type field.
Rounding G/L Account	The account to which the truncated amount is to be posted.
Show WHT Entries	Select to view the withholding tax entries for the specified period.
Post	Select to post the WHT settlement entries.

3. Choose the **Print** button to print the report or choose the **Preview** button to view it on the screen.

Calculate Goods and Services Tax on Prepayments

3/31/2019 • 2 minutes to read

When a partial payment or prepayment is made, you must calculate Goods and Services Tax (GST) for that partial payment or prepayment based on the total invoice amount, instead of on a partial amount. If you account for GST on a non-cash basis, you must report and pay GST on payments during the period in which you receive partial payment or issue a tax invoice for payment.

To calculate GST on prepayments

1. Choose the  icon, enter **General Ledger Setup**, and then choose the related link.
2. On the **Local Functionalities** FastTab, select the **Full GST on Prepayment** check box to calculate GST for the total invoice amount when a prepayment invoice is posted.
3. Choose the **OK** button.

Electronic Funds Transfer (EFT)

3/31/2019 • 2 minutes to read

You can pay vendors using the electronic funds transfer (EFT) system in New Zealand.

Setting up Electronic Funds Transfer in Business Central

Business Central can export EFT files that you can then upload to your bank's website for additional processing. To submit EFT files, you must set up the following information:

- You must add EFT information to the bank account or bank accounts that you will use to pay vendors electronically. The EFT-specific fields are in the **Transfer** FastTab on the **Bank Account** page.
- For those vendors that you want to pay electronically, you must select the **EFT Payment** check box and specify the vendor bank account in the **EFT Vendor Bank Account Code** field on the **Vendor** page.

When you have set up bank accounts and vendors, you can create EFT file that are based on entries in the payment journal. When you create an EFT file, an entry is made in the **EFT Register** table. On the EFT Register page you can drill down to see the vendor ledger entries for the EFT file. On the Payment Journal page, you can also import existing EFT register entries to the payment journal by using the **Transfer EFT Register** batch job.

Print Deposit Slip Reports

3/31/2019 • 2 minutes to read

The **Deposit Slip** report displays cash and check details in a format required by the bank.

To a print deposit slip report

1. Choose the  icon, enter **Cash Receipt Journals**, and then choose the related link.
2. Select the **Bank** journal.
3. Choose the **Edit Journal** action.
4. On the **Cash Receipt Journal** page, choose the **Print Deposit Slip** action.
5. On the **Gen. Journal Line** FastTab, select the appropriate filters.
6. Choose the **Print** button to print the report or choose the **Preview** button to view it on the screen.

Calculating Distribution Amounts

3/31/2019 • 2 minutes to read

You can reallocate the amount in one general ledger account to other general ledger accounts so that the balances of your accounts remain proportionate to one another.

Use the **Calculate Distribution Amount** function to calculate the allocation percentage based on the balances of the accounts, or the net changes between the accounts. Run the **Calculate Distribution Amount** function from the **Allocation** page for the Standard Balance and Reverse Balance recurring methods in the **Recurring Journal**.

The net changes or balances of the accounts on the **Allocation** page determine the allocation percentage calculated.

Addresses

3/31/2019 • 2 minutes to read

A single postal code can include multiple cities in the same region.

At the same time, cities with the same name are sometimes located in different regions.

To avoid confusion and improve address accuracy, available options display when you enter data in address fields. For example, when you enter a postal code on a customer card, you can select from a list of all available cities for that postal code in the **City** field drop-down list. Likewise, when you enter a city name, you can select from a list of all available regions in the **Region** field drop-down list.

To enable this functionality, you must enter the data into the **Post Code** table. You can do this manually, or you can download a copy of the New Zealand postal codes for New Zealand.

To increase postal efficiency in New Zealand, the postal department has introduced an address bar coding system in which every address is assigned a unique identifier called a Delivery Point Identifier (DPID). From the DPID, a bar code is generated and printed for each address. Companies can receive discounts on bulk mailings if they use these bar codes. To retrieve a DPID, you must connect to the local postal database that uses authorized Address Matching Approval System (AMAS) software. You can reduce your number of postal returns by validating customer addresses using the AMAS database.

When you print an address that has a DPID, a bar code will be printed together with the address. If you cannot print bar codes, the DPID will be printed together with the address.

Contact your Microsoft partner for information on how to obtain AMAS software.

Determine Sales Price by Cost Plus Percentage

3/31/2019 • 2 minutes to read

Use the cost plus percentage function to set a sales price based on the cost of an item. The cost of the item can be calculated along with cost plus calculation. The discount will be based on this calculation. This functionality eliminates the need for the use of spreadsheets in determining percentage discounts as they correspond to cost plus percentage.

To determine sales tax by cost plus percentage

1. Choose the **Receivables** action.
2. Choose the **Customers** action.
3. Open the card for a relevant customer.

–or–

Choose the **New** action.

NOTE

For a new customer, in the **No.** field, enter the customer number.

4. To open the **Sales Prices** page, choose the **Prices** action.
5. In the **General** section, fill in the fields as described in the following table.

FIELD	DESCRIPTION
Sales Type Filter	Select one of the following options: <ul style="list-style-type: none">- Customer- Customer Price Group- All Customers- Campaign- None
Sales Code Filter	The sales code.
Item No. Filter	The item number.
Starting Date Filter	The starting date.
Currency Code Filter	The currency code.

6. Enter information into the relevant fields.
7. To send the details to a recipient, choose the **Send To** action, and then select one of the following formats:
 - **Recipient as Attachment**
 - **Microsoft Word**
 - **Microsoft Excel**

8. Choose the **OK** button.

[New Zealand Local Functionality](#)

New Zealand Inland Revenue Department Numbers and Adjustment Notes

3/31/2019 • 2 minutes to read

A New Zealand Inland Revenue Department Number (IRD) is a single identifier for all business dealings with the tax office, and for dealings with other government departments and agencies.

IRDs and adjustment notes—or credit memos—are used to satisfy tax requirements.

IRD number

All companies must register and apply for an IRD number to report the details of payment summaries issued to their payees during the financial year. The payment summary includes the Tax File Numbers (TFN) or business numbers of the payees.

Adjustment Notes

Adjustment notes are issued by suppliers to a business when the amount of consideration for taxable supplies changes. The recipient needs an adjustment note to claim more or less GST credits than previously claimed.

An adjustment event may result in an increase or decrease to your net amount for the tax period.

Adjustment notes—or credit memos—should be connected to an invoice.

Because credit memos are used for adjustment notes, each credit memo should satisfy all of the legal requirements for an adjustment note. Each credit memo should have an original invoice number, date, and reason code assigned to it. The following fields are included in the adjustment note:

- **Adjustment Applies to:** The number of the document to which the adjustment note applies. If you use the **Copy Document** function, this field populates automatically. You must enter a reason code before the transaction can be posted. You can use this field to create an adjustment note for a paid or closed transaction.
- **Adjustment Reference No:** The number of the adjustment note. For **Sales & Receivables**, the number assigned to the posted document populates automatically in this field.
- **Adjustment Note Date:** Automatically populated from the document date.
- **Adjustment:** These entries populate automatically. Adjustment notes can only be applied against a single document.

Norwegian VAT Reporting

3/31/2019 • 2 minutes to read

Business Central [../](#)includes Norwegian enhancements that allow you to calculate and report VAT to the Norwegian tax authorities.

This topic shows the typical steps that you should follow when reporting Norwegian VAT.

Print the Trade Settlement

First, you must print the trade settlement. Use the **Tradesettlement** report to print the trade settlement that is required by the authorities.

This report prints detailed information about the posted VAT in the specified period. On the last page of the report, the actual trade settlement to report is printed.

This report can be printed as many times as required. No posting or other changes are made to the data when you use this report.

Check the Trade Settlement

Next, you must check the trade settlement. Verify that the amounts in the trade settlement are correct, and make any necessary adjustments.

Post VAT

If the information in the trade settlement is correct, the final step is to post the VAT using the **Calc. and Post VAT Settlement** report. It is required that you manually specify the correct VAT period in the **Starting Date** and **Ending Date** fields. Generally, these dates correspond to the period previously specified in the **Tradesettlement** report.

When using this report, you can decide not to post if you want to check the results before you actually post VAT.

When posting VAT, the corresponding VAT period is created and marked as closed in the **Settled VAT Period** table. If you specify a period that does not correspond to one of the typical six Norwegian VAT periods, all periods that are affected by the specified date interval are closed.

See Also

[Norway Local Functionality](#)

Norwegian VAT Codes

3/31/2019 • 3 minutes to read

In Business Central, VAT processing information can be easily set up using standard Norwegian VAT codes. The following table shows the standard Norwegian VAT codes.

CODE	DESCRIPTION
0	Sale - No VAT
1	Purchase - VAT
2	Purchase - VAT and Inv. Tax
3	Sale - VAT
4	Purchase - VAT and 0% Inv. Tax
11	Purchase - Full VAT
13	Sale - Full VAT
14	Purchase - Reverse Charge VAT

Typically, you enter the **VAT Bus. Posting Group** and **VAT Prod. Posting Group** fields when you specify the VAT handling process.

If you want to use only the **VAT Code** field when you specify the VAT handling process, you can assign a VAT code in the **VAT Posting Setup** table, and use this code instead of the posting group fields. The VAT code can be used as a shortcut in the **VAT Posting Setup** table and at the same time, you can use standard Norwegian VAT codes.

Set Up of Norwegian VAT Codes

You must create the Norwegian VAT codes on the **VAT Codes** page. Then assign the VAT codes in the **VAT Posting Setup** table, using the **VAT Code** field. For more information, see [Use One VAT Code in Journals](#).

Use of VAT Codes

When you specify a VAT code, you can select the VAT posting setup information for this code. This information will be used in journals or on document lines when you specify the VAT setup information. If you use the VAT code in these cases, the posting group fields are used with the information from the corresponding VAT posting setup information.

Alternatively, you will have to specify both the **VAT Bus. Posting Group** and the **VAT Prod. Posting Group** fields when you select or change the VAT posting setup information on the journal line or the document line.

Example: Using VAT Codes

There are two different VAT posting setup instances that can be used when you post a sales document.

One VAT posting setup scenario will calculate 24 percent VAT for domestic customers:

- VAT Bus. Posting Group: DOMESTIC
- VAT Prod. Posting Group: NORMAL
- VAT %: 24
- VAT Code: 3

One VAT posting setup scenario will calculate without VAT for international customers:

- VAT Bus. Posting Group: EXPORT
- VAT Prod. Posting Group: NORMAL
- VAT %: 0
- VAT Code: 1

Typically, when you specify the VAT setup information on a journal line, the **VAT Bus. Posting Group** field must be set to **DOMESTIC** and the **VAT Prod. Posting Group** field must be set to **NORMAL** in order to choose the domestic setup.

If you use standard Norwegian VAT codes, you could specify **VAT Code 3** for the domestic VAT posting setup information, and **VAT Code 1** for the international VAT posting setup information. This lets you choose between the VAT posting setup information using only one field and the familiar standard Norwegian VAT codes.

Example: Restricting the Use of VAT Codes

The standard Norwegian **VAT Code 3** is used for sales inclusive of VAT. Unless you restrict the use of this VAT code, it can be used for both sales and purchases in Business Central.

You can define the **Gen. Posting Type** field as a sale in the **G/L Account (Analysis View)** table. This general posting type will be used together with **VAT Code 3**.

The general posting type will be handled in two ways, depending on the value in the **Test Gen. Posting Type** field.

OPTION	DESCRIPTION
Mandatory	<p>The general posting type is automatically set to Sale on journal lines. Before you post, Business Central verifies if the general posting type is specified, but there is no verification if the field is set to Sale.</p> <p>VAT Code 3 can be used for both sales and purchase documents.</p>
Same	<p>The general posting type is automatically set to Sale on journal lines. Before you post, Business Central verifies if the general posting type is set to Sale.</p> <p>VAT Code 3 can be used for sales documents, but not on purchase documents.</p> <p>This enables you to restrict the use of VAT codes to predefined general posting types.</p>

[Norwegian VAT Reporting](#)

Use One VAT Code in Journals

3/31/2019 • 2 minutes to read

In Norway, you can use the feature one VAT code in a journal, so that you can post VAT by using a single field, **VAT Code**. After it is set up, the one VAT code is a quick way to fill in the commonly used VAT fields.

To set up the VAT code for purchase orders and sales orders, the corresponding VAT business posting groups and the VAT product posting groups have to be defined.

The VAT rate is calculated from the combination of VAT business posting groups, buyer information, and VAT product posting groups.

To create a VAT code

1. Choose the  icon, enter **VAT Codes**, and then choose the related link.
2. Choose the **New** action.
3. Enter information in the **Code**, **General Posting Type**, and **Description** fields for each VAT code.
4. Choose the **OK** button to close the **VAT Codes** page.

The following procedure explains the VAT posting setup.

To set up VAT posting

1. Choose the  icon, enter **VAT Posting Setup**, and then choose the related link.
2. Choose the **New** action.
3. In the **VAT Posting Setup** card, fill in the following fields:
 - **VAT Business Posting Group**
 - **VAT Product Posting Group**
 - **VAT Identifier**
 - **VAT Percentage**
 - **Sales VAT Account**
 - **Purchase VAT Account**
4. In the **VAT Code** field, select a code from the list.

Now, when you post a document in the general journal and close it, the information specified in the **VAT Posting Setup** card is applied.

For example, the VAT rate posted in the journal is defined by the setup that you have specified on the **VAT Posting Setup** page.

NOTE

The **VAT Code** and the **Bal. VAT Code** fields have been added to the journal. The **Bal. VAT Code** is the VAT code that is used to calculate the balancing account.

No changes are made to the posting.

See Also

Proportional VAT

3/31/2019 • 2 minutes to read

Business Central allows you to calculate VAT when there is both deductible and non-deductible VAT. Because it is difficult to know where and how an item is used, you will have to contact the Norwegian tax authorities to determine whether a specified percentage of the VAT is deductible based on historical data.

Example

A bus company owns both buses and trucks. When gasoline is purchased, the gasoline is stored in one holding tank. When the gasoline is used in a bus for transporting children, it is not deductible. When the gasoline is used in a truck, the gasoline may be deductible. The agreement between the bus company and the Norwegian tax authorities might be that 60 percent of the VAT is deductible.

If you have a purchase invoice of \$12,500 based on 25 percent VAT with the **Calc. Prop. Deduction VAT** field on the **VAT Posting Setup** page set to **Yes** and the **Proportional Deduction VAT %** field set to **60 percent**, only 60 percent of the VAT is deductible in a journal. When the invoice is posted, the postings are as follows:

- To vendor general ledger account - \$12,500 (credit)
- To cost account 4010 - \$11,000 (debit)
- To VAT account 2720 - \$1,500 (debit)

Generally, based on 25 percent VAT, the VAT amount would be \$2,500. However, only 60 percent is deductible; therefore the VAT amount is $\$2,500 \times 60\% = \$1,500$. The non-deductible amount of \$1,000 is added to the cost account. The VAT base has corresponding values. This amount should have been \$10,000, but because only 60 percent is deductible, the base is \$6,000.

This also works if the transaction with this VAT combination is posted through a purchase order.

NOTE

If this functionality is used on a purchase order that is used for buying items for inventory, the functionality will not influence the cost of the item. The cost of the item will be added by using the non-deductible VAT. This works on the general ledger level only.

[Calculate Proportional VAT](#)
[Norwegian VAT Reporting](#)

Calculate Proportional VAT

3/31/2019 • 2 minutes to read

You can use proportional VAT to calculate VAT when there is both deductible and non-deductible VAT. Because it is difficult to know where and how an item is used, you will have to contact the Norwegian tax authorities to determine whether a specified percentage of the VAT is deductible based on historical data.

To calculate proportional VAT

1. Choose the  icon, enter **VAT Posting Setup**, and then choose the related link.
2. On the **VAT Posting Setup** page, fill in the fields as described in the following table.

FIELD	DESCRIPTION
Calc. Prop. Deduction VAT	Select to indicate that you want to use the proportional VAT percentage. Important: This field is available on the VAT Posting Setup page, but it is not shown by default. You can change how certain UI elements are displayed. For more information, see Personalizing Your Workspace .
Proportional Deduction VAT %	Enter the percentage of VAT to deduct.

3. Choose the **OK** button.

Print a VAT Reconciliation Report

3/31/2019 • 2 minutes to read

The **VAT Reconciliation** report shows the reconciliation settlement for the base amount and the VAT amount for general ledger accounts. These amounts are grouped by different VAT types.

To print the VAT reconciliation report

1. Choose the  icon, enter **VAT Reconciliation**, and then choose the related link.
2. On the **Options** FastTab, fill in the fields as described in the following table.

FIELD	DESCRIPTION
Show Details	Select if you want to include individual transactions. If cleared, only one accumulated total will be printed for each account.
Show Transactions without VAT	Select if you want to print a list of all transactions without VAT amounts.

3. Choose the **Print** button to print the report or choose the **Preview** button to view it on the screen.

Electronic Banking in Norway

3/31/2019 • 2 minutes to read

Business Central includes Norwegian enhancements to electronic banking. You can use this functionality to perform the following operations:

- Receive electronic payments based on an optical character recognition (OCR) payment ID.
- Print Kunde ID (KID) numbers on sales and receivables documents.
- Send electronic payments to vendors.

Customer Identification Numbers

Kunde ID (KID) is a customer identification number that provides a payment reference to the vendor and ensures that the vendor is posting the payment correctly. If the vendor documents include the KID number, you should use this number as there may be a higher cost for the payment if you do not.

The KID can be entered in the following locations:

- Sales invoices
- Finance charge memos
- Reminders
- Purchase orders
- Purchase invoices
- Purchase journals
- Remittance journals

NOTE

The KID cannot be used for credit memos. If a credit memo is part of the payment, invoices in the same payment must be treated as payments without a KID.

Electronic Payments to Vendors in Norway

3/31/2019 • 2 minutes to read

Business Central includes Norwegian enhancements for automatically making payments to vendors. This reduces errors that occur from manual data entry. You can use this functionality to perform the following operations:

- Search invoices that are due based on different conditions.
- Send payments to the bank.
- Receive messages from the bank on the status of payments.
- Receive paid transaction information to be posted.

You can make electronic payments using the following formats:

- TelePay
- Remittance payment

Electronic Payment Process

The following steps show how electronic payments are processed:

1. The payment proposal is run in the electronic payments feature and transferred to the bank by using the bank's software.
2. The bank's software receives the payments and transfers payments to the bank.
3. The bank receives the payments and sends the first-time return receipt to Business Central using the bank's software.
4. The bank executes the payments and sends the settlement return (second-time return receipt) to Business Central using the bank's software where the payments are posted.

Vendor Payment Requirements

If the payment transactions do not fulfill the requirements, an error message appears and you cannot create a payment file for transfers to the bank. The following criteria must be met when you process payments to vendors:

- The payment transaction must be positive or zero. A payment transaction must transfer a positive amount (or zero) to the payment receiver. This means that deducting a credit memo requires an invoice with the same or higher amount in the same payment transaction. Money cannot be deducted from the vendor's account.
- A credit memo must be applied with the invoice. Generally a credit memo does not contain a Kunde ID (KID). You cannot pay a credit memo in a payment transaction with invoices that contain a KID. This is because payments are usually split into transactions with or without a KID. This means that if a credit memo without a KID is paid with an invoice in the same payment transaction, the invoice must be paid without a KID, and the recipient reference number must be used instead.
- If the invoice and credit memo are paid in the same payment transaction, the payment must occur on the same date using the same currency and exchange rate.

EHF Electronic Invoicing in Norway

3/31/2019 • 2 minutes to read

Companies must send sales invoices and credit memos to the Norwegian public sector electronically in the Elektronisk Handelsformat (EHF) based on Universal Business Language (UBL). If a company does not send these documents electronically, the authorities can deny payment. The standard supported format for electronic exchange between parties is the Ehandel.no format. For more information on EHF electronic invoicing, see [E-Procurement](#).

Implementation in Business Central

From January, 2019, the requirements for sending electronic invoices are based on the PEPPOL BIS Billing 3.0 standard. For more information, see the [EHF Billing 3.0](#) page from the Agency of Public Management and eGovernment. Companies that are already sending electronic documents in the pre-2019 format can continue to do so during 2019.

To send documents electronically, you must assign European Article Numbering (EAN) location numbers and account codes to the relevant customers on the **Customer Card** page. For more information, see [Set Up Customers for EHF](#). These numbers are included when you create, post, or issue documents. After documents are posted or issued, you can create electronic versions to send to customers.

Business Central exports certain electronic documents in EHF version 3.0, which uses UBL version 2.1. You can submit the following types of documents:

- Sales and service invoices
- Sales and service credit memos

Business Central exports other electronic documents in version 1.6, which uses UBL version 2.0. You can submit the following types of documents:

- Finance charge memo
- Reminder

You can specify where to store electronic documents on the **Sales & Receivables Setup** page. You can also use the [Document Exchange functionality](#) to generate and send them.

VAT Treatment

VAT percentages and the type of transaction determine the VAT Type that is exported in the electronic document.

XML	TYPE
S	Outgoing VAT, ordinary rate
H	Outgoing VAT, reduced rate – food and beverage
R	Outgoing VAT, reduced rate – raw fish
AA	Outgoing VAT, low rate
AE	VAT Reverse Charge

XML	TYPE
L	Canary Islands general indirect tax
M	Tax for production, services and importation in Ceuta and Melilla
G	Free export item, tax not charged
O	Services outside scope of tax
E	VAT Exempt
Z	VAT Exempt (goods and services not included in the VAT regulations)
K	VAT exempt for EEA intra-community supply of goods and services

[Set Up Customers for EHF](#)

Set Up Customers for EHF

3/31/2019 • 2 minutes to read

To create Elektronisk Handelsformat (EHF) documents for customers in the public sector, you must add EHF information to the relevant customers.

This topic only describes fields that apply to EHF. For more information on setting up customers, in general, see [Register New Customers](#).

To set up a customer that uses Elektronisk Handelsformat

1. Choose the  icon, enter **Customers**, and then choose the related link.
2. Open the customer that you want to enable for EHF.
3. On the **Invoicing** FastTab, fill in the fields as described in the following table.

FIELD	DESCRIPTION
GLN	Required. Enter the Global Location Number (GLN) for the customer.
Account Code	Enter the account code for the customer. Customers in the public sector provide an account code when they place an order or requisition. Based on the value of this field, the account code is included in the EHF documents that you create in Business Central. For more information, see Account Code .
E-Invoice	Select the check box to use electronic invoicing with this customer.
Responsibility Center	Make sure that the Responsibility Center that you have selected has a Country/Region Code specified.

These fields are specific to EHF. The values are used in all EHF documents that you create for this customer. For more information, see [EHF Electronic Invoicing in Norway](#).

Set Up EHF

3/31/2019 • 2 minutes to read

You must define a location for storing Elektronisk Handelsformat (EHF) files when you create electronic documents such as invoices or credit memos. You must also define payment methods and set up relevant customers for EHF.

To set up EHF file locations for sales and receivables

1. Choose the  icon, enter **Sales & Receivables Setup**, and then choose the related link.
2. On the **Sales & Receivables Setup** page, on the **E-Invoice** FastTab, in the **Output Paths** section, fill in the fields as described in the following table.

FIELD	DESCRIPTION
Invoice Path	The path and name of the folder where you want to store the EHF files for sales invoices.
Cr. Memo Path	The path and name of the folder where you want to store the EHF files for sales credit memos.
E-Invoice Reminder Path	The path and name of the folder where you want to store the EHF files for reminders.
E-Invoice Fin. Charge Path	The path and name of the folder where you want to store the EHF files for finance charge memos.

3. Choose the **OK** button.

To set up EHF file locations for service management

1. Choose the  icon, enter **Service Mgt. Setup**, and then choose the related link.
2. On the **Service Mgt. Setup** page, on the **E-Invoice** FastTab, in the **Output Paths** section, fill in the fields as described in the following table.

FIELD	DESCRIPTION
E-Invoice Service Invoice Path	The path and name of the folder where you want to store the EHF files for service invoices.
E-Invoice Serv. Cr. Memo Path	The path and name of the folder where you want to store the EHF files for service credit memos.

3. Choose the **OK** button.

Create Electronic Documents for EHF

3/31/2019 • 2 minutes to read

When you sell goods or services to a customer in the public sector, you must submit documents electronically. In Business Central, you can create electronic documents for invoices, credit memos, reminders, and finance charge memos. Before you can create the electronic documents, you must have set up file locations and information about the customers. For more information, see [Set Up EHF](#) and [Set Up Customers for EHF](#).

Electronic documents can only be created after a document has been posted or issued. The following procedures describe how to post a sales invoice with the required information and then create an electronic sales invoice, but the same steps also apply to sales credit memos, reminders, finance charge memos, service invoices, and service credit memos.

NOTE

The sum of lines in an exported electronic document will not reflect invoice rounding, even if it is enabled. Instead, Business Central sums the lines without rounding.

To post a sales invoice

1. Choose the  icon, enter **Sales Invoices**, and then choose the related link.
2. Select the sales invoice that you want to post, and then choose the **Edit** action.
3. On the **General** FastTab, make sure that the following fields contain values:

- **External Document No.**
- **Your Reference**

The **External Document No.** field contains the document number that the customer provided.

4. On the **Invoicing** FastTab, make sure that the following fields have values:

- **GLN No.**
- **Account Code**
- **Bill-to Customer**
- **Shipment Date**

Select the **E-Invoice** check box.

The default value of the **Shipment Date** field is the posting date of the document.

NOTE

For reminders and finance charge memos, the **GLN No.**, **Account Code**, and **E-Invoice** fields are on the **Posting** FastTab.

5. Choose the **Post** action to post the invoice.

To create an electronic sales invoice

1. Choose the  icon, enter **Posted Sales Invoices**, and then choose the related link.

2. Select the relevant sales invoice.
3. Choose the **Create Electronic Invoice** action.

IMPORTANT

The **E-Invoice** check box must be selected on the invoice in order to create an electronic invoice.

4. Optionally, in the **Create Electronic Invoices** batch job page, set additional filters.
5. Choose the **OK** button.

An XML file is created and stored at the location that was defined on the **Sales & Receivables Setup** page. You can now submit the document to the customer.

Create Manual Remittance Payments

3/31/2019 • 2 minutes to read

Generally, payments are created automatically in the payment journal using the remittance suggestion function. However, you can also create a payment manually, either as a payment of an existing invoice or as a payment without a link to an existing invoice, such as a payment to a vendor.

To create a manual remittance payment

1. Choose the  icon, enter **Payment Info**, and then choose the related link.
2. On the **Payment Info** page, choose the **Initialize Payment Info** action.

If the payment is linked to an existing vendor ledger entry, information will be transferred from the entry.
If the payment is not linked to a vendor ledger entry, only partial information will be created.

3. Choose the **OK** button.

Set Up Remittance Agreements

3/31/2019 • 3 minutes to read

You must sign an agreement of remittance with the bank when you set up electronic payments. You can create more than one remittance agreement if you have an agreement with two or more banks. For each agreement, you must specify one or more accounts from which the payment should be made. For each account, you must create a remittance account. For more information, see [Create Remittance Accounts](#).

To set up a remittance agreement

1. Choose the  icon, enter **Remittance Agreement Overview**, and then choose the related link.
2. Choose the **New** action.
3. On the **General** FastTab, fill in the fields as described in the following table.

FIELD	DESCRIPTION
Code	Specify the agreement code from the bank.
Description	Specify a name for the agreement, such as the name of the bank.
Payment System	Select the payment system that will be used. Payment systems include DnB Telebank, K-LINK, SparNett, Fokus Bank, Postbanken, Other bank , and BBS .

4. On the **Bank** FastTab, fill in the fields as described in the following table.

FIELD	DESCRIPTION
Operator No.	Specify the operator information given by the bank.
Company/Agreement No.	Specify the company information given by the bank.
Division	Specify the division information given by the bank.
Latest Sequence No.	Specify the latest sequence number.
Latest Daily Sequence No.	Specify the latest daily sequence number.
Latest Export	Specify the date of the latest export.

5. On the **BBS** FastTab, fill in the fields as described in the following table.

FIELD	DESCRIPTION
BBS Customer Unit ID	Specify the identification of the agreement for Bankernes Betalingssentral (BBS). This code is provided by BBS.

FIELD	DESCRIPTION
Latest BBS Payment Order No.	Specify the entry number that was used when payment was sent to BBS.

6. On the **Send** FastTab, fill in the field as described in the following table.

FIELD	DESCRIPTION
Payment File Name	Specify the path and the name of the file that contains the electronic payment order that was sent to the bank.

7. On the **Receive** FastTab, fill in the fields as described in the following table.

FIELD	DESCRIPTION
Save Return File	Select to automatically name the return file after it is imported without errors.
Receipt Return Required	Select to verify that the first-time return report is imported.
Return File Is Not In Use	Select if you do not want to use return files for approval and settlement of payment. You can use this feature if you do not want to update payments with return information from the bank.
On Hold Rejection Code	<p>Enter the code to update a rejected vendor ledger entry. The ledger entry will be marked as On Hold, which means that after rejection, it is not added to the remittance proposal again.</p> <p>If the code is blank, the entry is not marked as On Hold, which means that after rejection it can be added to a remittance proposal again.</p>

8. On the **Finance** FastTab, fill in the field as described in the following table.

FIELD	DESCRIPTION
New Document Per Field	Specify how documents are numbered when payments are posted. Options include Date , Vendor , and Specified for account .

9. Choose the **Return File Setup List** action.
10. On the **Return File Setup List** page, choose the **New** action.
11. Enter the return file name in the **Return File Name** field.

NOTE

At a minimum, you must set up one file name for each receipt return, rejected return, and settlement return. Contact your bank about the naming conventions that it uses.

12. Choose the **OK** button.

Set Up Vendors for Remittance

3/31/2019 • 4 minutes to read

Business Central includes Norwegian enhancements for automatically making payments to vendors. This reduces errors that occur from manual data entry. To pay vendors using the remittance system, you must set up vendor information.

To set up a vendor for remittance

1. Choose the  icon, enter **Vendors**, and then choose the related link.
2. Choose the **Edit** action.
3. On the **General** FastTab, fill in the fields as described in the following table.

FIELD	DESCRIPTION
Name	Specify the vendor's name. This field is used by remittance against Bankernes Betalingssentral (BBS).
Address	Specify the vendor's address. This field is used by remittance against BBS.
Address 2	Specify an additional line for the vendor's address, if necessary. This field is used by remittance against BBS.
Post Code	Specify a valid postal code of four digits for domestic remittance.
Country/Region Code	Specify a valid country/region code for a foreign address.

4. On the **Payments** FastTab, fill in the fields as described in the following table.

FIELD	DESCRIPTION
Remittance	Select if the vendor is to be remitted.
Remittance Account Code	Specify the account code to be used for the vendor.
Recipient Bank Account No.	Specify the account number used to remit the vendor.

5. Choose the **Remittance Info** action.
6. On the **General** FastTab, fill in the fields as described in the following table.

FIELD	DESCRIPTION
Remittance Account Code	Specify the code of the remittance account which the vendor is using.
Remittance Agreement Code	Specify the code of the agreement to which the account is linked.

FIELD	DESCRIPTION
Recipient Bank Account No.	Specify the vendor's account number used for remittance.

7. On the **Domestic** FastTab, fill in the fields as described in the following table.

FIELD	DESCRIPTION
Own vendor recipient ref.	Select to use the recipient reference from the vendor.
Recipient ref. 1 -- inv.	Enter the text that will print on the payment invoice.
Recipient ref. 1 - cred.	Enter the text that will print on the payment invoice when deducting a credit memo.

If remittance to BBS is used, the text from **Recipient ref. - inv.** and **Recipient ref. -cred.** is displayed on the payment specification in lines one through three, columns one and two. You can insert a maximum of 80 characters on the payment specification.

The text in the recipient reference fields can be formatted automatically with special codes. For more information, see [Recipient Reference Codes](#).

8. On the **Payment abroad** FastTab, fill in the fields as described in the following table.

FIELD	DESCRIPTION
Recipient Ref. Abroad	Enter the text that will print on the payment invoice.
Warning Notice	Select one of the following options to specify how a warning notice is sent from the recipient's bank to the recipient. <ul style="list-style-type: none"> - None - No confirmation is sent. - Phone - Confirmation is given by phone. - Fax - Confirmation is sent by fax. - Other - A text message in the Warning Text field is used.
Warning Text	Enter the warning text that is used if the Warning Notice field is set to Other .
Recipient Confirmation	Select to specify how confirmation of payment is sent to the recipient.
Telex Country/Region Code	Specify the country/region code if the confirmation is sent using telex.
Telex/Fax No.	Specify the telex or fax number if the confirmation is sent using telex or fax.
Recipient Contact	Specify the contact person's name if a telex or fax confirmation is sent to the recipient.

FIELD	DESCRIPTION
Charges Domestic	Specify who is charged the domestic charges in connection with the payment. <ul style="list-style-type: none"> - Debitremitter - The remitter is charged. - Debitrecipient - The recipient is charged. - Default - The bank's way of charging is used. Typically this is the remitter who is charged.
Charges Abroad	Specify who is charged for foreign payments. <ul style="list-style-type: none"> - Debitremitter - The remitter is charged. - Debitrecipient - The recipient is charged. - Default - The bank's way of charging is used. Typically this is the remitter who is charged.
Payment Type Code Abroad	Enter a two-digit code for the payment type.
Specification (Norges Bank)	Specify information for your local government bank. Contact your bank for further information.

9. On the **Bank abroad** FastTab, fill in the fields as described in the following table.

FIELD	DESCRIPTION
SWIFT	Enter the Society for Worldwide Interbank Financial Telecommunication (SWIFT) address by which the recipient's bank is identified.
Bank Name	Specify the bank's name.
Bank Address 1	Specify the address of the recipient's bank.
Rcpt. Bank Country/Region Code	Specify the country/region code for the recipient. This field is required and must comply with ISO standards.
SWIFT Remb. Bank	Specify the SWIFT address for reimbursement that is the recipient's corresponding bank.

10. Choose the **OK** button.

Recipient Reference Codes

3/31/2019 • 2 minutes to read

The recipient reference code determines the message that is sent to the recipient. The code is displayed on the remittance account and is used for vendors that are paid from this account. For each vendor, a special recipient reference code can be created if the general reference text is not used.

The text in recipient reference fields can be formatted automatically with special codes. For example, if you enter **Payment of Invoice %2** in a recipient reference field, the information that will print is **Payment of Invoice 10000**.

The recipient reference codes are described in the following table.

CODE	DESCRIPTION
%1	The document type. Either invoice or credit memo.
%2	The vendor's invoice number.
%3	The Our Account No. field from the Vendor Card page. This is usually the customer number that is used by the vendor.
%4	The invoice or credit memo number.
%5	The description from the vendor ledger entry.
%6	The original amount from the vendor ledger entries. The amount is shown as positive.
%7	The remaining amount from the vendor ledger entries. The amount is shown as positive.
%8	The local currency amount from the vendor ledger entry. The amount is shown as positive.
%9	The currency code from the vendor ledger entry.
%10	The due date from the vendor ledger entry.
%11	The Kunde ID number from the vendor ledger entry.

Set Up Payment Line Information

3/31/2019 • 2 minutes to read

Payment journal line information for the remittance payment is set up on the **Payment Info** page.

To set up payment line information

1. Choose the  icon, enter **Payment Journals**, and then choose the related link.
2. Choose the **Payment Info** action.
3. On the **Payment Info** page, on the **General** FastTab, fill in the fields as described in the following table.

FIELD	DESCRIPTION
Remittance Account Code	Select the remittance account code.
Remittance Agreement Code	Specify the agreement code assigned to the account code.
Remittance Type	Specify the remittance type assigned to the account code. Remittance types include Domestic and Foreign .

4. On the **Domestic** FastTab, fill in the fields as described in the following table.

FIELD	DESCRIPTION
Recipient Ref. 1 – 3	Specify the payment text which is sent to the vendor.
KID (Cust. id number)	Specify the number sent to the vendor during payment.
Our Account. No.	Specify the account number for your company.
External Document No.	Specify the number of the external document.
Payment Type Code Domestic	Specify the payment type code that is assigned to the payment.

NOTE

The recipient reference and the KID number cannot be entered for the same payment. If the KID is used, this is the only information that the vendor receives.

5. On the **Foreign** FastTab, fill in the fields as described in the following table.

FIELD	DESCRIPTION
Recipient Ref. Abroad	Specify the payment text that is sent to the vendor.

FIELD	DESCRIPTION
Payment Type Code Abroad	Specify the payment type code that is assigned to the payment.
Check	Specify whether a check must be issued. * No - No check is issued. * Send to employer - Check is issued and sent to the employer. * Send to beneficiary - Check is issued and sent to the beneficiary.
Urgent	Select if the payment is urgent and should be treated as an urgent transfer.
Agreed Exch. Rate	Specify the exchange rate which the bank agrees upon.
Agreed With	Specify who the agreement is entered with, if an exchange rate is agreed upon.
Futures Contract No.	Specify the future contract number that is used for this payment.
Futures Contract Exch. Rate	Specify the future contract exchange rate that is used for this payment.

6. Choose the **OK** button.

Create Remittance Accounts

3/31/2019 • 3 minutes to read

You must create one remittance account for each bank account where payment is made. If an account is used to make payments to both domestic and foreign vendors, this account must be created two times—one time for domestic payments and one time for foreign payments.

NOTE

The currency used for the bank account should be the same as the currency that the bank is using for this account. Exchange rates are based on the currency of the account and calculations are based on this currency.

To create a remittance account

1. Choose the  icon, enter **Remittance Account Overview**, and then choose the related link.
2. Choose the **New** action.
3. On the **Remittance Account Card** page, on the **General** FastTab, fill in the fields as described in the following table.

FIELD	DESCRIPTION
Code	Specify the identification code for the account.
Remittance Agreement Code	Select the agreement to which the account is connected.
Type	Select the payment type. Payment types include Domestic , Foreign , and Payment Instr. If remitting to Bankernes Betalingssentral (BBS), you can only choose Domestic .
Description	Specify the description of the account.
Bank Account No.	Specify the account number of the bank.
BBS Agreement ID	Specify the agreement identification for each account in BBS.

4. On the **Finance** FastTab, fill in the fields as described in the following table.

FIELD	DESCRIPTION
Account Type	Select the account type. Account types include Finance account and Bank account .
Account No.	Specify the account number depending on your selection in the Account Type field.
Charge Account No.	Specify the account number for the charge account.

FIELD	DESCRIPTION
Round off/Divergence Acc. No.	Specify the finance account to post the difference as a result of rounding.
Max. Round off/Diverg. (LCY)	Specify the maximum rounding or difference, which is accepted by settlement return.
Document No. Series	Specify the number series to be used when you post payments by using the remittance system.
New Document Per.	Select how documents will be numbered when you post a payment: <ul style="list-style-type: none"> - Date - A new document is numbered according to the date the payment is made. - Vendor - A new document is numbered according to the vendor.
Return Journal Template Name	Specify the general journal template to which settled payments are transferred.
Return Journal Name	Specify the general journal batch to which settled payments are transferred.

5. On the **Domestic** FastTab, fill in the fields as described in the following table.

FIELD	DESCRIPTION
Recipient ref. 1- Invoice	Specify the text that will print on the payment invoice.
Recipient ref. 1- Cr. Memo	Specify the text that will print on the payment invoice when deducting a credit memo.

6. On the **Foreign** FastTab, fill in the fields as described in the following table.

This information is only used if the account is used for foreign payments. For remittance to BBS, do not use this tab.

FIELD	DESCRIPTION
Currency Code	Specify the currency that is used for the bank account. If the account is a currency account, the currency code must be given.
Recipient Ref. Aboard	Specify the template text that displays on the vendor card. This field is for foreign payments only.
Futures Contract No.	Specify the number of the futures contract, if the transaction is linked to a futures contract.
Futures Contract Exch. Rate	Specify the exchange rate for the futures contract.

7. Choose the **OK** button.

Test Remittance Payments

3/31/2019 • 2 minutes to read

After you have set up remittance payments and generated suggestions, you can test the payment journal lines for errors before posting them.

To test the payment journal lines, you can use the **Remittance Test** report. This report prints an overview of all journal lines together with any errors, such as missing fields or incorrect bank accounts.

If a warning is printed in the test report, you cannot transfer the payments to the bank before the problem is corrected. You should print the test report to make sure that all payments are made as expected.

To print a remittance test report

1. Choose the  icon, enter **Payment Journals**, and then choose the related link.
2. Choose the **Test Report** action.
3. On the **Options** FastTab, select the **Show Dimensions** field to print dimensions on the test report.
4. Choose the **Print** button to print the report or choose the **Preview** button to view it on the screen.

Create Remittance Suggestions

3/31/2019 • 2 minutes to read

You can create a remittance suggestion so that payment proposals are sent to vendors who are set up to receive remittance payments. One payment transaction per posting date for each vendor is transferred to the bank.

NOTE

To avoid creating payment suggestions for vendors who are remitted when the usual vendor suggestion process is used, add a filter for **Remittance** on the **Suggest Vendor Payments** page and set the filter to **No**.

To create a remittance suggestion

1. Choose the  icon, enter **Payment Journals**, and then choose the related link.
2. Choose the **Remittance Suggestion** action.
3. On the **Suggest Remittance Payments** page, on the **Options** FastTab, fill in the fields as described in the following table.

FIELD	DESCRIPTION
Last Payment Date	Specify the last payment date.
Find Payment Discounts	Select if you want to search for entries where a payment discount is available.
Use Vendor Priority	Select if the vendor priority should be used to search entries.
Available Amount (LCY)	Specify the payments for total amounts that are less than or equal to the given amount.
Posting Date	Specify a posting date.
Replace Posting Date with Due Date	Select to insert the due date of the entry as the posting date for the payments.
Test Document Type	Specify which of the following document types should be tested for payment: - All - All document types are tested. - Invoice/Credit memo - Only invoice or credit memo entries are tested.
Invoice/Debit Vendor Ledger Entries only	Select to pay only invoice or debit entries.

4. Choose the **OK** button.

Types of Payment Returns Files

3/31/2019 • 2 minutes to read

Business Central includes two types of payment return files that can be imported:

- Receipt returns
- Settlement returns

You can also choose to not use return files by selecting the **Return File Is Not In Use** field in the **Remittance Agreement** table. For more information, see [Set Up Remittance Agreements](#).

Receipt Returns

The receipt return is received from the bank after you have sent the remittance file to the bank. When data is imported, information about the number of invoices that are received correctly and the number that are received with error is displayed. After you import a receipt return, the status of the payments in the **Waiting Journal** table is set to **Approved**.

NOTE

You may also receive a rejected return from the bank. If the remittance is rejected, the settlement return will not be received.

Settlement Returns

The settlement return is received from the bank after the payment is executed. When data is imported, information about the number of settled invoices is displayed.

The following occurs when the settlement return is imported:

- Payment status in the **Waiting Journal** table is set to **Settled**.
- Information will be transferred from the **Waiting Journal** page to the payment journal.
- A balancing account will be created for each transaction.
- Document numbers will be inserted for each transaction.

Exchange Rates by Settlement

For a payment, the exchange rates are managed in the following ways:

- Payment from an account in local currency - If a payment in another currency is from an account in LCY, the bank will flag the settlement return with a warning about the exchange rate between LCY and the currency that is used as payment.
- Payment from a currency account - If payment is made from a currency account, the exchange rate for this currency and LCY is used. This is because the bank does not inform the system about the exchange rate.

Warnings on Settlement Returns

When the settlement return is imported, warnings can occur. Payment journal lines with warnings are marked with a symbol. To view the information about the warning, you can open the **Settlement Info** page.

Import Payment Return Data

3/31/2019 • 2 minutes to read

To import receipt and settlement returns, use the **Rem. payment order – import** page. If any errors are indicated when importing settlement returns, you can view this information on the **Settlement Info** page.

To import return data

1. Choose the  icon, enter **Rem. payment order – import**, and then choose the related link.
2. On the **Options** FastTab, fill in the fields as described in the following table.

FIELD	DESCRIPTION
Payment order note	Enter a note that is transferred to the payment order.
ControlBatch	Select the check box to verify return files in advance to ensure if the import can be made. Return data is not imported.
Return files	Specifies how many return files are found and imported.

3. Choose the **Return Files** button to display the return files.
4. On the **Return Files** page, select the **Import** option next to each file to be imported. If the option is cleared, the file will not be imported.
5. Choose the **OK** button.

To view settlement information

1. Choose the  icon, enter **Settlement Info**, and then choose the related link.
2. On the **General** FastTab, view the fields as described in the following table.

FIELD	DESCRIPTION
Remittance Handling Ref.	Shows the reference that the bank enters for foreign payments.
Remittance Warning	If selected, the journal line contains a warning.
Remittance Warning Text	Shows the description of the warning, if applicable.

3. Choose the **OK** button.

Remittance Errors

3/31/2019 • 2 minutes to read

Remittance errors for payments may occur when data is transferred and after payments have been sent to the bank. Both kinds of errors are reported on the **Return Error** page.

The remittance system handles all error codes which can be sent through the return files. It is not required to manually cancel payments rejected by the bank.

Types of Errors

There are two types of remittance errors:

- Transfer error
- Rejection

Transfer Errors

If errors occur during transfer and no return data is created, payments have not been received by the bank.

If the payment file cannot be sent to the bank, you must cancel the payment order in the remittance system.

Rejections

If there is an error or information is missing with a payment that was sent to the bank, the return will contain a rejection of the payment.

NOTE

Rejections vary from bank to bank. Contact your bank regarding how to handle rejection of payments.

If there is a rejection, the error code from the bank and an explanation is displayed for the payment on the **Waiting Journal** page. You will have to handle the rejection based how the remittance agreement was set up. For more information, see [Set Up Remittance Agreements](#).

View Remittance Error Codes

3/31/2019 • 2 minutes to read

For a remittance error, the error code from the bank and an explanation of the error will be shown for the payment on the **Waiting Journal** page.

To view error codes

1. Choose the  icon, enter **Return Error**, and then choose the related link.
2. On the **Return Error** page, fill in the fields as described in the following table.

FIELD	DESCRIPTION
Waiting Journal Reference	Specify the reference code from the waiting journal.
Message Text	Specify the message from the bank.

3. Choose the **Close** button.

Cancel Payments

3/31/2019 • 2 minutes to read

Business Central includes Norwegian enhancements that allow you to cancel payments. If the payment has been sent to the bank, the bank must be contacted to cancel the remittance that they received.

- A payment order can be canceled if the payments are not received by the bank and a new remittance must be made. You can also cancel a payment order if you do not want to transfer the payments to the bank, for example if the payments are incorrect. Only open payment orders can be canceled.
- An individual payment can be canceled if the payment cannot be processed by the bank and a new remittance has to be made. You can also cancel a payment if you do not want to process the payment. Settled payments cannot be canceled.

To cancel a payment order

1. Choose the  icon, enter **Remittance Payment Order**, and then choose the related link.
2. Select the payment order, choose the **Export** action, and then choose the **Cancel Payment Order** action.
3. Choose the **Yes** button.

To cancel a payment

1. Choose the  icon, enter **Waiting Journal**, and then choose the related link.
2. Select the payment, and then choose the **Cancel Payment** action.
3. Choose the **Yes** button.

Delete Remittance Payment Orders

3/31/2019 • 2 minutes to read

Orders can be deleted if they are managed in full and are in a closed financial year. An order is managed in full if no payments on the **Waiting Journal** page have a status of **Sent** or **Approved**.

To delete a remittance payment order

1. Choose the  icon, enter **Delete rem. payment order**, and then choose the related link.
2. On the **Delete rem. payment order** page, fill in the fields as described in the following table.

FIELD	DESCRIPTION
Start date	Specify the start date of orders to be deleted.
End date	Specify the end date of orders to be deleted.

3. Choose the **OK** button.

Export Remittance Payments

3/31/2019 • 2 minutes to read

You can use the export remittance payments process to export the payments file to your computer. You can then transfer the remittance payments to the bank.

IMPORTANT

Before you can export a remittance payment, you must select a payment format in the **Payment Export Format** field on the **Bank Account Card** page.

You export payments to a bank file by choosing the **Export Payments** button on the **Payment Journal** page. The process may be different, depending on the export format that you select:

- Payments using the SEPA payment standard are directly exported to a file when you choose the **Export Payments** button. For more information, see [Making Payments](#).
- Payments using local payment standards, such as **Telepay**, are exported with either the **Remittance - export (bank)** or the **Remittance - export (BBS)** report, which automatically opens when you choose the **Export Payments** button.

The procedure for exporting payments using the **Remittance – Export** batch job is described in this topic.

To export remittance payments using the Remittance - Export batch jobs

1. Choose the  icon, enter **Payment Journals**, and then choose the related link.
2. Prepare to export the payments from the journal. For more information, see [Export Payments to a Bank File](#).
3. Choose the **Export Payments** action.
4. In the report page that opens, choose the **Options** FastTab, and fill in the fields as described in the following table.

FIELD	DESCRIPTION
Remittance agreement code	Specify the code for the agreement.
Operator	Specify the operator number.
Password	Specify the password for the payments.
Division	Specify the division that is paying remittance.
Current note	Specify a note for the payment.
Filename	Specify the name and directory of the payment file.

5. Choose the **OK** button.

The payment information is exported to the file that is set up in the remittance agreement.

The payment journal is deleted and the transactions are transferred to the waiting journal.

Norwegian Giro and OCR-B Font

3/31/2019 • 2 minutes to read

A General Interbank Recurring Order (giro) is a payment system that operates like a credit transfer.

The last line on the giro uses the OCR-B font. This is required by Bankenes Betalingssentral (BBS) for use with optical character recognition (OCR) when handling payments from customers. For more information, see the [Brukehåndbok Indbetalingstjeneste \(NO\).pdf](#) on the NETS.eu website.

The OCR-B-10 BT font is generally available from software vendors. In Business Central, Norwegian sales documents use the OCR-B-10 BT font from BitStream Inc. on the giro. For more information, see the fonts.com website at [OCR-B-10 BT](#).

You can use any OCR-B font, but if other fonts are used, the sales documents must be updated by a Microsoft Certified Partner. Contact your partner for more information.

Set Up OCR Payments

3/31/2019 • 2 minutes to read

You can process electronic payments from customers according to a predefined payment ID. This is often referred to as an optical character recognition (OCR) payment. The payment ID is used with electronic payment transactions. Customers can refer to this ID when they make payments. The payment ID is also used to identify imported payment transactions and automatically apply imported payment data.

To set up OCR payments

1. Choose the  icon, enter **OCR Setup**, and then choose the related link.
2. On the **General** FastTab, fill in the fields as described in the following table.

FIELD	DESCRIPTION
Format	Select an OCR payment file format. Formats include BBS and Data Dialog .
FileName	Enter the full path of the OCR payment file.
Delete Return File	Select to rename the file after import and prevent the file from being imported more than one time.

3. On the **Gen. Ledger** FastTab, fill in the fields as described in the following table.

FIELD	DESCRIPTION
Bal. Account Type	Select a balance account type. Balance account types include Gen. Ledg. Account and Bank Account .
Bal. Account No.	Select a balance account number.
Max. Divergence	Enter a maximum divergence value. If the divergence on a payment is less than or equal to the value entered, the divergence amount is automatically posted. Otherwise, the divergence is not automatically posted. In both situations, a warning is displayed in the cash receipt journal when importing OCR Giro payments.
Divergence Account No.	Enter the divergence account number that will receive posting.
Journal Template Name	Select the name of the journal template that should receive the imported OCR Giro payments.

FIELD	DESCRIPTION
Journal Name	Select the name of the journal that should receive the imported OCR Giro payments. If the Journal Template Name and Journal Name fields are blank, you can import OCR Giro payments in any journal. Otherwise, you must import OCR Giro payments in the journal that is specified.

4. Choose the **OK** button.

NOTE

OCR payments can only be posted to cash receipt journals when the **Force Doc. Balance** field has been cleared in the **Gen. Journal Template** table. For more information, see Gen. Journal Template.

Import and Post OCR Payments

3/31/2019 • 2 minutes to read

Before you can receive optical character recognition (OCR) payments, you must make the following preparations:

- Set up a cash receipt journal template to balance OCR transactions according to the document number, instead of the document type.
- Import and post the OCR payment files to a cash receipt journal.

To import OCR payments

1. Choose the  icon, enter **Cash Receipt Journals**, and then choose the related link.
2. In the **Batch Name** field, select a journal batch.

NOTE

OCR payments can only be posted to a cash receipt journal that does not use a balance account in the **Bal. Account No.** field on the cash receipt journal line.

3. Choose the **Import Payments** action.
4. On the **OCR Payment-BBS** page, fill in the fields as described in the following table.

FIELD	DESCRIPTION
** File Name**	Enter the full path of the import file.

5. Choose the **OK** button to import the payment file to the journal.

To post OCR payments

1. Choose the  icon, enter **Cash Receipt Journals**, and then choose the related link.
2. Choose the **Post** action.

The OCR payment files are posted to the cash receipt journal.

Print the OCR Journal - Test Report

3/31/2019 • 2 minutes to read

You can print the **OCR Journal – Test** report to test the imported payment transactions in the cash receipt journal. You can also view potential warnings and reconcile conflicts before the payments are posted to the journal.

To print the OCR Journal – Test report

1. Choose the  icon, enter **OCR Journal - Test**, and then choose the related link.
2. On the **Options** FastTab, fill in the fields as described in the following table.

FIELD	DESCRIPTION
Show only Lines with OCR Errors	Select to print only the journal lines that contain a warning in the test report.
Show Dimensions	Select to print dimension information on the test report.

3. Choose the **Print** button to print the report or choose the **Preview** button to view it on the screen.

Apply General Ledger Entries in Closed Periods

3/31/2019 • 2 minutes to read

Business Central allows you to post entries after a posting period is closed, even if no actual posting is performed during that period. You can also choose the users who will make these entries.

To apply an entry in a closed period

1. Choose the  icon, enter **General Ledger Setup**, and then choose the related link.
2. On the **General** FastTab, select the **Application always Allowed** check box to apply entries outside the allowed posting period.

NOTE

By default, the **Application always Allowed** check box is not selected.

3. Choose the **OK** button.
4. Choose the  icon, enter **User Setup**, and then choose the related link.
5. On the **User Setup** page, select the **Application always Allowed** check box for each user who can apply entries to a closed period.
6. Choose the **OK** button.

Recurring Orders

3/31/2019 • 2 minutes to read

You can use recurring orders to create blanket order templates so that sales orders can be created based on date intervals that you define. For example, if you deliver the same sales order every two weeks, you can use a blanket sales order and create recurring orders.

You can use recurring groups to define a range of parameters that show how you make the orders. These groups are assigned to blanket orders that have to be created regularly. To create the recurring orders, you will have to periodically run the create recurring orders process. For more information see [Create Recurring Orders](#).

[Work with Blanket Sales Orders](#)

Create Recurring Orders

3/31/2019 • 2 minutes to read

The create recurring orders process will find all of the recurring orders based on the options selected on the **Create Recurring Orders** page and will create the new sales orders. This is a periodic activity that you must run regularly.

To create recurring orders

1. Choose the  icon, enter **Create Recurring Orders**, and then choose the related link.
2. On the **Options** FastTab, fill in the fields as described in the following table.

FIELD	DESCRIPTION
Processing Date	Enter the date to process the blanket orders.
Create only latest	Select to create only the latest recurring order for the blanket orders processed. This option overrides the equivalent option for the recurring group.

3. Choose the **OK** button.

Set Up Recurring Groups

3/31/2019 • 2 minutes to read

The **Recurring Group Code** field on the **Blanket Sales Order** page defines date formulas that can be used both as a template and to create sales orders based on date intervals. You must set up recurring groups before you can set up recurring orders.

To set up recurring groups

1. Choose the  icon, enter **Recurring Groups**, and then choose the related link.
2. Choose the **New** action.
3. On the **General** FastTab, fill in the fields as described in the following table.

FIELD	DESCRIPTION
Code	Enter a code to identify the recurring group.
Description	Enter a description for the recurring group.
Date formula	Enter a date formula to calculate the time interval between orders.
Create only the latest	Select if you want only the latest recurring order created if the recurring group interval created by the Date formula has been exceeded. If the order date on the blanket sales order has exceeded more than one interval period, selecting this check box prevents how all orders are created, and will only create the latest order.
Starting date	Enter the first date of the recurring group.
Closing date	Enter the last date of the recurring group.

4. On the **Update** FastTab, fill in the fields as described in the following table.

FIELD	DESCRIPTION
Update Document Date	Select one of the following options to update the document date: - Posting Date - The document date is calculated using the posting date and the date formula specified in the Document Date Formula field. - Processing Date - The document date is calculated using the processing date and the date formula specified in the Document Date Formula field.
Document Date Formula	Enter a date formula to calculate the document date on the order.

FIELD	DESCRIPTION
Delivery Date Formula	Enter a date formula to calculate the delivery date on the order.
Update Price	<p>Select one of the following options for updating prices on new orders:</p> <ul style="list-style-type: none"> - Fixed - The price used on a new order is the same price that is specified in the blanket order. - Recalculate - The price on a new order is recalculated to reflect the current price for the customer. - Reset - The price on a new order is cleared to specify a new price.
Update Number	<p>Select one of the following options to manage the quantity specified on the original order:</p> <ul style="list-style-type: none"> - Constant - The quantity on the blanket order remains unchanged. This enables you to make orders indefinitely from the blanket order. - Reduce - The quantity on the blanket order is reduced with the quantity that is specified on the new order. The recurring order processing stops when the quantity specified on the blanket order is used on new orders.
Reset Delivery	Select to reset the delivery options for the recurring group.

5. Choose the **OK** button.

The Payroll Data Definitions (NO) Extension

3/31/2019 • 2 minutes to read

If your business uses the Huldt & Lillevik Lønn - Visma payroll service provider in Norway, the **Payroll Data Definitions (NO)** extension can help you quickly and accurately register payroll transactions from these providers. The extension contains data exchange definitions that enable you to import payroll transactions in files that the providers send to you. For more information about data exchange definitions, see [Set Up Data Exchange Definitions](#).

Getting Started

The first step is to map the types of payroll transactions to the general ledger accounts that you want to post them to in Business Central. For example, you might want to post retirement plan contributions to an account named Pension, and the taxes paid on the contributions to an account named Pension Tax. This happens outside of Business Central, for example, you might use an Excel worksheet to visualize the mapping. Work with the payroll service provider to ensure that the file they export contains the mapping. Typically, you can find information about how to configure export files on the provider's website.

After you install the extension, the next step is to specify the format for the payroll data file from the payroll service provider. To do that, go to the **General Ledger Setup** page and choose the provider in the **Payroll Trans. Import Format** field.

To import a payroll file

1. Choose the  icon, enter **General Journals**, and then choose the related link.
2. Choose the journal to use, and then use the **Import Payroll File** action to import the data file from the payroll service provider.

See Also

[Norway Local Functionality](#)

Import Payroll Transactions

3/31/2019 • 2 minutes to read

You can import payroll transactions into a general journal from the leading Norwegian payroll solution, Huldt & Lillevik Lønn - Visma. You can then use the general journal to post the imported payroll transactions to general ledger accounts or bank accounts. To import payroll transactions, you must first set up payroll integration.

NOTE

To import payroll transactions, your Business Central must include the **Payroll Data Definitions (NO)** extension. If you are not sure if you have this extension, please talk to your administrator.

To import payroll transactions

1. Choose the  icon, enter **General Journals**, and then choose the related link.
2. Choose the journal to use, and then use the **Import Payroll File** action to import the data file from the payroll service provider.
3. Choose the **OK** button.

Set Up KID Numbers on Sales Documents

3/31/2019 • 2 minutes to read

Kunde ID (KID) is a customer identification number that provides a payment reference to the vendor and ensures that the vendor is posting the payment correctly. You can set up KID numbers on sales documents to identify document and customer information on electronic banking transactions.

To set up KID numbers on sales documents

1. Choose the  icon, enter **Sales & Receivables Setup**, and then choose the related link.
2. On the **Documents** FastTab, fill in the fields as described in the following table.

FIELD	DESCRIPTION
KID Setup	Specifies a KID number format.
Document No. length	Enter the number of digits used for the document number.
Customer No. length	Enter the number of digits used for the customer number.
Use KID on Fin. Charge Memo	Select to print KID numbers on finance charge memos. Note: If selected, then you must also select the Document Type + Document No. format in the KID Setup field.
Use KID on Reminder	Select to print KID numbers on reminders. Note: If selected, then you must also select the Document Type + Document No. format in the KID Setup field.

3. Choose the **OK** button.

Set Up Document Printing

3/31/2019 • 2 minutes to read

In Business Central, you can print the sales reports that use the required giro specifications by using different paper types and paper trays.

When you use tray numbers and paper sources for Norwegian sales documents, you must consider how the printer and printer driver interpret this information. You may have to specify other tray numbers for your specific printer.

NOTE

KID information will also print where the giro information is printed.

The following documents require a printed giro:

- Invoices
- Credit memos
- Finance charge memos
- Reminders

The Norwegian version of Business Central contains the following sets of sales documents.

SET	DESCRIPTION
1	The standard Business Central documents. No giro information is printed.
2	The giro is printed on every page. The last page prints the giro total.

To set up paper trays

1. Choose the  icon, enter **Printer Selections**, and then choose the related link.
2. Select the report.
3. Choose the **Sales Document Paper Tray Setup** action.
4. Select a paper source from the **First Page - Paper Source** field.
5. The **First Page – Tray Number** field will automatically display the selected paper source. You can also manually enter a tray number.

IMPORTANT

Not all printers will have the same paper source names. You can specify a number in the **Tray Number** field. The number may correspond to a paper source. To find the number that a specific printer is using, see the technical documentation for the printer.

The **Other Pages** and **Giro Page** fields are set up the same way.

6. Choose the **OK** button.

VAT Reports

3/31/2019 • 2 minutes to read

VAT is charged on transactions that involve goods and services in Spain or goods imported into Spain. The following information provides more details about VAT functionality.

Equivalence Charge

Equivalence Charge (EC) tax applies to activities that do not follow VAT rules. According to EC rules, companies must pay a surcharge to their vendors in addition to VAT. However, they can only charge VAT without the surcharge on sales invoices.

VAT with EC Percentage

Preset general posting groups have an EC percentage in addition to their VAT percentage. Although the EC is tracked separately, both tax values are merged with VAT when it is possible. If the EC percentage is a separate field in the posting group, the EC is merged with the value in the **VAT %** column.

For printing sales and purchase invoice books, the VAT percent and EC percentages are displayed in the **VAT Entry** table during posting.

NOTE

If the item has no taxable VAT, 0 is automatically displayed in the **VAT %** field in the VAT information pages.

Telematic VAT

With telematic VAT you can design and generate monthly and yearly tax reports as electronic files or printed files. You can submit these reports to the tax authorities using a third-party program or an XML file from the tax authorities' website.

VAT Statement

The VAT statement displays VAT amounts and base amounts in different columns.

There are two report template types in the **VAT Statement Name** table:

- **One-Column Report**
- **Two-Columns Report**

VAT-VIES Declaration

With VAT-VIES declaration you can run a batch file to generate European Union (EU) sales reports. The batch file exports the entries in the required file format for submission to customs and tax authorities.

[Spain Local Functionality](#)

[Report 340](#)

[Report 347](#)

Report 340

3/31/2019 • 3 minutes to read

The **Report 340** report contains information about invoices and taxes that were issued or received by your company in a given period. The report is generated in a format that is approved by the tax authorities. This report should be submitted in the company's monthly or quarterly liquidation period, depending on the size of the company. This file can be uploaded to the Spanish Tax Agency website or submitted on CD-ROM. For more information, see the [Spanish Tax Agency](#) website. If the number of operations exceeds 1,000,000, the report can be submitted electronically.

Reporting Requirements for Entrepreneurs and Small Companies

The reporting requirements for entrepreneurs and small businesses are modified to support businesses that use the cash accounting criteria (CAC).

A company can use the cash accounting method if business sales do not exceed 2,000,000 euros per year. There is one exception to this rule for a business whose receipts in cash from any single customer exceeds the sum of 100,000 euros.

In Business Central, you can set up posting groups for cash-based VAT accounting for purchases and sales.

If you file a report under this regimen, the following label is applied to certain Business Central reports: **Régimen especial del criterio de caja**. The modified reports are:

REPORT	DESCRIPTION
Report 117	Reminder
Report 118	Finance Charge Memo
Report 205	Order Confirmation
Report 206	Sales - Invoice
Report 207	Sales - Credit Memo
Report 405	Purchase Order
Report 406	Purchase - Invoice
Report 407	Purchase - Credit Memo
Report 5900	Service Order
Report 5911	Service - Invoice
Report 5912	Service - Credit Memo

File Format

The file format for the **Report 340** report includes one deponent record, and at least one issued invoice or one received invoice. Deponent information comes from the **Company Information** table and the request form. Issued invoices come from the companies to which you have sold goods or services. Customer information comes from the **Customer** table. Received invoices come from the companies from which you have purchased goods or services. Vendor information comes from the **Vendor** table.

NOTE

If there are no file format records, the file is not created and an error message is displayed.

Entries Included in Report 340

The entries included in **Report 340** must have been posted in the period and fiscal year entered in the request form. The entries that are included in the report of payments in cash can be posted from the previous year.

Businesses

Report 340 must include the following entries:

- Posted sales invoices and credit memos.
- Posted purchase invoices and credit memos.
- Posted service invoices and credit memos.
- Auto invoices and auto credit memos.
- Payments in cash.

Entries in the **Sales Invoice Book** report must be included in the report as issued invoices.

Entries in the **Purchase Invoice book** report must be included in the report as received invoices.

Small Businesses

For small businesses and entrepreneurs operating under the Cash Accounting Criteria (CAC), Report 340 reports invoices under the CAC. The invoice is marked with a "Z" for operation type. If the invoice is under the CAC, then the following is reported:

- Payment/receipt method, that is, cash, check, transfer, and so forth. This field is blank in the report if no payment collection has occurred.
- Payment/receipt amount (full, partial)
- Payment/receipt dates

Invoices Including Different VAT Percentages or EC Percentages

If the invoice has more than one VAT percentage or equivalence charge (EC) percentage, the report must include all of the records with different VAT percentage and EC percentage. If the invoice includes equivalence charges (EC), the EC percentage and EC amount without VAT will be displayed.

All of these records will show the same invoice ID and customer VAT number.

File Format Restrictions

Before creating the **Report 340** report, you should consider the following file format restrictions:

- All amounts must be in euro.
- All amounts must be positive. In the fields where negative amounts are possible, **N** is specified.
- All text must be capitalized.
- All alphanumeric fields must be left-aligned.
- All numeric fields must be right-aligned.

- Special characters are converted to standard characters.
- If the field has no value, it will be empty for alphanumeric fields and populated with zeros for numeric fields.

Create Report 340

3/31/2019 • 3 minutes to read

Report 340 includes all sales invoices and purchase invoices posted by a company during a given period. The report also includes the operation codes with related taxes and payments in cash.

This report is generated in a format approved by the tax authorities. You should submit this report on a monthly or quarterly basis, depending on the size of your company.

To create Report 340

1. Choose the  icon, enter **Make 340 Declaration**, and then choose the related link.
2. On the **Make 340 Declaration** page, on the **Options** FastTab, fill in the fields as described in the following table.

FIELD	DESCRIPTION
Fiscal Year	Enter the fiscal year for which you want to create the operation declaration.
Month	Select the month that you want to include in the operations declaration.
Min. Payment Amount	Enter the amount that you have received in cash for the selected G/L Acc. for Payments in Cash . Important: The field is designed for reporting payments in cash. The amount that you have selected decides the sum of customer entries in the report. If the total invoiced amount for a customer per year is less than the amount specified in the field, then the sum of the customer entries is not included in the report. If the total invoiced amount for a customer per year is greater than the amount specified in the field, then the sum of customer entries is included in the report. When you export the data to a declaration .txt file, you will see that the Amount Received in Cash field in the declaration .txt file contains the accumulated amount of customer entries in one line per year.
G/L Acc. for Payments in Cash	Select one or more on general ledger accounts to include only the entries that are posted to the filtered general ledger accounts in the report. Important: The field is designed for reporting payments in cash. When you export the data to a declaration .txt file, you will see that the Amount Received in Cash field in the declaration .txt file contains the accumulated value for the selected general ledger accounts. If you do not select any general ledger accounts, type 2 lines for payments in cash will not be created.
Contact Name	Enter the surname and name for the company that is creating the operations declaration.

FIELD	DESCRIPTION
Telephone Number	Enter the telephone number for the company that is creating the operations declaration.
Non Deduct. Gen. Prod. Post. Groups	Select the general product posting group. The selected posting groups are non-deductible VAT.
Declaration Number	Enter the number to identify the operations declaration.
Electronic Code	Specify the electronic code that is provided by the tax authorities.
Declaration Media Type	Select the media type for the declaration.
Replacement Declaration	Select if this is a replacement of a previously sent declaration.
Previous Declaration Number	If the Replacement Declaration option is selected, enter the previous declaration number.

3. Select the appropriate filters, and then choose the **OK** button. The text file for report 340 is created in the specified path.

To create a Modelo 340 report under the CAC regimen

1. Perform the steps in the previous procedure.
2. As needed, adjust and modify the operation code information. In order for the report to pass validation when you submit it to the tax authority, any line that has an unrealized payment must be updated to include an operation code. You can change an operation code of Z or 3 to Z or 1 – 8 only for cash based payments.
3. Choose the **OK** button. The report is exported to the file location that you specified. The report will only contain lines for invoices, credit memos, whether applied or not, and payments that have unrealized VAT.

Invoices will be exported and will contain the Z operation code. Collection data is blank.

Payments against an invoice will be exported and will contain the collection data.

If you print the posted document, for example, a posted sales invoice, it will include the following label: **Régimen especial del criterio de caja**.

Report 347

3/31/2019 • 2 minutes to read

The **Report 347** report is a required annual report sent by all companies to the tax authorities to reflect the sales or purchases in a given period. This report also includes entries such as payment in cash that was received in the period. The **Report 347** report is generated in a format that is approved by the tax authorities. This file can be uploaded to the Spanish Tax Agency website or submitted on CD-ROM. For more information, see the [Spanish Tax Agency](#) website.

File Format for Report 347

The file format for **Report 347** includes at least one responsible company, a deponent, and a customer/vendor register. A responsible company is a company that submits the information to the Spanish Tax Agency. Deponent information comes from the **Company Information** table and the request form. Customer information comes from the **Customer** table, the **Cust. Ledger Entry** table, and the **G/L Entry** table. Vendor information comes from the **Vendor** table and the **Vendor Ledger Entry** table.

NOTE

If there are no file records, the file is not created and an error message is displayed.

File Format Restrictions for Report 347

Before creating **Report 347**, the following file format restrictions will be considered:

- All amounts must be positive.
- All text must be capitalized.
- All alphanumeric fields must be left-aligned.
- All numeric fields must be right-aligned.
- If the company receives payments in cash that are over the predefined official threshold for these transactions, a four-digit year must be included. The year indicates when the invoices that are related to receivables were posted.
- Special characters must be converted to standard characters.
- If the field has no value, it will be blank for alphanumeric fields and populated with zeros for numeric fields.

[Create Report 347](#)

Create Report 347

3/31/2019 • 2 minutes to read

All companies must provide an annual declaration, **Report 347**, to the tax authorities providing the sales and purchase transactions from the previous fiscal period.

The Report 347 declaration is generated in a format that is approved by the tax authorities for upload to their Virtual Office website or submission on CD-ROM.

Before you create the Report 347 declaration, you can run a report to identify payments in cash that have not been applied to a document.

To identify unapplied payments in cash

1. Choose the  icon, enter **347**, and then choose the link for the **347 Declaration** area.
2. Choose the **Unapplied Payments in Cash** action.
3. On the **Options** FastTab, fill in the fields.

To create a Report 347 declaration

1. Choose the  icon, enter **Make 347 Declaration**, and then choose the related link.
2. On the **Options** FastTab, fill in the fields. For more information, see [Make 347 Declaration](#).
3. Choose the **OK** button.

When you send the Report 347 declaration, you must include 347 declaration labels. The labels are required as part of the package for the tax authorities.

To create 347 declaration labels

1. Choose the  icon, enter **347 Declaration Labels**, and then choose the related link.
2. On the **Options** FastTab, fill in the fields. For more information, see [Declaration Labels](#).

Report 349

3/31/2019 • 3 minutes to read

You must submit a periodic report of trade with other EU countries/regions to the tax authorities. In Spain, this Report 349 is part of the EU intra-community VAT Information Exchange System (VIES).

In Business Central, the Report 349 declaration is based on VAT entries that are filtered by the EU country/region codes. You must create a 349 declaration and then submit the file to the [Spanish Tax Agency](#) website or on CD-ROM.

When you create a Report 349 declaration that includes credit memos, the entries will display on the **Customer/Vendor Warnings 349** page so that you can include them as corrections to invoices. You must make the appropriate changes to the lines on the **Customer/Vendor Warnings 349** page before you can submit the declaration. For more information, [Create Report 349](#).

Delivery Operation Codes

The **Report 349** declaration must specify separate operation codes for the delivery of goods to other EU countries/regions. You can set up separate VAT product posting groups for each type of export delivery. Then, when you apply a VAT posting group to an item that is sold, Business Central stores the delivery operation code, and the transaction is included in the quarterly 349 declaration.

Before you submit the 349 declaration, you must make sure that all VAT entries have the relevant delivery operation codes. The following table describes the delivery operation codes that are currently supported in Business Central.

DELIVERY OPERATION CODE	DESCRIPTION
E	Identifies transactions with items that were delivered to customers in another EU country/region and are not included in either the M or the H delivery operation code.
M	Identifies transactions with items that were delivered to customers in another EU country/region and which were previously imported into Spain as tax exempt according to the VAT law.
H	Identifies transactions with items that were delivered to customers in another EU country/region and which were previously imported into Spain as tax exempt according to the VAT law, and which were conducted by an official tax representative.

To help you manage exports to other EU countries/regions in Business Central, you can create VAT product posting groups for each operation code. Then, when you apply a VAT posting group to an item that is sold, the Delivery Operation Code field in the **VAT Entry** table identifies the VAT transactions according to the operation code.

Delivery Operation Codes and Item Setup

You can set up a VAT product posting group for each delivery operation type and then assign the appropriate VAT product posting group to items in the Item Card page.

If you have an inventory item that can be imported in different ways, for example if it is tax exempt in some cases and not tax exempt in other cases, you can create separate item cards with the appropriate VAT product posting

group.

In the following example, you import chairs from another EU country/region, and you resell the chairs to customers in other countries/regions. One type of chair is exempt from VAT when you import it under certain circumstances, but otherwise it is not exempt. As a result, you create two item cards for it:

- One item card with a VAT product posting group with the **Delivery Operation Code** field set to **M**.
- One item card with a VAT product posting group with the **Delivery Operation Code** field set to **E**.

Then, when you create a sales order, you must make sure that you select the correct item in the sales lines.

When you post the sales invoice, Business Central saves the delivery operation code in the **VAT Entry** table, and then, when you create the Report 349 declaration, the VAT amount is included in the section for the appropriate delivery operation code.

[Create Report 349](#)

Create Report 349

3/31/2019 • 3 minutes to read

You must submit a periodic report of trade with other EU countries/regions to the tax authorities. This declaration, Report 349, must be submitted to the tax authorities electronically on the tax agency website or on a CD-ROM. For more information, see the [Spanish Tax Agency](#) website.

To create Report 349

1. Choose the  icon, enter **Make 349 Declaration**, and then choose the related link.
2. On the **Options** FastTab, fill in the fields as described in the following table.

FIELD	DESCRIPTION
Fiscal Year	Specify the year of the reporting period.
Period	Select the period that the report covers. This can be a year, a month, or a quarter.
Period Frequency Change	Select to change the period frequency of the report.
Contact Name	Specify the contact name for your company.
Telephone Number	Specify the telephone number for contact.
Declaration Number	Specify the number of the declaration. For example, if this is your first 349 declaration, the number is 349000000000 .
Company Country/Region	Enter the country/region for your company.
Declaration Media Type	Select the media type for the declaration. To submit the declaration electronically, select Telematic . To submit the declaration on CD-ROM, select Physical support . If you want to submit the 349 declaration on a CD-ROM, you must also print labels for the disk. For more information, see Declaration Labels.
Excluded Gen. Product Posting Groups	Specify the general product posting group that you do not want to include in the declaration.

3. Choose the **OK** button.

If the period includes a credit memo, a message appears, and if you choose the **OK** button, the **Customer/Vendor Warnings 349** page opens and shows all credit memos for that period.

Entries related to credit memos display on the **Customer/Vendor Warnings 349** page because you may want to include them as corrections to invoices. For example, if you posted a sales invoice in October, and you then post a credit memo in November that corrects the October invoice, a warning displays. Then, you can make the appropriate changes on the **Customer/Vendor Warnings 349** page. You must specify which section of the total

amount for that customer must be included in the November 349 declaration.

To correct warnings for Report 349

1. On the **Customer/Vendor Warnings 349** page, select the line for the relevant customer.
2. Make the appropriate changes to the line.

The following table describes the key fields for correcting a 349 declaration that includes a credit memo.

FIELD	DESCRIPTION
Include Correction	Select to accept the correction that the credit memo has resulted in.
Delivery Operation Code	Specifies the type of export delivery for the VAT transaction. If you select a month in the Original Declaration Period field, the Delivery Operation Code field helps you identify the appropriate amount, which is shown in the Previous Declared Amount field.
Previous Declared Amount	Specifies the total amount that has been included in a 349 declaration. This field is calculated only if you changed the Original Declaration Period field. It is calculated based on the specified delivery operation code.
Original Declaration FY	Specifies the fiscal year that the original 349 declaration was submitted to the tax authorities with the invoice that this credit memo corrects. Warning: Do not change this field if the credit memo applies to an invoice that has not yet been declared to the tax authorities because it is part of the current 349 declaration.
Original Declaration Period	Specifies the month, such as 01 for the month of January, for the original 349 declaration that included the invoice that this credit memo corrects. Warning: Do not change this field if the credit memo applies to an invoice that has not yet been declared to the tax authorities because it is part of the current 349 declaration.
Original Declared Amount	Specifies the correction for the original transaction. For a credit memo for an invoice that was included in an earlier 349 declaration, enter the amount that should have been declared for this customer or vendor. This amount is the invoiced amount less the credit memo amount. For a credit memo for an invoice that is part of the current 349 declaration, enter the credit memo amount.

3. When you have made the appropriate changes, choose the **Process** action.

A page appears where you must confirm that you want to update the 349 declaration for those entries where the **Include Correction** check box is selected.

For corrections to amounts that were included in an earlier 349 declaration, the page can show more than one

warning for a customer or vendor with the same values in the **Original Declaration FY** and **Original Declaration Period** fields. In that case, you should combine the corrections in a single line so that the appropriate amounts for the **Previous Declared Amount** field and the **Original Declared Amount** field are included in the 349 declaration.

Set Up 340 Reports for Small Businesses

3/31/2019 • 2 minutes to read

Use the following procedure to set up your business to report on a cash basis, that is, Cash Accounting Criteria (CAC). If you have not already done so, you can set up posting groups for cash-based VAT accounting for purchases and sales.

When you file a report 340, any transaction lines that are associated with unrealized VAT are assumed to have taken place under cash accounting.

After VAT posting is set up to handle unrealized VAT, any printed sales order, purchase order, and so forth will be modified to have the following label in bold font added to the report just before the section reporting the document lines: **Régimen especial del criterio de caja**.

To set up reporting under CAC

1. Choose the  icon, enter **General Ledger Setup**, and then choose the related link.
2. On the **General** FastTab, select the **Unrealized VAT** check box on the **General Ledger Setup** page. Choose the **OK** button.
3. Choose the  icon, enter **VAT Posting Setup**, and then choose the related link.
4. On the **VAT Posting Setup** page, select a group to modify or create a posting group that has general ledger accounts to treat the VAT amounts for the various unrealized VAT accounts in your VAT Posting Setup, and then choose the **Edit** action.
5. On the **General** FastTab, set the **Unrealized VAT Type** to **Percentage**.
6. On the **Sales** and **Purchase** FastTabs, specify general ledger accounts for the various **VAT Unreal. Account** fields.

Create Templates for Telematic VAT Statements in Text File Format

3/31/2019 • 2 minutes to read

In order to submit VAT statements electronically, you must create templates to generate the required files. You can submit files in text format and in XML format. This procedure describes how to create templates for text files.

For more information, see the [Spanish Tax Agency](#) website.

To create a template for VAT statements in text file format

1. Choose the  icon, enter **VAT Statement**, and then choose the appropriate link.
2. Select the required VAT statement, and then choose the **Design txt file** action.
3. On the **Transference Format** page, fill in the fields as described in the following table.

IMPORTANT

The values for the fields are determined by the tax authorities.

For more information, see the [Spanish Tax Agency](#) website.

FIELD	DESCRIPTION
VAT Stmt. Name	Specify the VAT statement name that this template is for.
No.	Specify the field number in the text file.
Position	Specify the position of this field in the text file.
Length	Specify the length of the field.
Type	Specify the type of the field. The available options are Alphanumerical , Numerical , Fix , Ask , and Currency .
Subtype	Specify the subtype of the field. The subtype specifies if the line must show only the integer part of an amount, the decimal part, or the full amount.
Description	Specify the text that you want to appear on the label.
Value	Specify the value for the label.
Box	Specify the box number from which to retrieve the data.

4. Repeat the previous step for additional lines in the VAT statement.
5. Choose the **OK** button.

This creates the template. Now, you can create a file that you can then submit to the tax authorities.

Create Templates for Telematic VAT Statements in XML File Format

3/31/2019 • 2 minutes to read

In order to submit VAT statements electronically, you must create templates to generate the required files. You can submit files in text format and in XML format. This procedure describes how to create templates for XML files.

For more information, see the [Spanish Tax Agency](#) website.

To create a template for VAT statements in XML file format

1. Choose the  icon, enter **VAT Statement**, and then choose the appropriate link.
2. Select the required VAT statement, and then choose the **Design XML file** action.
3. On the **XML Transference Format** page, fill in the fields as described in the following table.

IMPORTANT

The values for the fields are determined by the tax authorities.

For more information, see the [Spanish Tax Agency](#) website.

FIELD	DESCRIPTION
VAT Stmt. Name	Specify the VAT statement name that this template is for.
No.	Specify the field number in the text file.
Line Type	Specify whether the VAT statement line type is an XML element or an XML attribute.
Indentation Level	Specify the indentation level for the label. This level is used to format the XML file.
Parent Line No.	Specify the line number of the parent line that the current line is indented under.
Value Type	Specify the subtype of the field. The subtype specifies if the line must show only the integer part of an amount, the decimal part, or the full amount.
Description	Specify the text that you want to appear on the label.
Value	Specify the value for the label.
Box	Specify the box number from which to retrieve the data.

FIELD	DESCRIPTION
Ask	Specifies if the Value field can be changed before you create the XML file.
Exists Amount	Select to include the existing amount.

4. Repeat the previous step for additional lines in the VAT statement.

5. Choose the **OK** button.

This creates the template. Now, you can create a file that you can then submit to the tax authorities.

Export VAT Statements in XML Format

3/31/2019 • 2 minutes to read

You can export a VAT statement in XML format and then submit it electronically to the tax authorities.

For more information, see the [Spanish Tax Agency](#) website.

To export a VAT statement in XML format

1. Choose the  icon, enter **VAT Statement**, and then choose the appropriate link.
2. Select the required VAT statement, and then choose the **Generate XML file** action.

IMPORTANT

The VAT statement name must be of the template type **One Column Report**.

In the standard version of Business Central, the VAT statement name for the 392 telematic statement is of the type **One Column Report**.

3. On the **XML VAT Declaration** page, on the **Options** FastTab, fill in the fields as described in the following table.

FIELD	DESCRIPTION
VAT entries included	Specify if the VAT statement must include open entries, closed entries, or both open and closed entries.
VAT entries included	Specify if the VAT statement must include only entries from the period that is specified in the Date Filter field, or also entries from previous periods.
Additional Currency	Select to display the report amounts in the additional reporting currency.

4. On the **VAT Statement Line** FastTab, specify a value for the **Date Filter** field.
Optionally, select additional filters.
5. Choose the **OK** button.
6. On the **XML Transference Format** page, verify that the VAT statement is set up as required, and then choose the **OK** button.

You can open or save the generated XML file. You can now submit the VAT statement to the tax authorities.

Equivalence Charges (EC)

3/31/2019 • 2 minutes to read

An Equivalence Charge (EC) is a tax that is used in retail sales and in activities that do not follow VAT rules. Under EC rules, companies must pay a surcharge to their vendors when purchasing goods, in addition to the usual VAT. However, when selling goods, only VAT can be charged. Some general posting groups must have an EC percentage in addition to the VAT percentage. This information is tracked separately, but in order to minimize changes, both taxes are usually combined.

The **EC %** field is a separate field in the **Purchase Line**, **Sales Line**, **Sales Line Archive** and **Purchase Line Archive** tables. However, in sales and purchase lines, both taxes are combined and the value is displayed in the **VAT %** field. The **VAT + EC %** field is used when these values are combined. At the time of posting, the VAT percentage and the EC percentage are inserted in the **VAT Entry** table. This makes it possible to print the **Sales Invoice Book** report and the **Purchases Invoice Book** report.

Electronic Payments – AEB N34.1

3/31/2019 • 2 minutes to read

With the electronic payments functionality, you can pay vendors using electronic payments rather than printing paper checks. Electronic payments are exported into a standard AEB N34.1 file format used by most banks in Spain. This file is then transmitted to your bank.

You can create electronic payments from the payment journals or from the Cartera functionality (report list). This is intended to cover the following cases:

- Invoices and open, non-grouped Cartera documents. If you select to pay using electronic payments, then the payment file is generated from the **Export Electronic Payments** report.
- Invoices and Cartera documents that are grouped in a payment order. If you select to pay using electronic payments, the payment file is generated from the **PO - Export N34.1** report, available in the Cartera report list.

NOTE

Partners may need to modify this report to meet their customer's bank individual requirements.

Before you can transfer payments electronically to a vendor, you will need to set up a bank account for the vendor. You will also need to set up the electronic payment links with your bank and set up the bank account card in Business Central for your own bank to handle the electronic payments. The bank should provide the transmission program.

Set Up Bank Accounts for Electronic Payments

3/31/2019 • 2 minutes to read

In Business Central, you can set up bank accounts to make electronic payments.

To set up bank accounts for electronic payments

1. Choose the  icon, enter **Bank Account Card**, and then choose the related link.
2. On the **Transfer** FastTab, make sure that the **CCC Bank No.**, **CCC Bank Branch No.**, **CCC Control Digits**, and **CCC Bank Account No.** fields are filled in correctly.
3. On the **Transfer** FastTab, fill in the fields as described in the following table.

FIELD	DESCRIPTION
E-Pay Export File Path	Enter the full path of the electronic payment file, start with the drive letter and end with a backslash (). The file name is not included here. You should use the directory where Business Central is installed. For example: C:NAV would be a possible entry for this field. You can enter a maximum of 100 characters.
Last E-Pay Export File Name	Specify the name of the file with the .txt file name extension, without the path., Because the file name will be incremented every time that an electronic payment file is exported, this file name should have digits in it. This will create a permanent record of every file that you have exported to the bank. For example, DD000000.txt could be a possible first entry for this field. You can enter a maximum of 50 characters.

4. On the **Posting** FastTab, fill in the fields as described in the following table.

FIELD	DESCRIPTION
Last Remittance Advice No.	Specify a number series that differs from the check number series. This is needed so that the numbers do not conflict with each other. The remittance advice is printed on blank paper in a form that is easy to mail to the vendor.

To set up vendor bank accounts for electronic payments

1. Choose the  icon, enter **Vendor Bank Account Card**, and then choose the related link.
2. On the **General** FastTab, fill in the fields as described in the following table.

FIELD	DESCRIPTION
Use For Electronic Payments	Specify if this vendor bank account will be used for electronic payments. For electronic payments, only one bank account can be selected for each vendor.

3. On the **Transfer** FastTab, make sure that the **CCC Bank No.**, **CCC Bank Branch No.**, **CCC Control Digits**, and **CCC Bank Account No.** fields are filled in correctly.

Pay Vendors Using Electronic Payments

3/31/2019 • 2 minutes to read

In Business Central, you can pay a vendor using electronic payments. Payments will be exported to a file, which will then be transmitted to your bank. The bank then electronically transfers the payments from your bank account to the payee's (vendor) bank account.

This process is similar to how computer checks are processed.

To pay a vendor electronically

1. Choose the  icon, enter **Payment Journals**, and then choose the related link.
2. Fill in the fields as described in the following table.

FIELD	DESCRIPTION
Bank Payment Type	Specify Electronic Payment to create a corresponding check ledger entry for the amount.
Payment Type	Specify the payment type for the special transfer payment, if applicable. Select Blank if you do not want to use the special transfer payment type. Select 01 to create a special payment for "goods" on the journal line. Select 02 to create a special payment for "non-goods" on this journal line.
Statistical Code	Specify the statistical code for the special transfer payment, if applicable. The statistical code must be used at the same time as the payment type. Select 01 to create a special payment for "goods" on the journal line. Select 02 to create a special payment for "non-goods" on this journal line.

Export Electronic Payments

3/31/2019 • 5 minutes to read

In Business Central, you can export payment journal entries into a file format according to four different payment standards. You must use the following pages to export according to the different payment standards.

PAYMENT STANDARD	PAGE TO EXPORT FROM
AEB N34	Payment Orders
AEB N34.1	Payment Orders
E-PAY	Payment Journal
SEPA	Payment Journal or Payment Orders

IMPORTANT

Before you can export a payment, you must select a payment format in the **Payment Export Format** field on the **Bank Account Card** page.

To export electronic payments using the Payment Orders page

1. Choose the  icon, enter **Payment Orders**, and then choose the related link.
2. Select the documents that you want to pay.
3. Choose THE **Export to File** action.

Payments of type SEPA will be exported to a file immediately.

Payments of type N34 or N34.1 will be exported when you run the **Payment order - Export N34** or **PO - Export N34.1** report, which automatically opens when you choose **Export** in step 3.

4. On the **PO - Export N34.1** page, fill in the fields as described in the following table.

FIELD	DESCRIPTION
Bank Account No.	Select the bank account from which the payments will be exported.
Settle Date	Specify the date that the export will be transmitted to the bank. This date will be the posting date for the payment journal entries that are exported.
If Posting Date does not match Delivery Date	Specify if you want to match the settle date, or if you want to skip any payment journal lines where the entered posting date does not match the settle date.
Expenses Code	Specify who is responsible for the payment expenses.

FIELD	DESCRIPTION
Shared (Only International Transf.	Specify if you want to share the expenses between the payer and the payee. This is only applicable for international transfers.
Payment Order Concept.)	Specify the payment order concept, either Payroll , Retirement Payroll , or Others .
Relation	Specify if you want the bank to send you a detailed list of all transfer charges. If you do not select this field, the bank will send the total of all charges for all the transfers made.
Number Of Copies	Specify the number of additional copies of the remittance advice that will be printed by this process. One document is always printed so that it can be mailed to the payee.

5. Choose the **Print** or the **Preview** action to see the created payment file.

The payment journal entries which have the **Bank Payment Type** field set to **Electronic Payment** will be exported. The data will be exported to a file that is formatted according the N34 or N34.1 standard format. In addition, remittance advice will be printed, which is suitable for mailing to each payee.

NOTE

You can only post the payment order after you have successfully exported the electronic payments.

To export electronic payments using the Payment Journal page

1. Choose the  icon, enter **Payment Journals**, and then choose the related link.
2. Select the documents that you want to pay.
3. On the **Navigate** tab, choose **Electronic Payments**, and then choose **Export**.

Payments of type SEPA will be exported to a file immediately.

Payments of type E-PAY will be exported when you run the **Export Electronic Payments** report, which automatically opens when you choose **Export** in step 3.

4. On the **Export Electronic Payments** page, fill in the fields as described in the following table.

FIELD	DESCRIPTION
Bank Account No.	Select the bank account from which the payments will be exported.
Settle Date	Specify the date that the export will be transmitted to the bank. This date will be the posting date for the payment journal entries that are exported.
If Posting Date does not match Delivery Date	Specify if you want to match the settle date, or if you want to skip any payment journal lines where the entered posting date does not match the settle date.
Expenses Code	Specify who is responsible for the payment expenses.

FIELD	DESCRIPTION
Shared (Only International Transf.	Specify if you want to share the expenses between the payer and the payee. This is only applicable for international transfers.
Payment Order Concept.)	Specify the payment order concept, either Payroll , Retirement Payroll , or Others .
Relation	Specify if you want the bank to send you a detailed list of all transfer charges. If you do not select this field, the bank will send the total of all charges for all the transfers made.
Number Of Copies	Specify the number of additional copies of the remittance advice that will be printed by this process. One document is always printed so that it can be mailed to the payee.

5. Choose the **Print** or the **Preview** action to see the created payment file.

The payment journal entries which have the **Bank Payment Type** field set to **Electronic Payment** will be exported. The data will be exported to a file that is formatted according to the selected payment standard. In addition, remittance advice will be printed, which is suitable for mailing to each payee.

NOTE

You can only post the payment order after you have successfully exported the electronic payments.

NOTE

In the generic version of Business Central, the **Payment Journal** page is used in a similar way to export electronic payments in the SEPA Credit Transfer format. For more information, see [Make Payments with Bank Data Conversion Service or SEPA Credit Transfer](#).

To export electronic payments from the Cartera module

1. Choose the  icon, enter **PO - Export N34.1**, and then choose the related link.
2. Fill in the fields as described in the following table.

FIELD	DESCRIPTION
Delivery Date	Specify the delivery date of the electronic payment.
Expenses Code	Specify who is responsible for the payment expenses.
Payment Order Concept	Specify the payment order concept, either Payroll , Retirement Payroll , or Others .
Relation	Specify if you want the bank to send you a detailed list of all transfer charges. If you do not select this field, the bank will send the total of all charges for all the transfers made.

FIELD	DESCRIPTION
Number Of Copies	Specify the number of additional copies of the remittance advice that will be printed by this process. One document is always printed so that it can be mailed to the payee.
Shared (Only Internation Transf.)	Specify if you want to share the expenses between the payer and the payee. This is only applicable for international transfers.

NOTE

You can only post the payment order after you have successfully exported the electronic payments.

Void Electronic Payments

3/31/2019 • 2 minutes to read

In Business Central, you can void the exported payment file. By voiding the file, the entire payment journal from which the file was created, will be deleted.

To void electronic payments

1. Choose the  icon, enter **Void Electronic Payments**, and then choose the related link.
2. On the **Options** FastTab, fill in the fields as described in the following table.

FIELD	DESCRIPTION
Bank Account No.	Specify the bank account number from which the payments will be voided.

To void electronic payments in the Cartera module

1. Choose the  icon, enter **Void PO – Export N34.1**, and then choose the related link.
2. On the **Options** FastTab, fill in the fields as described in the following table.

FIELD	DESCRIPTION
Payment Order No.	Specify the payment order number from which the payments will be voided.

Set Up Bank CCC Codes

3/31/2019 • 2 minutes to read

Código Cuenta Cliente (CCC) is a unique account code used by banks to identify their customers. The CCC code is printed on bank documents such as checks and statements.

You can set up CCC codes in the following locations:

- **Bank Account Card** page
- **Company Information** page
- **Customer Bank Account Card** page
- **Vendor Bank Account Card** page

The following procedure describes how to set up bank CCC codes for your company.

To enter CCC codes

1. Choose the  icon, enter **Company Information**, and then choose the related link.
2. On the **Payments** FastTab, fill in the fields as described in the following table.

FIELD	DESCRIPTION	
CCC Bank No.	1-4	Identifies the bank where the account has been opened.
CCC Bank Branch No.	5-8	Identifies the branch code. If the bank does not use this reference, the branch code can be zeros.
CCC Control Digits	9-10	Identifies the control digits.
CCC Bank Account No.	11-20 (Spain) 11-21 (Portugal)	Identifies the account number, which may be adjusted with preceding zeros.

The following procedure describes how to set up bank CCC codes for existing customer bank accounts, but the same steps apply to vendors, bank accounts, and company information.

To set up bank CCC codes for a customer bank account

1. Choose the  icon, enter **Customer Bank Account Card**, and then choose the related link.
2. On the **Transfer** FastTab, enter information into the relevant CCC fields.

NOTE

You must set up the company information on the **Payments** FastTab.

3. Choose the **OK** button.

Enter CCC Codes

3/31/2019 • 2 minutes to read

Código Cuenta Cliente (CCC) is a unique bank account identification code. The following component fields make up the 20-digit (Spain) or 21-digit (Portugal) bank CCC code structure.

If you change the CCC code structure, the **CCC No.** field updates automatically. Similarly, if you change the **CCC No.** field, the CCC code structure updates automatically.

To enter CCC codes

1. Choose the  icon, enter **Company Information**, and then choose the related link.
2. On the **Payments** FastTab, fill in the fields as described in the following table

FIELD	DESCRIPTION	
CCC Bank No.	1-4	Identifies the bank where the account has been opened.
CCC Bank Branch No.	5-8	Identifies the branch code. If the bank does not use this reference, these can be zeros.
CCC Control Digits	9-10	Identifies the control digits.
CCC Bank Account No.	11-20 (Spain) 11-21 (Portugal)	Identifies the account number, which may be adjusted with preceding zeros.

Set Up Payment Days and Non-Payment Periods

3/31/2019 • 2 minutes to read

Payment days and non-payment periods are used to calculate due dates. Due date calculation is used for sales and purchase documents.

A payment day is a day on which invoices are paid.

A non-payment period is a range of dates during which the company does not make payments. This functionality is often used for holiday periods.

For sales and purchase invoices, the customer and vendor payment days and non-payment periods are taken into account.

To set up payment days and non-payment periods for a company

1. Choose the  icon, enter **Company Information**, and then choose the related link.
2. Expand the **Payments** FastTab.
3. Fill in the fields as described in the following table.

FIELD	DESCRIPTION
Payment Days Code	Enter the payment day code.
Non-Paymt. Periods Code	Enter the non-payment periods code.

4. To open the **Payment Days** page, choose the **Payment Days** action.
5. On the **Payment Days** page, in the **Payment Day** field, enter the payment day for the company.
6. Choose the **OK** button.
7. To open the **Non-Payment Periods** page, choose the **Non-Payment Periods** action.
8. Enter information into the relevant fields.
9. Choose the **OK** button.

To set up payment days for customers and vendors

1. Choose the  icon, enter **Customers** or enter **Vendors**, and then choose the related link.
2. Select the required customer or vendor, and then choose the **Payment Days** action.
3. On the **Payment Days** page, in the **Payment Day** field, enter the payment day for the customer or vendor.
4. Choose the **OK** button.

To set up non-payment periods for customers and vendors

1. Choose the  icon, enter **Customers** or enter **Vendors**, and then choose the related link.
2. Select the required customer or vendor, and then choose the **Non-Payment Periods** action.
3. Fill in the fields as described in the following table.

FIELD	DESCRIPTION
From Date	Enter the starting date for the non-payment period.
To Date	Enter the ending date for the non-payment period.
Description	Enter a description.

4. Choose the **OK** button.

Payments in Cash

3/31/2019 • 2 minutes to read

As of January 1, 2012, companies in Spain are required to submit a summary for payments in cash that are greater than EUR 6.000.00 for each customer for each year.

Reporting Payments in Cash

If you are reporting payments in cash, the following sequence of tasks are listed in the order in which they are generally performed:

- Applying payments in cash to invoices.
- Making 340 Payments in cash declaration.

Applying Payments in Cash to Invoices

You apply payments in cash to invoices that you have received from customers. For information about how to apply payments to invoices, see [Managing Receivables](#). Only the applied payments in cash are used for reporting payments in cash. If you do not apply payments in cash to invoices, you cannot report payments in cash.

Making 340 Payments in Cash Declaration

You use the **Make 340 Declaration** batch job to report 340 payments in cash declaration. For information about how to specify and select information to generate the declaration, see [Make 340 Declaration](#).

NOTE

The payments made through banks are excluded.

NOTE

The amount received in cash in the declaration .txt file can contain values that differ from the total invoiced amount for a customer. This is because not all of the payments are made in cash.

Cartera Module

3/31/2019 • 2 minutes to read

The Cartera module allows you to use specific documents, such as bills of exchange and promissory notes, to manage customer and vendor payments.

You can use the Cartera module to manage transactions made with different financial units based on:

- Document type
- Cost
- Credit limit

The balances are kept in local currencies and original currencies.

The Cartera module contains the Receivables Cartera module and the Payments Cartera module. The Receivables Cartera module allows you to manage bills generated from sales invoices. The Payments Cartera module allows you to manage payables documents generated from purchase invoices or from the Cartera journal.

See Also

[Receivables Cartera Module](#)

[Payments Cartera Module](#)

[Spain Local Functionality](#)

Receivables Cartera Module

3/31/2019 • 2 minutes to read

The Receivables Cartera module allows you to manage bills generated from sales invoices. The documents can be managed by:

- Due date
- Bank
- Value
- Document type
- Currency

You can manually create bills using the **Cartera Journal**. You can also use the Receivables Cartera module to manage all sales invoices that the company yields to a factoring company.

Bill Groups

With the Receivables Cartera module, you can manage bill groups and discount bill groups in your local currency or original currency.

There are various criteria for grouping documents in a bill group. You can group documents for the same customer, documents with the same due date, documents drawn in the same market, and so on. You can group one or more receivable documents in one bill group.

A bill group consists of one or more documents grouped together to submit to a bank. A bill group can be submitted for collection or discount.

If submitted for collection, the bank is only responsible for processing the collection of the documents on the due date.

If the bill group is submitted for discount, the bank will advance the amount of the bill group (or a portion of it, in the case of factoring) to the company, and will take responsibility for collecting on the due dates of the documents that make up the bill group.

A bill group of invoices can be submitted to a financial institution (factor) for risked factoring (the risk of insolvency is covered by the company) or unrisked factoring (the risk of insolvency is covered by the factor).

Bill groups include:

- Finance charges for collection or discount management
- Finance charges for returned bills
- Interest for discounts

With the Receivables Cartera module, you can yield credits or factoring of sales invoice bill groups, including the finance charge calculation by the factoring company. You can request the anticipated value of the yielded invoices, or only the management of the collection.

You can use bill groups for the following:

- Factoring without risk - The factoring company takes on the risks associated with non-payment.
- Factoring with risk - You take on the risks associated with non-payment.

[Cartera Module](#)

[Payments Cartera Module](#)

Payments Cartera Module

3/31/2019 • 2 minutes to read

The Payments Cartera module allows you to manage payables documents generated from purchase invoices or from the **Cartera Journal**. The documents can be managed by:

- Bank
- Due date
- Value
- Currency

Payment Orders

A payment order is comprised of one or several documents that are grouped for delivery to a bank.

There are different criteria for grouping documents into a single payment order. You can group documents sent to the same vendor, documents that have the same due date, documents sent to the same address, and so on.

Use the Payments Cartera module to manage the following:

- Drafts of payment orders to vendors (payment confirmation)
- Distinct payables documents

NOTE

The drafts, payment orders to vendors, and distinct payables documents can be managed in your local currency or original currency.

Finance charges from financial entities are included.

Payment confirmation is a service provided by a financial entity. With payment confirmation, you can manage a company's payments to its suppliers, and use the invoice to charge the customers or vendors before the due date.

SII - Invoice and Credit Memo Types in Sales and Purchase Documents

3/31/2019 • 3 minutes to read

Business Central supports the Spanish SII requirements for VAT reporting (Immediate Information Supply). For more information, see [Setup and user guide for electronic VAT information under SII in the Spanish version of Dynamics NAV](#).

The following table shows the output of the various types that are used for invoices and credit memos in connection with SII and how they are implemented in Business Central.

Sales Invoices

TYPE	DESCRIPTION	IMPLEMENTATION
F1	Invoice	Normal invoice
F2	Simplified invoice (ticket)	Implemented as for F1, except a non-existing block is called "Contraparte" and additional nodes are called "ImporteTotal" and "Macrodato".
F3	Invoice issued to replace simplified invoices issued and filed	Same as Normal invoice
F4	Invoice summary entry	Possible, but the XML file is same as for F1 because Business Central does not support Summary invoices. Submissions will result in known error: Missing "NumSerieFacturaEmisorResumenFin" element.
R1	Corrected invoice (Error based on Art. 80.1, 80.2, and 80.6 LIVA)	Not supported. Only used for credit memos.
R2	Corrected invoice (Art. 80.3)	Not supported. Only used for credit memos
R3	Corrected invoice (Art. 80.4)	Not supported. Only used for credit memos
R4	Corrected invoice (other)	Not supported. Only used for credit memos
R5	Corrected invoice in simplified invoices	Not supported. Only used for credit memos

Sales Credit Memos

TYPE	DESCRIPTION	IMPLEMENTATION
F1	Invoice	Same structure as sales invoice, type F1, but with negative values
F2	Simplified invoice (ticket)	Same structure as sales invoice type F2, but with negative values
F3	Invoice issued to replace simplified invoices issued and filed	Not supported
F4	Invoice summary entry	Not supported
R1	Corrected invoice (Error based on Art. 80.1, 80.2, and 80.6 LIVA)	Normal credit memo
R2	Corrected invoice (Art. 80.3)	Same as normal credit memo
R3	Corrected invoice (Art. 80.4)	Same as normal credit memo
R4	Corrected invoice (other)	Same as normal credit memo
R5	Corrected invoice in simplified invoices	Same as normal credit memo except the block is called "Contraparte".

Purchase Invoices

TYPE	DESCRIPTION	IMPLEMENTATION
F1	Invoice	Normal invoice
F2	Simplified invoice (ticket)	Implemented as for F1, except a non-existing block is called "Contraparte" and additional nodes are called "ImporteTotal" and "Macrodato".
F3	Invoice issued to replace simplified invoices issued and filed	Sames as for Normal invoice
F4	Invoice summary entry	Possible, but the XML file is same as for F1 because Business Central does not support Summary invoices. Submissions will result in known error: Missing "NumSerieFacturaEmisorResumenFin" element.
F5	Imports (DUA)	Same as for Normal invoice
F6	Accounting support material	Sames as for Normal invoice
R1	Corrected invoice (Error based on Art. 80.1, 80.2, and 80.6 LIVA)	Not supported. Only used for credit memos

TYPE	DESCRIPTION	IMPLEMENTATION
R2	Corrected invoice (Art. 80.3)	Not supported. Only used for credit memos
R3	Corrected invoice (Art. 80.4)	Not supported. Only used for credit memos
R4	Corrected invoice (other)	Not supported. Only used for credit memos
R5	Corrected invoice in simplified invoices	Not supported. Only used for credit memos

Purchase Credit Memos

TYPE	DESCRIPTION	IMPLEMENTATION
F1	Invoice	Same structure as for purchase invoice, type F1, but with negative values
F2	Simplified invoice (ticket)	Same structure as for purchase invoice, type F1, but with negative values
F3	Invoice issued to replace simplified invoices issued and filed	Not possible
F4	Invoice summary entry	Not possible
F5	Imports (DUA)	Not possible
F6	Accounting support material	Not possible
R1	Corrected invoice (Error based on Art. 80.1, 80.2, and 80.6 LIVA)	Normal credit memo
R2	Corrected invoice (Art. 80.3)	Same as normal credit memo
R3	Corrected invoice (Art. 80.4)	Same as normal credit memo
R4	Corrected invoice (other)	Same as normal credit memo
R5	Corrected invoice in simplified invoices	Same as for normal credit memo except the block is called "Contraparte"

Set Up and Close Income Statement Balances

3/31/2019 • 2 minutes to read

You can use income statement balancing accounts to balance and track several accounts at the same time. The **Close Income Statement** batch job transfers income statement accounts to an account in the balance sheet, and closes the income statement accounts. When the **Close Income Statement** batch job is run, the entries are automatically posted.

NOTE

The fiscal year must be closed before the batch job can run.

To set up the income statement balance account

1. Choose the  icon, enter **Chart of Accounts**, and then choose the related link.
2. Select an existing general ledger account, and then choose the **Edit** action to open the **G/L Account Card** page.
3. Expand the **General** FastTab.
4. In the **Income Stmt. Bal. Acc.** field, select the adjustment account for the auxiliary commercial account.

NOTE

During adjustment, balances will be expensed or credited to this account.

5. Enter information into the required fields, and then choose the **OK** button.

To close income statement balances

1. Choose the  icon, enter **Close Income Statement**, and then choose the related link.
2. In the **Options** FastTab, fill in the fields as described in the following table.

FIELD	DESCRIPTION
Fiscal Year Ending Date	Select the date of the closed fiscal year.
Gen. Journal Template	Select the required general journal template.
Gen. Journal Batch	Select the required general journal batch.
Document No.	Enter the document number.
Retained Earnings Acc.	Select the account for the retained earnings entries.
Posting Description	Enter the required description.

3. In the **Close by** section, fill in the fields as described in the following table.

FIELD	DESCRIPTION
Business Unit Code	Select to create an entry for each business code.
Dimensions	Select to create an entry for each general ledger dimension.
Inventory Period Closed	Select to indicate that the inventory period with ending dates equal to or greater than the last date of the accounting period is closed.

4. Choose the **OK** button.

Indent and Validate Chart of Accounts

3/31/2019 • 2 minutes to read

You can indent and validate the chart of accounts on the **G/L Account Card** page. You can enter a maximum of 20 numbers. Accounts are sorted in string order, as shown in the following example.

1
10
101
2
20
2100001
3
31

To indent and validate the chart of accounts

1. Choose the  icon, enter **Chart of Accounts**, and then choose the related link.
2. Choose the **New** action.
3. On the **General** FastTab, in the **No.** field, enter the number of the general ledger account that you are setting up.
4. In the **Account type** field, select **Posting** or **Heading**. **Posting** implies that entries can be posted to the account. **Heading** implies that entries cannot be posted to the account.

NOTE

For Portugal, select **Posting** or **Total** in the **Account type** field.

5. In the **Income Stmt. Bal. Acc.** field, select the account to which the changes will be sent after correction.
6. Enter information into the other relevant fields.
7. Choose the **OK** button to close the **G/L Account Card** page.
8. On the **Chart of Accounts** page, select an account, and then choose **Indent Chart of Accounts**.
9. To validate the chart of accounts, choose the **Yes** button in the dialog box. After validation, you will be notified whether the chart of accounts is correct.
10. Choose the **OK** button.

To validate the chart of accounts in Portugal

1. On the **Chart of Accounts** page, choose the **Check Chart of Accounts** action.
2. Choose the **Yes** button.

Print Account Book Reports

3/31/2019 • 2 minutes to read

Account book reports display all the general ledger entries created in a specific period. The two account book reports are:

- **Official Account Book** report - Displays information for every general ledger entry, grouped by transaction.
- **Official Account Summarized Book** report - Displays a summary of general entries, grouped by heading or posting accounts.

When sending these reports to the authorities or auditors, you can include additional pages that will precede your report. To do this, you need to manually set the report's first page number. For example, if you have three pages of information preceding your report, you can set the first page of the report to indicate that it is page 4.

To print an official account book report

1. Choose the  icon, enter **Account - Official Acc. Book**, and then choose the related link.
2. In the **Options** FastTab, fill in the fields as described in the following table.

FIELD	DESCRIPTION
Closing Transaction Description	Enter the description for the closing period transaction.
Opening Transaction Description	Enter the description for the opening period transaction.
First Page	Enter the number that you want to include on the first page of the report.
Show Amounts in Add. Currency	Select to show the report amounts in additional reporting currency (ACY).

3. In the **GL Register** FastTab, select appropriate filters.
4. Choose the **Print** button to print the report or choose the **Preview** button to view it on the screen.

To print an official account summarized book report

1. Choose the  icon, enter **Official Acc.Summarized Book**, and then choose the related link.
2. In the **Options** FastTab, fill in the fields as described in the following table.

FIELD	DESCRIPTION
From Date	Enter the start date of the report.
To Date	Enter the end date of the report.
Include Closing Entries	Select to include the closing entries in the report.
Show Amounts in Add. Currency	Select to show the report amounts in additional reporting currency (ACY).

FIELD	DESCRIPTION
First page	Enter the number that you want to include on the first page of the report.
Account Type	Select Posting or Heading . Posting implies that entries can be posted to the account, and Heading implies that entries cannot be posted to the account.

3. Choose the **Print** button to print the report or choose the **Preview** button to view it on the screen.

Print Sales and Purchase Invoice Books

3/31/2019 • 2 minutes to read

The **Sales Invoice Book** report and **Purchases Invoice Book** report allow you to check all of the sales and purchase documents created for a specific period.

Invoices posted from a journal are displayed in these reports. When a sales or purchase general posting journal line is posted, the VAT entry that is created stores information about the customer or vendor.

You can print the **Sales Invoice Book** report and **Purchases Invoice Book** report in additional reporting currency. You can also filter these reports to get a list of the following:

- Invoices
- Credit memos
- Invoices and credit memos

To print sales invoice book and purchase invoice book reports

1. Choose the  icon, enter **Sales Invoice Book** or enter **Purchases Invoice Book**, and then choose the related link.
2. On the **Options** FastTab, fill in the fields as described in the following table.

OPTION	DESCRIPTION
Show Amounts in Add. Currency	Select to display amounts in an additional currency.
Order by posting date	Select to order the document by posting date.

3. Choose the **Print** button to print the report or choose the **Preview** button to view it on the screen.

Transaction Numbers

3/31/2019 • 2 minutes to read

Transaction numbers allow you to group entries with the same document number and date, so that you can balance them together. Transaction numbers usually begin with the number 2 each year. The number 1 is reserved for the opening transaction, which is automatically created each year. The only exception is for the first accounting period in the first year. In this case, the opening transaction is the number 1.

When you enter a transaction number in the first line of a journal, the same transaction number is automatically entered into the other lines if the entries are not balanced. If the entries are balanced, the next number in the sequence is automatically entered into the other lines.

Having a unique sequential transaction number, ordered by date, allows you to identify every transaction posted in a fiscal year.

Post and Print All Transactions for a Period

3/31/2019 • 2 minutes to read

Companies must submit their business transaction entries, grouped by transaction numbers, in an annual report to tax authorities. Every general ledger transaction must have a sequential number for the fiscal year. Posting transactions will assign transaction numbers to general ledger entries.

To post all transactions for a period

1. Choose the  icon, enter **General Journal**, and then choose the related link.
2. Fill in the fields as described in the following table.

FIELD	DESCRIPTION
Batch Name	Select the required general journal batch name.
Transaction No.	Enter the transaction number. Note: If the transaction is balanced, the next number displays automatically, and the related transaction details appear in the next row. If the transaction is not balanced, the same transaction number is displayed with related transaction details.

3. Choose the **Post** action, and then choose the **Yes** button to confirm posting.
4. Choose the **OK** button.

After the journal is posted, a final transaction number is assigned to entries in the journal. This number is a sequential, non-gap number. Thus, for each fiscal year, all of the entries grouped by their transaction number are sorted by date in sequential order, with no gaps or blanks.

To print all transactions for a period

1. Choose the  icon, enter **G/L Registers**, and then choose the related link.
2. To set the **Period Trans. No.** field for all of the general ledger entries in the period in a sequential order, choose the **Set Period Transaction No.** action.
3. Select the appropriate filters.
4. Choose the **OK** button.

NOTE

All transactions are ordered by posting date, and a sequential number is assigned to each entry in the **Period Trans. No.** field.

5. On the **G/L Registers** page, choose the **Print Page** action.

Corrective Invoices

3/31/2019 • 2 minutes to read

The corrective invoice functionality allows you to send a corrective invoice when there is an error or dispute that affects a VAT amount or fiscal data. This invoice includes all legally required data and refers to the original invoice or invoices. The original invoices cannot be voided, and remain valid. The corrective invoice contains the corrections, and reasons for these corrections.

The following options are available:

- You can set parameters to ensure that all corrective invoices contain corrected invoice number information.
- When preparing a corrective invoice for posting, you can select posted invoices from a list. These invoice numbers are used as identifiers for the corrected invoices.
- You can print corrective invoices according to legal requirements.
- From a posted invoice, you can use a reference to look up the related corrective invoices.

The corrective invoice must meet the following requirements:

- You can correct several invoices by using a single corrective invoice. The corrective invoice must use all of the corrected invoice numbers.
- You must clearly indicate the invoice numbers for the invoices you are correcting.
- You can post a corrective invoice without corrected invoice numbers only when the corrections are necessary due to discounts or volume rebates.

Calculating Due Dates

3/31/2019 • 3 minutes to read

In Spain, there is a legal limit for the number of days that a payment can be delayed. You must submit an annual report of purchases and sales for payments that were made before or after the due date. The legal requirements depend on whether the customer is a private company or a public administration. For more information, see the official declaration [BOE-A-2010-10708](#) on the Boletín Oficial del Estado website.

Payment Terms

To help you meet the legal requirements, you can set up payment terms so that the due dates are calculated correctly. This includes specifying the maximum number of calendar days that a payment can be delayed after delivery. For example, you can create separate payment terms for sales to the public sector and sales to private companies. The following table illustrates how you can set up payment terms.

FIELD	PUBLIC SECTOR	PRIVATE COMPANY
Code	1M(8D) PUB	1M(8D) PRI
Due Date Calculation	1M	1M
Max. No. of Days till Due Date	30	60

For each customer and vendor, you must select the appropriate payment term code. Then, when you create a document for that customer or vendor, Business Central will calculate a due date that does not exceed the limit for the relevant payment term.

IMPORTANT

You cannot post a document that creates a bill where one or more installments have a due date that is later than the limit that is specified in the **Max. No. of Days till Due Date** field.

If a due date cannot be calculated based on the limit, the due date is set to blank. For example, if the calculated due date falls in a non-payment period and there is no available date before that period, you must specify a due date manually. You cannot post a document that has an empty due date.

You can change the calculated due date manually, but you cannot make it later than the limit that you specify for the payment term. For example, the due date can be calculated to be very late because of conflicts with non-payment periods. In that case, you can decide to make the due date earlier than the non-payment period.

Overdue Payments

You must include information about overdue payments in the annual reports for the government. Business Central includes two reports to help you identify overdue payments from customers and payments that you are late in making.

The **Customer - Overdue Payments** and **Vendor - Overdue Payments** reports include a section for each customer or vendor that lists the payments with the following information:

- Invoice number

- Invoice description
- Document number
- Posting date
- Due date
- Days overdue
- Currency code
- Amount
- Amount in the local reporting currency (LCY)

Each section has a summary section with the following information.

INFORMATION	DESCRIPTION
Weighted average term exceeded	This formula is calculated based on the number of posted payments for the specified period, the number of days that payments were delayed, and the paid amount in (LCY). For more information, see the official declaration BOE-A-2010-10708 on the Boletín Oficial del Estado website.
Payments within the legal limit	The amounts in LCY and the percentage of the total payments that were made before the maximum allowed due date for each transaction.
Payments outside the legal limit	The amounts in LCY and the percentage of the total payments that were made after the maximum allowed due date for each transaction.

At the end of these reports, there is a section that summarizes this information for all payments. These reports will show information based on applied detailed customer ledger entries or applied detailed vendor ledger entries. The information is based on the date filters that you specify. For more information, see [Customer - Overdue Payments](#) and [Vendor - Overdue Payments](#).

Set Up Operation Codes

3/31/2019 • 2 minutes to read

You can add as many operation codes as you want to the table. However, the operation codes C, D, and I already exist in Business Central. For example, Credit Memos always have the operation code D. You cannot set up these values in the table because they are system-created codes. If you try to add them, Business Central will return an error.

To set up operation codes

1. Choose the  icon, enter **Operation Codes**, and then choose the related link.
2. On the **Operation Codes** page, fill in the fields as described in the following table

FIELD	DESCRIPTION
Code	Enter an operation code. You can only enter one letter or number. Valid codes are numbers 1 – 8, and letters A – Z. To submit a report under the CAC regimen, you must make certain that the code Z, which is required for these types of transactions, is in the list of operation codes.
Description	Enter a description for the operation code. You can enter a maximum of 30 letters and numbers.

To link operation codes to general product posting groups

1. Choose the  icon, enter **Posting Groups**, and then choose the related link.
2. Choose the **General Product Posting Groups** action.
3. On the **General Product Posting Groups** page, link each operation code to a general product posting group.

FIELD	DESCRIPTION
Code	Enter a code to create a new general product posting group.
Description	Enter a description for the general product posting group
Def. VAT Prod. Posting Group	Select a VAT percentage to link it to the general product posting group.
Operation Code	Select an appropriate operation code to link it to the general product posting group. You can assign the same operation code to different posting groups. Note: It is important to link the operation code to the correct VAT product posting group. The Make 340 Declaration report uses the setup to create trade declarations.

When you add an operation code to the general product posting group, that association is in turn applied to the items that have that general product posting group.

Enter NACE Codes

3/31/2019 • 2 minutes to read

Nomenclature générale des Activités économiques dans les Communautés Européennes (NACE) codes represent the statistical classification of economic activities within the European Union (EU).

A NACE code serves as a basis to compile statistics for many things, including:

- Production
- Factors of production such as labor, raw materials, or energy
- Fixed capital formation operations
- Financial operations

You can enter NACE codes on the **Company Information** page. NACE codes are unique five- or six-digit codes that are assigned to industry sectors. For example, DA.15.83 - Manufacture of Sugar.

To enter NACE codes

1. Choose the  icon, enter **Company Information**, and then choose the related link.
2. On the **General** FastTab, in the **Industrial Classification** field, enter the NACE code.
3. Choose the **OK** button.

[Spain Local Functionality](#)

Set Limits for Due Dates

3/31/2019 • 2 minutes to read

You can modify payment terms to have limits for the maximum number of days that can be between a delivery and the corresponding payment.

Legal limits for the gap between delivery and payment determine how due dates are calculated. For example, if you create a payment term that will be used for sales to the public sector, the **Max. No. of Days till Due Date** field for that payment term must be set to 30 days.

To set limits for due dates on payment terms

1. Choose the  icon, enter **Payment Terms**, and then choose the related link.
2. Select the payment term that you want to modify, and then, in the **Max. No. of Days till Due Date** field, specify the number of calendar days to allow between delivery and payment.

Next, you must make sure that you specify the appropriate payment terms for your public and private customers and vendors. When you create a document for that customer or vendor, the due date for the payment is calculated from the day that the customer received the items or services. Then, you must update the **Document Date** field for the document with the date of the receipt. For example, if you update a sales invoice when you are informed of delivery, the due date is calculated based on the new document date that you specified. The calculated due date cannot be further away than the limit that you specified for the payment term.

IMPORTANT

You cannot post a document that creates a bill where one or more installments have a due date that is later than the limit that is specified in the **Max. No. of Days till Due Date** field.

Set Up EU Third-Party Purchase Transactions

3/31/2019 • 2 minutes to read

European Union (EU) third-party trade occurs when you receive a purchase invoice from a customer in one EU country/region and the products are sent to a different EU country/region without entering Sweden. The transaction amount must be identified and reported separately to comply with Swedish VAT reporting and VAT Information Exchange System (VIES) requirements. Business Central includes Swedish enhancements that allow purchase transactions to be set up as EU third-party trade. Posted EU third-party transactions can then be filtered in VAT statements and excluded from the amount in the **Sales to Customer** column in the **VAT- VIES Declaration Tax Auth** report.

To set up EU third-party purchase transactions

1. Choose the  icon, enter **Purchase Invoices**, and then choose the related link.
2. Select an existing purchase invoice, or choose the **New** action to create a new one.
3. On the **Invoice Details** FastTab, select the **EU 3-Party Trade** check box.
4. Choose the **OK** button.

Automatic Account Codes

3/31/2019 • 2 minutes to read

You can use customized posting groups to automate recurring transactions in journals, sales documents, or purchase documents. These posting groups can be used throughout Business Central to trigger automatic postings and allocations across different accounts or dimensions.

Automatic account codes can be used to automate postings related to payroll overhead. For example, when posting total salary expenses at the end of the month, you can use automatic account codes to assign a percentage of the total salary to automatically post as overhead expenses.

You can also use automatic account codes to trigger cost or revenue allocations across different dimensions. For example, you can set up an automatic account group to divide total expenses across three departments when posting an invoice.

Set Up Automatic Account Posting Groups

3/31/2019 • 2 minutes to read

To use automatic account codes, you must create an automatic account posting group.

To set up automatic account posting groups

1. Choose the  icon, enter **Auto. Acc. Groups**, and then choose the related link.
2. Choose the **New** action.
3. On the **General** FastTab, fill in the fields as described in the following table.

FIELD	DESCRIPTION
No.	Enter a unique alphanumeric number for the automatic account posting group.
Description	Enter a description for the automatic account posting group.

4. On the **Automatic Acc. Line** FastTab, fill in the fields as described in the following table.

FIELD	DESCRIPTION
Allocation Percentage	Enter the percentage of the source line amount that is to be allocated.
G/L Account No.	Enter the general ledger account number to which the allocation should be posted.

NOTE

The **Total Balance** field totals the **Allocation Percentage** field for automatic account lines in a posting group. If the total allocation percent for a posting group does not balance to zero, an error message will be displayed when the item is posted.

5. Choose the **OK** button.

Import and Export Data in Standard Import Export Format

3/31/2019 • 2 minutes to read

You can import and export general ledger data according to the standard import export (SIE) format. By specifying SIE dimensions and file types, you can specify the level of detail covered by import or export transactions. For more information, see [Standard Import Export Group](#).

To import data in SIE format

1. Choose the  icon, enter **SIE Import**, and then choose the related link.
2. Fill in the fields as described in the following table.

FIELD	DESCRIPTION
Gen. Journal Template	Select a general journal template.
Gen. Journal Batch	Select a general journal batch.
Dimensions	Select the SIE dimensions to import.
Insert G/L Account	Select if the general ledger account in the import file is missing in the chart of accounts and needs to be set up during the import process.
Use Number Series for Doc. No.	Select if a document number is not provided in the import file.

3. Choose the **OK** button.
4. Select the file to import.

To export data in SIE format

1. Choose the  icon, enter **SIE Export**, and then choose the related link.
2. On the **G/L Account** FastTab, choose the appropriate filters.
3. On the **Options** FastTab, fill in the fields as described in the following table.

FIELD	DESCRIPTION
-------	-------------

FIELD	DESCRIPTION
File Type	<p>Select the type of file to be created. Select from one of the following options:</p> <ul style="list-style-type: none"> - Year - End Balances - Contains the annual account balance carried forward for all accounts in the chart of accounts. - Periodic Balances - Contains the annual account balance carried forward and monthly changes for all accounts in the chart of accounts. - Object Balances - Contains the annual account balance carried forward, monthly changes, and balances on the object level, such as cost units and projects, for all accounts in the chart of accounts. - Transactions - Contains all the general ledger entries for the period.
Contact	Enter the contact person. This field is optional.
Comments	Describe the content of the file.
Dimensions	Select the dimensions to export.
Fiscal Year	Enter the fiscal tax year.

4. Choose the **OK** button.

5. Choose the **Open** or **Save** button to decide where to place the exported file.

Create and Print a Swiss VAT Statement

3/31/2019 • 2 minutes to read

Based on the information that you have specified on the **VAT Posting Setup** page, Business Central can automatically create a new VAT Statement Setup for realized VAT reporting. Before proceeding with the procedures in this topic, make sure that you have set up VAT posting setup with values specified for the sales and purchase cipher fields.

To set up a Swiss VAT statement template

1. Choose the  icon, enter **Update VAT Statement Template**, and then choose the related link.
2. Select a template in the **VAT Statement Template Name** field.
3. Choose the **OK** button. Choose the **Yes** button to confirm that you want to create a new template.
4. Check the resulting VAT Statement and adjust as needed.

The VAT Statement page contains the **VAT Statement Cipher** field, which indicates in which cipher of the report the result will be printed. This field is automatically populated by the batch job based on the information on the **VAT Posting Setup** page. The field can be edited if needed.

To print the Swiss VAT statement

1. Choose the  icon, enter **Swiss VAT Statement**, and then choose the related link.
2. On the **Options** FastTab, fill in the fields as described in the following table.

FIELD	DESCRIPTION
Starting Date	Enter the date that you want the time interval for VAT statement lines that appear in the report to start.
Ending Date	Enter the date that you want the time interval for VAT statement lines that appear in the report to end.
Closed with VAT Register No.	Select the VAT Register that contains the posting source of the VAT adjusting entries. This option evaluates accounting periods that have already been settled. When you choose this option, you do not specify options in the following Include VAT Entries fields.
Include VAT Entries	Select one of the available options.
Include VAT Entries	Select one of the available options.
Normal Rate %	Enter the standard VAT rate that applies to the time period.
Reduced Rate %	Enter the reduced VAT tax for certain goods and services.
Hotel Rate %	Enter the VAT rate for accommodation that applies to the time period.

FIELD	DESCRIPTION
Normal (Other Rate) %	Enter an alternative VAT rate for standard transactions that applies to certain transactions during the time period.
Reduced (Other Rate) %	Enter an alternative VAT rate for other transactions that applies to certain transactions during the time period.
Hotel (Other Rate) %	Enter an alternative VAT rate for accommodation that applies to certain transactions during the time period.
Show Amounts in Add. Reporting Currency	Select to show amounts in an additional reporting currency.

Print Swiss VAT Statements (older version)

3/31/2019 • 2 minutes to read

NOTE

This topic is retained for backward compatibility with the **Swiss VAT Statement** report. For information about using the newer Swiss VAT Statement, see [Swiss VAT Statement](#).

The **Swiss VAT Statement** is the standard calculation report for realizing VAT. You can print this report, and use it for quarterly tax reporting. The **Swiss VAT Statement** includes the following:

- A VAT entry.
- VAT adjusting entries.
- An accounting sheet.

To print the Swiss VAT statement

1. Choose the  icon, enter **Swiss VAT Statement**, and then choose the related link.

NOTE

You will receive a message stating that the **Swiss VAT Statement** will open in the local language.

2. On the **Options** FastTab, fill in the fields as described in the following table.

FIELD	DESCRIPTION
Closed with Journal no.	Select the general ledger journals that contain the posting source of the VAT adjusting entries. This field evaluates accounting periods that have already been settled.
Open until date	Select the last date for settling open or unsettled VAT entries.
Show Postings	Specifies if all of the VAT entries for each group will be printed.
Show Chargeback	Specifies if VAT entries and general ledger entries with closed summaries or reposted tax will be printed.
Normal rate VAT %	Select the current typical VAT rates used to assign the correct rates to the business and product groups defined in the VAT settings.
Reduced rate VAT %	Select the current reduced tax rates used to assign the correct rates to the business and product groups defined in the VAT settings.

FIELD	DESCRIPTION
Special rate VAT %	Select the current special tax rates used to assign the correct rates to the business and product groups defined in the VAT settings.
Investment/Operating Purchase VAT G/L Account	Select the VAT general ledger account.
Own Consumption Bus. Group	Select the business and product group for own consumptions.
Service Foreign Bus. Group	Select the foreign service business and product group.
Export Bus. Group	Select the business and product group for exports.

3. Choose the **Print** button to print the VAT statement or choose the **Preview** button to view it on the screen.

[Swiss Value Added Tax](#)

[VAT Rates for Switzerland](#)

Swiss Value Added Tax

3/31/2019 • 2 minutes to read

Business Central includes the following enhancements to Swiss VAT reporting:

- Automatic adjustment of VAT amounts for invoices, according to payment discounts.
- Additional VAT exchange rates for invoices in foreign currencies.

For more information about Swiss VAT reporting and coding requirements, see [Swiss VAT Information](#). The information is available in French, German, and Italian.

VAT Amounts and VAT Exchange Rates

According to local VAT laws, the VAT base amount for an invoice can be reduced by the payment discount if a discount is granted. To allow automatic VAT adjustment for a payment discount on an invoice, the **Adjust for Payment Discount** field is activated by default on the **General Ledger Setup** page. You can also activate this function in the VAT posting setup. For more information, see the General Ledger Setup table and the VAT Posting Setup table.

Currency Exchange Rates for VAT Reporting

For invoices in foreign currency, you must use the official exchange rate provided by the government for the VAT calculation itself. You can also set up additional exchange rates for VAT, which you can use for aspects of the invoice other than the VAT calculation. You can provide the correct government VAT exchange rate for each relevant foreign currency in the exchange rate setup for invoices. For more information, see the Currency Exchange Rate table.

You can also adjust all VAT amounts in VAT entries that result from foreign currency transactions. When you activate the adjust VAT exchange rate function, VAT exchange rates are adjusted automatically. The positive differences that result from exchange rates are posted to exchange rate gain accounts. The negative differences that result from exchange rates are posted to exchange rate loss accounts. For more information, see the Adjust Exchange Rates batch job.

Additional information, such as VAT rate and original currency amount, is transferred to the VAT entries. For more information, see the VAT Entry table.

Close an LSV Collection

3/31/2019 • 2 minutes to read

You must close Lastschrift Verfahren (LSV+) collections to write LSV files that can be sent to the bank for payment collection. When you close a collection, the collection is complete, and the postings in the LSV journal are combined.

When the collection is complete, the current collection number is assigned in the LSV journal, based on the last collection. This LSV number is transferred to the customer entries for all outstanding invoices. The collection file can be reconstructed at any time using the LSV number. The **On Hold** field is also populated with **LSV** in the customer entries to avoid the duplication of open entries. For more information, see the **LSV Journal** table and the **Cust. Ledger Entry** table. You can also reopen a closed collection.

To close an LSV collection

1. Choose the  icon, enter **LSV Journal List**, and then choose the related link.
2. Select the required journal line, and then choose the **Modify Posting Date** action. This will modify the value in the **Credit Date** field by using the value suggested during the LSV collection.
3. In the **New Date** field, enter the new date.
4. Choose the *Close Collection action*.

NOTE

The fields on the **Options** FastTab for the **LSV Close Collection** batch job cannot be modified, and correspond to the selected journal line.

5. Choose the **OK** button.

On the **LSV Journal List** page, the value in the **LSV Status** field is changed from **Edit** to **Released**. The journal lines can no longer be modified.

To reopen an LSV collection

1. Choose the  icon, enter **LSV Journal List**, and then choose the related link.
2. Select the required journal line for which you want to reopen the collection, on then choose the **Reopen Collection** action.

NOTE

You can only reopen the collection if you have not yet submitted the LSV+ file to the bank.

3. Choose the **Yes** button to confirm the reopening of the collection.

Export Payments Using LSV

Export Payments Using LSV

3/31/2019 • 2 minutes to read

You can export or write Lastschrift Verfahren (LSV+) files that contain payments information after closing the LSV collection. You can send the generated files to the bank on a disk, or use an electronic file transfer such as your online banking software or an Internet portal.

To export payments using LSV

1. Choose the  icon, enter **LSV Journal List**, and then choose the related link.
2. On the **LSV Journal List** page, select the required LSV journal.
3. Choose the **Write LSV File** action.
4. On the **Write LSV File** page, on the **Options** FastTab, fill in the fields as described in the following table.

FIELD	DESCRIPTION
No.	Specify the LSV journal number that you want to export.
Test	Specify if you are sending test deliveries to your bank. The bank does not process test files.

5. All related lines are transferred to the LSV journal. The LSV file is generated in the predetermined folder.

Import ESR Payments

3/31/2019 • 2 minutes to read

After you receive payment from a customer, you receive a file that contains information about paid invoices. You can receive this file from your bank electronically, or by mail.

You can import the Einzahlungsschein mit Referenznummer (ESR) invoice data from the file, print the data by using the sales invoice ESR report or the sales ESR coupon report, and verify before posting. For more information, see [Print ESR Invoices](#).

To import ESR payments

1. Choose the  icon, enter **Cash Receipt Journals**, and then choose the related link.
2. In the **Batch Name** field, select the required journal batch.

NOTE

The journal must be empty before you import the ESR file. You cannot import more than one ESR file into the same cash receipt journal.

3. Choose the **Read ESR File** action.

NOTE

If you have defined more than one ESR bank, a warning message displays instructing you to choose the relevant bank. For more information, see the ESR Setup table.

4. Choose the **Yes** button, and then choose the **OK** button.

The payments information is imported to the journal lines. The payments are automatically applied to the respective invoices according to unique ESR reference numbers.

Print ESR Invoices

3/31/2019 • 2 minutes to read

You can print an Einzahlungsschein mit Referenznummer (ESR) payment slip in the following ways:

- As part of the sales invoice ESR.
- As a separate document called an ESR coupon.

The sales invoice ESR report corresponds with the sales invoice that is accompanied by an additional ESR coupon. By using the sales ESR coupon report, you can print the blue deposit slip.

NOTE

You must select a printer and select settings during the ESR payment module installation to print the deposit slip correctly. For more information, see the Printer Selection table.

The following procedure describes how to print ESR sales invoices, but the same steps also apply for printing ESR coupons.

To print ESR invoices

1. Choose the  icon, enter **Invoice ESR**, and then choose the related link.
2. In the **Sales Invoice ESR** batch job, on the **Options** FastTab, fill in the fields as described in the following table.

FIELD	DESCRIPTION
No. of copies	Enter the required number of report copies.
ESR Bank	Select the ESR bank code that is to be printed in the report. If the value in this field is and the ESR payment method code is not defined on the ESR Setup page, then the ESR main bank selected on the ESR Setup page will be printed.
LogInteraction	Specify if the interactions that you have with your contacts will be logged.
ESR System	Select the ESR system through which you can send new ESR coupons to customers. To use the ESR system that is used by the bank that you have specified in ESR Bank field, select Based on ESR Bank .

3. Choose the **Print** button to print the report or choose the **Preview** button to view it on the screen.

You can also reprint the sales invoice ESR report or sales ESR coupon report.

Import ESR Payments

Import Swiss Bank Clearing Numbers

3/31/2019 • 2 minutes to read

Bank clearing numbers are unique numbers used to identify each bank agency or branch in the bank directory. This information is required for electronic payment. The file can be downloaded from the [SIX Interbank Clearing](#) website.

You can import the BC Bank Master file—the official Swiss bank clearing number file—to update the bank clearing number information in the bank directory. When you import the bank clearing number file, the data is imported to the **Bank Directory** table, and the existing data is overwritten. After importing the bank clearing number file, you can define the updated bank branch number for customers and vendors. For more information, see the Customer Bank Account table and the Vendor Bank Account table.

To import Swiss bank clearing numbers

1. Choose the  icon, enter **Bank Directory**, and choose the related link.
2. Choose the **Import Bank Directory** action.
3. On the **Import Bank Directory** page, on the **Options** FastTab, select the **Automatically Update Clearing Numbers** field to update the bank clearing numbers automatically.
4. Choose the **Print** button or the **Preview** button to import the bank clearing numbers, and then, on the **Open** page, locate the file that you have downloaded from the SIX Interbank Clearing website.
5. Choose the **Open** button.

If you choose the **Print** button, the contents of the file will be printed. If you choose the **Preview** button, the **Bank Directory** table will be updated and a report that has clearing numbers that have changed will be displayed.

The following procedure describes how to define bank branch numbers for customer bank accounts, but the same steps also apply for defining bank branch numbers for vendor bank accounts.

To define bank branch numbers for customer bank accounts

1. Choose the  icon, enter **Customers**, and then choose the related link.
2. Select the customer for whom you want to create bank account information, and then choose the **Bank Accounts** action.
3. On the **Customer Bank Account List** page, select the required bank account, and then choose the **Edit** action.
4. On the **General** FastTab, in the **Bank Branch No.** field, select the number of the bank agency or branch.
5. Choose the **OK** button.

Post LSV+ Payments

3/31/2019 • 2 minutes to read

You can post payments after you have received Lastschrift Verfahren (LSV+) payment advice from the bank.

To post LSV+ payments

1. Choose the  icon, enter **Cash Receipt Journals**, and then choose the related link.
2. Select the required journal, and then choose the **Edit Journal** action.

NOTE

You can select the journal batch for LSV where the balance account you want to address is defined. You cannot import more than one LSV journal line into the same cash receipt journal. For more information, see the Cash Receipt Journal page.

3. Choose the **Get From LSV Journal** action.
4. On the **LSV Journal List** page, select the LSV journal line that you want to import to the cash receipt journal.

NOTE

You can only import journal lines where the **LSV Status** field is set to **File Created**.

5. Choose the **OK** button.

The LSV journal line is imported into the cash receipt journal. The value in the **LSV Status** field on the **LSV Journal List** page changes from **File Created** to **Finished**.

You can check the imported payments, and compare them with your bank payment advice on the **Cash Receipt Journal** page. You can also delete the payment lines that could not be processed by the bank, and for which you must follow up with the customer manually.

6. Choose the **Post** action.

Print Vendor Payments List Reports

3/31/2019 • 2 minutes to read

The **Vendor Payments List** report provides a list of payments for each vendor. The report can sort payments chronologically or grouped by vendor.

To print the vendor payments list report

1. Choose the  icon, enter **Vendor Payments List**, and then choose the related link.
2. On the **Options** FastTab, fill in the fields as described in the following table.

FIELD	DESCRIPTION
Sorting	Specifies the sort order. You can sort by vendor or chronologically. If you sort by vendor, you will see a subtotal for each vendor. If you sort chronologically, you will not see subtotals.
Layout	<p>Specifies the layout of the report.</p> <p>The results can be displayed in the following layouts:</p> <p>Standard Displays the vendor number and vendor name, together with posting details, such as the document number and the amount in local currency.</p> <p>FCY Amounts Displays the vendor number, vendor name, document number, payment status (O for open, PP for partial payment, and C for closed), and payment amount.</p> <p>Posting Info Displays the vendor number, vendor name, cost center, cost object, user ID, and payment amount.</p>

At the end of the report, the number of processed payments is displayed.

Process an LSV Collection

3/31/2019 • 2 minutes to read

You can use the **LSV Journal** page to create and process payments from Lastschrift Verfahren (LSV+) customers. You can register these payments in the cash receipt journal, create an LSV file, and then print the collection order. For more information, see the Cash Receipt Journal page and [Export Payments Using LSV](#).

When you run the **LSV Suggest Collection** batch job, each suggested collection is registered on an LSV journal line, and the open invoices are transferred to the LSV journals. For more information, see the LSV Journal table.

You can view, edit, or delete the suggested payment lines. If you correct the suggested amount, then the difference is marked as a discount. You can run the batch job multiple times for different customer groups. The suggestion lines can be placed in the same journal.

To create an LSV collection

1. Choose the  icon, enter **LSV Journal List**, and then choose the related link.
2. Choose the **New** action.
3. On the **LSV Journal List** page, fill in the required fields as described in the following table.

FIELD	DESCRIPTION
LSV Bank Code	Select the LSV bank code for the bank that will perform the collection.
LSV Journal Description	Enter a description for the entry.

4. Select the required LSV journal entry, and then choose the **LSV Suggest Collection** action to create the payments to be collected automatically by LSV+.
5. On the **LSV Suggest Collection** page, on the **Options** FastTab, fill in the fields as described in the following table.

FIELD	DESCRIPTION
No.	Enter the LSV journal number.
From due date	Specify the starting due date of open entries to be suggested for collection.
To due date	Specify the ending due date of open entries to be suggested for collection.
Collection date	Specify the date on which the collection closes. The LSV+ order must be submitted at least three banking days before the collection date.

6. Choose the **OK** button.

All related lines are transferred to the LSV journal. After processing the LSV collection, you can view, check, or edit the suggested payments on the **LSV Journal** page. For more information, see the LSV Journal Line table.

To manage suggested payments

1. On the **LSV Journal List** page, select the required journal entry, and then choose the **LSV Journal Line** action.

You can view and modify the suggested payments in this page. You can enter the required payments manually. For new journal lines, the **LSV Status** field is set to **Open** to indicate that the invoice is unpaid.

2. Choose the **OK** button.

Swiss Electronic Payments

3/31/2019 • 2 minutes to read

Business Central allows you to send invoices to customers electronically. The invoices are presented and paid directly using the customer's online banking software.

Electronic Payment Methods

You can make electronic payments using the following methods:

- Einzahlungsschein mit Referenznummer (ESR)
- Lastschrift Verfahren (LSV+)
- SEPA credit transfers

ESR

ESR is an electronic debtor service that uses payment slips to collect money. It is the standard electronic payment system created by Swiss Post. You can print ESR payment slips as invoice attachments, calculate ESR reference numbers, and import ESR files that have payment information from banks. For more information, see [Swiss Electronic Payments Using ESR](#). You can also make ESR and ESR+ payments using the bank's version of this payment method, which is named Bank-ESR (BESR).

LSV+

LSV+ is a direct debit service that is used for processing payments. Companies can release customer payments directly from the customer's bank using direct debit. You can request and collect customer payments using direct debit in the LSV+ bank format, or in the DebitDirect PostFinance format. For more information, see [Swiss Electronic Payments Using LSV+](#).

SEPA Credit Transfers

To export payments according to the SEPA standard, you must use a bank account. To make sure that the related general ledger entries are consistent with those generated for local Swiss payment methods (see above), the value in the **Bank Acc. Posting Group** field on the **Bank Account Card** page must point to the relevant general ledger account. For more information about how to export SEPA payments, see [Create SEPA Direct Debit Collection Entries and Export to a Bank File](#).

Swiss Electronic Payments Using ESR

3/31/2019 • 2 minutes to read

The Einzahlungsschein mit Referenznummer (ESR) electronic payment method is an electronic debtor service that allows the customer to bill open invoices in Swiss Francs (CHF) and Euros (EUR), and to post incoming payments efficiently. The reference number, or code line, contains all relevant bookkeeping data.

With ESR electronic payments, you can do the following:

- Send ESR payment slips with unique reference numbers on the invoices. Because of the unique ESR reference numbers, the payments for settlement are automatically applied to the related invoices. For more information, see [Print ESR Invoices](#).
- Download the ESR files from the bank daily. The files contain information about all paid invoices.
- Import the ESR files and create payment lines automatically for each payment. For more information, see [Import ESR Payments](#).

NOTE

Before you can use the ESR module, you must set up the bank, bank account, and file name. You must also specify whether ESR or ESR+ should be used.

When you have evaluated the setup information, you can adjust the invoice form, and you can create a test series that you can ask your bank or postal service to validate.

When you set up number series for invoices, you must follow these guidelines:

- Use a maximum of eight digits.
- Use only numeric characters.
- Do not precede numbers with zeros.

Swiss Electronic Payments Using LSV+

3/31/2019 • 2 minutes to read

The Lastschrift Verfahren (LSV+)—or direct debit—electronic payment method, an improved version of LSV, allows companies to retrieve payments directly from its customers' bank accounts. To retrieve customer payments, you must send an LSV file to the bank, and the bank will collect the payments requested in the file.

The LSV+ method is a direct debit principle with right of objection. Business Direct Debit (BDD) is a direct debit system without right of objection. The file format to be sent to the bank is the same for LSV+ and BDD.

Before using the LSV module, you must define the settings on the **LSV Setup** page.

Automatic ESR Processing

You can download payment credit transactions in Einzahlungsschein mit Referenznummer (ESR) file format from the bank. You can receive processed LSV payments in the ESR file if the ESR reference number is integrated with the LSV+ system. If LSV+ payments are included in your imported LSV files, the related LSV journal lines are closed automatically. Automatic ESR processing is performed only for payments that use Swiss Francs (CHF), and requires that you do the following:

- After you have sent the LSV+ file to the bank, submit a payments report within three business days following the requested LSV processing date.
- Import the ESR files, and post the ESR journals. If an imported ESR transaction is related to an open LSV+ payment line, then the appropriate LSV journal line is automatically closed by ESR.

NOTE

When importing an ESR file, the LSV journal line is closed by ESR if the appropriate LSV journal is found, regardless of the ESR transaction type.

- After the LSV processing date, you can check the LSV journal lines. If all of the LSV journal lines are closed, then the status of the **LSV Status** field is updated to **Finished**.

Swiss General Ledger Accounts

4/4/2019 • 2 minutes to read

Business Central includes Swiss enhancements to general ledger accounts.

- Maintain the foreign currency balances of a bank account in the general ledger.
- Sort general ledger account numbers on the **Chart of Accounts** page.
- Preview the effects that posting general journals would have on the balances of certain general ledger accounts before actually posting them.

General Ledger Accounts and General Journals

Companies often have different bank accounts for foreign currencies, and have a general ledger account for each bank account. In Business Central, you can set up currency code and foreign currency balance information on the **Chart of Accounts** page. This allows you to maintain the original foreign currency balance of a bank account. For more information, see [Understanding the General Ledger and the COA](#).

For example, a company has two bank accounts: one for local currency (LCY) and one for euros (EUR). You must create a general ledger account for each bank account. For the EUR account, define the currency code as **EUR** and post journals in EUR or LCY.

When the exchange rate for EUR and LCY changes, you can update and adjust the local currency balance for the EUR general ledger account using the adjust exchange rates batch job. This batch job creates and posts currency adjustment entries to the general ledger and updates the LCY balance.

Data Type for General Ledger Accounts

The data type is set to text for the general ledger account number or account code to support the sorting requirements for the standardized Swiss Kontenrahmen Käfer (KMU) common chart of accounts. The account numbers list is sorted based on the text data type. The KMU chart of accounts contains the following account numbers:

- 1176
- 119.0
- 1190

Viewing Temporary Balances in General Journals

Before posting a general journal you can preview the effect that posting would have on the balances of certain general ledger accounts. You can open a statistics page that shows the balances of the accounts, and the balances of the active lines that included the unposted values for the current journal. For more information, see [View Temporary Balances in General Ledger Journals](#).

[View Temporary Balances in General Ledger Journals](#)

Adjust Exchange Rates

3/31/2019 • 2 minutes to read

If you have taxable sales in a foreign currency, you must use the official rate for VAT currency conversion as set by the Federal Tax Administration.

If these rates do not match the currency rates used in the purchase or sales invoices, you will have to adjust the VAT rates with a batch job later. These adjustments can only be run using an authorized VAT rate.

You can run this batch job as often as you like, however make sure that you always run it before creating a VAT statement.

NOTE

When using a report currency, make sure that the **VAT Exchange Rate Adjustment** field on the **General Ledger Setup** page is set to **No Adjustment**.

For more information about VAT and foreign currencies, see the [ESTV](#) website.

To adjust an exchange rate

1. Choose the  icon, enter **Currencies**, and then choose the related link.
2. Choose the **Exch. Rates** action.
3. On the **Currency Exchange Rates** page, enter the official VAT rate per period for each currency in the **VAT Exch. Rate Amount** and the **Relational VAT Exch. Rate Amt** fields.
4. Choose the **OK** button.
5. Choose the  icon, enter **Adjust Exchange Rates**, and then choose the related link.
6. On the **Options** FastTab, fill in the fields as described in the following table.

FIELD	DESCRIPTION
Starting Date	Enter a date to specify the beginning of the period for which entries will be adjusted.
Ending Date	Enter the last date for which entries will be adjusted. This date is typically the same as the posting date in the Posting Date field.
Adjust VAT exch. rate	Specify if you want to adjust the VAT exchange rate.

7. Choose the **Print** button to start the batch job. This batch job controls whether VAT entries have to be adjusted and prepares an adjusting entry for each of these entries for the Unrealized/Realized Exchange Rate Adjustment accounts. The existing VAT entries are also corrected.

View Temporary Balances in General Ledger Journals

3/31/2019 • 2 minutes to read

When you enter a new transaction in the general journal, you can view temporary balances that show how the general ledger account balances would be affected by posting the journal. You can view the balance details of the account and counter account for the active journal line. You can also view the unposted values for the current journal.

If you use foreign currency in general ledger accounts, then the balance in the general ledger account is also populated. This helps you analyze the entries that will be posted, and decide whether to post the entries. For more information, see **General Journal** page and **Gen. Journal Line** table.

To view temporary balances in general ledger journals

1. Choose the  icon, enter **General Journals**, and choose the related link.
2. Select the required general journal entry, and then choose the **Balance** action.

On the **View – G/L Account temp. Balance** page, on the **General** FastTab, you can view how general ledger account balances would be affected by posting the journal.

3. Choose the **Close** button.

See Also

[Swiss General Ledger Accounts](#)

Print General Ledger Setup Information

3/31/2019 • 2 minutes to read

Before you use Business Central in the daily business, you can run the **G/L Setup Information** report to display the master data that you have set up. You can look over this master data so that you have a baseline to compare to, and then verify that you have set up posting groups correctly, for example.

To print general ledger setup information

1. Choose the  icon, enter **G/L Setup Information**, and then choose the related link.
2. On the **Options** FastTab, in the **Setup Information** field, select the master data area as described in the following table.

OPTION	DESCRIPTION
G/L Setup - Company Data - Consolidation	Displays tables for general ledger setup, company information, and business units.
Posting Groups	Displays customer posting group tables, vendor posting group tables, inventory posting group tables, and bank account posting group tables.
Posting Matrix	Displays general business posting group tables, general product posting group tables, and general posting group tables.
VAT Setup	Displays VAT business posting group tables, VAT product posting group tables, and VAT posting setup tables.
Source Code - Reason Code	Displays source tables, source code setup tables, and reason codes tables.
Check Number Series	Select to provide an overview of the use of number series so that you can identify number series that are problematic for the data export for the Grundsätze zum Datenzugriff und zur Prüfbarkeit digitaler Unterlagen (GDPdU). The report will show number series with one of the following issues: <ul style="list-style-type: none">- The number series allows manual document numbers.- The number series is not chronological.- The number series is used in more than one table or field.

3. Choose the **Print** button to print the report or choose the **Preview** button to view it on the screen.

Delivery Reminders

3/31/2019 • 2 minutes to read

Delivery reminders are used to track overdue vendor shipments, and to remind vendors about overdue deliveries. To create delivery reminders, you must set up the following:

- Delivery reminder terms

Delivery reminder terms are identified by a code that must be assigned to vendors. To use more than one combination of settings, you must set up a code for each setting separately. You can set up any number of delivery reminder terms.

- Delivery reminder levels

For every delivery reminder term, you must set up delivery reminder levels. These levels determine how often delivery reminders can be created for a specific term. Level 1 is the first delivery reminder that you create for an overdue delivery. Level 2 is the second delivery reminder, and so on. When delivery reminders are created, the number of reminders that were created previously is considered, and the current number is used to apply terms.

- Delivery reminder text messages

You must set up delivery reminder text messages for every delivery reminder level. There are two types of delivery reminder text messages: beginning and ending. The beginning text message is printed under the header section, before the list of entries that are marked for reminder. The ending text message is printed after this list.

For more information, see [Set Up Delivery Reminder Terms, Levels, and Text](#).

After you have set up the delivery terms, you must assign the delivery reminder term codes to vendors. For more information, see [Assign Delivery Reminder Codes to Vendors](#).

You can create delivery reminders manually or automatically. You can use the **Create Delivery Reminder** batch job to create delivery reminders automatically. This batch job allows you to select the purchase orders for which delivery reminders must be created. For more information, see [Generate Delivery Reminders](#).

You can also track documents in relation to purchase order lines and sales order lines.

Business Central provides the following reports:

- **Issued Delivery Reminder** - To view the delivery reminders for vendors.
- **Delivery Reminder - Test** - To verify the delivery reminders before you issue them.

For more information, see [Print Test Reports for Delivery Reminders](#).

Set Up Delivery Reminders

3/31/2019 • 2 minutes to read

In Business Central, you can use purchase delivery reminders to remind vendors about overdue deliveries. To create delivery reminders for vendors, you must set up base data for delivery reminder creation and number series for the delivery reminders on the **Purchases & Payables Setup** page.

To set up delivery reminders

1. Choose the  icon, enter **Purchases & Payables Setup**, and then choose the related link.
2. On the **General** FastTab, in the **Default Del. Rem. Date Field** field, specify one of the following options as described in the following table.

OPTION	DESCRIPTION
Requested Receipt Date	To specify that the date value in the Requested Receipt Date field on the purchase order line will be used as the default date for creating delivery reminders.
Promised Receipt Date	To specify that the date value in the Promised Receipt Date field on the purchase order line will be used as the default date for creating delivery reminders.
Expected Receipt Date	To specify that the date value in the Expected Receipt Date field on the purchase order line will be used as the default date for creating delivery reminders.

3. On the **Numbering** FastTab, fill in the fields as described in the following table.

FIELD	DESCRIPTION
Delivery Reminder Nos.	The number series code for delivery reminders.
Issued Delivery Reminder Nos.	The number series code for issued delivery reminders.

4. Choose the **OK** button.

Set Up Delivery Reminder Terms, Levels, and Text

3/31/2019 • 2 minutes to read

To create delivery reminders, you must set up the following:

- Delivery reminder terms
- Delivery reminder levels
- Delivery reminder text messages

Each delivery reminder term has two or more delivery reminder levels, and for each delivery reminder level, you can specify text that will be part of the delivery reminder.

For more information, see [Delivery Reminders](#).

To set up delivery reminder terms

1. Choose the  icon, enter **Delivery Reminder Terms**, and then choose the related link.
2. Choose the **New** action.
3. Fill in the fields as described in the following table.

FIELD	DESCRIPTION
Code	The code for the delivery reminder term. You can enter a maximum of 10 alphanumeric characters.
Description	The description for the delivery reminder term. You can enter a maximum of 30 alphanumeric characters.
Max. No. of Delivery Reminders	The maximum number of delivery reminders that can be created for an order. NOTE: This is the maximum number across all reminder levels for this reminder term. For example, if you have set up three levels, and you set Max. No. of Delivery Reminders to 5, the first reminder is created at level 1, the second at level 2, and the last three at level 3.

4. Choose the **OK** button.

To add delivery reminder levels to a delivery reminder term

1. On the **Delivery Reminder Terms** page, select the delivery reminder term for which you want to set up levels, and then choose the **Levels** action.
2. Choose the **New** action.
3. Fill in the fields as described in the following table.

FIELD	DESCRIPTION
No.	The delivery reminder level number. This field is filled in automatically.

FIELD	DESCRIPTION
Due Date Calculation	The formula for the due date calculation for the delivery reminder. You can enter a combination of numbers from 0 to 9999, and date codes (D for day, WD for weekday, W for week, M for month, Q for quarter, or Y for year). The date codes denote the calculation for the delivery reminder due date. You can enter a maximum of 20 characters for the due date calculation formula.

4. Choose the **OK** button.

For each delivery reminder level, you can define text messages that are added to the delivery reminder. You can define beginning text that is added before the description of the overdue purchase order, and ending text that is added after the description of the overdue purchase order.

The following procedure describes how to set up beginning text messages, but the same steps apply for setting up ending text messages.

To set up delivery reminder text messages

1. On the **Delivery Reminder Levels** page, select a level, and then choose the **Beginning Text** action.
2. Choose the **New** action.
3. In the **Description** field, enter the beginning text message for the delivery reminder.
4. Choose the **OK** button.

Create Delivery Reminders Manually

3/31/2019 • 2 minutes to read

In Business Central, you can create delivery reminders when a purchase has not been delivered as expected. You can create a single delivery reminder manually, or you can generate delivery reminders for all overdue deliveries. For more information, see [Generate Delivery Reminders](#).

NOTE

To create delivery reminders, you must set up the delivery reminder properties. For more information, see [Set Up Delivery Reminders](#).

To create a delivery reminder manually

1. Choose the  icon, enter **Delivery Reminder**, and then choose the related link.
2. Choose the **New** action.
3. On the **Delivery Reminder** page, on the **General** FastTab, fill in the fields as described in the following table.

FIELD	DESCRIPTION
No.	The unique identification number for the delivery reminder.
Vendor No.	The number of the vendor for whom you want to post the delivery reminder. When you select the vendor number, the Name , Address , Post Code/City , and Contact fields are filled in automatically.
Posting Date	The posting date for the delivery reminder. This date is copied to all of the delivery reminder ledger entries.
Document Date	The document date for the delivery reminder. This date is also used to calculate the due date for the delivery reminder. You can modify the posting date if required.
Reminder Level	The delivery reminder level. This value is based on the number of delivery reminders that have already been sent. For more information, see Set Up Delivery Reminder Terms, Levels, and Text .
Reminder Terms Code	Specify the delivery reminder terms code that is set up for the vendor.
Due Date	The due date for the delivery reminder.

4. Choose the **Suggest Reminder Lines** action

If there are overdue deliveries from the specified vendor, these are added to the deliver reminder.

5. Choose the **OK** button.

The delivery reminder is created. You can now issue and print the delivery reminder.

Issue Delivery Reminders

3/31/2019 • 2 minutes to read

After you have created delivery reminders, you must issue and print them so that you can send reminders to vendors. Before you issue the delivery reminders, you can print a test report. For more information, see [Print Test Reports for Delivery Reminders](#).

When you issue the delivery reminders, delivery reminder ledger entries are created. You can view the created ledger entries on the **Deliv. Reminder Ledger Entries** page.

To issue delivery reminders

1. Choose the  icon, enter **Delivery Reminder**, and then choose the related link.
2. On the **Delivery Reminder** page, select the delivery reminder that you want to issue, and then choose the **Edit** action.
3. Choose the **Issue** action.
4. On the **Issue Delivery Reminder** page, on the **Options** FastTab, fill in the fields as described in the following table.

FIELD	DESCRIPTION
Print	Select to print the delivery reminders when they are issued.
Replace Posting Date	Select to replace the existing posting date for the delivery reminder.
Posting Date	The posting date for the delivery reminder. This posting date is used for all delivery reminders if you have selected the Replace Posting Date check box. If the Replace Posting Date check box is cleared, this date will be used for only those delivery reminders for which a posting date is not available.

5. Optionally, on the **Delivery Reminder Header** FastTab, select the appropriate filters.

NOTE

You can remove filters and issue all delivery reminders at the same time.

6. Choose the **OK** button.

You can view the issued reminders on the **Issued Delivery Reminder** page. Optionally, you can now print a delivery reminder.

To view delivery reminder ledger entries

1. Choose the  icon, enter **Purchase Orders**, and then choose the related link.
2. Select the purchase order for which you want to view the reminder status, and then choose the **Edit** action.

3. Choose the **Deliv. Reminder Ledger Entries** action.

In the Deliv. Reminder Ledger Entries page, you can view the delivery reminder ledger entries for the selected purchase order.

[Create Delivery Reminders Manually](#)

Generate Delivery Reminders

3/31/2019 • 2 minutes to read

In Business Central, you can create delivery reminders when a purchase has not been delivered as expected. You can generate delivery reminders for all overdue deliveries, or you can create a single delivery reminder manually. For more information, see [Create Delivery Reminders Manually](#).

NOTE

To create delivery reminders, you must set up the delivery reminder properties. For more information, see [Set Up Delivery Reminders](#).

To generate delivery reminders for all overdue deliveries

1. Choose the  icon, enter **Delivery Reminder**, and then choose the related link.
2. Choose the **New** action.
3. On the **Delivery Reminder** page, choose the **Create Delivery Reminder** action.
4. On the **Purchase Header** FastTab and the **Purchase Line** FastTab, select the appropriate filters.
5. Choose the **OK** button.

If there are overdue deliveries that match the filters that you have set, delivery reminders are created. You can now issue and print the delivery reminders.

Print Test Reports for Delivery Reminders

3/31/2019 • 2 minutes to read

After you have created delivery reminders and made any needed modifications, you can either print the test reports or issue the delivery reminders.

A test report is a document that lets you review and modify a delivery reminder before you issue it.

To print test reports before issuing delivery reminders

1. Choose the  icon, enter **Delivery Reminder**, and then choose the related link.
2. On the **Delivery Reminder List** page, choose the **Delivery Reminder - Test** action.
3. On the **Delivery Reminder - Test** page, set a filter if you want to print only selected delivery reminders.
4. Choose the **Print** to print the report or choose the **Preview** button to view it on the screen.

Swiss Inventory Management

3/31/2019 • 2 minutes to read

Business Central includes Swiss enhancements to inventory management. This includes the following:

- Detailed reporting. For more information, see the Inventory - Sales Statistics report and the Inventory - List report.
- The ability to track an invoice with multiple shipments.
- Including an item card location code as the default location code for sales lines and item journals. For more information, see [Set Up Locations](#).

Managing Item Details

Companies can have different warehouses for different product categories. In such cases, you must use the default location code retrieved from the item card. When you define a location code for an item, it is transferred to the sales lines and item journals as a default item location code. For more information, see the Sales Line and the Item Journal Line table.

Additional information, such as customer number, ship-to address code, and customer sales person code, is stored in item ledger entries. This information helps you to create customized reporting criteria, such as revenue per customer, and item or sales provisions for sales people. For more information, see the Item Ledger Entry table.

Invoices with Multiple Shipments

If multiple shipments have been posted for a customer, then you can create a combined invoice with the **Get Shipment Lines** function. For more information, see the Get Shipment Lines page. When you use this function, the text created on the invoice lines includes information about the shipment number and the shipment date. For example, the text could appear as Shipment No. 102040 of 25.01.01. This allows you to easily track invoices with multiple shipments.

Copy Existing Items to New Items

3/31/2019 • 2 minutes to read

You can group items with similar settings in an item catalog. When you add a new item, to save time, you can use the **Copy Item** function to copy an existing item to use as a template for a new item.

To copy existing items to new items

1. Choose the  icon, enter **Items**, and then choose the related link.
2. Select the item that you want to copy, and then choose the **Copy Item** action.
3. On the **Item Copy** page, fill in the fields as described in the following table.

FIELD	DESCRIPTION
Source Item No.	Sets the item number from which the data is to be copied.
Target Item No.	Sets the item number for the item to which the data is to be copied.
Target No. Series	Sets the item number series to which the data is to be copied.

NOTE

You can specify an item number in the **Target Item No.** field or in the **Target No. Series** field. The copy item will be assigned to the next available number in that number series.

4. Select the appropriate check boxes for the data that you want to copy.
5. To copy your selections to the new item, choose the **OK** button.

Print an Inventory Picking List from a Sales Order

3/31/2019 • 2 minutes to read

You can print an inventory picking list directly from a sales order. The picking list contains a list of items with the following information:

- Bin code
- Location code
- Serial number
- Quantity

The picking list includes only those items with a shipping quantity greater than 0.

To print an inventory picking list from a sales order

1. Choose the  icon, enter **Sales Orders**, and then choose the related link.
2. Select the required sales order, and then choose the **Edit** action.
3. Choose the **Picking List** action.
4. On the **Options** FastTab, in the **No. of Copies** field, enter the required number of copies.
5. Choose the **Print** button to print the picking list or choose the **Preview** button to view it on the screen.

Import Swiss Post Codes

3/31/2019 • 2 minutes to read

You can import the latest post code file and use it to update the **Post Code** table. The post code file can be downloaded from the [Swiss Post](#) website. After importing the latest post code, you can define post codes for customers or vendors. For more information, see [Register New Vendors](#).

To import post codes

1. Choose the  icon, enter **Post Codes**, and then choose the related link.
2. Choose the **Import Post Codes** action.
3. On the **Import Post Codes** page, in the **Filename** field, enter the name of the post code file that you want to import to the **Post Code** table.
4. Choose the **OK** button.

The latest post code information is imported.

The following procedure describes how to define post codes for customers, but the same steps also apply to defining post codes for vendors.

To define post codes for customers

1. Choose the  icon, enter **Customers**, and then choose the related link.
2. Select the customer for whom you want to define a post code, and then choose the **Edit** action.
3. On the **Customer Card** page, on the **General** FastTab, in the **Post Code** field, select the post code for the customer's address.

NOTE

When you select the post code, the **City** and **Country/Region Code** fields populate automatically with the information from the **Post Code** table. For more information, see [Register New Customers](#).

4. Choose the **OK** button.

Swiss Purchase Documents and Sales Documents

3/31/2019 • 2 minutes to read

Business Central includes Swiss enhancements to purchase documents and sales documents. This includes the following:

- Enhanced posting descriptions for general ledger entries, customer ledger entries, and vendor ledger entries. For more information, see the G/L Entry table, the Cust. Ledger Entry table, and the Vendor Ledger Entry table.
- The ability to have subtitles, subtotals, and begin and end totals in sales quotes and sales orders.
- The ability to round invoice totals in payment journal lines if there is a payment discount.
- The ability to turn off printing of additional shipment documents for purchase invoices and sales invoices.

Purchase Documents and Sales Documents

The posting descriptions posted to ledger entries for purchase orders and sales orders display the name of the vendors or customers, and the invoices or credit memo numbers. For example, **Inv. 103020/ The Cannon Group PLC** is a posting description. This posting description displays a number that is relevant for financial transactions, which helps to analyze the transactions more easily.

Sales Quotes and Sales Orders

When a sales quote or sales order is created, if the type of the sales quote line or sales order line is **Begin Total** or **End Total**, then the items listed on the lines are marked as physical items or as service items. The items then have subheadings for each item group, and a subtotal is created for each item group.

The items are divided based on the system generated values displayed in the **Level** field.

You can specify an item as a variant in the sales quote line. This allows you to list the alternative items without including the price in the quote. You can also refer to specific parts of a sales quote or sales order based on the value displayed in the **Position** field of the sales quote line or the sales order line. For more information, see the Sales Line table.

Purchase Invoices and Sales Invoices with Payment Discounts

For purchase invoices and sales invoices, the invoice amount is reduced by the discount amount, and then rounded. The invoice total is also rounded if there is a discount. For more information, see the General Ledger Setup table.

Shipment Documents

On the **Sales & Receivables Setup** page, the **Shipment on Ship and Invoice** field is used to turn off printing of additional shipment documents for purchase invoices and sales invoices. When you post an order, a posted shipment and a posted invoice are automatically created. If the printed invoice is also used as a shipment document, additional shipment documentation does not need to be printed. You can turn off printing of additional shipment documents for purchase invoices and sales invoices by clearing the **Shipment on Ship and Invoice** field on the **Sales & Receivables Setup** page. For more information, see the Sales & Receivables Setup table.

Making Tax Digital in the United Kingdom

3/31/2019 • 6 minutes to read

Her Majesty's Revenue and Customs (HMRC) is implementing the first step of Making Tax Digital, which imposes new requirements on VAT registered businesses above the VAT threshold. Requirements will be implemented in phases. In the first phase, with a deadline in April, 2019, the following requirements will take effect:

- Keeping records digitally - Businesses must now keep all their records digitally. For users of ERP systems this will not have any impact since they already keep their records digitally in these systems.
- Submit VAT return electronically using [software recognized by HMRC](#).

Business Central already supports submitting VAT returns to HMRC using the GovTalk service. From April, 2019 HMRC is switching to newer technology and communication mechanisms that required changes in Business Central.

Making Tax Digital for VAT Capabilities in Dynamics 365 Business Central

In Business Central you can use the VAT Return report for creating VAT reports. The Making Tax Digital VAT features extend this capability to communicate with HMRC. For example, the Making Tax Digital VAT extension lets you:

- Retrieve VAT obligations from HMRC
- Get reminded about VAT obligations that are approaching or already past due
- Submit VAT returns to HMRC
- View the VAT return
- View VAT payments with HMRC
- View VAT liabilities with HMRC

Set up Making Tax Digital for VAT

The Making Tax Digital feature uses a service connection to communicate with HMRC. To make it easy to establish communications, Business Central provides the **HMRC VAT Setup** service connection, which contains most of the information needed to communicate with HMRC. To finish the connection, you must give the **Dynamics 365 Business Central MTD VAT** application the authority to interact with HMRC on your behalf. Microsoft manages the **Dynamics 365 Business Central MTD VAT** application on the HMRC web site, and the application is a requirement for the connection. You give permission by requesting an authorization code from HMRC, and then copying the code to the service connection. The following steps describe how to set up the service connection.

NOTE

If you are using an on-premises version, there are some additional steps to set up the features for Making Tax Digital. In the cloud version, these happen automatically. For more information, see the section titled [Additional Setup Requirements for On-Premises Versions](#) below.

1. Choose the  icon, enter **Service Connections**, and then choose the related link.
2. On the **Service Connections** page, choose **HMRC VAT Setup**.

NOTE

If you use an on-premises version of Business Central you will also need to provide a client ID and client secret. If you are not sure what these are, contact your partner. They can get the information for you on [PartnerSource](#).

3. To open a GOV.UK website and request an authorization code, choose **Process**, then **Request Authorization Code**, and then choose **Continue**.
4. Sign in with your HMRC credentials. To allow the **Dynamics 365 Business Central MTD VAT** application to interact with HMRC on your behalf, choose **Grant authority**.
5. A confirmation page displays "Authorization granted" and an authorization code. To copy the authorization code, choose **Copy**.
6. Return to the service connection you are setting up, and paste the authorization code in the **Enter Authorization Code** field. Then choose **Enter**.

NOTE

Business Central will use the authorization code to test whether the service connection can communicate with HMRC. If the connection is successful, a confirmation page prompts you to verify your VAT registration number. To open the **Company Information** page and verify the number is correct, and the one you have used to register with HMRC, choose **Yes**.

Additional Setup Requirements for On-Premises Versions

1. You must add a VAT report configuration on the **VAT Reports Configuration** page.
 - a. Create a new configuration, and choose the VAT Return type.
 - b. Give the configuration a descriptive name, such as **HMRC MTD**.
 - c. In the **Suggest Lines Codeunit ID** field, choose codeunit **745**.
 - d. In the **Content Codeunit ID** field, choose codeunit **10531**.
 - e. In the **Submission Codeunit ID** field, choose codeunit **10532**.
 - f. In the **Validate Codeunit ID** field, choose codeunit **10533**.
 - g. Fill in the remaining fields as necessary. Hover over a field to read a short description.
2. You must edit the VAT report setup on the **VAT Report Setup** page.
 - a. Expand the **Return Period** FastTab.
 - b. In the **Report Version** field, choose the VAT report configuration that you created in the previous step.
 - c. In the **Manual Receive Codeunit ID** field, choose codeunit **10534**.
 - d. In the **Receive Submitted Return Codeunit ID** field, choose codeunit **10536**.
 - e. Optional: If you want to automatically update the information about VAT obligations, specify how often to do so in the **Update Period Job Frequency** field, and then specify codeunit **10535** in the **Auto Receive Codeunit ID** field.
 - f. Fill in the remaining fields as necessary. Hover over a field to read a short description.

VAT Obligations

HMRC maintains a list of VAT obligations for companies, which are the periods for which they must report VAT and the due date for the report. HMRC exposes this information through their APIs, which enables Business Central to retrieve the obligations. Business Central stores VAT obligations as **VAT Return Periods**, and uses them to:

- Remind you about VAT returns that are due or overdue.
- Automatically enter start and end dates when you create VAT returns.

To retrieve the VAT return periods from the HMRC:

1. Choose the  icon, enter **VAT Return Periods**, and then choose the related link.
2. On the **VAT Return Periods** page, choose **Process**, and then choose **Get VAT Return Periods**.
3. Enter the **Start Date** and **End Date** to specify the period for which to get the VAT return periods, and then choose **OK**.

The VAT obligations are now retrieved from HMRC and you can view them on the **VAT Return Periods** page. A confirmation page shows how many obligations were retrieved.

VAT Returns

Use this report to submit VAT for sales and purchase documents, such as purchase and sales orders, invoices, and credit memos.

To create and submit a VAT return:

1. Choose the  icon, enter **VAT Return Periods**, and then choose the related link.
2. On the **VAT Return Periods** page, choose **Process**, and then choose **Create VAT Return**.
3. If you want to open the VAT return, on the confirmation page, choose **Yes**.
4. On the **VAT Return** page, to calculate and prepare the amounts for the VAT return, choose **Process**, and then choose **Suggest Lines**.
5. Fill in the fields as necessary, and choose **OK**. VAT amounts display in the **Report Lines** section on the **VAT Return** page.
6. To release the VAT return and prepare it for submission, choose **Process**, and then choose **Release**. After you release a VAT return you cannot edit it. If you need to change something, you must reopen the return. Releasing the VAT return does not submit it.
7. To submit the VAT return to HMRC, choose **Process**, and then choose **Submit**.

VAT Liabilities and Payments

If you want to check the status of your VAT, you can retrieve information from HMRC about your VAT liabilities and payments. VAT liabilities are the amounts that you owed to HMRC, and show if there are outstanding amounts to be paid. VAT payments are the actual payments your company has made to HMRC.

To retrieve VAT liabilities:

1. Choose the  icon, enter **VAT Liabilities**, and then choose the related link.
2. On the **VAT Liabilities** page, choose **Process**, and then select **Get Liabilities**.
3. Enter the **Start Date** and **End Date** of the period to retrieve VAT liabilities for, and then choose **OK**.

The VAT liabilities are now retrieved from HMRC and you can view them on the **VAT Liabilities** page. A confirmation page shows how many liabilities were retrieved.

To retrieve VAT payments from HMRC:

1. Choose the  icon, enter **VAT Payments**, and then choose the related link.
2. On the **VAT Payments** page, choose **Process**, and then choose **Get Payments**.
3. Enter the **Start Date** and **End Date** of the period to retrieve VAT payments for, and then choose **OK**.

The VAT payments are now retrieved from HMRC and you can view them on the **VAT Payments** page. A confirmation page shows how many VAT payments were retrieved.

Change VAT Setup in Journals

3/31/2019 • 2 minutes to read

You can add VAT setup information to journal lines if needed. If you enter items without VAT, you do not need to remove VAT setup information manually.

To change VAT setup in journals

1. Choose the  icon, enter **General Journals**, and then choose the related link.
2. On the **General Journal** page, choose the **AssistEdit** button in the **Batch Name** field.
3. On the **General Journal Batches** page, on the **Home** tab, choose **New**.
4. Enter information into the required fields.
5. To include VAT information, select the **Copy VAT Setup to Jnl. Lines** check box.

NOTE

For an item without VAT, do not select the **Copy VAT Setup to Jnl. Lines** check box.

6. Choose the **OK** button.

[United Kingdom Local Functionality](#)
[How To: Report VAT to Tax Authorities](#)

Print VAT Audit Reports

3/31/2019 • 2 minutes to read

All vendors must export the data required for auditing in a Content Separated Value (CSV) file format. The following reports comply with this requirement:

- **VAT Audit** report – This report is used for VAT auditing.
- **VAT Entry Exception** report - This report details the differences between the calculated VAT and the changes that occur because of rounding, VAT tolerance percentage, and discounts. It also displays the difference in VAT amounts for the tax authorities.

To print the VAT audit report

1. Choose the  icon, enter **VAT Audit**, and then choose the related link.
2. On the **VAT Audit** page, on the **Options** FastTab, fill in the fields as described in the following table.

FIELD	DESCRIPTION
Export Customers	Select to export the file to the Customer table.
Export Open Payments	Select to export the open credit entries.
Export Late Invoicing	Select to export customer entries that took longer to invoice than the number of days specified in the Late Invoice Delay (Days) field.
Late Invoice Delay (Days)	Enter the number of days between the invoice issue date and the payment received date. If the Export Late Invoicing field is selected, entries exceeding this limit will be exported.
Export Vendors	Select to export the file to the Vendor table.
Export VAT Entries	Select to export the entries in the VAT Entry table.

NOTE

You must select at least one check box in this page.

3. To export the file, choose the **OK** button.

The VAT audit information is exported. You can save the data to a file, or open the file in the appropriate program.

To print the VAT entry exception report

1. Choose the  icon, enter **VAT Entry Exception Report**, and then choose the related link.
2. On the **VAT Entry Exception Report** page, on the **Options** FastTab, fill in the fields as described in the following table.

FIELD	DESCRIPTION
VAT Base Discount	Select if you want to enter a value in the VAT Base Discount % field.
Manual VAT Difference	Select if you want to enter a value in the Manual VAT Difference field.
VAT Calculation Types	Select to determine the VAT calculation type.
VAT Rate	Select to determine the VAT rate for a particular journal line.
VAT Base Discount %	Enter a value in this field if you have selected the VAT Base Discount field.
Manual VAT Difference	Enter a value in this field if you have selected the Manual VAT Difference field.
VAT Rate % Difference	Specify the maximum VAT rate difference.

NOTE

You must select at least one check box in this page.

3. Choose the **Print** button to print the report or choose the **Preview** button to view it on the screen.

Print VAT Reports

3/31/2019 • 2 minutes to read

You can use the following reports for VAT reporting:

- **Day Book VAT Entry** – Displays the daily total for VAT entries for a specific period.
- **Day Book Cust. Ledger Entry** – Displays the daily total for customer ledger entries for a specific period.
- **Unposted Sales** – Displays sales documents that have not yet been posted.
- **Day Book Vendor Ledger Entry** – Displays the daily total for vendor ledger entries for a specific period.
- **Unposted Purchases** – Displays purchase documents that have not yet been posted.

To print the day book VAT entry report

1. Choose the  icon, enter **Day Book VAT Entry**, and then choose the related link.
2. On the **Options** FastTab, fill in the field as described in the following table.

FIELD	DESCRIPTION
Show Amounts in Add. Reporting Currency	Select to show amounts in the report in additional reporting currency.

3. Choose the **Print** button to print the report or choose the **Preview** button to view it on the screen.

To print the day book customer ledger entry report

1. Choose the  icon, enter **Day Book Cust. Ledger Entry**, and then choose the related link.
2. On the **Options** FastTab, fill in the fields as described in the following table.

FIELD	DESCRIPTION
Print Cust. Ledger Details	Select to display the customer ledger entries.
Print G/L Entry Details	Select to display the general ledger entries.

3. Choose the **Print** button to print the report or choose the **Preview** button to view it on the screen.

To print the unposted sales report

1. Choose the  icon, enter **Unposted Sales**, and then choose the related link.
2. On the **Options** FastTab, fill in the fields as described in the following table.

FIELD	DESCRIPTION
Show	Select the details that you want in the Unposted Sales report.
Show Amounts in LCY	Select to show amounts in the report in local currency.

3. Choose the **Print** button to print the report or choose the **Preview** button to view it on the screen.

To print the day book vendor ledger entry report

1. Choose the  icon, enter **Day Book Vendor Ledger Entry**, and then choose the related link.
2. On the **Options** FastTab, fill in the fields as described in the following table.

FIELD	DESCRIPTION
Print Vend. Ledger Details	Select to display the vendor ledger entries.
Print G/L Entry Details	Select to display the general ledger entries.

3. Choose the **Print** button to print the report or choose the **Preview** button to view it on the screen.

To print the unposted purchases report

1. Choose the  icon, enter **Unposted Purchases**, and then choose the related link.
2. On the **Options** FastTab, fill in the fields as described in the following table.

FIELD	DESCRIPTION
Show	Select the details that you want in the Unposted Purchases report.
Show Amounts in LCY	Select to show amounts in the report in local currency.

3. Choose the **Print** button to print the report or choose the **Preview** button to view it on the screen.

Set Up Reverse Charge VAT

4/4/2019 • 2 minutes to read

In Business Central, you can use reverse charge VAT accounting for a specific range of items to prevent Missing Trader Intercommunity Fund Fraud (MTIC), also known as carousel fraud. This feature is supplemented by the **Reverse Charge Sales List** report. The VAT accounting changes will affect companies trading in electronic goods and integrated circuit devices, such as mobile telephones, microprocessors, and central processing units. These goods will apply to reverse charges.

IMPORTANT

Legislative information may be subject to change by HM Revenue & Customs (HMRC). For more information, see the [HMRC website](#).

To reverse charges on VAT

1. Choose the  icon, enter **VAT Business Posting Groups**, and then choose the related link.
2. Create a new VAT business posting group. Set up the needed VAT product posting groups.
3. Choose the  icon, enter **General Ledger Setup**, and then choose the related link.
4. On the **Reverse Charge** FastTab, fill in the fields as necessary. Hover over a field to read a short description.
5. Choose the  icon, enter **Sales & Receivables Setup**, and then choose the related link.
6. On the **Reverse Charge** FastTab, fill in the fields as necessary.
7. Choose the  icon, enter **Purchases & Payables Setup** and then choose the related link.
8. On the **Reverse Charge** FastTab, fill in the fields as necessary.
9. To set up items subject to reverse charge, select the item, and open the **Item Card** page.
10. On the **Invoicing** FastTab, fill in the **Reverse Charge Applies** field.

Reverse Charge Sales List

This report displays sales of goods which are subject to reverse charge. The report is based on information in the VAT Entry table. You use this to report to the customs and tax authorities the reverse charge sales.

Examples of goods subject to reverse charge:

- Mobile telephones.
- Computer chips

Consult the [HMRC website](#) for the list of goods subject to reverse charge.

Print Checks for APACS

3/31/2019 • 2 minutes to read

The Association for Payment Clearing Services (APACS) specification defines a standard layout for fields on checks. The **Check** report uses this specification.

To print checks for APACS

1. Choose the  icon, enter **Payment Journals**, and then choose the related link.
2. To preview the check, choose the **Preview Check** action.
3. To print the check, choose the **Print Check** action.
4. On the **Options** FastTab, fill in the fields as described in the following table.

FIELD	DESCRIPTION
Bank Account	Specifies bank account code.
Last Check No.	Specifies the last check number that was specified on the Bank Account Card page.
One Check per Vendor per Document No.	Select to print only one check per vendor for each document number.
Reprint Checks	Select to reprint canceled checks.
Test Print	Select to print checks on blank paper before printing them on check forms.
Preprinted Stub	Select to use check forms with preprinted stubs.

5. Choose the **Print** button to print the report or choose the **Preview** button to view it on the screen.

Print Remittance Advice

3/31/2019 • 2 minutes to read

You can print remittance advice before posting a payment journal and after posting a payment. This advice displays vendor invoice numbers, which helps vendors to perform reconciliations.

To print remittance advice

1. Choose the  icon, enter **Payment Journals**, and then choose the related link.
2. On the **Payment Journal** page, select the payment for which remittance advice must be printed.
3. Choose the **Print Remittance Advice** action.
4. In the **Remittance Advice - Journal** batch job, on the **Gen. Journal Line** FastTab, and select the appropriate filters.

NOTE

You can filter using the vendor's external document number to match payments with invoices.

5. On the **Vendor** FastTab, select the appropriate filters.
6. Choose the **Print** button to print the report or choose the **Preview** button to view it on the screen.

Define Accounting Periods for Straight-Line Depreciation of Fixed Assets

3/31/2019 • 2 minutes to read

You can define 13 accounting periods to calculate straight line depreciation. You must calculate depreciation daily and distribute across the relevant periods. You can also define these accounting periods in the **FA - Projected Value** report.

NOTE

To calculate depreciation using both the old (360 days) and the new methods (365 or 366 days), create separate depreciation books; one for the old method, and one for the new method. Attach these books to the relevant assets.

To define accounting periods to calculate straight line depreciation

1. Choose the  icon, enter **Depreciation Books**, and then choose the related link.
2. To open a new **Depreciation Book Card** page, on the **Home** tab, choose **New**.
3. On the **General** FastTab, fill in the fields as necessary. Hover over a field to read a short description.
4. Choose the **OK** button.

To define accounting periods in the FA - Projected Value report

1. Choose the  icon, enter **FA - Projected Value**, and then choose the related link.
2. On the **Options** FastTab, fill in the fields as necessary. Hover over a field to read a short description.
3. Choose the **Print** button to print the report or choose the **Preview** button to view it on the screen.

Set Up a Posting Date Warning

3/31/2019 • 2 minutes to read

A warning message will be displayed when you post or batch post sales and purchase documents with a posting date not same as the work date. You must set up for this on the **Sales Receivables Setup** and **Purchases Payables Setup** pages.

To set up a posting date warning for sales and purchases

1. Choose the  icon, enter **Sales & Receivables Setup** or **Purchases & Payables Setup**, and then choose the related link.
2. On the **Sales Receivables Setup** page or the **Purchases Payables Setup** page, in the **General** FastTab, select the **Posting Date Check on Posting** check box.
3. Choose the **OK** button.

NOTE

A warning message displays when you post or batch post documents with a posting date not same as the work date. If you select **Replace Posting Date** check box while batch posting, you will be warned about the replacing posting date not being the same as the work date.

Enter Statutory Information

3/31/2019 • 2 minutes to read

To comply with legal requirements, statutory information is available on the **Statutory** FastTab on the **Company Information** page.

To enter statutory information

1. Choose the  icon, enter **Company Information**, and then choose the related link.
2. On the **Statutory** FastTab, fill in the fields as described in the following table.

FIELD	DESCRIPTION
Registration No.	Specifies the registration number of the company.
Registered Name	Specifies the registered name of the company.
Registered Address	Specifies the registered address of the company.
Registered Address 2	Specifies an additional part of the company's registered address.
Registered City	Specifies the city where the company is registered.
Registered County	Specifies the county of the company's registered address.
Registered Post Code	Specifies the registered postal code of the company.
Branch Number	Specifies the branch number of the company.
Contact Name	Specifies the name of the contact person for the company.

3. Choose the **OK** button.

The GetAddress.io UK Postcodes Extension

3/31/2019 • 2 minutes to read

The GetAddress.io UK Postcodes extension can save time and prevent mistakes when you enter addresses for entities like customers, vendors, bank accounts, and employees. For example, when you're creating a customer, you just choose a postcode and Business Central shows a list of addresses. Pick the address you want, and presto, the address fields are filled out.

##To use the GetAddress.io UK Postcodes extension when you enter an address

1. Under **Address**, choose **Look up address from postcode**.

NOTE

The **Look up address from postcode** option is available only if the **Country/Region Code** field is either empty, or contains **GB**.

2. On the **Postcode Search** page, in the **Postcode** field, enter or choose the postcode.
3. On the **Address Selection** page, choose the address.

TIP

If you know the street number, you can filter the addresses by entering some or all of the number in the **Delivery Point** field.

Set Up the GetAddress.io UK Postcodes Extension

3/31/2019 • 2 minutes to read

This extension makes it easy to enter addresses in the United Kingdom (UK) for entities like customers, contacts, employees, vendors, bank accounts, and so on.

The GetAddress.io UK Postcodes extension uses the getAddress API to find addresses in postcodes in the UK. To use the extension, you need to get a plan and an API Key for the getAddress API. We help you do that when you set up the GetAddress.io UK Postcodes extension. Plans are based on use, or what are sometimes referred to as "calls." A call, in this case, is when Business Central displays a list of addresses in a postcode. Depending on how often you add addresses, choose the plan that is best for you. If you just choose **Get API Key** you will use the **Free** plan, which lets you add 20 addresses per day, and is valid for 30 days.

##To set up the GetAddress.io UK Postcodes extension

1. Choose the  icon, enter **Service Connections**, and then choose the related link.
2. On the **Service Connections** page, choose **UK Postcode Service**.
3. On the **Postcode provider configuration** page, choose **Disabled**.
4. On the **Postal code service selection** page, choose **GetAddress.io**.
5. On the **GetAddress.io Config** page, choose **Get API Key** to open the **Plans** page on the website for the getAddress API.

NOTE

You might need to allow pop-ups in your browser.

6. Purchase a plan, or just choose **Get API Key**, and then provide your email address.
7. Open the email from getAddress.io, and copy the API key. The key is under the **Your API Key** heading.
8. On the **GetAddress.io Config** page, paste the API key in the **API Key** field, and then choose **OK**.
9. On the **Service Connections** page, verify that the **Address Provider** field shows **GetAddress.io**. If it does, the service is enabled.

Reporting Sales Tax in the US

3/31/2019 • 2 minutes to read

When you first start using Business Central, you can run an assisted setup guide to quickly and easily set up sales tax information for your company, customers, and vendors. In a matter of minutes, you are ready to create sales documents and purchase documents with sales tax calculated correctly. This is explained [in our blog post](#). If you move to the empty My Company, we recommend that you start by using each of the assisted setup guides, including the one for sales tax. If you prefer to set up sales tax yourself, this article explains what you have to take into consideration.

Tax Groups, Tax Areas, and Tax Jurisdictions

In Business Central, a tax group represents a group of inventory items or resources that are subject to identical tax terms. For example, you can set up a tax group for taxable items and another for nontaxable items. You must assign tax group codes to inventory items and general ledger accounts. Similarly, you must assign tax area codes to customers, locations, and to your own company settings. The assisted setup guide helps you do this.

Each tax area is a grouping of sales tax jurisdictions based on a particular geographic location. For example, the Miami, Florida, tax area includes three sales tax jurisdictions: city (Miami), county (Dade), and state (Florida). Business Central includes a limited set of tax areas with a default configuration, but you can change them and add new tax areas.

If you set up new tax areas and tax jurisdictions, you must make sure that you fill in the fields correctly. In the United States, states, counties, cities, and localities can charge sales tax. Companies collect and remit sales tax to these government authorities for products sold to end users. Sales tax can also be charged to existing sales tax. For example, tax can be calculated on a sales invoice amount that already includes the tax from other jurisdictions.

Tax Details

The **Tax Details** page shows different combinations of sales tax jurisdictions and sales tax groups to establish sales tax rates. For each tax jurisdiction, we recommend that you set up one tax group for normal sales tax, another tax group for items or services that are not taxed, and an additional tax group for every type of item or service that is handled with a different sales tax rate in that jurisdiction.

In the United States, when you sell to a customer at a location where you do not have a *situs*—or a legal location in that state—you do not collect sales tax. For locations in which you do not have a situs, ensure that both the **Tax Below Minimum** and **Tax Above Maximum** fields are 0.00.

Reporting Transactions as 1099 Liable in the US

3/31/2019 • 2 minutes to read

The Internal Revenue Service (IRS) requires one or more versions of the 1099 tax form for payments to vendors. Copies of these forms must be sent to vendors annually on or before the last day of January. On your purchase documents, you can specify that the document is 1099 liable, and you can specify the 1099 code for the vendor.

Regulatory 1099 Format Changes December 2018

In Business Central, A new 1099 Form Box code *DIV-05* has been added, and all the 1099 codes from *DIV-05* to *DIV-11* were upgraded to codes from *DIV-06* to *DIV-12*. When you open the **IRS 1099 Form Box** page, a notification pops up to upgrade the form boxes. If you change the 1099 code on the **Vendor Card** page, a notification will display asking if you want to update the 1099 codes for all the associated entries (like purchase documents, journal lines, posted invoices, credit memos and vendor ledger entries).

1099 codes

In Business Central, the most common 1099 codes are already set up for you so you are ready to generate the required reports. The codes are defined on the **IRS 1099 Form Box** page where you can also add new 1099 codes. For each tax liable vendor, you can then specify the relevant 1099 code on the **Payments** FastTab on the Vendor card.

With the **Vendor 1099 Information** report, you can review 1099 transactions paid during a specified period. At the end of the year, you can print 1099 transactions on preprinted forms.

Printing 1099 tax forms

From the **IRS 1099 Form Box** page, you can access the following tax forms:

- **Vendor 1099 Div** - Prints the federal form 1099-DIV for dividends and distribution. You can print all or specific 1099-DIV forms. The report uses the codes that apply to the DIV form amount boxes from the **IRS 1099 Form-Box** page.
- **Vendor 1099 Int** - Prints the federal form 1099-INT for interest income. You can print all or specific 1099-INT forms. The report uses the codes that apply to the INT form amount boxes from the **IRS 1099 Form-Box** page.
- **Vendor 1099 Misc - Miscellaneous income** - Prints the federal form 1099-MISC for miscellaneous income. You can print all or specific 1099-MISC forms. The report uses the codes that apply to the MISC form amount boxes from the **IRS 1099 Form-Box** page.

Regulatory changes affecting this report and the table data are generally handled in end-of-year updates. It may be helpful to run the **Vendor 1099 Information** report to review the data before printing the forms.

Submitting 1099 tax forms electronically

To submit the 1099 tax forms electronically, use the **Vendor 1099 Magnetic** report. Specifies the 1099 forms that can be exported. The form information exported by this report is the same as the reports that print 1099 forms that are described in the previous section.

The report uses the codes that apply to the form amount boxes from the **IRS 1099 Form-Box** page. The codes are mapped to the form boxes in the file layouts of this report, therefore the table data and report version for a particular tax year must be in agreement. If any custom codes are added to the table these must be mapped to the form boxes inside this object.

Regulatory changes affecting this report and the table data are generally handled in end-of-year updates. It may be helpful to run the **Vendor 1099 Information** report to review the data before generating the electronic file.

Set Up Use Tax and Purchase Tax

3/31/2019 • 4 minutes to read

Sales tax includes taxes that companies pay for using items:

- Use tax (United States) – Use tax is a United States sales tax that is paid on items that are purchased by a company and are used by that company instead of being sold to a customer. The company must pay sales tax for those items to the government, in the form of use tax.
- Purchase tax (Canada) – Purchase tax is a Canadian sales tax that is paid by a company on items that are purchased from a vendor. When a company purchases items for use by the company itself, the vendor charges the appropriate sales tax for the items.

To set up use tax for a purchase order

1. Choose the  icon, enter **Purchase Orders**, and then choose the related link in **Order Processing**.
2. On the **Purchase Orders** page, on the **Home** tab, in the **New** group, choose **New**.
3. On the **Lines** FastTab, fill in the fields as necessary. Hover over a field to read a short description.
4. On the **Invoicing** FastTab, fill in the fields as described in the following table.

FIELD	DESCRIPTION
Tax Liabile	Select to set up tax liability. Important: This field is available on the Purchase Header page, but it is not shown by default. To select the field, you must first add the column that shows this field. You can change how certain UI elements are displayed. For more information, see Personalizing Your Workspace .
Tax Area Code	The tax area code of the vendor. Important: This field is available on the Purchase Header page, but it is not shown by default. To select the field, you must first add the column that shows this field. You can change how certain UI elements are displayed. For more information, see Personalizing Your Workspace .
Tax Exemption No.	The company's tax exemption number. You can enter a maximum of 30 alphanumeric characters. Important: This field is available on the Purchase Header page, but it is not shown by default. To select the field, you must first add the column that shows this field. You can change how certain UI elements are displayed. For more information, see Personalizing Your Workspace .
Provincial Tax Area Code	The tax code for the province. Important: This field is available on the Purchase Header page, but it is not shown by default. To select the field, you must first add the column that shows this field. You can change how certain UI elements are displayed. For more information, see Personalizing Your Workspace .

5. Choose the **OK** button.

To set up use tax details

1. Choose the  icon, enter **Tax Details**, and then choose the related link.
2. On the **Tax Details** page, choose the **New** action.
3. On the **New - Tax Details** page, fill in the fields as described in the following table.

FIELD	DESCRIPTION
Tax Jurisdiction Code	The tax jurisdiction code for the tax detail entry.
Tax Group Code	The tax group code for the tax detail entry.
Tax Type	Sales and Use Tax – To apply both sales tax and use tax to the tax detail entry. –or– Excise Tax – To apply excise tax to the tax detail entry. –or– Sales Tax Only – To apply only sales tax to the tax detail entry. –or– Use Tax Only – To apply only use tax to the tax detail entry.

4. Choose the **OK** button.

To set up purchase tax for a company

1. Choose the  icon, enter **Company Information**, and then choose the related link.
2. On the **Company Information** page, on the **Tax** FastTab, fill in the fields as described in the following table.

FIELD	DESCRIPTION
Tax Area Code	The company's tax area code. The tax area code is used in conjunction with a tax group code field and the Tax Liable field to find the necessary information for calculating sales tax.
Tax Exemption No.	The company's tax exemption number. You can enter a maximum of 30 alphanumeric characters.
Provincial Tax Area Code	The tax code for the province.

3. Choose the **OK** button.

To set up purchase tax for a location

1. Choose the  icon, enter **Locations**, and then choose the related link.
2. On the **Locations** page, select the required location, and then choose the **Edit** action.

3. On the **General** FastTab, fill in the fields as described in the following table.

FIELD	DESCRIPTION
Do Not Use For Tax Calculation	Select to specify whether the tax information included on this location record is to be used for sales tax calculations on purchase documents.
Tax Area Code	The tax area code for the location. The tax area code is used in conjunction with a tax group code field and the Tax Liable field to find the necessary information for calculating sales tax.
Tax Exemption No.	The company's tax exemption number. You can enter a maximum of 30 alphanumeric characters.
Provincial Tax Area Code	The tax code for the province.

4. Choose the **OK** button.

To set up purchase tax for non-recoverable tax

1. Choose the  icon, enter **Tax Details**, and then choose the related link.
2. On the **Tax Details** page, choose the **New** action.
3. Select the **Expense/Capitalize** check box.

NOTE

This check box must be selected if the tax paid is not recoverable.

4. Choose the **OK** button.

Set Up Unrealized Sales Tax and Sales Payment Discounts

3/31/2019 • 4 minutes to read

You can use the **General Ledger Setup** page to set up unrealized sales tax. You can also set up maximum correction tax amounts so that you can limit the tax correction amounts that are entered for sales and purchases. This allows you to overwrite the calculated tax when there are rounding differences between what is calculated on the purchase order, and what is calculated on the purchase invoice from the vendor.

To set up unrealized sales tax

1. Choose the  icon, enter **General Ledger Setup**, and then choose the related link.
2. On the **General Ledger Setup** page, on the **General** FastTab, fill in the fields as described in the following table.

FIELD	DESCRIPTION
Pmt. Disc. Excl. Tax	Select to calculate the payment discount on amounts excluding sales tax.
Adjust for Payment Disc.	Select to recalculate the tax amounts when you post payments that trigger payment discounts. This field is used in the context of VAT, not sales tax.
Unrealized VAT	Select if any of your sales tax jurisdictions allow you to pay your sales tax after you have been paid. If you do not select this check box this function will be blocked for all sales tax jurisdictions.

3. Choose the **OK** button.

To set up unrealized tax for jurisdictions

1. Choose the  icon, enter **Tax Jurisdictions**, and then choose the related link.
2. On the **Tax Jurisdictions** page, choose the **Edit List** action.
3. Fill in the fields as described in the following table.

FIELD	DESCRIPTION
-------	-------------

FIELD	DESCRIPTION
<p>Unrealized Tax Type</p>	<p>– The unrealized tax feature is not used for this tax jurisdiction.</p> <p>–or–</p> <p>Percentage – Each payment covers both tax amounts and invoice amounts in proportion to the remaining invoice amount. The paid tax amount is transferred from the unrealized tax account to the tax account.</p> <p>–or–</p> <p>First – Payments cover the tax first, and then the invoice amount.</p> <p>–or–</p> <p>Last – Payments cover the invoice amount first, and then the tax amount. In this case, nothing will be transferred from the unrealized tax account to the tax account until the total invoice amount—exclusive of tax—has been paid.</p> <p>–or–</p> <p>First (Fully Paid) – Payments cover the tax first, but nothing is transferred to the tax account until the full tax amount has been paid.</p> <p>–or–</p> <p>Last (Fully Paid) – Payments cover the invoice amount first, but nothing is transferred to the tax account until the full tax amount has been paid. Important: This field is available on the Tax Jurisdiction page, but it is not shown by default. To select the field, you must first add the column that shows this field. You can change how certain UI elements are displayed. For more information, see Personalizing Your Workspace.</p>
<p>Unreal. Tax Acc (Sales)</p>	<p>The general ledger account that you want to use to post calculated unrealized tax on sales transactions. Important: This field is available on the Tax Jurisdiction page, but it is not shown by default. To select the field, you must first add the column that shows this field. You can change how certain UI elements are displayed. For more information, see Personalizing Your Workspace.</p>
<p>Unreal. Tax Acc (Purchases)</p>	<p>The general ledger account that you want to use to post calculated unrealized tax on purchase transactions. Important: This field is available on the Tax Jurisdiction page, but it is not shown by default. To select the field, you must first add the column that shows this field. You can change how certain UI elements are displayed. For more information, see Personalizing Your Workspace.</p>

FIELD	DESCRIPTION
Unreal. Rev. Charge (Purch.)	The general ledger account that you want to use for posting calculated unrealized reverse-charge tax on purchase transactions. Important: This field is available on the Tax Jurisdiction page, but it is not shown by default. To select the field, you must first add the column that shows this field. You can change how certain UI elements are displayed. For more information, see Personalizing Your Workspace .

4. Choose the **OK** button.

To set up adjustments for payment discounts in a tax posting group

1. Choose the  icon, enter **Tax Posting Setup**, and then choose the related link.
2. Choose the **Edit** action.
3. On the **Tax Posting Setup Card** page, select the **Adjust for Payment Discount** check box.

IMPORTANT

This field is available on the **VAT Posting Setup** page, but it is not shown by default. To select the field, you must first add the column that shows this field. You can change how certain UI elements are displayed. For more information, see [Personalizing Your Workspace](#).

4. Choose the **OK** button.

To set up maximum tax correction amounts

1. Choose the  icon, enter **Sales & Receivables Setup**, and then choose the related link.
2. On the **Sales Receivables Setup** page, on the **General** FastTab, select the **Allow Tax Difference** check box.
3. Choose the **OK** button.
4. Choose the  icon, enter **Purchases & Payables Setup**, and then choose the related link.
5. On the **Purchases & Payables Setup** page, on the **General** FastTab, select the **Allow Tax Difference** check box.
6. Choose the **OK** button.
7. Choose the  icon, enter **General Ledger Setup**, and then choose the related link.
8. On the **General Ledger Setup** page, in the **Max. Tax Difference Allowed** field, enter the maximum tax correction amount that is allowed for the local currency.

NOTE

In this field, if you enter USD 5, you may correct tax amounts by up to five dollars. To use the tax difference function, an amount must be entered in the **Max. Tax Difference Allowed** field.

9. Choose the **OK** button.

Create Deposits

3/31/2019 • 2 minutes to read

You can make deposits to maintain a transaction record that contains information that can be applied to outstanding invoices and credit memos.

The **Deposit** page specifies bank deposit information. The information includes the bank account number, total deposit amount, deposit lines, posting date, document date, department code, currency code, and deposit notes. You can use the page to create new deposits, post deposits, print deposits, view deposit comments, or view a report that shows the deposit amount to be reconciled.

The **Deposit** report displays customer and vendor deposits with the original deposit amount, the amount of the deposit that remains open, and the amount applied. The report also shows the total posted deposit amount to be reconciled.

Deposit lines contain information about the individual deposited items, such as checks from customers. This information includes the document date and number, account type and number, and amount. The total of the amounts on the lines must add up to the total amount of the deposit entered on the deposit header.

After you have filled in the deposit information and the associated deposit lines, you must post it in order to update the bank ledger, general ledger, customer ledger, and any other relevant ledgers. Posted deposits are stored for future reference and can be viewed on the **Posted Deposits** page.

To create a deposit

1. Choose the  icon, enter **Deposits**, and then choose the related link.
2. Choose the **New** action.
3. On the **General** FastTab, fill in the required fields as described in the following table.

FIELD	DESCRIPTION
No.	The unique identification number for the deposit.
Bank Account No.	The bank account number for the deposit.
Total Deposit Amount	The total deposit amount posted to the bank ledger. You can post this deposit only if the sum of the deposit lines is equal to the value in this field.
Posting Date	The posting date for the deposit.
Document Date	The deposit document date.

4. On the **Lines** FastTab, fill in the required fields as described in the following table.

FIELD	DESCRIPTION
Account Type	The account type.

FIELD	DESCRIPTION
Account No.	The unique identification account number that is associated with the selected account type, to which the entry will be posted.
Description	The journal line entry description.
Document Date	The journal line entry document date.
Document Type	The journal line entry document type.
Document No.	The journal line entry document number.
Credit Amount	The total credit amount on the journal line.

- Optionally, choose the **Dimensions** action, and then add relevant dimensions on the **Dimension Set Entries** page.
- Choose the **Post** action.

NOTE

You can post a deposit only if the amount displayed in the **Total Deposit Lines** field is equal to the amount in the **Total Deposit Amount** field.

Next, you can use the **Deposit Test** and **Deposit** reports to reconcile your posted deposits with outstanding invoices and credit memos.

Reconciling Bank Accounts

3/31/2019 • 3 minutes to read

Use the **Bank Rec. Worksheet** page to reconcile bank account ledger entries with bank statements.

NOTE

This topic describes the North American bank reconciliation functionality. You can also use the standard functionality. For more information, see [Reconcile Bank Accounts Separately](#).

To reconcile bank accounts with bank statements

1. Choose the  icon, enter **Bank Account Reconciliations**, and then choose the related link.
2. Choose the **New** action.
3. On the **General** FastTab, fill in the required fields as described in the following table.

FIELD	DESCRIPTION
Bank Account No.	The bank account number to reconcile.
Statement No.	The bank statement number to reconcile.
Statement Date	The bank statement date.
Statement Balance	The bank statement balance.

4. Choose the **Mark Lines** action.
5. On the **Bank Rec. Process Lines** page, fill in the fields as described in the following table.

FIELD	DESCRIPTION
Record type to process	Specify the type as Checks , Deposits , or Both .
Mark lines as cleared	Select to process the option selected in the Record type to process field.

6. On the **Bank Rec. Line** FastTab, select the appropriate filters.
7. Choose the **OK** button.
8. On the **Bank Rec. Worksheet** page, on the **Bank Rec. Adj. Lines Subform** FastTab, enter information in the remaining fields to make adjustments.

NOTE

If needed, you can also use the **Bank Rec. Worksheet** page to view the **Bank Reconciliation Comments** card or the **Bank Reconciliation** card.

To post a bank reconciliation

You can post bank reconciliation if you have reconciled the bank accounts on the **Bank Rec. Worksheet** page. After the bank reconciliation has been posted a bank account statement is created and can be viewed on the bank account card.

1. Choose the  icon, enter **Bank Account Reconciliations**, and then choose the related link.
2. Choose the bank account reconciliation that you want to post, and then choose the **Edit** action.

NOTE

On the **General** FastTab, the value in the **Difference** field must be zero before you can post the bank reconciliation.

When the bank reconciliation is posted, all of the related files are posted to the historical **Post Bank Rec. Worksheet** table. Any adjustments are posted to the **G/L Entry** table.

3. Choose the **Post** action.
4. To review a preliminary draft of the bank reconciliation statement, choose the **Test Report** action. The **Bank Rec. Test Report** shows the entries that will result if you post.

To view the posted bank account reconciliations

1. Choose the  icon, enter **Bank Accounts**, and then choose the related link.
2. Choose the bank account that you want to view the posted reconciliations for, and then choose the **Statements** action.
3. Choose the **Close** button.

To print a bank reconciliation test report

You can print the following bank reconciliation reports:

- **Bank Rec. Test Report** - Displays the list of errors that are found in the bank reconciliation statement. You can generate this report before you post the bank reconciliation statement to make sure that there are no errors in the statement.
- **Bank Account – Reconcile** - Displays the reconciliation details for each bank account. This report lists deposits, withdrawals, and adjustments for a bank account.

1. Choose the  icon, enter **Bank Account Reconciliations**, and then choose the related link.
2. Choose the **Bank Rec. Test Report** action.
3. On the **Options** FastTab, fill in the fields as described in the following table.

FIELD	DESCRIPTION
Print details	Include reconciliation details in the report. If you select this check box, all of the other print check boxes are automatically selected. You can clear a check box if you do not want to include its details in the report.
Print checks	Print check details in the report.
Print deposits	Print deposit details in the report.

FIELD	DESCRIPTION
Print adjustments	Print adjustment details in the report.
Print outstanding checks	Print outstanding check details in the report.
Print outstanding deposits	Print outstanding deposit details in the report.

4. On the **Bank Rec. Header** FastTab, select the appropriate filters.
5. Choose the **Print** button to print the report. Choose the **Preview** button to view it on the screen.

To print a bank reconciliation report

1. Choose the  icon, enter **Bank Account Reconciliations**, and then choose the related link.
2. Choose the **Bank Account – Reconcile** action.
3. To print each bank account on a new page, choose the **New Page per Bank Account** check box.
4. On the **Bank Account** FastTab, choose the appropriate filters.
5. Choose the **Print** button to print the report. Choose the **Preview** button to view it.

[Reconcile Bank Accounts Separately](#)

Making Payments with Bank Data Conversion Service or SEPA Credit Transfer

4/12/2019 • 9 minutes to read

On the **Payment Journal** page, you can process payments to your vendors by exporting a file together with the payment information from the journal lines. You can then upload the file to your electronic bank where the related money transfers are processed. Business Central supports the SEPA Credit Transfer format, but in your country/region, other formats for electronic payments may be available.

In the generic version of Business Central, a global provider of services to convert bank data to any file format that your bank requires is set up and connected. In North American versions, the same service can be used to send payment files as electronic funds transfer (EFT), however with a slightly different process. See step 6 in [To export payments to a bank file](#).

To enable SEPA credit transfers, you must first set up a bank account, a vendor, and the general journal batch that the payment journal is based on. You then prepare payments to vendors by automatically filling the **Payment Journal** page with due payments with specified posting dates.

NOTE

When you have verified that the payments are successfully processed by the bank, you can proceed to post the payment journal lines.

Setting Up the Bank Data Conversion Service.

Activate the Bank Data Conversion Service feature to have any bank statement file converted to a format that you can import or to have your exported payment files converted to the format that your bank requires. For more information, see [Set Up the Bank Data Conversion Service](#).

Setting Up SEPA Credit Transfer

From the **Payment Journal** page, you can export payments to a file for upload to your electronic bank for processing of the related money transfers. Business Central supports the SEPA Credit Transfer format, but in your country/region, other formats for electronic payments may be available.

To enable export of a bank file formats that are not supported out of the box in Business Central, you can set up a data exchange definition by using the data exchange framework. For more information, see [Set Up Data Exchange Definitions](#).

Before you can process payment electronically by exporting payment files in the SEPA Credit Transfer format, you must perform the following setup steps:

- Set up the bank account in question to handle the SEPA Credit Transfer format
- Set up vendor cards to process payments by exporting files in the SEPA Credit Transfer format
- Set up the related general journal batch to enable payment export from the **Payment Journal** page
- Connect the data exchange definition for one or more payment types with the relevant payment method or methods

To set up a bank account for SEPA Credit Transfer

1. In the **Search** box, enter **Bank Accounts**, and then choose the related link.

2. Open the card of the bank account from which you will export payment files in the SEPA Credit Transfer format.
3. On the **Transfer** FastTab, in the **Payment Export Format** field, choose **SEPADD**.
4. In the **SEPA CT Msg. ID No. Series** field, choose a number series from which numbers are assigned to SEPA credit transfer entries.
5. Make sure the **IBAN** field is filled.

NOTE

The **Currency Code** field must be set to **EUR**, because SEPA credit transfers can only be made in the EURO currency.

To set up a vendor card for SEPA Credit Transfer

1. In the **Search** box, enter **Vendors**, and then choose the related link.
2. Open the card of the vendor whom you will pay electronically by export payment files in the SEPA Credit Transfer format.
3. On the **Payment** FastTab, in the **Payment Method Code** field, choose **BANK**.
4. In the **Preferred Bank Account** field, choose the bank to which the money will be transferred when it is processed by your electronic bank.

The value in the **Preferred Bank Account** field is copied to the **Recipient Bank Account** field on the **Payment Journal** page.

To set the payment journal up to export payment files

1. In the **Search** box, enter **Payment Journals**, and then choose the related link.
2. Open the payment journal that you use to process payments by exporting files in the SEPA Credit Transfer format.
3. In the **Batch Name** field, choose the drop-down button.
4. On the **General Journal Batches** page, on the **Home** tab, in the **Manage** group, choose **Edit List**.
5. On the line for the payment journal that you will use to export payments, select the **Allow Payment Export** check box.

To connect the data exchange definition for one or more payment types with the relevant payment method or methods

1. In the **Search** box, enter **Payment Methods**, and then choose the related link.
2. On the **Payment Methods** page, select the payment method that is used to export payments from, and then choose the **Pmt. Export Line Definition** field.
3. On the **Pmt. Export Line Definitions** page, select the code that you specified in the **Code** field on the **Line Definitions** FastTab in step 4 in the "To describe the formatting of lines and columns in the file" section in the [Set Up Data Exchange Definitions](#) procedure.

The direct-debit mandate is automatically inserted in the **Direct Debit Mandate ID** field when you create a sales invoice for the customer that you selected in step 2. For more information, see [Create Recurring Sales and Purchase Lines](#).

Preparing the Payment Journal

Fill the payment journal with lines for due payments to vendors, with the option to insert posting dates based on the due date of the related purchase documents. For more information, see [Managing Payables](#).

Exporting Payments to a Bank File

When you are ready to make payments to your vendors, or reimbursements to your employees, you can export a file with the payment information on the lines on the **Payment Journal** page. You can then upload the file to your bank to process the related money transfers.

In the generic version of Business Central, the Bank Data Conversion service is set up and connected. In North American versions, the same service can be used to send payment files as electronic funds transfer (EFT), however with a slightly different process. See step 6 in [To export payments to a bank file](#).

NOTE

Before you can export payment files from the payment journal, you must specify the electronic format for the involved bank account, and you must enable the bank data conversion service. For more information, see [Set Up Bank Accounts](#) and [Set Up the Bank Data Conversion Service](#). In addition, you must select the **Allow Payment Export** check box on the **General Journal Batches** page. For more information, see [Working with General Journals](#).

You use the **Credit Transfer Registers** page to view the payment files that have been exported from the payment journal. From this page, you can also re-export payment files in case of technical errors or file changes. Note, however, that exported EFT files are not shown in this page and cannot be re-exported.

To export payments to a bank file

The following describes how to pay a vendor by check. The steps are similar to refund a customer by check.

1. Choose the  icon, enter **Payment Journals**, and then choose the related link.
2. Fill in the payment journal lines. For more information, see [Record Payments and Refunds](#).

NOTE

If you are using EFT, you must select either **Electronic Payment** or **Electronic Payment-IAT** in the **Bank Payment Type** field. Different file export services and their formats require different setup values in the **Bank Account Card** and **Vendor Bank Account Card** pages. You will be informed about wrong or missing setup values as you try to export the file.

3. When you have completed all payment journal lines, choose the **Export** action.
4. On the **Export Electronic Payments** page, fill in the fields as necessary.

Any error messages will be shown in the **Payment File Errors** FactBox where you can also choose an error message to see detailed information. You must resolve all errors before the payment file can be exported.

TIP

When you use the bank data conversion service, a common error message states that the bank account number does not have the length that your bank requires. To avoid or resolve the error, you must remove the value in the **IBAN** field on the **Bank Account Card** page and then, in the **Bank Account No.** field, enter a bank account number in the format that your bank requires.

5. On the **Save As** page, specify the location that the file is exported to, and then choose **Save**.

NOTE

If you are using EFT, save the resulting vendor remittance form as a Word document or select to have it emailed directly to the vendor. The payments are now added to the **Generate EFT File** page from where you can generate multiple payment orders together to save transmission cost. For more information, see the following steps.

6. On the **Payment Journal** page, choose the **Generate EFT File** action.

On the **Generate EFT File** page, all payments set up for EFT that you have exported from the payment journal for a specified bank account but not yet generated are listed on the **Lines** FastTab.

7. Choose the **Generate EFT File** action to export one file for all the EFT payments.

8. On the **Save As** page, specify the location that the file is exported to, and then choose **Save**.

The bank payment file is exported to the location that you specify, and you can proceed to upload it to your electronic bank account and make the actual payments. Then you can post the exported payment journal lines.

To plan when to post exported payments

If you do not want to post a payment journal line for an exported payment, for example because you are waiting for confirmation that the transaction has been processed by the bank, you can just delete the journal line. When you later create a payment journal line to pay the remaining amount on the invoice, the **Total Exported Amount** field shows how much of the payment amount has already been exported. Also, you can find detailed information about the exported total by choosing the **Credit Transfer Reg. Entries** button to see details about exported payment files.

If you follow a process where you do not post payments until you have confirmation that they have been processed in the bank, you can control this in two ways.

- In a payment journal with suggested payment lines, you can sort on either the **Exported to Payment File** column or the **Total Exported Amount** and then delete payment suggestions for open invoices for which payments have already been made and you do not want to make payments for.
- On the **Suggest Vendor Payments** page, where you specify which payments to insert in the payment journal, you can select the **Skip Exported Payments** check box if you do not want to insert journal lines for payments that have already been exported.

To see information about exported payments, choose the **Payment Export History** action.

To re-export payments to a bank file

You can re-export payment files from the **Credit Transfer Registers** page. Before you delete or post payment journal lines, you can also re-export the payment file from the **Payment Journal** page by simply exporting it again. If you have deleted or posted the payment journal lines after exporting them, you can re-export the same payment file from the **Credit Transfer Registers** page. Select the line for the batch of credit transfers that you want to re-export, and then use the **Reexport Payments to File** action.

NOTE

Exported EFT files are not shown on the **Credit Transfer Registers** page and cannot be re-exported.

1. Choose the  icon, enter **Credit Transfer Registers**, and then choose the related link.
2. Select a payment export that you want to re-export, and then choose the **Reexport Payment to File** action.

Posting the Payments

When the electronic payment is successfully processed by the bank, post the payments. For more information,

see [Making Payments](#).

Manage Customer Credit Information

2 minutes to read

In Business Central, you can add comments to customer credit information. You can also hold and block customers with bad credit before shipping or invoicing occurs.

To add comments to customer credit information

1. Choose the  icon, enter **Credit Management**, and then choose the related link.
2. On the **Customer List - Credit Mgmt.** page, select a customer, and then choose the **Comments** action.
3. On the **Comment Sheet** page, fill in the fields as described in the following table.

FIELD	DESCRIPTION
Date	The date of the comment.
Comment	The comment about the customer. You can enter a maximum of 80 alphanumeric characters.

4. Choose the **OK** button.

To prevent an order from shipping or invoicing

1. Choose the  icon, enter **Customers**, and then choose the related link.
2. Select the customer, and then choose the **Ledger Entries** action.
3. In the **On Hold** field, enter the initials of the customer.
4. Choose the **OK** button.

NOTE

You must have the proper security clearance to add or remove holds on individual sales orders using the **On Hold** field.

To block a sales order for a customer

1. Choose the  icon, enter **Customers**, and then choose the related link.
2. Select a customer, and then choose the **Edit** action.
3. On the **General** FastTab, in the **Blocked** field, select one of the following options:
 - – Transaction is allowed for this customer.
 - **Ship** – New orders and new shipments cannot be created for this customer. Existing shipments not yet invoiced can be invoiced.
 - **Invoice** – New orders, new shipments, and new invoices cannot be created for this customer. Existing shipments not yet invoiced cannot be invoiced.
 - **All** – No transaction is allowed for this customer, including payments.

4. Choose the **OK** button.

Print Troubleshooting Reports

3/31/2019 • 2 minutes to read

The following troubleshooting reports are available to assist Microsoft Certified Partners with troubleshooting issues:

- **License Information** report – This report contains the license number, the name of the licensed user, which application granules they have purchased, and when the license expires, if applicable.
- **Data Dictionary** report (report #10315) – This report allows you to print detailed table reference, field reference, and table properties for table objects.

You must have access to Business Central Object Designer, which is available only to administrators.

You can print these reports and send them to your Microsoft Certified Partner to help resolve issues with your Business Central implementation.

To print the License Information report

1. In Business Central Object Designer, on the **Tools** menu, choose **License Information**.
2. On the **License Information** page, you can preview the license information, or you can choose the **Export** button to print the **License Information** report.

To print the Data Dictionary report

1. In Business Central Object Designer, on the **Tools** menu, choose **Object Designer**.
2. Choose the **Report** button.
3. In the **Type** column, find **ID 10315**, which is the **Data Dictionary** report.
4. On the **Object Designer** page, choose the **Run** button to open the **Data Dictionary** report.
5. On the **Options** tab, enter the relevant information into the fields.
6. Choose the **Print** button to print the report or choose the **Preview** button to view it on the screen.

Submit Alerts about Country/Region-Specific Regulatory Features

3/31/2019 • 3 minutes to read

We invite you to use Microsoft Dynamics Lifecycle Services (LCS) to submit regulatory alerts through the Dynamics regulatory alert submission service.

To submit a regulatory alert in LCS

1. Go to <https://lcs.dynamics.com> and log in You will be presented with the projects you have access to
2. Select the **Regulatory Alerts - Worldwide** project This will open the project and show a variety of things related to this project
3. Select the **Alert service** on the right side in the **More tools** section You will see a list of alerts with the headline **Dynamics Regulatory Alert Submission**
4. You can add a new alert by clicking the plus sign (+) sign at the top of the list This will present you with a 4-step guide to create the alert. The guide has the following steps:

- Search for existing items

Search for any information you think is relevant for the alert you are going to create. If you do not find any relevant search results you can select the **Submit regulatory alert** button at the bottom of the page to proceed with the alert submission.

- Attach business processes

This part is not relevant for Dynamics 365 Business Central. Choose **Skip** to proceed to the next step.

- Describe the alert

Enter information about the alert in the appropriate fields. Required fields are indicated by a red asterisk (*) in the guide.

FIELD	DESCRIPTION
Title	Enter a descriptive title to identify the area of impact. For example, enter <i>Changes in invoice document as of July 1, 2019</i> .
Description	Enter a brief overview of the law. Your description should focus on issues that are relevant to enterprise resource planning (ERP), so that users can understand the requirements at a high level without having to read the legislation first.
Country	Specify the country or region that the legislation applies to.
Industry	Specify the industry, if the requirement applies only to specific industries. For example, choose Public sector , Retail , or Manufacturing .

FIELD	DESCRIPTION
Feature reference	This is not relevant for Dynamics 365 Business Central, but you can enter a feature reference, if you know it. The list of features for the specific country can be found in the Localization portal .
Law enforcement date	Specify the date when affected customers must start to comply with the law.
Government announcement date	Specify the date when the authority announced the change.
Latest filing date	Select the deadline for the first submission of the new or changed report.
Link to legislation	Enter one or more links to the published law, interpretation guideline, implementation guidance, or any other useful documentation that will help users understand or implement the requirement.
Company name	Enter the company name for the person who is submitting the alert.
Contact name	Enter the name of the person who is submitting the alert.
Contact email	The email address of the person who is submitting the alert.
Business process	The business processes that you selected through the Alert submission wizard
Comments	Enter any additional information that might be help users understand or implement the requirement. Click Submit to save your comment. Multiple comments can be added and should be submitted separately. Comments are saved in the order that they are added.
Attachments	Click the Upload button, and then browse to select a file to add as an attachment. After you select the file, it is uploaded and appears as a linked file. You can add up to three files that have a size of 5 MB each. To delete files that have been attached, click Remove under the title of the file. Attachments must be publicly available materials. They cannot be propriety or customer-specific/partner-specific.

Click **Submit** to save and submit the alert.

If you don't have all of the required information, or if you're not yet ready to submit the alert, you can save a partially completed alert.

- Submission confirmation

After you submit the alert, you will get a confirmation that the alert was successfully submitted to Microsoft.

Compliance

3/31/2019 • 2 minutes to read

This content contains information about compliance in relation to Business Central.

Compliance is a topic of increasing interest and throughout the evolution of Business Central we have ensured that the product empowers customers and partners on a broad scale and does not impose blockers in regards to compliance. On the contrary, Business Central contains functionality and is built on a platform that makes it easy for customers to comply with compliance and regulatory legislation.

In this section you can read more about our approach to compliance from an application, service and country specific perspective.

Application Compliance

3/31/2019 • 5 minutes to read

This content contains information about application compliance in relation to Business Central, like the International Financial Reporting Standards, local functionality, GDPR and more. Confidence in a business management solution is key to running an efficient business. With Business Central companies are empowered to streamline business processes while consistently and cost-efficiently complying with increasing regulation and reporting requirements.

Data Privacy

Business Central supports data privacy initiatives like the General Data Protection Regulation (GDPR) that went into effect on May 25th 2018. Read more about how [Business Central supports GDPR](#).

If you are a developer for Business Central extensions you must know about classifying data. Please see [this page](#). If you want to learn more about GDPR from a broader Dynamics 365 perspective, please see [this list of whitepapers](#).

Accounting processes and controls to aid compliance

Companies face increasing financial accounting challenges each year. Depending on industry, markets, geographic location, and financing needs, an organization may be subject to local generally accepted accounting principles (GAAP) and one or more of:

- The Sarbanes-Oxley Act (SOX), a U.S. law passed in 2002 to protect investors by improving the accuracy and reliability of corporate disclosures.
- The International Financial Reporting Standards section of the European Union's International Accounting Standards (IAS/IFRS), which went into effect in 2005 and sets forth international accounting standards for recognition, measurement, consolidation, and reporting.
- The New Basel Accord (Basel II), enacted in 2006 to address issues of financial institution risk and to promote greater stability in the overall financial system.

Good practices with technology

Compliance depends not only on accurate information and appropriate accounting processes, but also on the people who set up and administer those processes. An effective business management solution can facilitate compliance by helping to manage valid and accessible information through transparent processes that have been set up in compliance with industry and regulatory standards.

Realize the benefits of an integrated business management solution

Business Central delivers real-time, integrated operational and financial information from across your organization, so you can:

- Track financial data through custom account schedules for cash flow, revenues, balance sheets, fixed assets, capital structure, key performance indicators, and more.
- Help safeguard accuracy with role-based security and configurable application controls that prevent invalid or duplicate data entry.
- Quickly and easily generate financial reports in accordance with applicable regulatory standards.
- Maintain comprehensive audit trails with drill-down and drill-around functionality and change logs.

Gain control of critical information, processes, and reports

Manage compliance to the standards that matter

Deliver integrated information, aligned processes, and easy-to-use tools to help your people meet the financial management expectations and standards that matter to your specific business.

Tailor account schedules to your needs

- Define the structure of your company's chart of accounts based on business requirements and applicable regulatory standards
- Create accounts and handle complex processes related to a spectrum of business activities, including inventory valuation, foreign currencies, segment reporting, and departures from local GAAPs.
- Control the level of detail for each recorded transaction and select detailed registration for specific types of transactions, such as fixed assets and accounts payable.
- Tailor schedule calculations and display for financial reporting, or export the information to Microsoft® Office Excel® for further analysis.

Improve information validity

- Configure data fields to accept only information in the correct format, such as the correct number of decimal places or alphanumeric patterns.
- Help ensure information is complete with application controls such as requiring a vendor invoice number to be entered before a purchase order can be posted.
- Reduce the risk of inaccurate information or tampering and help protect sensitive information with access to information based on job role.
- Prohibit access, provide read-only access, or enable full-access users to add, edit, or delete information.
- Easily identify and resolve discrepancies with a reconciliation feature that retrieves current bank account and transaction information and compares it to general ledger posts.
- Schedule manual or automatic backups to help protect information from electronic failures

Comply quickly with discovery requests and reporting demands

- Save time when you create standard reports that use common business parameters and criteria to satisfy typical reporting needs, ranging from order summaries to aging accounts receivable.
- Perform complex reviews with basic or advanced business analytics functionality.
- Create custom reports and display in product and by utilizing integration to Microsoft PowerBI.
- Speed transmission of financial information to customers, shareholders, regulatory agencies, and the public with XML-based XBRL documents that support the exchange of financial information across different software and technologies, including the Internet.

Help ensure clear audit trails

- Trace documents and information both forward and backward through the system, from the original source to final financial statements and back.
- Identify how, when, and by whom information was entered or edited, and to what account financial entries have been posted.
- Look up database changes, including previous and revised data, in the solution's Change Log.
- Increase audit trail transparency and usability, and speed information access for third-party auditors with drill-down, look-up, filtering, register, and navigation

Compliance and local functionality

Microsoft is building localized versions of Business Central for some countries. These localizations primarily focus on regulatory features in the tax and financial area but can sometimes involve other parts of the application. If you want to see what is built in localized country versions of Business Central, see **Local Functionality** in the menu

and choose a country to learn about country specific functionality.

NOTE

Sarbanes-Oxley: Validating Data and Processes

The Sarbanes-Oxley Act establishes standards for all U.S. public company boards, management, and public accounting firms, including evaluation and disclosure of the adequacy of the company's internal controls over financial reporting. Documenting and testing critical manual and automated controls represents a huge commitment of time and resources for companies. Business Central is especially suited for subsidiaries of larger organizations, and can help support small to midsized businesses in complying with Sarbanes-Oxley.

NOTE

IAS/IFRS: Recognition and Measurement Standards

Depending on the local GAAPs currently in use, one of the major recognition and measurement changes for IAS/IFRS is extended use of fair-value principles instead of historical cost. Business Central can help companies calculate fair-value and net present value (NPV) concepts, which are focused on current and expected cash flow streams rather than historical purchase price. On the reporting side, it can provide segment reporting by business unit and geographical location.

NOTE

Basel II: Implications for Reporting and Analysis

Basel II, developed by the Bank for International Settlements, helps ensure safety and security in the financial system in three key areas: minimum capital requirements, supervisory review process, and market discipline. Although the accord applies to financial institutions and does not target small and mid-sized businesses, Basel II may have some implications for these organizations in reporting and analysis.

Service Compliance

3/31/2019 • 2 minutes to read

This content contains information about service compliance in relation to Business Central.

Business Central is a cloud service with a global reach and scale running on one of the World's largest hyperscale infrastructures, Microsoft Azure, with datacenters in regions all over the World. Running a cloud service also imposes the need to conform to certain standards in security and compliance, so from a service perspective Business Central lives up to the strict requirements in several ISO and industry specific certifications.

Please find the detailed list of [Cloud compliance offerings for Business Central here](#).

If you are interested in the complete list of compliance offerings from Microsoft, see [this page](#).

Certifications

3/31/2019 • 2 minutes to read

This content contains information about certifications in relation to Business Central.

Country certifications and accreditations

In some countries accounting software must be certified to comply with local tax regulatives and financial requirements. Some countries exercise this as a yearly recurring requirement and others as a one-off requirement to comply with. Below is a list of the current countries in which Business Central has achieved certifications. Note that only some countries have this requirement.

- France (Tax Audit Certification)
- Germany (also covers Austria and Switzerland) ([link to certification in German](#))

NOTE

Certifications in countries where Microsoft does not release localized versions

In countries where Microsoft does not release a local version, it is usually up to the partners to achieve certification of the Business Central base product including the partner's localization and regulatory features on top.

Other certifications

Business Central as a cloud service also has achieved certifications like ISO 27001 and more. For a complete list of these certifications, see [this page \(PDF\)](#).
